Mycobacterium spp.

ANAEROBES

Bacteroides spp.
Peptococcus spp.
Clostridium spp.
Fusobacterium spp.
Prevotella spp.

OTHER

Candida spp.

VIRAL

Rhinovirus.
Adenovirus.
Coronavirus.
Herpes simplex 1, 2.
Influenza A, B.
Parainfluenza.
Cytomegalovirus.
Epstein-Barr.
Varicella-zoster.
Hepatitis virus.
Noninfectious Causes

SYSTEMIC

Kawasaki disease.
Stevens-Johnson syndrome.
Cyclic neutropenia.
Thyroiditis.
Connective tissue disease.

TRAUMA, MISCELLANEOUS

Penetrating injury.
Angioneurotic edema.
Retained foreign body.
Anomalous aortic arch.
Laryngeal fracture.
Calcific retropharyngeal tendinitis.
Retropharyngeal hematoma.
Caustic exposure.

TUMOR

Tongue.
Larynx.
Thyroid.
Leukemia.

SPASTIC PARAPLEGIAS

ICD-10CM # G82.20 Paraplegia, unspecified

Cervical spondylosis.
Friedreich ataxia.
Multiple sclerosis.
Spinal cord tumor.
HIV.
Tertiary syphilis.
Vitamin B_{12} deficiency.
Spinocerebellar ataxias.
Syringomyelia.
Spinal cord AV malformations.
Adrenoleukodystrophy.

SPINAL CORD COMPRESSION, EPIDURAL

ICD-10CM # Varies with specific diagnosis

Osteoarthritis.
Meningioma.
Spinal epidural abscess.
Spinal epidural hematoma.
Spinal epidural vascular malformations.
RA.
Metastatic cancer (vertebral, intramedullary, leptomeninges).
Radiation myelopathy.
Neurofibroma.
Sarcoidosis.
Paraneoplastic myelopathy.
Histiocytosis.

SPINAL CORD DYSFUNCTION

ICD-10CM #	G95.9	Disease of spinal cord, unspecified
	Q07.9	Congenital malformation of nervous system, unspecified
	D51.1	Vitamin B_{12} deficiency anemia due to selective vitamin B_{12} malabsorption with proteinuria
	D51.3	Other dietary vitamin B_{12} deficiency anemia
	D51.8	Other vitamin B_{12} deficiency anemias
	G95.89	Other specified diseases of spinal cord
	G95.19	Other vascular myelopathies

Trauma.
Multiple sclerosis.
Transverse myelitis.
Neoplasm (primary, metastatic).
Syringomyelia.
Spinal epidural abscess.
HIV myelopathy.
Diskitis.
Spinal epidural hematoma.
Spinal cord infarction.
Spinal AV malformation.
Subarachnoid hemorrhage.

SPINAL CORD DYSFUNCTION, NONTRAUMATIC[7]

ICD-10CM #	Q07.9	Congenital malformation of nervous system, unspecified

NONTRAUMATIC ETIOLOGIES OF SPINAL CORD DYSFUNCTION

Processes Affecting the Spinal Cord or Blood Supply Directly
Multiple sclerosis.
Transverse myelitis.
Spinal arteriovenous malformation/subarachnoid hemorrhage.
Syringomyelia.
HIV myelopathy.
Other myelopathies.
Spinal cord infarction.
Compressive Lesions Affecting the Spinal Cord
Spinal epidural abscess.
Spinal epidural hematoma.
Diskitis.
Neoplasm.
Metastatic.
Primary CNS.

CNS, Central nervous system; *HIV,* human immunodeficiency virus.

SPINAL CORD ISCHEMIC SYNDROMES

ICD-10CM # Varies with specific diagnosis

Systemic hypotension.
Venous or arterial occlusion.
Arterial dissection.
Thromboembolism.
Endovascular procedures.
Vasculitis.
Fibrocartilaginous embolism.
Regional hemodynamic compromise.

SPINAL TUMORS[32]

ICD-10CM # Varies with specific diagnosis

EXTRADURAL

Metastases.
Primary bone tumors arising in spine.

INTRADURAL EXTRAMEDULLARY

Meningiomas.
Neurofibromas.
Schwannomas.
Lipomas.
Arachnoid cysts.
Epidermoid cysts.
Metastasis.

INTRAMEDULLARY

Ependymoma.
Glioma.
Hemangioblastoma.
Lipoma.
Metastases.

SPLENIC CYSTS, CLASSIFICATION[15]

ICD-10CM # D73.4 Cyst of spleen

Primary (true).
Parasitic.

Nonparasitic.
Congenital.
Epidermoid.
Dermoid.
Mesothelial (serous).
Transitional.
Neoplastic.
Secondary (false): pseudocysts.
Traumatic.
Degenerative.
Inflammatory.
Hemorrhagic.

SPLENIC MASSES, FOCAL SOLID[74]

ICD-10CM # Varies with specific diagnosis

FOCAL SOLID SPLENIC MASSES

Benign
Hemangioma.
Hamartoma.
Littoral cell angioma.
Lymphangioma.
Sclerosing angiomatoid nodular transformation (SANT).
Inflammatory pseudotumor.
Malignant
Lymphoma.
Metastases.
Angiosarcoma.
Hemangiopericytoma.
Other
Infarct.

SPLENIC NODULES[74]

ICD-10CM # Varies with specific diagnosis

CAUSES OF SPLENIC NODULES

Infectious
Tuberculosis/*Mycobacterium avium-intracellulare* complex.
Pyogenic abscesses.
Histoplasmosis.
Candida abscesses.
Cat-scratch disease.
Pneumocystis jiroveci (formerly *P. carinii pneumonia*).
Inflammatory
Sarcoidosis.
Malignant
Lymphoma.
Metastases.
Other
Gamna-Gandy bodies.
Gaucher disease.

SPLENIC TUMORS, CLASSIFICATION[15]

ICD-10CM # C26.1 Malignant neoplasm of spleen

Malignant.
Lymphoproliferative disease.
Non-Hodgkin lymphoma.
Hodgkin disease.
Hairy cell leukemia.
Chronic lymphocytic leukemia.
Myeloproliferative disease.
Chronic myelogenous leukemia.
Myelofibrosis.
Primary tumors.
Angiosarcoma.
Metastatic tumors.
Benign.
Hemangiomas.
Hamartomas.
Lymphangiomas.
Sclerosing angiomatoid nodular transformation (SANT).

SPLENOMEGALY

ICD-10CM # R16.1 Splenomegaly, not elsewhere classified
D73.2 Chronic congestive splenomegaly
R16.1 Splenomegaly, not elsewhere classified

Hepatic cirrhosis.
Neoplastic involvement: CML, CLL, lymphoma, multiple myeloma.
Bacterial infections: TB, infectious endocarditis, typhoid fever, splenic abscess.
Viral infections: infectious mononucleosis, viral hepatitis, HIV.
Gaucher disease and other lipid storage diseases.
Sarcoidosis.
Parasitic infections (malaria, kala-azar, histoplasmosis).
Hereditary and acquired hemolytic anemias.
Idiopathic thrombocytopenic purpura (ITP).
Collagen vascular disorders: SLE, RA (Felty syndrome), polyarteritis nodosa.
Serum sickness, drug hypersensitivity reaction.
Splenic cysts and benign tumors: hemangioma, lymphangioma.
Thrombosis of splenic or portal vein.
Polycythemia vera, myeloid metaplasia.

SPLENOMEGALY AND HEPATOMEGALY[86]

ICD-10CM # R16.1 Splenomegaly, not elsewhere classified
R16.0 Hepatomegaly, not elsewhere classified

CAUSES OF SPLENOMEGALY AND HEPATOSPLENOMEGALY

Massive Splenomegaly
Hematologic disease (e.g., chronic myeloid leukemia, myelofibrosis).
Moderate Splenomegaly
The above causes.
Portal hypertension.
Hematologic disease (e.g., lymphoma, leukemia, thalassemia).
Storage disease (e.g., Gaucher disease).
Small Splenomegaly
The above causes.
Infective (hepatitis, leptospirosis, malaria, bacterial endocarditis).
Hematologic disease (e.g., hemolytic anemias, essential thrombocythemia, polycythemia rubra vera).
Connective tissue diseases or vasculitis (e.g., rheumatoid arthritis, systemic lupus erythematosus, polyarteritis nodosa).
Solitary cyst, polycystic syndrome, hydatid cyst.
Infiltration (amyloid, sarcoid).
Hepatosplenomegaly
Chronic liver disease with portal hypertension.
Hematologic disease (e.g., myeloproliferative disease, lymphoma).
Infection (e.g., amyloid, sarcoid).
Connective tissue disease (e.g., systemic lupus erythematosus).

SPLENOMEGALY AND HYPERSPLENISM[46]

ICD-10CM # R16.1 Splenomegaly, not elsewhere classified
D73.1 Hypersplenism
D73.81 Neutropenic splenomegaly

DIFFERENTIAL DIAGNOSIS OF SPLENOMEGALY AND HYPERSPLENISM

Infections
Acute
Viral (viral hepatitis, infectious mononucleosis, CMV infection).
Bacterial (septicemia, salmonellosis, brucellosis, splenic abscess).
Parasite (toxoplasmosis).
Subacute and Chronic
Subacute bacterial endocarditis.
Tuberculosis.
Malaria.
Kala-azar.
Fungal disease.
Inflammation
Felty syndrome.
SLE.
Serum sickness.
Rheumatic fever.
Sarcoidosis.
ALPS.
Congestive Splenomegaly
Intrahepatic
Cirrhosis.
Extrahepatic
Portal vein obstruction.
Splenic vein obstruction.
Hepatic vein occlusion (Budd-Chiari syndrome).
Chronic Passive Congestion
Heart failure.
Hematologic Disorders
RBC disorders: hemolytic anemias, thalassemia, sickle cell disorders.
Neoplasia
Malignant
MPDs.
Myeloid metaplasia.
Polycythemia rubra vera.
Essential thrombocythemia.
Chronic leukemia.
Chronic myeloid leukemia.

Chronic lymphocytic leukemia.
Hairy cell leukemia.
Lymphoma.
Acute leukemia.
Malignant histiocytosis.
Benign
Hamartoma.
Hemangioma.
Lymphangioma.
Fibroma.
Storage Diseases
Gaucher disease.
Niemann-Pick disease.
Miscellaneous
Amyloidosis.
Cysts.

ALPS, Autoimmune lymphoproliferative syndrome; *CMV,* cytomegalovirus; *MPD,* myeloproliferative disorder; *RBC,* red blood cell; *SLE,* systemic lupus erythematosus.

SPLENOMEGALY, CHILDREN[45]

ICD-10CM # R16.1 Splenomegaly, not elsewhere classified

DISORDERS OF THE BLOOD

Hemolytic anemia: congenital/acquired.
Thalassemia.
Sickle cell disease.
Leukemia.
Osteopetrosis.
Myelofibrosis/myeloid metaplasia/thrombocythemia.

INFECTIONS: ACUTE AND CHRONIC

Viral:
- Congenital (e.g., TORCH association).
- Mononucleosis (e.g., EBV, CMV infection).
- Virus-associated hemophagocytic syndrome.
- HIV.

Bacterial:
- Sepsis/abscess.
- Brucellosis.
- Salmonellosis.
- Tularemia.
- Tuberculosis.
- Subacute bacterial endocarditis.
- Syphilis.
- Lyme disease.

Fungal:
- Histoplasmosis (disseminated).

Rickettsial:
- Rocky Mountain spotted fever.
- Cat-scratch disease.

Parasitic:
- Toxoplasmosis.
- Malaria.
- Leishmaniasis (kala-azar).
- Schistosomiasis.
- Echinococcosis.

HEPATIC/PORTAL SYSTEM DISORDERS

Acute/chronic active hepatitis.
Cirrhosis/hepatic fibrosis/biliary atresia.
Portal or splenic venous obstruction (Banti syndrome).

AUTOIMMUNE DISEASE

Juvenile rheumatoid arthritis.
Systemic lupus erythematosus.
Autoimmune lymphoproliferative syndrome (Canale–Smith syndrome).

NEOPLASMS/CYSTS

Lymphomas (Hodgkin and non-Hodgkin).
Hemangiomas/lymphangiomas.
Hamartomas.
Congenital or acquired (posttraumatic) cysts.

STORAGE DISEASES/INBORN ERRORS OF METABOLISM

Lipidoses: Gaucher disease, Niemann–Pick disease, others.
Mucopolysaccharidoses.
Defects in carbohydrate metabolism: galactosemia, fructose intolerance.
Sea-blue histiocyte syndrome.

MISCELLANEOUS DISORDERS

Histiocytoses:
- Reactive.
- Langerhans cell.
- Malignant.

Sarcoidosis.
Congestive heart failure.
Familial Mediterranean fever.

CMV, Cytomegalovirus; *EBV,* Epstein-Barr virus; *TORCH,* toxoplasmosis, other infections, rubella, cytomegalovirus infection, herpes simplex.

SPONTANEOUS PNEUMOTHORAX[60]

ICD-10CM # J93.0 Spontaneous tension pneumothorax
J93.11 Primary spontaneous pneumothorax
J93.12 Secondary spontaneous pneumothorax

CAUSES OF SECONDARY SPONTANEOUS PNEUMOTHORAX

Airway Disease
Chronic obstructive pulmonary disease.
Asthma.
Cystic fibrosis.
Infections
Necrotizing bacterial pneumonia, lung abscess.
Pneumocystis jiroveci pneumonia.
Tuberculosis.
Interstitial Lung Disease
Sarcoidosis.
Idiopathic pulmonary fibrosis.
Lymphangiomyomatosis.
Tuberous sclerosis.
Pneumoconioses.
Neoplasms
Primary lung cancers.
Pulmonary or pleural metastases.
Miscellaneous
Connective tissue diseases.
Pulmonary infarction.
Endometriosis, catamenial pneumothorax.

STATURAL OVERGROWTH[62]

ICD-10CM # E34.4 Constitutional tall stature

FETAL OVERGROWTH

Maternal diabetes mellitus.
Cerebral gigantism (Sotos syndrome).
Weaver syndrome.
Beckwith-Wiedemann syndrome.
Other insulin-like growth factor 2 (IGF2) excess syndromes.

POSTNATAL OVERGROWTH LEADING TO CHILDHOOD TALL STATURE

Familial (constitutional) tall stature.
Cerebral gigantism.
Beckwith-Wiedemann syndrome.
Exogenous obesity.
Excess growth hormone (GH) secretion (pituitary gigantism).
McCune-Albright syndrome or multiple endocrine neoplasia (MEN) associated with excess GH secretion.
Precocious puberty.
Marfan syndrome.
Klinefelter syndrome (XXY).
Weaver syndrome.
Fragile X syndrome.
Homocystinuria.
XYY.
Hyperthyroidism.

POSTNATAL OVERGROWTH LEADING TO ADULT TALL STATURE

Familial (constitutional) tall stature.
Androgen or estrogen deficiency/estrogen resistance (in males).
Testicular feminization.
Excess GH secretion.
Marfan syndrome.
Klinefelter syndrome (XXY).
XYY.

STEATOHEPATITIS

ICD-10CM # K76.0 Fatty (change of) liver, not elsewhere classified
K76.89 Other specified diseases of liver

Alcohol abuse.
Obesity.
DM.
Parenteral nutrition.
Medications (high-dose estrogen, amiodarone, corticosteroids, methotrexate, nifedipine).
Jejunoileal bypass.
Abetalipoproteinemia.
Wilson disease, Weber-Christian disease.

STOMATITIS, BULLOUS

ICD-10CM # K12.30 Oral mucositis (ulcerative), unspecified

Erythema multiforme.
Erosive lichen planus.
Bullous pemphigoid.

SLE.
Pemphigus vulgaris.
Mucous membrane pemphigoid.

STRIDOR IN NEONATES[1]

ICD-10CM # R06.1 Stridor

INTRINSIC LESIONS

Larynx
Laryngomalacia.
Infection (laryngitis).
Vocal cord paralysis.
Laryngeal web.
Laryngocele or laryngeal cyst.
Laryngotracheal esophageal cleft.
Foreign body.
Trachea
Tracheomalacia.
Tracheal stenosis.
Tracheoesophageal fistula.
Subglottic hemangioma.
Tracheal web.
Extrinsic Compression
Vascular ring.
Anomalous innominate artery.
Mediastinal mass.
Esophageal foreign body.
Other
Macroglossia.
Gastroesophageal reflux.

STRIDOR, PEDIATRIC AGE[9]

ICD-10CM # R06.1 Stridor

RECURRENT

Allergic (spasmodic) croup.
Respiratory infections in a child with otherwise asymptomatic anatomic narrowing of the large airways.
Laryngomalacia.

PERSISTENT

Laryngeal obstruction:
- Laryngomalacia.
- Papillomas, other tumors.
- Cysts and laryngoceles.
- Laryngeal webs.
- Bilateral abductor paralysis of the cords.
- Foreign body.

Tracheobronchial disease:
- Tracheomalacia.
- Subglottic tracheal webs.

Endotracheal, endobronchial tumors.
Subglottic tracheal stenosis.
Congenital.
Acquired.
Extrinsic masses.
Mediastinal masses.
Vascular ring.
Lobar emphysema.
Bronchogenic cysts.
Thyroid enlargement.
Esophageal foreign body.
Tracheoesophageal fistulas.
Other.
Gastroesophageal reflux.
Macroglossia, Pierre Robin syndrome.
Cri-du-chat syndrome.
Hysterical stridor.
Hypocalcemia.

STROKE[82]

ICD-10CM # Varies with specific diagnosis

STROKE "MIMICS"

Hypoglycemia.
Drug overdose or intoxication.
Hysterical conversion reaction.
Hyperventilation.
Metabolic encephalopathy.
Migraine.
Syncope.
Transient global amnesia.
Seizures.
Vestibular vertigo.

STROKE, PEDIATRIC AGE[52]

ICD-10CM # I67.89 Other cerebrovascular disease

CARDIAC DISEASE

Congenital:
- Aortic stenosis.
- Mitral stenosis; mitral prolapse.
- Ventricular septal defects.
- Patent ductus arteriosus.
- Cyanotic congenital heart disease involving right-to-left shunt.

Acquired:
- Endocarditis (bacterial, SLE).
- Kawasaki disease.
- Cardiomyopathy.
- Atrial myxoma.
- Arrhythmia.
- Paradoxical emboli through patent foramen ovale.
- Rheumatic fever.
- Prosthetic heart valve.

HEMATOLOGIC ABNORMALITIES

Hemoglobinopathies:
- Sickle cell (SS) disease.
- Sickle (SC) disease.

Polycythemia.
Leukemia/lymphoma.
Thrombocytopenia.
Thrombocytosis.
Disorders of coagulation:
- Protein C deficiency.
- Protein S deficiency.
- Factor V Leiden.
- Antithrombin III deficiency.
- Lupus anticoagulant.

Oral contraceptive pill use.
Pregnancy and the postpartum state.
Disseminated intravascular coagulation.
Paroxysmal nocturnal hemoglobinuria.
Inflammatory bowel disease (thrombosis).

INFLAMMATORY DISORDERS

Meningitis:
- Viral.
- Bacterial.
- Tuberculosis.

Systemic infection:
- Viremia.
- Bacteremia.
- Local head and neck infections.

Drug-induced inflammation:
- Amphetamine.
- Cocaine.

Autoimmune disease:
- SLE.
- Juvenile RA.
- Takayasu arteritis.
- Mixed connective tissue disease.
- Polyarteritis nodosum.
- Primary CNS vasculitis.
- Sarcoidosis.
- Behçet syndrome.
- Granulomatosis with polyangiitis.

METABOLIC DISEASE ASSOCIATED WITH STROKE

Homocystinuria.
Pseudoxanthoma elasticum.
Fabry disease.
Sulfite oxidase deficiency.
Mitochondrial disorders:
- MELAS.
- Leigh syndrome.

Ornithine transcarbamylase deficiency.

INTRACEREBRAL VASCULAR PROCESSES

Ruptured aneurysm.
Arteriovenous malformation.
Fibromuscular dysplasia.
Moyamoya disease.
Migraine headache.
Postsubarachnoid hemorrhage vasospasm.
Hereditary hemorrhagic telangiectasia.
Sturge-Weber syndrome.
Carotid artery dissection.
Postvaricella.

TRAUMA AND OTHER EXTERNAL CAUSES

Child abuse.
Head trauma/neck trauma.
Oral trauma.
Placental embolism.
ECMO therapy.

CNS, Central nervous system; *ECMO,* extracorporeal membrane oxygenation; *MELAS,* mitochondrial encephalomyopathy, lactic acidosis, and stroke.

STROKE, YOUNG ADULT, CAUSES[3]

ICD-10CM # I64 Stroke
I67.89 Other cerebrovascular disease

Cardiac factors (ASD, MVP, patent foramen ovale).
Inflammatory factors (SLE, polyarteritis nodosa).
Infections (endocarditis, neurosyphilis).
Drugs (cocaine, heroin, oral contraceptives, decongestants).
Arterial dissection.
Hematolic factors (DIC, TTP, deficiency of protein S, protein C, antithrombin III).

Migraine.
Postpartum angiopathy.
Other: premature atherosclerosis, fibromuscular dysplasia.

ST-SEGMENT DEPRESSION, NONCORONARY CAUSES[11]

ICD-10CM # R94.31 Abnormal electrocardiogram

NONCORONARY CAUSES OF ST-SEGMENT DEPRESSION

Anemia.
Cardiomyopathy.
Digitalis use.
Glucose load.
Hyperventilation.
Hypokalemia.
Intraventricular conduction disturbance.
Left ventricular hypertrophy.
Mitral valve prolapse.
Preexcitation syndrome.
Severe aortic stenosis.
Severe hypertension.
Severe hypoxia.
Severe volume overload (aortic, mitral regurgitation).
Sudden excessive exercise.
Supraventricular tachyarrhythmias.

ST-SEGMENT ELEVATION[1]

ICD-10CM # R94.31 Abnormal electrocardiogram [ECG] [EKG]

DIFFERENTIAL DIAGNOSIS OF ST-SEGMENT ELEVATION ON ELECTROCARDIOGRAPHY

ST-segment elevation myocardial infarction.
Pericarditis.
Benign early repolarization.
Left bundle branch block.
Left ventricular hypertrophy.
Left ventricular aneurysm.
Paced ventricular rhythms.
Prinzmetal angina.
Hyperkalemia.
Hypothermia with Osborne waves.
Intracranial hemorrhage.
Brugada syndrome.
Normal variant.

ST SEGMENT ELEVATIONS, NONISCHEMIC

ICD-10CM # R94.31 Abnormal electrocardiogram [ECG] [EKG]

Early repolarization.
Acute pericarditis.
LVH.
Normal pattern variant.
LBBB.
Pulmonary embolism.
Hyperkalemia.
Postcardioversion.

SUDDEN CARDIAC DEATH[59]

ICD-10CM # **Z86.74** Personal history of sudden cardiac arrest
Z82.41 Family history of sudden cardiac death

CAUSES OF AND CONTRIBUTING FACTORS IN SUDDEN CARDIAC DEATH

Coronary Artery Abnormalities
Coronary atherosclerosis:
- Chronic coronary atherosclerosis with acute or transient myocardial ischemia—thrombosis, spasm, physical stress.
- Acute myocardial infarction, onset and early phase.
- Chronic atherosclerosis with a change in myocardial substrate, including previous myocardial infarction.

Congenital abnormalities of coronary arteries:
- Anomalous origin from the pulmonary artery.
- Other coronary arteriovenous fistula.
- Origin of a left coronary branch from the right or noncoronary sinus of Valsalva.
- Origin of the right coronary artery from the left sinus of Valsalva.
- Hypoplastic or aplastic coronary arteries.
- Coronary-intracardiac shunt.

Coronary artery embolism:
- Aortic or mitral endocarditis.
- Prosthetic aortic or mitral valves.
- Abnormal native valves or left ventricular mural thrombus.
- Platelet embolism.

Coronary arteritis:
- Polyarteritis nodosa, progressive systemic sclerosis, giant cell arteritis.
- Mucocutaneous lymph node syndrome (Kawasaki disease).
- Syphilitic coronary ostial stenosis.

Miscellaneous mechanical obstruction of the coronary arteries:
- Coronary artery dissection in Marfan syndrome.
- Coronary artery dissection in pregnancy.
- Prolapse of aortic valve myxomatous polyps into the coronary ostia.
- Dissection or rupture of the sinus of Valsalva.

Functional obstruction of the coronary arteries:
- Coronary artery spasm with or without atherosclerosis.
- Myocardial bridges.

Hypertrophy of the Ventricular Myocardium
Left ventricular hypertrophy associated with coronary heart disease.
Hypertensive heart disease without significant coronary atherosclerosis.
Hypertrophic myocardium secondary to valvular heart disease.
Hypertrophic cardiomyopathy:
- Obstructive.
- Nonobstructive.

Primary or secondary pulmonary hypertension:
- Advanced chronic right ventricular overload.
- Pulmonary hypertension in pregnancy (highest risk peripartum).

Myocardial Diseases and Dysfunction, With or Without Heart Failure
Chronic congestive heart failure:
- Ischemic cardiomyopathy.
- Idiopathic dilated cardiomyopathy, acquired.
- Hereditary dilated cardiomyopathy.
- Alcoholic cardiomyopathy.
- Hypertensive cardiomyopathy.
- Postmyocarditis cardiomyopathy.
- Peripartum cardiomyopathy.
- Idiopathic fibrosis.

Acute and subacute cardiac failure:
- Massive acute myocardial infarction.
- Myocarditis, acute or fulminant.
- Acute alcoholic cardiac dysfunction.
- Takotsubo syndrome (uncertain risk for sudden death).
- Ball valve embolism in aortic stenosis or prosthesis.
- Mechanical disruptions of cardiac structures:
  - Rupture of the ventricular free wall.
  - Disruption of the mitral apparatus:
    - Papillary muscle.
    - Chordae tendineae.
    - Leaflet.
  - Rupture of the interventricular septum.
- Acute pulmonary edema in noncompliant ventricles.

Inflammatory, Infiltrative, Neoplastic, and Degenerative Processes
Viral myocarditis, with or without ventricular dysfunction:
- Acute phase.
- Postmyocarditis interstitial fibrosis.

Myocarditis associated with the vasculitides.
Sarcoidosis.
Progressive systemic sclerosis.
Amyloidosis.
Hemochromatosis.
Idiopathic giant cell myocarditis.
Chagas disease.
Cardiac ganglionitis.
Arrhythmogenic right ventricular dysplasia, right ventricular cardiomyopathy.
Neuromuscular diseases (e.g., muscular dystrophy, Friedreich ataxia, myotonic dystrophy).
Intramural tumors:
- Primary.
- Metastatic.

Obstructive intracavitary tumors:
- Neoplastic.
- Thrombotic.

Diseases of the Cardiac Valves
Valvular aortic stenosis/insufficiency.
Mitral valve disruption.
Mitral valve prolapse.
Endocarditis.
Prosthetic valve dysfunction.

Congenital Heart Disease
Congenital aortic (potentially high risk) or pulmonic (low risk) valve stenosis.
Congenital septal defects with Eisenmenger physiology:
- Advanced disease.
- During labor and delivery.

Late after surgical repair of congenital lesions (e.g., tetralogy of Fallot).

Electrophysiologic Abnormalities
Abnormalities of the conducting system:
- Fibrosis of the His-Purkinje system:
  - Primary degeneration (Lenègre disease).
  - Secondary to fibrosis and calcification of the "cardiac skeleton" (Lev disease).
  - Postviral conducting system fibrosis.
  - Hereditary conducting system disease.
- Anomalous pathways of conduction (Wolff-Parkinson-White syndrome, short refractory period bypass).

Abnormalities of repolarization:
- Congenital abnormalities in duration of the QT interval:
  - Congenital long–QT interval syndromes:
    - Romano-Ward syndrome (without deafness).
    - Jervell and Lange-Nielsen syndrome (with deafness).
  - Congenital short–QT interval syndrome.
- Acquired (or provoked) long–QT interval syndromes:
  - Drug effect (with genetic predisposition?):
    - Cardiac, antiarrhythmic.
    - Noncardiac.
    - Drug interactions.
  - Electrolyte abnormality (response modified by genetic predisposition?).
  - Toxic substances.
  - Hypothermia.
  - CNS injury, subarachnoid hemorrhage.
- Brugada syndrome—right bundle branch block and ST-segment elevations in the absence of ischemia:
  - Early repolarization syndrome.

Ventricular fibrillation of unknown or uncertain cause:
- Absence of identifiable structural or functional causes:
  - "Idiopathic" ventricular fibrillation.
  - Short-coupled torsades de pointes, polymorphic ventricular tachycardia.
  - Nonspecific fibrofatty infiltration in a previously healthy victim (variation of right ventricular dysplasia?).
- Sleep-death in Southeast Asians (see VIIB3, Brugada syndrome):
  - Bangungut.
  - Pokkuri.
  - Lai-tai.

Electrical Instability Related to Neurohumoral and Central Nervous System Influences
- Catecholaminergic polymorphic ventricular tachycardia.

Other catecholamine-dependent arrhythmias.
CNS related:
- Psychic stress, emotional extremes (Takotsubo syndrome).
- Auditory related:
- "Voodoo death" in primitive cultures.
- Diseases of the cardiac nerves.
- Arrhythmia expression in congenital long–QT interval syndrome.

Sudden Infant Death Syndrome and Sudden Death in Children
Sudden infant death syndrome:
- Immature respiratory control function.
- Long–QT interval syndrome.
- Congenital heart disease.
- Myocarditis.

Sudden death in children:
- Eisenmenger syndrome, aortic stenosis, hypertrophic cardiomyopathy, pulmonary atresia.
- After corrective surgery for congenital heart disease.
- Myocarditis.
- Genetic disorders of electrical function (e.g., long–QT interval syndrome).
- No identified structural or functional cause.

Miscellaneous
- Sudden death during extreme physical activity (seek predisposing causes).
- Commotio cordis—blunt chest trauma.
- Mechanical interference with venous return:
  - Acute cardiac tamponade.
  - Massive pulmonary embolism.
  - Acute intracardiac thrombosis.
- Dissecting aneurysm of the aorta.
- Toxic and metabolic disturbances (other than the QT interval effects listed above):
  - Electrolyte disturbances.
  - Metabolic disturbances.
  - Proarrhythmic effects of antiarrhythmic drugs.
  - Proarrhythmic effects of noncardiac drugs.
- Mimics sudden cardiac death:
  - "Café coronary."
  - Acute alcoholic states ("holiday heart").
  - Acute asthmatic attacks.
  - Air or amniotic fluid embolism.

SUDDEN DEATH, PEDIATRIC AGE[9]

ICD-10CM # R99 Ill-defined and unknown cause of mortality

SIDS AND SIDS "MIMICS"
SIDS.
Long QT syndromes.
Inborn errors of metabolism.
Child abuse.
Myocarditis.
Duct-dependent congenital heart disease.

CORRECTED OR UNOPERATED CONGENITAL HEART DISEASE
Aortic stenosis.
Tetralogy of Fallot.
Transposition of great vessels (postoperative atrial switch).
Mitral valve prolapse.
Hematologic left heart syndrome.
Eisenmenger syndrome.

CORONARY ARTERIAL DISEASE
Anomalous origin.
Anomalous tract.
Kawasaki disease.
Periarteritis.
Arterial dissection.
Marfan syndrome.
Myocardial infarction.

MYOCARDIAL DISEASE
Myocarditis.
Hypertrophic cardiomyopathy.
Dilated cardiomyopathy.
Arrhythmogenic right ventricular dysplasia.

CONDUCTION SYSTEM ABNORMALITY/ARRHYTHMIA
Long QT syndromes.
Proarrhythmic drugs.
Preexcitation syndromes.
Heart block.
Commotio cordis.
Idiopathic ventricular fibrillation.
Heart tumor.

MISCELLANEOUS
Pulmonary hypertension.
Pulmonary embolism.
Heat stroke.
Cocaine.
Anorexia nervosa.
Electrolyte disturbances.

SIDS, Sudden infant death syndrome.

SUDDEN DEATH, YOUNG ATHLETE

ICD-10CM # R99 Ill-defined and unknown cause of mortality

Hypertrophic cardiomyopathy.
Coronary artery anomalies.
Myocarditis.
Ruptured aortic aneurysm (Marfan syndrome).
Arrhythmias.
Aortic valve stenosis.
Asthma.
Trauma (cerebral, cardiac).
Drug and alcohol abuse.
Heat stroke.
Cardiac sarcoidosis.
Atherosclerotic coronary artery disease.
Dilated cardiomyopathy.

SWOLLEN LIMB

ICD-10CM # M79.89 Other specified soft tissue disorders

Trauma.
Insect bite.
Abscess.
Lymphedema.
Thrombophlebitis.
Lipoma.
Neurofibroma.
Postphlebitic syndrome.
Myositis ossificans.
Nephrosis, cirrhosis, CHF.
Hypoalbuminemia.
Varicose veins.

TALL STATURE[63]

ICD-10CM # E22.0 Acromegaly and pituitary gigantism

CONSTITUTIONAL (FAMILIAL OR GENETIC)—MOST COMMON CAUSE

Endocrine Causes
Growth hormone excess—gigantism.

Electrophysiologic Abnormalities
Abnormalities of the conducting system:
- Fibrosis of the His-Purkinje system:
  - Primary degeneration (Lenègre disease).
  - Secondary to fibrosis and calcification of the "cardiac skeleton" (Lev disease).
  - Postviral conducting system fibrosis.
  - Hereditary conducting system disease.
- Anomalous pathways of conduction (Wolff-Parkinson-White syndrome, short refractory period bypass).

Abnormalities of repolarization:
- Congenital abnormalities in duration of the QT interval:
  - Congenital long–QT interval syndromes:
    - Romano-Ward syndrome (without deafness).
    - Jervell and Lange-Nielsen syndrome (with deafness).
  - Congenital short–QT interval syndrome.
- Acquired (or provoked) long–QT interval syndromes:
  - Drug effect (with genetic predisposition?):
    - Cardiac, antiarrhythmic.
    - Noncardiac.
    - Drug interactions.
  - Electrolyte abnormality (response modified by genetic predisposition?).
  - Toxic substances.
  - Hypothermia.
  - CNS injury, subarachnoid hemorrhage.
- Brugada syndrome—right bundle branch block and ST-segment elevations in the absence of ischemia:
  - Early repolarization syndrome.

Ventricular fibrillation of unknown or uncertain cause:
- Absence of identifiable structural or functional causes:
  - "Idiopathic" ventricular fibrillation.
  - Short-coupled torsades de pointes, polymorphic ventricular tachycardia.
  - Nonspecific fibrofatty infiltration in a previously healthy victim (variation of right ventricular dysplasia?).
- Sleep-death in Southeast Asians (see VIIB3, Brugada syndrome):
  - Bangungut.
  - Pokkuri.
  - Lai-tai.

Electrical Instability Related to Neurohumoral and Central Nervous System Influences
- Catecholaminergic polymorphic ventricular tachycardia.

Other catecholamine-dependent arrhythmias.
CNS related:
- Psychic stress, emotional extremes (Takotsubo syndrome).
- Auditory related:
- "Voodoo death" in primitive cultures.
- Diseases of the cardiac nerves.
- Arrhythmia expression in congenital long–QT interval syndrome.

Sudden Infant Death Syndrome and Sudden Death in Children
Sudden infant death syndrome:
- Immature respiratory control function.
- Long–QT interval syndrome.
- Congenital heart disease.
- Myocarditis.

Sudden death in children:
- Eisenmenger syndrome, aortic stenosis, hypertrophic cardiomyopathy, pulmonary atresia.
- After corrective surgery for congenital heart disease.
- Myocarditis.
- Genetic disorders of electrical function (e.g., long–QT interval syndrome).
- No identified structural or functional cause.

Miscellaneous
- Sudden death during extreme physical activity (seek predisposing causes).
- Commotio cordis—blunt chest trauma.
- Mechanical interference with venous return:
  - Acute cardiac tamponade.
  - Massive pulmonary embolism.
  - Acute intracardiac thrombosis.
- Dissecting aneurysm of the aorta.
- Toxic and metabolic disturbances (other than the QT interval effects listed above):
  - Electrolyte disturbances.
  - Metabolic disturbances.
  - Proarrhythmic effects of antiarrhythmic drugs.
  - Proarrhythmic effects of noncardiac drugs.
- Mimics sudden cardiac death:
  - "Café coronary."
  - Acute alcoholic states ("holiday heart").
  - Acute asthmatic attacks.
  - Air or amniotic fluid embolism.

SUDDEN DEATH, PEDIATRIC AGE[9]

ICD-10CM # R99 Ill-defined and unknown cause of mortality

SIDS AND SIDS "MIMICS"
SIDS.
Long QT syndromes.
Inborn errors of metabolism.
Child abuse.
Myocarditis.
Duct-dependent congenital heart disease.

CORRECTED OR UNOPERATED CONGENITAL HEART DISEASE
Aortic stenosis.
Tetralogy of Fallot.
Transposition of great vessels (postoperative atrial switch).
Mitral valve prolapse.
Hematologic left heart syndrome.
Eisenmenger syndrome.

CORONARY ARTERIAL DISEASE
Anomalous origin.
Anomalous tract.
Kawasaki disease.
Periarteritis.
Arterial dissection.
Marfan syndrome.
Myocardial infarction.

MYOCARDIAL DISEASE
Myocarditis.
Hypertrophic cardiomyopathy.
Dilated cardiomyopathy.
Arrhythmogenic right ventricular dysplasia.

CONDUCTION SYSTEM ABNORMALITY/ARRHYTHMIA
Long QT syndromes.
Proarrhythmic drugs.
Preexcitation syndromes.
Heart block.
Commotio cordis.
Idiopathic ventricular fibrillation.
Heart tumor.

MISCELLANEOUS
Pulmonary hypertension.
Pulmonary embolism.
Heat stroke.
Cocaine.
Anorexia nervosa.
Electrolyte disturbances.

SIDS, Sudden infant death syndrome.

SUDDEN DEATH, YOUNG ATHLETE

ICD-10CM # R99 Ill-defined and unknown cause of mortality

Hypertrophic cardiomyopathy.
Coronary artery anomalies.
Myocarditis.
Ruptured aortic aneurysm (Marfan syndrome).
Arrhythmias.
Aortic valve stenosis.
Asthma.
Trauma (cerebral, cardiac).
Drug and alcohol abuse.
Heat stroke.
Cardiac sarcoidosis.
Atherosclerotic coronary artery disease.
Dilated cardiomyopathy.

SWOLLEN LIMB

ICD-10CM # M79.89 Other specified soft tissue disorders

Trauma.
Insect bite.
Abscess.
Lymphedema.
Thrombophlebitis.
Lipoma.
Neurofibroma.
Postphlebitic syndrome.
Myositis ossificans.
Nephrosis, cirrhosis, CHF.
Hypoalbuminemia.
Varicose veins.

TALL STATURE[63]

ICD-10CM # E22.0 Acromegaly and pituitary gigantism

CONSTITUTIONAL (FAMILIAL OR GENETIC)—MOST COMMON CAUSE

Endocrine Causes
Growth hormone excess—gigantism.

Sexual precocity (tall as children, short as adults):
  True sexual precocity.
  Pseudosexual precocity.
Androgen deficiency:
  Klinefelter syndrome.
  Bilateral anorchism.

GENETIC CAUSES

Klinefelter syndrome.
Syndromes of XYY, XXYY.

MISCELLANEOUS SYNDROMES AND DISORDERS

Cerebral gigantism or Sotos syndrome: prominent forehead, hypertelorism, high arched palate, dolichocephaly, mental retardation, large hands and feet, and premature eruption of teeth. Large at birth, with most rapid growth in first 4 yr of life.
Marfan syndrome: disorder of mesodermal tissues, subluxation of the lenses, arachnodactyly, and aortic aneurysm.
Homocystinuria: same phenotype as Marfan syndrome.
Obesity: tall as infants, children, and adolescents.
Total lipodystrophy: large hands and feet, generalized loss of subcutaneous fat, insulin-resistant DM, and hepatomegaly.
Beckwith-Wiedemann syndrome: neonatal tallness, omphalocele, macroglossia, and neonatal hypoglycemia.
Weaver-Smith syndrome: excessive intrauterine growth, mental retardation, megalocephaly, widened bifrontal diameter, hypertelorism, large ears, micrognathia, camptodactyly, broad thumbs, and limited extension of elbows and knees.
Marshall-Smith syndrome: excessive intrauterine growth, mental retardation, blue sclerae, failure to thrive, and early death.

TARDIVE DYSKINESIA[31]

ICD-10CM # R27.9 Unspecified lack of coordination
F44.4 Conversion disorder with motor symptom or deficit
F44.6 Conversion disorder with sensory symptom or deficit
G24.4 Idiopathic orofacial dystonia

DIFFERENTIAL DIAGNOSIS

Medications (antidepressants, anticholinergics, amphetamines, lithium, L-dopa, phenytoin).
Brain neoplasms.
Ill-fitting dentures.
Huntington disease.
Idiopathic dystonias (tics, blepharospasm, aging).
Wilson disease.
Extrapyramidal syndrome (postanoxic or postencephalitic).
Torsion dystonia.

TASTE AND SMELL LOSS[3]

ICD-10CM # R43.0 Anosmia
R43.1 Parosmia
R43.2 Parageusia

TASTE

Local: radiation therapy.
Systemic: cancer, renal failure, hepatic failure, nutritional deficiency (vitamin B_{12}, zinc), Cushing syndrome, hypothyroidism, DM, infection (influenza), drugs (antirheumatic and antiproliferative).
Neurologic: Bell palsy, familial dysautonomia, multiple sclerosis.

SMELL

Local: allergic rhinitis, sinusitis, nasal polyposis, bronchial asthma.
Systemic: renal failure, hepatic failure, nutritional deficiency (vitamin B_{12}), Cushing syndrome, hypothyroidism, DM, infection (viral hepatitis, influenza), drugs (nasal sprays, antibiotics).
Neurologic: head trauma, multiple sclerosis, Parkinson disease, frontal brain tumor.

TELANGIECTASIA

ICD-10CM # I78.8 Other diseases of capillaries
I78.9 Disease of capillaries, unspecified

Oral contraceptive agents.
Pregnancy.
Rosacea.
Varicose veins.
Trauma.
Drug induced (corticosteroids, systemic or topical).
Spider telangiectases.
Hepatic cirrhosis.
Mastocytosis.
SLE, dermatomyositis, systemic sclerosis.

TENDINOPATHY[60]

ICD-10CM # M67.90 Unspecified disorder of synovium and tendon, unspecified site
M71.9 Bursopathy, unspecified

INTRINSIC FACTORS

Anatomic Factors
Malalignment.
Muscle weakness or imbalance.
Muscle inflexibility.
Decreased vascularity.
Systemic Factors
Inflammatory conditions (e.g., SLE).
Pregnancy.
Quinolone-induced tendinopathy.
Age-Related Factors
Tendon degeneration.
Increased tendon stiffness.
Tendon calcification.
Decreased vascularity.

EXTRINSIC FACTORS

Repetitive Mechanical Load
Excessive duration.
Excessive frequency.
Excessive intensity.
Poor technique.
Workplace factors.
Equipment Problems
Footwear.
Athletic field surface.
Equipment factors (e.g., racquet size).
Protective gear.

TESTICULAR CYSTIC LESIONS[74]

ICD-10CM # Varies with specific diagnosis

Benign
Tunica albuginea cysts.
Tunica vaginalis cysts.
Intratesticular cysts.
Tubular ectasia of rete testis.
Cystic dysplasia.
Epidermoid cysts.
Abscess.
Malignant
Nonseminomatous germ cell tumor.
Necrosis or hemorrhage in tumor.
Tubular obstruction by tumor.
Lymphoma.

TESTICULAR FAILURE[21]

ICD-10CM # E29 Testicular dysfunction

PRIMARY

Klinefelter syndrome (XXY).
XYY.
Vanishing testes syndrome (in utero or early postnatal torsion).
Noonan syndrome.
Varicocele.
Myotonic dystrophy.
Orchitis (mumps, gonorrhea).
Cryptorchidism.
Chemical exposure.
Irradiation to testes.
Spinal cord injury.
Polyglandular failure.
Idiopathic oligospermia or azoospermia.
Germinal cell aplasia (Sertoli cell-only syndrome).
Idiopathic testicular failure.
Testicular torsion.
Testicular trauma.
Diethylstilbestrol (maternal use during pregnancy leading to in utero estrogen exposure).
Testicular tumor with subsequent irradiation therapy, chemotherapy, or surgery (retroperitoneal lymph node dissection or orchiectomy).

SECONDARY

Delayed puberty.
Kallmann syndrome.
Isolated gonadotropin deficiency.
Prader-Labhart-Willi syndrome.
Lawrence-Moon-Biedl syndrome.

CNS irradiation.
Prepubertal panhypopituitarism.
Postpubertal panhypopituitarism.
Hypogonadism secondary to hyperprolactinemia.
Adrenogenital syndrome.
Chronic liver disease.
Chronic renal failure/uremia.
Hemochromatosis.
Cushing syndrome.
Malnutrition.
Massive obesity.
Sickle cell anemia.
Hyper/hypothyroidism.
Anabolic steroid use.

TESTICULAR PAIN

ICD-10CM # N50.9 Disorder of male genital organs, unspecified
R10.2 Pelvic and perineal pain

Testicular torsion.
Trauma.
Epididymitis.
Orchitis.
Neoplasm.
Urolithiasis.
Inguinal hernia.
Infection (cellulitis, abscess, folliculitis).
Anxiety.

TESTICULAR SIZE VARIATIONS[21]

ICD-10CM # N50.0 Atrophy of testis
N44.2 Benign cyst of testis
N44.8 Other noninflammatory disorders of the testis
N50.3 Cyst of epididymis
N50.8 Other specified disorders of male genital organs
N53.12 Painful ejaculation
E29.1 Testicular hypofunction

SMALL TESTES

Hypothalamic-pituitary dysfunction.
Gonadotropin deficiency.
Growth hormone deficiency.
Normal variant.
Primary hypogonadism.
Autoimmune destruction.
Chemotherapy.
Cryptorchidism.
Irradiation.
Klinefelter syndrome.
Orchiditis.
Testicular regression syndrome.
Torsion.
Trauma.

LARGE TESTES

Adrenal rest tissue.
Compensatory.
Fragile X syndrome.
Idiopathic.
Tumor.

TETANUS[60]

ICD-10CM # A35 Other tetanus

TETANUS "MIMICS"

Acute abdomen.
Black widow spider bite.
Dental abscess.
Dislocated mandible.
Dystonic reaction.
Encephalitis.
Head trauma.
Hyperventilation syndrome.
Hypocalcemia.
Meningitis.
Peritonsillar abscess.
Progressive fluctuating muscular rigidity (stiff-man syndrome).
Psychogenic.
Rabies.
Sepsis.
Subarachnoid hemorrhage.
Status epilepticus.
Strychnine poisoning.
Temporomandibular joint syndrome.

THROMBOCYTOPENIA

ICD-10CM # D47.3 Essential (hemorrhagic) thrombocythemia
D69.59 Other secondary thrombocytopenia
D69.6 Thrombocytopenia, unspecified

INCREASED DESTRUCTION

Immunologic

Drugs: quinine, quinidine, digitalis, procainamide, thiazide diuretics, sulfonamides, phenytoin, aspirin, penicillin, heparin, gold, meprobamate, sulfa drugs, phenylbutazone, NSAIDs, methyldopa, cimetidine, furosemide, INH, cephalosporins, chlorpropamide, organic arsenicals, chloroquine, platelet glycoprotein IIb/IIIa receptor inhibitors, ranitidine, indomethacin, carboplatin, ticlopidine, clopidogrel.
Idiopathic thrombocytopenic purpura (ITP).
Transfusion reaction: transfusion of platelets with plasminogen activator (PLA) in recipients without PLA-1.
Fetal/maternal incompatibility.
Collagen vascular diseases (e.g., SLE).
Autoimmune hemolytic anemia.
Lymphoreticular disorders (e.g., CLL).

Nonimmunologic

Prosthetic heart valves.
Thrombotic thrombocytopenic purpura (TTP).
Sepsis.
DIC.
Hemolytic-uremic syndrome (HUS).
Giant cavernous hemangioma.

DECREASED PRODUCTION

Abnormal marrow.
Marrow infiltration (e.g., leukemia, lymphoma, fibrosis).
Marrow suppression (e.g., chemotherapy, alcohol, radiation).
Hereditary disorders.
Wiskott-Aldrich syndrome: X-linked disorder characterized by thrombocytopenia, eczema, and repeated infections.
May-Hegglin anomaly: increased megakaryocytes but ineffective thrombopoiesis.
Vitamin deficiencies (e.g., vitamin B_{12}, folic acid).

SPLENIC SEQUESTRATION, HYPERSPLENISM

Dilutional, as a result of massive transfusion.

THROMBOCYTOPENIA, IN PREGNANCY[45]

ICD-10CM # D69.59 Other secondary thrombocytopenia

Incidental thrombocytopenia of pregnancy (gestational thrombocytopenia).
Preeclampsia/eclampsia.[41,43]
Peripartum/postpartum thrombotic microangiopathy.
Disseminated intravascular coagulation (DIC) secondary to:
Abruptio placentae.
Endometritis.
Amniotic fluid embolism.
Retained fetus.
Thrombotic thrombocytopenic purpura.
Hemolytic-uremic syndrome.

THROMBOCYTOPENIA, INHERITED DISORDERS[3]

ICD-10CM # D47.3 Essential (hemorrhagic) thrombocythemia

Amegakaryocytic thrombocytopenia.
Thrombocytopenia–absent radii.
MYH9-related thrombocytopenia:
May-Hegglin anomaly.
Fechtner syndrome.
Epstein syndrome.
Sebastian syndrome.
X-linked macrothrombocytopenia.
Wiskott-Aldrich syndrome.
X-linked thrombocytopenia.
Thrombocytopenia and radioulnar synostosis.
Familial platelet disorder—AML.
Familial dominant thrombocytopenia.
Paris-Trousseau thrombocytopenia.
Bernard-Soulier syndrome.
Bernard-Soulier carrier/Mediterranean macrothrombocytopenia.

THROMBOCYTOPENIA IN NEWBORNS, DIFFERENTIAL DIAGNOSIS[44]

ICD-10CM # D47.3 Essential (hemorrhagic) thrombocythemia
D69.59 Other secondary thrombocytopenia
D69.6 Thrombocytopenia, unspecified

DIFFERENTIAL DIAGNOSIS OF THROMBOCYTOPENIA IN NEWBORNS

Perinatal hypoxemia
Placental insufficiency
Congenital infection
- Sepsis.
- Toxoplasmosis.
- Rubella.
- Cytomegalovirus.

Autoimmune:
- Maternal immune thrombocytopenia.
- Maternal systemic lupus erythematosus.

Disseminated intravascular coagulation
Maternal drug exposure
Congenital heart disease
Hereditary thrombocytopenia
- MYH9 macrothrombocytopenia (including May-Hegglin anomaly).
- Thrombocytopenia absent radii syndrome.
- Amegakaryocytic thrombocytopenia.
- Wiskott-Aldrich syndrome.
- Fanconi anemia.

Hemangioma with thrombocytopenia
- Kasabach-Merritt syndrome.

Bone marrow infiltration
- Congenital leukemia.

THROMBOCYTOSIS

ICD-10CM # D75.9 Disease of blood and blood-forming organs, unspecified

Iron deficiency.
Posthemorrhage.
Neoplasms (GI tract).
CML.
Polycythemia vera.
Myelofibrosis with myeloid metaplasia.
Infections.
After splenectomy.
Postpartum.
Hemophilia.
Pancreatitis.
Cirrhosis.
Idiopathic.

THROMBOSIS OR THROMBOTIC DIATHESIS[3]

ICD-10CM # I74.09 Other arterial embolism and thrombosis of abdominal aorta

DIFFERENTIAL DIAGNOSIS OF THE PATIENT PRESENTING WITH THROMBOSIS OR THROMBOTIC DIATHESIS

Inherited (Primary) Hypercoagulable States
Activated protein C resistance caused by factor V Leiden mutation.
Prothrombin gene mutation (G to A transition at position 20210 in the 3-untranslated region).
Antithrombin III deficiency.
Protein C deficiency.
Protein S deficiency.
Dysfibrinogenemias (rare).

Acquired (Secondary) Hypercoagulable States
In association with physiologic or thrombogenic stimuli:
- Pregnancy (especially the postpartum period).
- Estrogen use (oral contraceptives, hormone replacement therapy).
- Immobilization.
- Trauma.
- Postoperative state.

Advancing age.
Obesity.
Prolonged air travel.
Lupus anticoagulant or antiphospholipid antibody syndrome.
In association with other clinical disorders.

Mixed/Unknown
Activated protein C resistance in the absence of factor V Leiden.
Elevated factor VIII level.
Elevated factor XI level.
Elevated factor IX level.
Elevated thrombin activatable fibrinolysis inhibitor (TAFI) level.
Decreased free tissue factor pathway inhibitor (TFPI) level.
Decreased plasma fibrinolytic activity.

THYMIC MASSES[77]

ICD-10CM # Varies with specific diagnosis

THYMIC MASSES

Thymic hyperplasia.
Thymoma.
Thymic carcinoma.
Thymic neuroendocrine tumors.
- Carcinoid.
- Small-cell carcinoma.

Thymic cysts (not rhizomatous).
Thymolipoma.
Metastases to the thymus.

THYMOMA, DISEASES ASSOCIATIONS[77]

ICD-10CM # Varies with specific diagnosis

SYSTEMIC DISEASES MOST COMMONLY ASSOCIATED WITH THYMOMA

Myasthenia gravis.
Cytopenias (most commonly red cell hypoplasia).
Nonthymic malignancies.
Hypogammaglobulinemia.
Systemic lupus erythematosus.
Polymyositis.
Rheumatoid arthritis.
Thyroiditis.
Sjögren syndrome.
Ulcerative colitis.

THYROMEGALY

ICD-10CM # Varies with specific diagnosis

Goiter.
Graves disease.
Thyroiditis (lymphocytic, granulomatous, suppurative).
Toxic adenoma.
Neoplasm (primary, metastatic).

THYROTOXICOSIS[62]

ICD-10CM # E05.80

CAUSES OF THYROTOXICOSIS

Sustained Hormone Overproduction (Hyperthyroidism)
Low TSH, high RAIU:
- Graves disease (von Basedow disease).
- Toxic multinodular goiter.
- Toxic adenoma.
- Chorionic gonadotropin-induced:
  - Gestational hyperthyroidism: physiologic hyperthyroidism of pregnancy, familial gestational hyperthyroidism due to TSH receptor mutations.
  - Trophoblastic tumors.

Inherited nonimmune hyperthyroidism associated with TSH receptor or G protein mutations.
Low TSH, low RAIU:
- Iodide-induced hyperthyroidism (Jod-Basedow effect).
- Amiodarone-associated hyperthyroidism due to iodide release.

Struma ovarii:
- Metastatic functioning thyroid carcinoma.

Normal or elevated TSH:
- TSH-secreting pituitary tumors.
- Thyroid hormone resistance with pituitary predominance.

Transient Hormone Excess (Thyrotoxicosis)
Low TSH, low RAIU
- Thyroiditis:
  - Autoimmune: lymphocytic thyroiditis (silent thyroiditis, painless thyroiditis, postpartum thyroiditis), acute exacerbation of Hashimoto disease.

Viral or postviral:
- Subacute (granulomatous, painful, postviral) thyroiditis.

Drug-induced or associated thyroiditis:
- Amiodarone.
- Lithium, interferon-α, interleukin-2, GM-CSF.

Infectious thyroiditis.
Exogenous thyroid hormone:
- Iatrogenic overreplacement.
- Thyrotoxicosis factitia.
- Ingestion of natural products containing thyroid hormone:
  - "Hamburger" thyrotoxicosis.
  - Natural foodstuffs.
  - Thyromimetic compounds (e.g., tiratricol PLB).
  - Occupational exposure to thyroid hormone (e.g., pill manufacturing, veterinary occupations).

GM-CSF, granulocyte-macrophage colony-stimulating factor; *RAIU,* radioactive iodine uptake; *TSH,* thyroid-stimulating hormone.

TICK-RELATED INFECTIONS

ICD-10CM #		
	A77.0	Spotted fever due to *Rickettsia rickettsii*
	A93.2	Colorado tick fever
	B60.0	Babesiosis
	A77.8	Other spotted fevers
	A69.20	Lyme disease, unspecified

Lyme disease.
Rocky Mountain spotted fever.
Babesiosis.
Tularemia.
Q fever.
Colorado tick fever.
Ehrlichiosis.
Relapsing fever.

TICS

ICD-10CM # F95.9 Tic disorder, unspecified

Tourette syndrome.
Physiologic tic.
Anxiety disorder.
Huntington disease.
Medications (e.g., antipsychotics, carbamazepine, phenytoin, phenobarbital).
Encephalitis.
Head trauma.
Schizophrenia.
Carbon monoxide poisoning.
Stroke.
Sydenham chorea.
Creutzfeldt-Jakob disease.

TORSADES DE POINTES[52]

ICD-10CM # I47.2 Ventricular tachycardia

Antiarrhythmics known to increase the QT interval (e.g., quinidine, procainamide, amiodarone, disopyramide, sotalol).
Tricyclic antidepressants and phenothiazines.
Histamine (H_1) antagonists (e.g., astemizole, terfenadine).
Antiviral and antifungal agents and antibiotics.
Hypokinemia.
Hypomagnesemia.
Insecticide poisoning.
Bradyarrhythmias.
Congenital long QT syndrome.
Subarachnoid hemorrhage.
Chloroquinine, pentamidine.
Cocaine abuse.

TOXIC MEGACOLON, CAUSES[15]

ICD-10CM #		
	K59.3	Megacolon, not elsewhere classified

INFLAMMATORY

Ulcerative colitis.
Crohn disease.

INFECTIOUS

Bacterial:
- *Clostridium difficile* pseudomembranous colitis.
- *Salmonella* (typhoid and nontyphoid).
- *Shigella.*
- *Campylobacter.*
- *Yersinia.*

Parasitic:
- *Entamoeba histolytica.*
- *Cryptosporidium.*

Viral:
- Cytomegalovirus colitis.

OTHER

Ischemia.
Kaposi sarcoma.

TRACHEOBRONCHIAL NARROWING ON X-RAY[36]

ICD-10CM # Varies with specific diagnosis

CAUSES OF TRACHEOBRONCHIAL NARROWING

Long-Segment/Diffuse Narrowing
Sarcoidosis.
Amyloidosis.
Granulomatosis with polyangiitis.
Relapsing polychondritis.
Tracheobronchopathia osteochondroplastica.
Pemphigoid.
Short-Segment Narrowing
Previous intubation or tracheostomy.
Congenital stenosis or web.
Extrinsic compression (from thyroid).
Adenoid cystic carcinoma.
Squamous carcinoma.

TREMOR

ICD-10CM #		
	R25.0	Abnormal head movements
	R25.1	Tremor, unspecified
	R25.2	Cramp and spasm
	R25.3	Fasciculation
	R25.9	Unspecified abnormal involuntary movements
	G25.0	Essential tremor
	G25.1	Drug-induced tremor
	G25.2	Other specified forms of tremor

REST TREMORS

Parkinson disease.
Other parkinsonian syndromes (less commonly).
Midbrain (rubral) tremor: rest <postural <kinetic.
Wilson disease (also acquired hepatocerebral degeneration).
Essential tremor—only if severe: rest <postural and action.

POSTURAL AND ACTION (TERMINAL) TREMORS

Physiologic tremor.
Exaggerated physiologic tremor (these factors can also aggravate other forms of tremor). Stress, fatigue, anxiety, emotion.
Endocrine: hypoglycemia, thyrotoxicosis, pheochromocytoma, adrenocorticosteroids.
Drugs and toxins: beta-agonists, dopamine agonists, amphetamines, lithium, tricyclic antidepressants, neuroleptics, theophylline, caffeine, valproic acid, alcohol withdrawal, mercury (Hatter shakes), lead, arsenic, others.
Essential tremor (familial or sporadic)
Primary writing tremor.
With other CNS disorders:
- Parkinson disease.
- Other akinetic-rigid syndromes.
- Idiopathic dystonia, including focal dystonias.

With peripheral neuropathy:
- Charcot-Marie-Tooth syndrome (controversial whether to call this the Roussy-Levy syndrome).
- Variety of other peripheral neuropathies (especially dysgammaglobulinemia).

Cerebellar tremor.

KINETIC (INTENTION) TREMOR

Disease of cerebellar outflow (dentate nucleus and superior cerebellar peduncle): multiple sclerosis, trauma, tumor, vascular disease, Wilson acquired hepatocerebral degeneration, drugs, toxins (e.g., mercury), others.

MISCELLANEOUS RHYTHMICAL MOVEMENT DISORDERS

Psychogenic tremor.
Orthostatic tremor.
Rhythmical movements in dystonia (dystonic tremor).
Rhythmical myoclonus (segmental myoclonus—e.g., palatal or branchial myoclonus, spinal myoclonus, limb myorhythmia).
Oscillatory myoclonus.
Asterixis.
Clonus.
Epilepsia partialis continua.
Hereditary chin quivering.
Spasmus nutans.
Head bobbing with third ventricular cysts.
Nystagmus.

TREMOR, IN CHILDREN, CAUSES[53]

ICD-10CM #		
	R25.0	Abnormal head movements
	R25.1	Tremor, unspecified
	R25.2	Cramp and spasm
	R25.3	Fasciculation
	R25.9	Unspecified abnormal involuntary movements

BENIGN

Enhanced physiologic tremor.
Shuddering attacks.
Jitteriness.
Spasmus nutans.

STATIC INJURY/STRUCTURAL

Cerebellar malformation.
Stroke (particularly in the midbrain or cerebellum).
Multiple sclerosis.

HEREDITARY/DEGENERATIVE

Familial essential tremor.
Fragile X premutation.

Wilson disease.
Huntington disease.
Juvenile parkinsonism (tremor is rare).
Pallidonigral degeneration.

METABOLIC

Hyperthyroidism.
Hyperadrenergic state (including pheochromocytoma and neuroblastoma).
Hypomagnesemia.
Hypocalcemia.
Hypoglycemia.
Hepatic encephalopathy.
Vitamin B_{12} deficiency.
Inborn errors of metabolism.
Mitochondrial disorders.

DRUGS/TOXINS

Valproate, phenytoin, carbamazepine, lamotrigine, gabapentin, lithium, tricyclic antidepressants, stimulants (cocaine, amphetamine, caffeine, thyroxine, bronchodilators), neuroleptics, cyclosporin, toluene, mercury, thallium, amiodarone, nicotine, lead, manganese, arsenic, cyanide, naphthalene, ethanol, lindane, serotonin reuptake inhibitors.

PERIPHERAL NEUROPATHIES

PSYCHOGENIC

TRICHOMEGALY[12]

ICD-10CM # Not available

CAUSES OF TRICHOMEGALY

Drug-induced: topical prostaglandin analogues, phenytoin and cyclosporine.
Malnutrition.
AIDS.
Porphyria.
Hypothyroidism.
Familial.
Congenital: Oliver–McFarlane, Cornelia de Lange, Goldstein–Hutt, Hermansky–Pudlak syndromes.

TUBULOINTERSTITIAL DISEASE, ACUTE[32]

ICD-10CM # N17.0 Acute kidney failure with tubular necrosis

DRUGS

Antibiotics, penicillins, cephalosporins, rifampin.
Sulfonamides: cotrimoxazole, sulfamethoxazole.
NSAIDs: propionic acid derivatives.
Miscellaneous: phenytoin, thiazides, allopurinol, cimetidine, ifosfamide.

INFECTIONS

Invasion of renal parenchyma.
Reaction to systemic infections: streptococcal, diphtheria, hantavirus.

SYSTEMIC DISEASES

Immune mediated: SLE, transplanted kidney, cryoglobulinemias.
Metabolic: urate, oxalate.
Neoplastic: lymphoproliferative diseases.

IDIOPATHIC

TUBULOINTERSTITIAL KIDNEY DISEASE[32]

ICD-10CM # N17.0 Acute kidney failure with tubular necrosis

Ischemic and toxic acute tubular necrosis.
Allergic interstitial nephritis.
Interstitial nephritis secondary to immune complex-related collagen vascular disease (e.g., SLE, Sjögren).
Granulomatous diseases (sarcoidosis, uveitis).
Pigment-related tubular injury (myoglobinuria, hemoglobinuria).
Hypercalcemia with nephrocalcinosis.
Tubular obstruction (drugs such as indinavir, uric acid in tumor lysis syndrome).
Myeloma kidney or cast nephropathy.
Infection-related interstitial nephritis: *Legionella, Leptospira.*
Infiltrative diseases (e.g., lymphoma).

TUMOR MARKERS ELEVATION[86]

ICD-10CM # R97.8 Other abnormal tumor markers

CAUSES OF ELEVATED LEVELS OF TUMOR MARKERS

Carcinoembryonic Antigen (CEA)
Colonic cancer (higher levels if the tumor is more differentiated or is extensive or has spread to the liver).
Lung or breast cancer; seminoma.
Cigarette smokers.
Cirrhosis, inflammatory bowel disease, rectal polyps, pancreatitis.
Advanced age.
Alpha-Fetoprotein
Hepatocellular cancer: very high titers or a rising titer is strongly suggestive, but >10% of patients do not have an elevated level.
Hepatic regeneration (e.g., cirrhosis, alcoholic or viral hepatitis).
Cancer of the stomach, colon, pancreas, or lung.
Teratocarcinoma or embryonal cell carcinoma (testis, ovary, extragonadal).
Pregnancy.
Ataxia-telangiectasia.
Normal variant.
Prostate-Specific Antigen
Prostate carcinoma (localized disease).
Prostatic hyperplasia.
Prostatitis.
Prostatic infarction.
Cancer-Associated Antigen (CA-19-9)[44]
Pancreatic carcinoma (80% with advanced, well-differentiated cancer have an elevated level).
Other GI cancers: colon, stomach, bile duct.
Acute or chronic pancreatitis.
Chronic liver disease.
Biliary tract disease.

UREMIC ENCEPHALOPATHY, DIFFERENTIAL DIAGNOSIS[28]

ICD-10CM # G93.40 Encephalopathy, unspecified

Differential Diagnosis	Comment
Hypertensive encephalopathy	
Systemic inflammatory response syndrome (SIRS):	Observed in septic patients.
Systemic vasculitis:	Vasculitis or lupus with cerebral involvement.
Drug-induced neurotoxicity	
Analgesics:	Meperidine, codeine, morphine, gabapentin.
Antibiotics:	High-dose penicillins (may cause seizures), acyclovir, ethambutol (optic nerve damage), erythromycin and aminoglycosides (may cause ototoxicity), nitrofurantoin and isoniazid (peripheral neuropathy).
Psychotropics:	Lithium, haloperidol, clonazepam, diazepam, chlorpromazine.
Immunosuppressants:	Cyclosporine, tacrolimus.
Chemotherapeutics:	Cisplatinum, ifosfamide.
Others:	High doses of loop diuretics (ototoxic), ephedrine, methyldopa, aluminum.
Cerebral atheroembolic disease:	Follows recent aortic or cardiac angiography; associated with peripheral manifestations, including lower extremity cyanosis, livedo reticularis, and eosinophilia.
Subdural hematoma	
Posterior leukoencephalopathy:	Observed particularly following renal transplantation due to reversible, abnormal permeability of the blood-brain barrier Often manifests as headache followed by mental depression, visual loss, and seizures in the context of volume expansion, acute hypertension, and often treatment with corticosteroids or calcineurin inhibitors Lesions in the parietal, temporal, and occipital lobes may be seen on imaging studies.

Wilson disease.
Huntington disease.
Juvenile parkinsonism (tremor is rare).
Pallidonigral degeneration.

METABOLIC

Hyperthyroidism.
Hyperadrenergic state (including pheochromocytoma and neuroblastoma).
Hypomagnesemia.
Hypocalcemia.
Hypoglycemia.
Hepatic encephalopathy.
Vitamin B_{12} deficiency.
Inborn errors of metabolism.
Mitochondrial disorders.

DRUGS/TOXINS

Valproate, phenytoin, carbamazepine, lamotrigine, gabapentin, lithium, tricyclic antidepressants, stimulants (cocaine, amphetamine, caffeine, thyroxine, bronchodilators), neuroleptics, cyclosporin, toluene, mercury, thallium, amiodarone, nicotine, lead, manganese, arsenic, cyanide, naphthalene, ethanol, lindane, serotonin reuptake inhibitors.

PERIPHERAL NEUROPATHIES

PSYCHOGENIC

TRICHOMEGALY[12]

ICD-10CM # Not available

CAUSES OF TRICHOMEGALY

Drug-induced: topical prostaglandin analogues, phenytoin and cyclosporine.
Malnutrition.
AIDS.
Porphyria.
Hypothyroidism.
Familial.
Congenital: Oliver–McFarlane, Cornelia de Lange, Goldstein–Hutt, Hermansky–Pudlak syndromes.

TUBULOINTERSTITIAL DISEASE, ACUTE[32]

ICD-10CM # N17.0 Acute kidney failure with tubular necrosis

DRUGS

Antibiotics, penicillins, cephalosporins, rifampin.
Sulfonamides: cotrimoxazole, sulfamethoxazole.
NSAIDs: propionic acid derivatives.
Miscellaneous: phenytoin, thiazides, allopurinol, cimetidine, ifosfamide.

INFECTIONS

Invasion of renal parenchyma.
Reaction to systemic infections: streptococcal, diphtheria, hantavirus.

SYSTEMIC DISEASES

Immune mediated: SLE, transplanted kidney, cryoglobulinemias.
Metabolic: urate, oxalate.
Neoplastic: lymphoproliferative diseases.

IDIOPATHIC

TUBULOINTERSTITIAL KIDNEY DISEASE[32]

ICD-10CM # N17.0 Acute kidney failure with tubular necrosis

Ischemic and toxic acute tubular necrosis.
Allergic interstitial nephritis.
Interstitial nephritis secondary to immune complex-related collagen vascular disease (e.g., SLE, Sjögren).
Granulomatous diseases (sarcoidosis, uveitis).
Pigment-related tubular injury (myoglobinuria, hemoglobinuria).
Hypercalcemia with nephrocalcinosis.
Tubular obstruction (drugs such as indinavir, uric acid in tumor lysis syndrome).
Myeloma kidney or cast nephropathy.
Infection-related interstitial nephritis: *Legionella, Leptospira.*
Infiltrative diseases (e.g., lymphoma).

TUMOR MARKERS ELEVATION[86]

ICD-10CM # R97.8 Other abnormal tumor markers

CAUSES OF ELEVATED LEVELS OF TUMOR MARKERS

Carcinoembryonic Antigen (CEA)
Colonic cancer (higher levels if the tumor is more differentiated or is extensive or has spread to the liver).
Lung or breast cancer; seminoma.
Cigarette smokers.
Cirrhosis, inflammatory bowel disease, rectal polyps, pancreatitis.
Advanced age.
Alpha-Fetoprotein
Hepatocellular cancer: very high titers or a rising titer is strongly suggestive, but >10% of patients do not have an elevated level.
Hepatic regeneration (e.g., cirrhosis, alcoholic or viral hepatitis).
Cancer of the stomach, colon, pancreas, or lung.
Teratocarcinoma or embryonal cell carcinoma (testis, ovary, extragonadal).
Pregnancy.
Ataxia-telangiectasia.
Normal variant.
Prostate-Specific Antigen
Prostate carcinoma (localized disease).
Prostatic hyperplasia.
Prostatitis.
Prostatic infarction.
Cancer-Associated Antigen (CA-19-9)[44]
Pancreatic carcinoma (80% with advanced, well-differentiated cancer have an elevated level).
Other GI cancers: colon, stomach, bile duct.
Acute or chronic pancreatitis.
Chronic liver disease.
Biliary tract disease.

UREMIC ENCEPHALOPATHY, DIFFERENTIAL DIAGNOSIS[28]

ICD-10CM # G93.40 Encephalopathy, unspecified

Differential Diagnosis	Comment
Hypertensive encephalopathy	
Systemic inflammatory response syndrome (SIRS):	Observed in septic patients.
Systemic vasculitis:	Vasculitis or lupus with cerebral involvement.
Drug-induced neurotoxicity	
Analgesics:	Meperidine, codeine, morphine, gabapentin.
Antibiotics:	High-dose penicillins (may cause seizures), acyclovir, ethambutol (optic nerve damage), erythromycin and aminoglycosides (may cause ototoxicity), nitrofurantoin and isoniazid (peripheral neuropathy).
Psychotropics:	Lithium, haloperidol, clonazepam, diazepam, chlorpromazine.
Immunosuppressants:	Cyclosporine, tacrolimus.
Chemotherapeutics:	Cisplatinum, ifosfamide.
Others:	High doses of loop diuretics (ototoxic), ephedrine, methyldopa, aluminum.
Cerebral atheroembolic disease:	Follows recent aortic or cardiac angiography; associated with peripheral manifestations, including lower extremity cyanosis, livedo reticularis, and eosinophilia.
Subdural hematoma	
Posterior leukoencephalopathy:	Observed particularly following renal transplantation due to reversible, abnormal permeability of the blood-brain barrier Often manifests as headache followed by mental depression, visual loss, and seizures in the context of volume expansion, acute hypertension, and often treatment with corticosteroids or calcineurin inhibitors Lesions in the parietal, temporal, and occipital lobes may be seen on imaging studies.

URETERAL COLIC[56]

ICD-10CM # R33.8 Other retention of urine
N13.8 Other obstructive and reflux uropathy

DIAGNOSTIC DIFFERENTIALS OF RENAL OR URETERAL COLIC

Acute cholecystitis, acute cholelithiasis.
Acute appendicitis.
Pelvic inflammatory disease.
Diverticulosis and/or diverticulitis.
Intestinal obstruction.
Leaking abdominal aortic aneurysm.
Musculoskeletal sprains.
Herniated disk.
Herpes zoster (shingles).
GI dysfunction with ileus and/or toxic colonic dilatation.

URETERAL STRICTURE[90]

ICD-10CM # Varies with specific diagnosis

ETIOLOGY OF URETERAL STRICTURE

Malignancy (e.g., transitional cell carcinoma, cervical cancer).
Ureteral calculus.
Radiation.
Ischemia or trauma caused by surgical dissection.
Periureteral fibrosis caused by abdominal aortic aneurysm or endometriosis.
Endoscopic instrumentation.
Renal ablation injury.
Infection (tuberculosis).
Idiopathic condition.

URETERIC OBSTRUCTION, CONGENITAL[36]

ICD-10CM # N13.8 Other obstructive and reflux uropathy
N20.9 Urolithiasis

CONGENITAL CAUSES OF URETERIC OBSTRUCTION

Primary megaureter.
Ureterocele (ectopic and orthotopic).
Ureteric valve.
Distal ureteric stenosis.
Ureteric atresia.
Circumcaval ureter and variants.
Bladder diverticulum.

URETHRAL BLEEDING[90]

ICD-10CM # Varies with specific diagnosis

DIFFERENTIAL DIAGNOSIS FOR URETHRAL BLEEDING

Male

Trauma:
- Blunt (straddle injury, kick to perineum).
- Penetrating (foreign body insertion, failed urethral catheterization).
- Intercourse related (penile fracture, masturbation).

Urethritis:
- Bacterial (gonococcal, nongonococcal).
- Viral.
- Chemical.
- Autoimmune (Reiter syndrome).

Malignancy:
- Urothelial carcinoma.
- Squamous cell carcinoma (meatus/glans).

Condyloma.
Calculus disease.

Female

Trauma:
- Blunt (pelvic fracture).
- Penetrating (foreign body).

Urethral diverticulum.
Urethral caruncle.
Urethritis.
Malignancy.
Calculus disease.

URETHRAL DISCHARGE AND DYSURIA

ICD-10CM # R36.0 Urethral discharge without blood
R36.9 Urethral discharge, unspecified
N36.9 Urethral disorder, unspecified
N39.9 Disorder of urinary system, unspecified
R30.0 Dysuria
R30.9 Painful micturition, unspecified

Urethritis (gonococcal, chlamydial, trichomonal).
Cystitis.
Prostatitis.
Vaginitis (candidiasis, chemical).
Meatal stenosis.
Interstitial cystitis.
Trauma (foreign body, masturbation, horseback or bike riding).

URETHRAL OBSTRUCTION, CHILDREN[36]

ICD-10CM # N13.8 Other obstructive and reflux uropathy

CAUSES OF URETHRAL OBSTRUCTION IN CHILDREN

Intrinsic Lesions

Valve (posterior, anterior, saccular diverticulum).
Stenosis, atresia.
Inflammatory stricture.
Traumatic stricture:
- External trauma (saddle injury, and so on).
- Iatrogenic trauma (catheter, cystoscopy, surgery).

Urethral "tumors":
- Girls: leiomyoma.
- Boys: polyp, rhabdomyosarcoma.

Miscellaneous (epidermolysis bullosa).

Extrinsic Lesions

Presacral mass dissecting inferiorly (tumor, cyst).
Fecal impaction (Hirschsprung, postrepair anal atresia, habitual constipation, neuropathy).
Mass originating in genital organs:
- Boys: utricle cyst, prostate rhabdomyosarcoma, seminal vesicle cyst, Cowper duct cyst.
- Girls: hydrometrocolpos, hydrocolpos, fused labia.

URETHRITIS, PEDIATRIC PATIENT[19]

ICD-10CM # N34.1 Nonspecific urethritis
N34.2 Other urethritis

ETIOLOGY OF URETHRITIS

Infectious	Noninfectious
Sexually Transmitted Infections	**Vasculitides**
Neisseria gonorrhoeae.	Reiter syndrome.
Chlamydia trachomatis.	Erythema multiforme.
Trichomonas vaginalis.	
Herpes simplex virus type 2.	Kawasaki disease.
Mycoplasma spp.	Mechanical
Non–Sexually Transmitted Infections	Masturbation.
	Foreign body.
Staphylococcus saprophyticus.	Trauma.
	Dysfunctional elimination.
Enterobacteriaceae.	Chemical
Gardnerella vaginalis.	Soaps.
Streptococcus spp.	Detergents.
Enterobius vermicularis.	Drugs.

URIC ACID STONES

ICD-10CM # N20.9 Urolithiasis

Hyperuricemia.
Excessive dietary purine.
Medications (salicylates, allopurinol, probenecid).
Urine pH <5.5 (e.g., diarrhea, high animal protein diet).
Decreased urine output (dehydration, malabsorption, diarrhea, inadequate fluid intake).
Tumor lysis.
Hemolytic anemia.
Myeloproliferative disorders.

URINARY INCONTINENCE, CHILDREN[53]

ICD-10CM # R32 Unspecified urinary incontinence

CAUSES OF URINARY INCONTINENCE IN CHILDHOOD

Overactive bladder.
Infrequent voiding.
Detrusor-sphincter dyssynergia.
Non-neurogenic neurogenic bladder (Hinman syndrome).
Vaginal voiding.
Giggle incontinence.
Cystitis.
Bladder outlet obstruction (posterior urethral valves).
Ectopic ureter and fistula.

Sphincter abnormality (epispadias, exstrophy; urogenital sinus abnormality).
Neuropathic.
Overflow incontinence.
Traumatic.
Iatrogenic.
Behavioral.
Combination.

URINARY RETENTION[56]

ICD-10CM # R33.9 Retention of urine, unspecified

COMMON CAUSES OF URINARY RETENTION

Obstructive Cause
Urethral stricture.
Enlarged prostate.
Lower genitourinary tract malignancy.
Pelvic malignancy.
Bladder stones.
Foreign body.
Blood clot.
Posterior urethral valves.
Ureterocele.
Primary Detrusor Insufficiency
Detrusor areflexia.
Multiple sclerosis.
Iatrogenic injury during abdominal or back surgery.
Spinal cord injury.
Myelomeningocele.

URINARY RETENTION, ACUTE

ICD-10CM # R33.9 Retention of urine, unspecified

Mechanical obstruction: urethral stone, foreign body, urethral stricture, BPH, prostate carcinoma, prostatitis, trauma with hematoma formation.
Neurogenic bladder.
Neurologic disease (MS, parkinsonism, tabes dorsalis, CVA).
Spinal cord injury.
CNS neoplasm (primary or metastatic).
Spinal anesthesia.
Lower urinary tract instrumentation.
Medications (antihistamines, antidepressants, narcotics, anticholinergics).
Abdominal or pelvic surgery.
Alcohol toxicity.
Pregnancy.
Anxiety.
Encephalitis.
Postoperative pain.
Spina bifida occulta.

URINARY TRACT BLEEDING, UPPER[90]

ICD-10CM # Varies with specific diagnosis

DIFFERENTIAL DIAGNOSIS FOR UPPER URINARY TRACT BLEEDING

Renal glomerular diseases:
IgA nephropathy (Berger disease).
Thin basement membrane disease.
Acute glomerulonephritis (e.g., poststreptococcal).
Lupus nephritis.
Hereditary nephritis (e.g., Alport syndrome).
Renal tubulointerstitial diseases:
Papillary necrosis.
Sickle cell nephropathy.
Analgesic nephropathy.
Polycystic kidney disease.
Medullary sponge kidney.
Vasculitis:
Henoch-Schönlein purpura.
Wegener granulomatosis.
Infection:
Pyelonephritis.
Xanthogranulomatous pyelonephritis.
Renal tuberculosis.
Fungal infection.
Obstruction:
Ureteropelvic junction obstruction.
Ureteral stricture.
Nephrolithiasis.
Malignancy:
Renal cortical tumors (renal cell carcinoma, benign tumors).
Upper tract urothelial carcinoma.
Fibroepithelial polyp.
Vascular diseases:
Renal arteriovenous malformations (congenital, acquired).
Iliac arterio-ureteral fistula.
Renal artery aneurysm (especially ruptured).
Renal artery pseudoaneurysm.
Renal artery and/or vein thrombosis.
Hemangioma.
Atheroembolic disease.
Nutcracker syndrome.
Loin-pain hematuria syndrome.
Trauma:
Blunt.
Penetrating.
Lateralizing essential hematuria.

URINARY TRACT OBSTRUCTION[34]

ICD-10CM # N21.8 Other lower urinary tract calculus
N20.9 Urolithiasis

INTRARENAL

Uric acid nephropathy.
Sulfonamide precipitates.
Acyclovir, indinavir precipitates.
Multiple myeloma.

URETERAL

Intrinsic
Intraluminal:
Nephrolithiasis.
Papillary necrosis.
Blood clots.
Fungus balls.
Intramural:
Ureteropelvic junction dysfunction.
Ureterovesical junction dysfunction.
Ureteral valve, polyp, or tumor.
Ureteral stricture.
Schistosomiasis.
Tuberculosis.
Scarring from instrumentation.
Drugs (e.g., NSAIDs).
Extrinsic
Vascular system:
Aneurysm: abdominal aorta or iliac vessels.
Aberrant vessels: ureteropelvic junction.
Venous: retrocaval ureter.
GI tract:
Crohn disease.
Diverticulitis.
Appendiceal abscess.
Colon cancer.
Pancreatic tumor, abscess, or cyst.
Reproductive system:
Uterus: pregnancy, prolapse, tumor, endometriosis.
Ovary: abscess, tumor, ovarian remnants.
Gartner duct cyst, tuboovarian abscess.
Retroperitoneal disease:
Retroperitoneal fibrosis: radiation, drugs, idiopathic.
Inflammatory: tuberculosis, sarcoidosis.
Hematoma.
Primary tumor (e.g., lymphoma, sarcoma).
Metastatic tumor (e.g., cervix, ovarian, bladder, colon).
Lymphocele.
Pelvic lipomatosis.

BLADDER

Neurogenic bladder:
Diabetes mellitus.
Spinal cord defect.
Trauma.
Multiple sclerosis.
Stroke.
Parkinson disease.
Spinal anesthesia.
Anticholinergics.
Bladder neck dysfunction.
Bladder calculus.
Bladder cancer.

URETHRA

Urethral stricture.
Prostate hypertrophy or cancer.
Obstruction from instrumentation.

URINARY TRACT OBSTRUCTION, CONGENITAL CAUSES[79]

ICD-10CM # Varies with specific diagnosis

CONGENITAL CAUSES OF URINARY TRACT OBSTRUCTION

Ureteropelvic Junction
Ureteropelvic junction obstruction.
Proximal and Middle Ureter
Ureteral folds.
Ureteral valves.
Strictures.
Benign fibroepithelial polyps.
Retrocaval ureter.

Distal Ureter
Ureterovesical junction obstruction.
Vesicoureteral reflux.
Prune-belly syndrome.
Ureteroceles.
Bladder
Bladder diverticula.
Neurologic conditions (e.g., spina bifida).
Urethra
Posterior urethral valves.
Urethral diverticula.
Anterior urethral valves.
Urethral atresia.
Labial fusion.

URINE CASTS

ICD-10CM # R82.99 Other abnormal findings in urine

Normal finding.
Pyelonephritis.
Chronic renal disease.
Nephrotic syndrome.
Acute tubular necrosis.
Interstitial nephritis.
Nephritic syndrome.
Glomerulonephritis.
Eclampsia.
Heavy metal ingestion.
Allograft rejection.
Hypothyroidism.

URINE COLOR ABNORMALITIES[56]

ICD-10CM # R82.5 Elevated urine levels of drugs, medicaments and biological substances
R82.99 Other abnormal findings in urine

COMMON CAUSES OF ABNORMAL URINE COLOR

Colorless.

DISEASE

Diabetes mellitus.
Diabetes insipidus.

DRUG

Ethyl alcohol.
Diuretics.

MISCELLANEOUS

Overhydration.
Yellow-orange

DRUG

Tetracycline.
Flutamide.
Pyridium.
Azo Gantrisin (Roche Labs, Nutley, NJ).
Sulfasalazine.
Vitamin B.

MISCELLANEOUS

Dehydration.
Milky White

DISEASE

Urinary tract infection/pyuria.
Blue-green

DISEASE

Pseudomonas urinary tract infection.

DRUG

Methylene blue.
Urised (Polymedica Pharmaceuticals, Woburn, MA).
Indigo carmine.
Doan's pills (Novartis Consumer Health, Parsippany, NJ).
Clorets (Cadbury Adams, Parsippany, NJ).
Amitriptyline.
Red-brown

DISEASE

Hematuria.
Hemolytic anemia.
Hemoglobinuria.
Lead poisoning.
Mercury poisoning.
Porphyria.

DRUG

Rifampin.
Ex-Lax (Novartis Consumer Health, Parsippany, NJ).
Phenolphthalein.
Phenothiazines.
Nitrofurantoin.
Doxorubicin.

MISCELLANEOUS

Beets.
Blackberries.
Rhubarb.
Brown-black

DISEASE

Fecaluria.
Methemoglobinuria.
Melaninuria.

DRUG

Metronidazole.
Methyldopa.
Methocarbamol.

MISCELLANEOUS

Fava beans.
Aloe.

URINE, RED[66]

ICD-10CM # Varies with specific diagnosis

WITH A POSITIVE DIPSTICK

Hematuria.
Hemoglobinuria: negative urinalysis.
Myoglobinuria: negative urinalysis.

WITH A NEGATIVE DIPSTICK

Drugs
Aminosalicylic acid.
Deferoxamine mesylate.
Ibuprofen.
Phenacetin.
Phenolphthalein.
Phensuximide.
Rifampin.
Anthraquinone laxatives.
Doxorubicin.
Methyldopa.
Phenazopyridine.
Phenothiazine.
Phenytoin.
Dyes
Azo dyes.
Eosin.
Foods
Beets, berries, maize.
Rhodamine B.
Metabolic
Porphyrins.
Serratia marcescens (red diaper syndrome).
Urate crystalluria.

UROLITHIASIS-LIKE PAIN[79]

ICD-10CM # Varies with specific diagnosis

DIFFERENTIAL DIAGNOSIS OF UROLITHIASIS-LIKE PAIN

Category
Disorders
Renal:
Pyelonephritis.
Blood clot.
Renal infarction.
Tumor (kidney or pelvis).
Papillary necrosis.
Ureteral:
Tumor.
Blood clot.
Stricture.
Bladder:
Tumor.
Blood clot.
Urinary retention.
Intraabdominal:
Peritonitis.
Appendicitis.
Biliary disease.
Bowel obstruction.
Vascular disorder.
Aortic aneurysm.
Mesenteric insufficiency.
Retroperitoneal:
Lymphadenopathy.
Fibrosis.
Tumor.
Gynecologic:
Ectopic or tubal pregnancy.
Ovarian torsion, cyst rupture.
Pelvic inflammatory disease.
Cervical cancer.
Endometriosis.
Ovarian vein syndrome.
Neuromuscular:
Muscle pain.
Rib fracture.
Radiculitis.
Infectious:
Herpes zoster.

Pleuritis, pneumonia.
Fungal bezoar.

UROPATHY, OBSTRUCTIVE[82]

ICD-10CM # N13.9 Obstructive and reflux uropathy, unspecified
N20.9 Urolithiasis

INTRINSIC CAUSES

Intraluminal
Intratubular deposition of crystals (uric acid, sulfas).
Stones.
Papillary tissue.
Blood clots.
Intramural
Functional.
Ureter (ureteropelvic or ureterovesical dysfunction).
Bladder (neurogenic): spinal cord defect or trauma, diabetes, multiple sclerosis, Parkinson disease, cerebrovascular accidents.
Bladder neck dysfunction.
Anatomic
Tumors.
Infection, granuloma.
Strictures.

EXTRINSIC CAUSES

Originating in the Reproductive System
Prostate: benign hypertrophy or cancer.
Uterus: pregnancy, tumors, prolapse, endometriosis.
Ovary: abscess, tumor, cysts.
Originating in the Vascular System
Aneurysms (aorta, iliac vessels).
Aberrant arteries (ureteropelvic junction).
Venous (ovarian veins, retrocaval ureter).
Originating in the Gastrointestinal Tract
Crohn disease.
Pancreatitis.
Appendicitis.
Tumors.
Originating in the Retroperitoneal Space
Inflammations.
Fibrosis.
Tumor, hematomas.

UROSEPSIS[56]

ICD-10CM # A41.9 Sepsis, unspecified organism

COMMON CAUSES OF UROSEPSIS

Obstructing ureteral stone with pyonephrosis.
Staghorn calculus with urinary tract infection.
Ureteral obstruction with proximal urinary tract infection.
Urinary retention with urinary tract infection.
Acute prostatitis with prostatic abscess.
Perinephric abscess or renal carbuncle.
Urethral stricture with periurethral abscess.
Fournier gangrene.
Foreign body within urinary tract (e.g., Foley catheter).

UTERINE BLEEDING, ABNORMAL[24SS]

ICD-10CM # N92.6 Irregular menstruation, unspecified
N93.9 Abnormal uterine and vaginal bleeding, unspecified

PREGNANCY

Threatened abortion.
Incomplete abortion.
Complete abortion.
Molar pregnancy.
Ectopic pregnancy.
Retained products of conception.

OVULATORY

Vulva: infection, laceration, tumor.
Vagina: infection, laceration, tumor, foreign body.
Cervix: polyps, cervical erosion, cervicitis, carcinoma.
Uterus: fibroids (submucous fibroids most likely to cause abnormal bleeding), polyps, adenomyosis, endometritis, intrauterine device, atrophic endometrium.
Pregnancy complications: ectopic pregnancy; threatened, incomplete, complete abortion; retained products of conception.
Abnormality of clotting system.
Midcycle bleeding.
Halban disease (persistent corpus luteum).
Menorrhagia.
Pelvic inflammatory disease.

ANOVULATORY

Physiologic causes:
  Puberty.
  Perimenopausal.
Pathologic causes:
  Ovarian failure (FSH over 40 IU/ml).
  Hyperandrogenism.
  Hyperprolactinemia.
  Obesity.
  Hypothalamic dysfunction (polycystic ovaries); LH/FSH ratio greater than 2:1.
  Hyperplasia.
  Endometrial carcinoma.
  Estrogen-producing tumors.
  Hypothyroidism.

UVEITIS, PEDIATRIC AGE

ICD-10CM # H20.9 Anterior uveitis

ANTERIOR UVEITIS

Juvenile rheumatoid arthritis (pauciarticular).
Sarcoidosis.
Trauma.
Tuberculosis.
Kawasaki disease.
Ulcerative colitis.
Postinfectious (enteric or genital) with arthritis and rash.
Spirochetal (syphilis, leptospiral).
Heterochromic iridocyclitis (Fuchs).
Viral (herpes simplex, herpes zoster).
Ankylosing spondylitis.
Stevens-Johnson syndrome.
Idiopathic.
Drugs.

POSTERIOR UVEITIS (CHOROIDITIS—MAY INVOLVE RETINA)

Toxoplasmosis.
Parasites (toxocariasis).
Sarcoidosis.
Tuberculosis.
Viral (rubella, herpes simplex, HIV, cytomegalovirus).
Subacute sclerosing panencephalitis.
Idiopathic.

ANTERIOR AND/OR POSTERIOR UVEITIS

Sympathetic ophthalmia (trauma to other eye).
Vogt-Koyanagi-Harada syndrome (uveo-otocutaneous syndrome: poliosis, vitiligo, deafness, tinnitus, uveitis, aseptic meningitis, retinitis).
Behçet syndrome.
Lyme disease.

VAGINAL BLEEDING, PREGNANCY[17]

ICD-10CM # N93.9 Abnormal uterine and vaginal bleeding, unspecified

FIRST TRIMESTER

Implantation bleeding.
Abortion:
  Threatened.
  Complete.
  Incomplete.
  Missed.
Ectopic pregnancy.
Neoplasia.
Hydatidiform mole.
Cervix.

THIRD TRIMESTER

Placenta previa.
Placental abruption.
Premature labor.
Choriocarcinoma.

VAGINAL DISCHARGE, PREPUBERTAL GIRLS[43]

ICD-10CM # N89.8 Other specified noninflammatory disorders of vagina

Irritative (bubble baths, sand):
  Poor perineal hygiene.
  Foreign body.
  Associated systemic illness (group A streptococci, chickenpox).
  Infections.
  Escherichia coli with foreign body.
  Shigella organisms.
  Yersinia organisms.
  Infections (consider sexual abuse):
    Chlamydia trachomatis.

Pleuritis, pneumonia.
Fungal bezoar.

UROPATHY, OBSTRUCTIVE[82]

ICD-10CM # N13.9 Obstructive and reflux uropathy, unspecified
N20.9 Urolithiasis

INTRINSIC CAUSES

Intraluminal
Intratubular deposition of crystals (uric acid, sulfas).
Stones.
Papillary tissue.
Blood clots.
Intramural
Functional.
Ureter (ureteropelvic or ureterovesical dysfunction).
Bladder (neurogenic): spinal cord defect or trauma, diabetes, multiple sclerosis, Parkinson disease, cerebrovascular accidents.
Bladder neck dysfunction.
Anatomic
Tumors.
Infection, granuloma.
Strictures.

EXTRINSIC CAUSES

Originating in the Reproductive System
Prostate: benign hypertrophy or cancer.
Uterus: pregnancy, tumors, prolapse, endometriosis.
Ovary: abscess, tumor, cysts.
Originating in the Vascular System
Aneurysms (aorta, iliac vessels).
Aberrant arteries (ureteropelvic junction).
Venous (ovarian veins, retrocaval ureter).
Originating in the Gastrointestinal Tract
Crohn disease.
Pancreatitis.
Appendicitis.
Tumors.
Originating in the Retroperitoneal Space
Inflammations.
Fibrosis.
Tumor, hematomas.

UROSEPSIS[56]

ICD-10CM # A41.9 Sepsis, unspecified organism

COMMON CAUSES OF UROSEPSIS

Obstructing ureteral stone with pyonephrosis.
Staghorn calculus with urinary tract infection.
Ureteral obstruction with proximal urinary tract infection.
Urinary retention with urinary tract infection.
Acute prostatitis with prostatic abscess.
Perinephric abscess or renal carbuncle.
Urethral stricture with periurethral abscess.
Fournier gangrene.
Foreign body within urinary tract (e.g., Foley catheter).

UTERINE BLEEDING, ABNORMAL[24SS]

ICD-10CM # N92.6 Irregular menstruation, unspecified
N93.9 Abnormal uterine and vaginal bleeding, unspecified

PREGNANCY

Threatened abortion.
Incomplete abortion.
Complete abortion.
Molar pregnancy.
Ectopic pregnancy.
Retained products of conception.

OVULATORY

Vulva: infection, laceration, tumor.
Vagina: infection, laceration, tumor, foreign body.
Cervix: polyps, cervical erosion, cervicitis, carcinoma.
Uterus: fibroids (submucous fibroids most likely to cause abnormal bleeding), polyps, adenomyosis, endometritis, intrauterine device, atrophic endometrium.
Pregnancy complications: ectopic pregnancy; threatened, incomplete, complete abortion; retained products of conception.
Abnormality of clotting system.
Midcycle bleeding.
Halban disease (persistent corpus luteum).
Menorrhagia.
Pelvic inflammatory disease.

ANOVULATORY

Physiologic causes:
  Puberty.
  Perimenopausal.
Pathologic causes:
  Ovarian failure (FSH over 40 IU/ml).
  Hyperandrogenism.
  Hyperprolactinemia.
  Obesity.
  Hypothalamic dysfunction (polycystic ovaries); LH/FSH ratio greater than 2:1.
  Hyperplasia.
  Endometrial carcinoma.
  Estrogen-producing tumors.
  Hypothyroidism.

UVEITIS, PEDIATRIC AGE

ICD-10CM # H20.9 Anterior uveitis

ANTERIOR UVEITIS

Juvenile rheumatoid arthritis (pauciarticular).
Sarcoidosis.
Trauma.
Tuberculosis.
Kawasaki disease.
Ulcerative colitis.
Postinfectious (enteric or genital) with arthritis and rash.
Spirochetal (syphilis, leptospiral).
Heterochromic iridocyclitis (Fuchs).
Viral (herpes simplex, herpes zoster).
Ankylosing spondylitis.
Stevens-Johnson syndrome.
Idiopathic.
Drugs.

POSTERIOR UVEITIS (CHOROIDITIS—MAY INVOLVE RETINA)

Toxoplasmosis.
Parasites (toxocariasis).
Sarcoidosis.
Tuberculosis.
Viral (rubella, herpes simplex, HIV, cytomegalovirus).
Subacute sclerosing panencephalitis.
Idiopathic.

ANTERIOR AND/OR POSTERIOR UVEITIS

Sympathetic ophthalmia (trauma to other eye).
Vogt-Koyanagi-Harada syndrome (uveo-otocutaneous syndrome: poliosis, vitiligo, deafness, tinnitus, uveitis, aseptic meningitis, retinitis).
Behçet syndrome.
Lyme disease.

VAGINAL BLEEDING, PREGNANCY[17]

ICD-10CM # N93.9 Abnormal uterine and vaginal bleeding, unspecified

FIRST TRIMESTER

Implantation bleeding.
Abortion:
  Threatened.
  Complete.
  Incomplete.
  Missed.
Ectopic pregnancy.
Neoplasia.
Hydatidiform mole.
Cervix.

THIRD TRIMESTER

Placenta previa.
Placental abruption.
Premature labor.
Choriocarcinoma.

VAGINAL DISCHARGE, PREPUBERTAL GIRLS[43]

ICD-10CM # N89.8 Other specified noninflammatory disorders of vagina

Irritative (bubble baths, sand):
  Poor perineal hygiene.
  Foreign body.
  Associated systemic illness (group A streptococci, chickenpox).
  Infections.
  Escherichia coli with foreign body.
  Shigella organisms.
  Yersinia organisms.
  Infections (consider sexual abuse):
    Chlamydia trachomatis.

Neisseria gonorrhoeae.
Trichomonas vaginalis.
Tumor (rare).

VALVULAR HEART DISEASE[3]

ICD-10CM # Varies with specific diagnosis

MAJOR CAUSES OF VALVULAR HEART DISEASE IN ADULTS

Aortic Stenosis
Bicuspid aortic valve.
Rheumatic fever.
Degenerative stenosis.
Aortic Regurgitation
Bicuspid aortic valve.
Aortic dissection.
Endocarditis.
Rheumatic fever.
Aortic root dilation.
Mitral Stenosis
Rheumatic fever.
Mitral Regurgitation

CHRONIC

Mitral valve prolapse.
Left ventricular dilation.
Posterior wall myocardial infarction.
Rheumatic fever.
Endocarditis.

ACUTE

Posterior wall or papillary muscle ischemia.
Papillary muscle or chordal rupture.
Endocarditis.
Prosthetic valve dysfunction.
Systolic anterior motion of mitral valve.

TRICUSPID REGURGITATION

Functional (annular) dilation.
Tricuspid valve prolapse.
Endocarditis.
Carcinoid heart disease.

VASCULAR LESIONS OF GI TRACT[26]

ICD-10CM # Varies with specific diagnosis

Primary Vascular Lesions
Aneurysms of the aorta and its branches.
Angioectasia (angiodysplasia, vascular ectasia).
Arteriovenous malformation.
Blue rubber bleb nevus.
Capillary phlebectasia.
Dieulafoy lesion.
Glomus tumor.
Hemangioma.
Hemangiomatosis.
Hemangioendothelioma.
Hemangiopericytoma.
Hemangiosarcoma.
Hemorrhoids.
Kaposi sarcoma.
Diseases and Syndromes with Vascular Lesions
Blue rubber bleb nevus syndrome.
Ehlers-Danlos syndrome.
Hereditary hemorrhagic telangiectasia (Osler-Weber-Rendu disease).
Klippel-Trenaunay or Parkes Weber syndrome.
Kohlmeier-Degos syndrome.
Marfan syndrome.
Pseudoxanthoma elasticum.
PSS (scleroderma, CREST).
Scurvy.
Turner syndrome.
von Willebrand disease.
Systemic Disorders Associated with Vascular Lesions
Portal hypertension:
Congestive gastropathy and colopathy.
GAVE (watermelon stomach).
Spider telangiectasias.
Varices.
Renal failure:
GI telangiectasias.
GAVE (watermelon stomach).
Vasculitis (e.g., polyarteritis nodosa).
Iatrogenic lesions:
Radiation telangiectasia.

CREST, Calcinosis, Raynaud phenomenon, esophageal dysmotility, sclerodactyly, telangiectasia; *GAVE,* gastric antral vascular ectasia

VASCULITIS, CLASSIFICATION[60]

ICD-10CM # I77.6 Arteritis, unspecified

LARGE VESSEL DISEASE

Arteritis
Giant cell arteritis.
Takayasu arteritis.
Arteritis associated with Reiter syndrome (reactive arthritis), ankylosing spondylitis.

MEDIUM AND SMALL VESSEL DISEASE

Polyarteritis Nodosa
Primary (idiopathic).
Associated with viruses (hepatitis B or C, CMV, HIV, herpes zoster).
Associated with malignancy (hairy cell leukemia).
Familial Mediterranean fever.
Granulomatous Vasculitis
Granulomatosis with polyangiitis.
Lymphomatoid granulomatosis.
Behçet Disease
Kawasaki Disease (Mucocutaneous Lymph Node Syndrome)

PREDOMINANTLY SMALL VESSEL DISEASE

Hypersensitivity Vasculitis (Leukocytoclastic Vasculitis)
Henoch-Schönlein purpura.
Mixed cryoglobulinemia.
Serum sickness.
Vasculitis associated with connective tissue diseases (SLE, Sjögren syndrome).
Vasculitis associated with specific syndromes:
Primary biliary cirrhosis.
Lyme disease.
Chronic active hepatitis.
Drug-induced vasculitis.
Churg-Strauss Syndrome
Goodpasture Syndrome
Erythema Nodosum
Panniculitis. Buerger Disease (Thrombophlebitis Obliterans)

VASCULITIS (DISEASES THAT MIMIC VASCULITIS)[65]

ICD-10CM # Varies with specific diagnosis

EMBOLIC DISEASE

Infectious or marantic endocarditis.
Cardiac mural thrombus.
Atrial myxoma.
Cholesterol embolization syndrome.

NONINFLAMMATORY VESSEL WALL DISRUPTION

Atherosclerosis.
Arterial fibromuscular dysplasia.
Drug effects (vasoconstrictors, anticoagulants).
Radiation.
Genetic disease (neurofibromatosis, Ehlers-Danlos syndrome).
Amyloidosis.
Intravascular malignant lymphoma.

DIFFUSE COAGULATION

Disseminated intravascular coagulation.
Thrombotic thrombocytopenic purpura.
Hemolytic-uremic syndrome.
Protein C and S deficiencies, factor V/Leiden mutation.
Antiphospholipid syndrome.

VEGETATIVE STATE, PERSISTENT[3]

ICD-10CM # R40.3 Persistent vegetative state

PERSISTENT VEGETATIVE STATE: COMMON CAUSES[43]

Trauma (diffuse axonal injury).
Cardiac arrest and hypoperfusion (laminar necrosis of cortical mantle and/or thalamic necrosis).
Bihemispheric infarctions.
Purulent meningitis or encephalitis (cortical injury).
Carbon monoxide.
Prolonged hypoglycemic coma.

VENTILATION–PERFUSION MISMATCH ON LUNG SCAN

ICD-10CM # Varies with specific diagnosis

Pulmonary embolism.
Emphysema.
Irradiation.
Pulmonary hypertension.

[43] A vegetative state may not necessarily begin with coma but can also develop as the end stage of neurodegenerative diseases (e.g., Alzheimer disease) of adults or children and can accompany severe congenital developmental abnormalities of the brain such as anencephaly.

AV malformations.
Pulmonary thrombosis.
External compression of pulmonary artery (neoplasm, cysts, fibrosing mediastinitis).
Vasculitis.
Tuberculosis.
Pulmonary thrombosis.
Congenital (pulmonary artery hypoplasia, congenital heart disease with upper lobe diversion).
Sequestered segment.
Parasitic lung disease.
Intraluminal obstruction from catheter fragments.

VENTRICULAR FAILURE

ICD-10CM # I51.9 Heart disease, unspecified

LEFT VENTRICULAR FAILURE

Systemic hypertension.
Valvular heart disease (AS, AR, MR).
Cardiomyopathy, myocarditis.
Bacterial endocarditis.
Myocardial infarction.
Idiopathic hypertrophic subaortic stenosis.

RIGHT VENTRICULAR FAILURE

Valvular heart disease (mitral stenosis).
Pulmonary hypertension.
Bacterial endocarditis (right-sided).
Right ventricular infarction.

BIVENTRICULAR FAILURE

Left ventricular failure.
Cardiomyopathy.
Myocarditis
Arrhythmias.
Anemia.
Thyrotoxicosis.
Arteriovenous fistula.
Paget disease.
Beriberi.

VERRUCOUS LESIONS

ICD-10CM # Varies with specific diagnosis

Warts.
Seborrheic keratosis.
Lichen simplex.
Acanthosis nigricans.
Scabies (Norwegian, crusted).
Verrucous carcinoma.
Nevus sebaceous.
Deep fungal infection.

VERTEBRAL LESIONS[64]

ICD-10CM # Varies with specific diagnosis

Anatomic Distribution of Vertebral Lesions

Anterior Elements of the Spine	Posterior Elements of the Spine	Both Anterior and Posterior Elements of the Spine
Multiple myeloma.	Osteoid osteoma.	Metastasis (spares disc end plates).
Hemangioma.	Osteoblastoma.	Infection (involves disc end plates).
Paget disease of bone.	Aneurysmal bone cyst.	Classic osteosarcoma.
Histiocytosis X (vertebra plana).		Postradiation sarcoma.
Giant cell tumor of bone.		Malignant histiocytoid variety.
Reparative granuloma.		Osteosarcoma.
Ewing sarcoma (primitive neuroectodermal tumor).		Osteochondroma.
Lymphoma of bone.		Primary chondrosarcoma.
Malignant fibrous histiocytoma.		Secondary chondrosarcoma.
Chordoma.		

VERTIGO

ICD-10CM #	R42	Dizziness and giddiness
	H81.13	Benign paroxysmal vertigo, bilateral
	H81.49	Vertigo of central origin, unspecified ear
	H81.399	Other peripheral vertigo, unspecified ear
	H81.23	Vestibular neuronitis, bilateral

PERIPHERAL

Otitis media.
Acute labyrinthitis.
Vestibular neuronitis.
Benign positional vertigo.
Meniere disease.
Ototoxic drugs: streptomycin, gentamicin.
Lesions of the eighth nerve: acoustic neuroma, meningioma, mononeuropathy, metastatic carcinoma.
Mastoiditis.

CNS OR SYSTEMIC

Vertebrobasilar artery insufficiency.
Posterior fossa tumor or other brain tumors.
Infarction/hemorrhage of cerebral cortex, cerebellum, or brain stem.
Basilar migraine.
Metabolic: drugs, hypoxia, anemia, fever.
Hypotension/severe hypertension.
Multiple sclerosis.
CNS infections: viral, bacterial.
Temporal lobe epilepsy.
Arnold–Chiari malformation, syringobulbia.
Psychogenic: ventilation, hysteria.

VERTIGO, CENTRAL[1]

ICD-10CM # R42

MAJOR CAUSES OF CENTRAL VERTIGO

Demyelination:
- Acquired.
- Leukodystrophies.
- Multiple sclerosis.

Familial disorders:
- Friedreich ataxia.
- Spinocerebellar ataxia.
- Familial episodic ataxia (type 1 and type 2).
- Olivopontocerebellar atrophy.

CNS infections:
- Lyme neuroborreliosis.
- Meningitis.
- Tuberculosis.

Intrinsic brainstem lesion:
- Tumor.
- Arteriovenous malformation.
- Trauma.

Migraine:
- Basilar.
- Benign paroxysmal positional vertigo of childhood.

Toxins:
- Drugs, alcohol.
- Analgesics.
- Anticonvulsants.
- Antihypertensives.
- Hypnotics.
- Tranquilizers.

Metabolic and endocrine disorders:
- Hyperinsulinism.
- Impaired glucose tolerance.
- Diabetes mellitus.
- Hypertriglyceridemia.
- Hypothyroidism.

Systemic conditions:
- Paget disease.

Stroke/ischemia:
- Vertebrobasilar.
- Cerebellar.
- Posterior inferior cerebellar artery syndrome.
- Lateral medullary syndrome.
- Medial medullary infarct.
- Basilar artery syndrome.
- Anterior inferior cerebellar artery.

Other causes of posterior ischemia:
- Subclavian steal syndrome.
- Rotational vertebral artery occlusion syndrome.
- Vertebral artery dissection.
- Vertebral or basilar artery dolichoectasia.
- Neoplasm of the fourth ventricle.
- Chiari malformation.
- Superficial siderosis of the CNS.
- Vestibular epilepsy.

VESICULOBULLOUS DISEASES[32]

ICD-10CM #	L94.2	Calcinosis cutis
	L98.8	Other specified disorders of the skin and subcutaneous tissue

IMMUNOLOGICALLY MEDIATED DISEASES

Bullous pemphigoid.
Herpes gestationis.
Mucous membrane pemphigoid.
Epidermolysis bullosa acquisita.
Dermatitis herpetiformis.
Pemphigus (vulgaris, foliaceus, paraneoplastic).

HYPERSENSITIVITY DISEASES

Erythema multiforme minor.
Erythema multiforme major (Stevens-Johnson syndrome).
Toxic epidermal necrolysis.

METABOLIC DISEASES

Porphyria cutanea tarda.
Pseudoporphyria.
Diabetic blisters.

INHERITED GENETIC DISORDERS

Epidermolysis bullosa:
- Simplex.
- Junctional.
- Dystrophic.

INFECTIOUS DISEASES

Impetigo.
Staphylococcal scalded skin syndrome.
Herpes simplex.
Varicella.
Herpes zoster.

VISION LOSS, ACUTE, PAINFUL

ICD-10CM # H53.139 Sudden visual loss, unspecified eye

Acute angle-closure glaucoma.
Corneal ulcer.
Uveitis.
Endophthalmitis.
Factitious.
Somatization syndrome.
Trauma.

VISION LOSS, ACUTE, PAINLESS

ICD-10CM # H53.139 Sudden visual loss, unspecified eye

Retinal artery occlusion.
Optic neuritis.
Retinal vein occlusion.
Vitreous hemorrhage.
Retinal detachment.
Exudative macular degeneration.
CVA.
Ischemic optic neuropathy.
Factitious.
Somatization syndrome, anxiety reaction.

VISION LOSS AFTER DIVING[4]

ICD-10CM # H53.139

DIFFERENTIAL DIAGNOSIS OF DECREASED VISION AFTER DIVING

Decompression sickness.
Arterial gas embolism.
Bubbles under contact lenses.
Displaced contact lens.
Antifog agent keratopathy.
Contact lens adherence syndrome.
Transdermal scopolamine
Hyperoxic myopia.
Oxymetazoline optic neuropathy.
Diving-induced migraine phenomena.
Eye disorders not related to diving.

VISION LOSS, CHILDREN

ICD-10CM # H53.9 Unspecified visual disturbance

Craniopharyngioma.
Hereditary optic atrophy.
Optic nerve glioma.
Glioma of chiasm.
Albinism.
Optic nerve hypoplasia.

VISION LOSS, CHRONIC, PROGRESSIVE

ICD-10CM # H54.7 Unspecified visual loss

Cataract.
Macular degeneration.
Cerebral neoplasm.
Refractive error.
Open-angle glaucoma.

VISION LOSS, MONOCULAR, TRANSIENT

ICD-10CM # H54.7 Unspecified visual loss

Thromboembolism.
Vasculitis.
Migraine (vasospasm).
Anxiety reaction.
CNS tumor.
Temporal arteritis.
Multiple sclerosis.

VITREOUS HEMORRHAGE[48]

ICD-10CM # H43.13 Vitreous hemorrhage, bilateral

CAUSES OF VITREOUS HEMORRHAGE

Acute posterior vitreous detachment associated either with a retinal tear or avulsion of a peripheral vessel.
Proliferative retinopathies:
- Diabetic.
- Following retinal vein occlusion.
- Sickle cell disease.
- Eales disease.
- Vasculitis.

Miscellaneous retinal disorders:
- Macroaneurysm.
- Telangiectasis.
- Capillary hemangioma.

Trauma:
- Blunt.
- Penetrating.
- Iatrogenic.

Systemic:
- Bleeding disorders.
- Terson syndrome.

VOCAL CORD PARALYSIS

ICD-10CM # J38.00 Paralysis of vocal cords and larynx, unspecified
J38.01 Paralysis of vocal cords and larynx, unilateral
J38.02 Paralysis of vocal cords and larynx, bilateral

Neoplasm: primary or metastatic (e.g., lung, thyroid, parathyroid, mediastinum).
Neck surgery (parathyroid, thyroid, carotid endarterectomy, cervical spine).
Idiopathic.
Viral, bacterial, or fungal infection.
Trauma (intubation, penetrating neck injury).
Cardiac surgery.
RA.
Multiple sclerosis.
Parkinsonism.
Toxic neuropathy.
CVA.
CNS abnormalities: hydrocephalus, Arnold–Chiari malformation, meningomyelocele.

VOLUME DEPLETION[3]

ICD-10CM # E86.9 Volume depletion, unspecified

GI losses:
- Upper: bleeding, nasogastric suction, vomiting.
- Lower: bleeding, diarrhea, enteric or pancreatic fistula, tube drainage.

Renal losses:
- Salt and water: diuretics, osmotic diuresis, postobstructive diuresis, acute tubular necrosis (recovery phase), salt-losing nephropathy, adrenal insufficiency, renal tubular acidosis.

Water loss: diabetes insipidus.
Skin and respiratory losses:
- Sweat, burns, insensible losses.

Sequestration without external fluid loss:
- Intestinal obstruction, peritonitis, pancreatitis, rhabdomyolysis, internal bleeding.

VOLUME EXCESS[3]

ICD-10CM # Varies with specific diagnosis

Primary Renal Sodium Retention (Increased Effective Circulating Volume)
Renal failure, nephritic syndrome, acute glomerulonephritis.
Primary hyperaldosteronism.
Cushing syndrome.
Liver disease.
Secondary Renal Sodium Retention (Decreased Effective Circulating Volume)
Heart failure.
Liver disease.
Nephrotic syndrome (minimal change disease).
Pregnancy.

VOMITING

ICD-10CM # R11.10 Vomiting, unspecified
R11.11 Vomiting without nausea
R11.12 Projectile vomiting

GI disturbances:
- Obstruction: esophageal, pyloric, intestinal.
- Infections: viral or bacterial enteritis, viral hepatitis, food poisoning, gastroenteritis.
- Pancreatitis.
- Appendicitis.
- Biliary colic.
- Peritonitis.
- Perforated bowel.
- Diabetic gastroparesis.

Other: gastritis, PUD, IBD, GI tract neoplasms.
Drugs: morphine, digitalis, cytotoxic agents, bromocriptine.
Severe pain: MI, renal colic.
Metabolic disorders: uremia, acidosis/alkalosis, hyperglycemia, DKA, thyrotoxicosis.
Trauma: blows to the testicles, epigastrium.
Vertigo.
Reye syndrome.
Increased intracranial pressure.
CNS disturbances: trauma, hemorrhage, infarction, neoplasm, infection, hypertensive encephalopathy, migraine.
Radiation sickness.
Nausea and vomiting of pregnancy, hyperemesis gravidarum.
Motion sickness.
Bulimia, anorexia nervosa.
Psychogenic: emotional disturbances, offensive sights or smells.
Severe coughing.
Pyelonephritis.
Boerhaave syndrome.
Carbon monoxide poisoning.

VOMITING, NEONATAL[1]

ICD-10CM # R11.10 Vomiting, unspecified

CAUSES OF NEONATAL VOMITING

Anatomic Causes

Esophagus, trachea, great vessels:
- Stricture.
- Web.
- Tracheoesophageal fistula.
- Laryngeal cleft.
- Double aortic arch.

Stomach and duodenum:
- Pyloric stenosis.
- Duodenal atresia (usually noted on the first day of life)

Small and large intestine:
- Volvulus secondary to malrotation.
- Incarcerated hernia.
- Hirschsprung disease (secondary to obstipation).
- Necrotizing enterocolitis.

Genitourinary:
- Testicular torsion.

Nonanatomic Causes

Infection:
- Septicemia.
- Meningitis.
- Urinary tract infection.
- Gastroenteritis.
- Otitis media

Increased intracranial pressure:
- Cerebral edema.
- Subdural hematoma.
- Hydrocephalus.
- Brain tumor.

Congenital adrenal hyperplasia (salt-losing variety).
Inborn errors of metabolism.
Renal disease.

VULVAR LESIONS[24]

ICD-10CM # N77.0 Ulceration of vulva in diseases classified elsewhere
N90.7 Vulvar cyst
N90.89 Other specified noninflammatory disorders of vulva and perineum
D07.1 Carcinoma in situ of vulva
N90.89 Other specified noninflammatory disorders of vulva and perineum
N90.5 Atrophy of vulva

RED LESION

Infection/Infestation

Fungal infection:
- *Candida.*
- *Tinea cruris.*
- Intertrigo.
- *Pityriasis versicolor.*

Sarcoptes scabiei.
- Erythrasma: *Corynebacterium minutissimum.*
- *Granuloma inguinale: Calymmatobacterium granulomatis.*
- Folliculitis: *Staphylococcus aureus.*
- Hidradenitis suppurativa.
- Behçet syndrome.

Inflammation

Reactive vulvitis.
Chemical irritation:
- Detergent.
- Dyes.
- Perfume.
- Spermicide.
- Lubricants.
- Hygiene sprays.
- Podophyllum.
- Topical 5-FU.
- Saliva.
- Gentian violet.
- Semen.

Mechanical trauma: scratching.
Vestibular adenitis.
Essential vulvodynia.
Psoriasis.
Seborrheic dermatitis.

Neoplasm

Vulvar intraepithelial neoplasia (VIN):
- Mild dysplasia.
- Moderate dysplasia.
- Severe dysplasia.
- Carcinoma-in-situ.

Vulvar dystrophy.
Bowen disease.
Invasive cancer:
- Squamous cell carcinoma.
- Malignant melanoma.
- Sarcoma.
- Basal cell carcinoma.
- Adenocarcinoma.
- Paget disease.
- Undifferentiated.

WHITE LESION

Vulvar dystrophy:
- Lichen sclerosus.
- Vulvar dystrophy.
- Vulvar hyperplasia.
- Mixed dystrophy.

VIN.
Vitiligo.
Partial albinism.
Intertrigo.
Radiation treatment.

DARK LESION

Lentigo.
Nevi (mole).
Neoplasm (see "Neoplasm, Vulvar," below).
Reactive hyperpigmentation.
Seborrheic keratosis.
Pubic lice.

ULCERATIVE LESION

Infection

Herpes simplex.
Vaccinia.
Treponema pallidum.
Granuloma inguinale.
Pyoderma.
Tuberculosis.

Noninfectious

Behçet disease.
Crohn disease.
Pemphigus.
Pemphigoid.
Hidradenitis suppurativa (see "Neoplasm, Vulvar," below).

Neoplasm

Basal cell carcinoma.
Squamous cell carcinoma.
Vulvar tumor <1 cm:
- Condyloma acuminatum.
- Molluscum contagiosum.
- Epidermal inclusion.
- Vestibular cyst.
- Mesonephric duct.
- VIN.
- Hemangioma.
- Hidradenoma.
- Neurofibroma.
- Syringoma.
- Accessory breast tissue.
- Acrochordon.
- Endometriosis.
- Fox-Fordyce disease.
- Pilonidal sinus.

Vulvar tumor >1 cm:
- Bartholin cyst or abscess.
- Lymphogranuloma venereum.
- Fibroma.
- Lipoma.
- Verrucous carcinoma.

Squamous cell carcinoma.
Hernia.
Edema.
Hematoma.
Acrochordon.
Epidermal cysts.
Neurofibromatosis.
Accessory breast tissue.

VULVAR PAIN[22]

ICD-10CM # N94.81 Vulvodynia
R10.2 Pelvic and perineal pain

DISEASES ASSOCIATED WITH VULVAR PAIN, NOT QUALIFYING FOR THE DIAGNOSIS OF VULVODYNIA

Podophyllin overdose.
Condylox (podofilox) overdose.
Behçet disease.
Aphthous ulcers.
Herpes (simplex and zoster).
Candidiasis.
Trichomonas.
Chancroid.
Sjögren disease.
Contact dermatitis.
Endometriosis.
Pemphigus.
Pemphigoid.
Atrophy.
Lichen sclerosus.
Lichen planus.
Crohn disease.
Bartholin abscess.
Trauma.
Imperforate hymen.
Prolapsed urethra.
Vulvar intraepithelial neoplasia.
Carcinoma.

VULVITIS, GRANULOMATOUS

ICD-10CM # N76.2 Acute vulvitis
N76.3 Subacute and chronic vulvitis

Differential diagnosis of granulomatous vulvitis
Syphilis.
Lymphogranuloma venereum.
Mycobacteria.
Fungus.
Bacillary angiomatosis.
Folliculitis.
Ruptured pilosebaceous unit.
Ruptured cyst.
Crohn disease.
Vulvitis granulomatosa.
Hydradenitis suppurativa.

WEAKNESS, ACUTE, EMERGENT[60]

ICD-10CM # M62.81 Muscle weakness (generalized)

Demyelinating disorders (Guillain-Barré, chronic inflammatory demyelinating polyneuropathy [CIDP]).
Myasthenia gravis.
Infectious (poliomyelitis, diphtheria).
Toxic (botulism, tick paralysis, paralytic shellfish toxin, puffer fish, newts).
Metabolic (acquired or familial hypokalemia, hypophosphatemia, hypermagnesemia).
Metal poisoning (arsenic, thallium).
Porphyria.

WEAKNESS, GRADUAL ONSET

ICD-10CM # M62.81 Muscle weakness (generalized)

Depression.
Malingering.
Anemia.
Hypothyroidism.
Medications (e.g., sedatives, antidepressants, narcotics).
CHF.
Renal failure.
Liver failure.
Respiratory insufficiency.
Alcoholism.
Nutritional deficiencies.
Disorders of motor unit.
Basal ganglia disorders.
Upper motor neuron lesions.

WEAKNESS, NONNEUROMUSCULAR CAUSES

ICD-10CM # G93.3 Postviral fatigue syndrome
R53.1 Weakness
R53.81 Other malaise
R53.83 Other fatigue

Anxiety disorder.
Infectious process.
Anemia.
Renal insufficiency.
Hyperventilation.
Malignancy.
Hypothyroidism.
Hypotension.
Hypercapnia.
Hypoglycemia.
Cardiac arrhythmias.
Hepatic insufficiency.
Electrolyte imbalance.
Malnutrition.
Cerebrovascular insufficiency.

WEIGHT GAIN

ICD-10CM # R63.5 Abnormal weight gain
E66.9 Obesity, unspecified

Sedentary lifestyle.
Fluid overload.
Discontinuation of tobacco abuse.
Endocrine disorders (hypothyroidism, hyperinsulinism associated with maturity-onset DM, Cushing syndrome, hypogonadism, insulinoma, hyperprolactinemia, acromegaly).
Medications (nutritional supplements, oral contraceptives, glucocorticoids, etc.).
Anxiety disorders with compulsive eating.
Laurence-Moon-Biedl syndrome, Prader-Willi syndrome, other congenital diseases.
Hypothalamic injury (rare; <100 cases reported in medical literature).

WEIGHT LOSS

ICD-10CM # R63.4 Abnormal weight loss

Malignancy.
Psychiatric disorders (depression, anorexia nervosa).
New-onset DM.
Malabsorption.
COPD.
AIDS.
Uremia, liver disease.
Thyrotoxicosis, pheochromocytoma, carcinoid syndrome.
Addison disease.
Intestinal parasites.
Peptic ulcer disease.
Inflammatory bowel disease.
Food faddism.
Postgastrectomy syndrome.

WHEEZING

ICD-10CM # R06.2 Wheezing

Asthma.
COPD.
Interstitial lung disease.
Infections (pneumonia, bronchitis, bronchiolitis, epiglottitis).
Cardiac asthma.
GERD with aspiration.
Foreign body aspiration.
Pulmonary embolism.
Anaphylaxis.
Obstruction of airway (neoplasm, goiter, edema or hemorrhage from trauma, aneurysm, congenital abnormalities, strictures, spasm).
Carcinoid syndrome.

WHEEZING, PEDIATRIC AGE[9]

ICD-10CM # R06.2 Wheezing

Reactive airways disease.
Atopic asthma.
Infection-associated airway reactivity.
Exercise-induced asthma.
Salicylate-induced asthma and nasal polyposis.
Asthmatic bronchitis.
Other hypersensitivity reactions:
- Hypersensitivity pneumonitis.
- Tropical eosinophilia.
- Visceral larva migrans.
- Allergic bronchopulmonary aspergillosis.

Aspiration:
- Foreign body.
- Food, saliva, gastric contents.
- Laryngotracheoesophageal cleft.
- Tracheoesophageal fistula, H-type.
- Pharyngeal incoordination or neuromuscular weakness.

Squamous cell carcinoma.
Hernia.
Edema.
Hematoma.
Acrochordon.
Epidermal cysts.
Neurofibromatosis.
Accessory breast tissue.

VULVAR PAIN[22]

ICD-10CM # N94.81 Vulvodynia
R10.2 Pelvic and perineal pain

DISEASES ASSOCIATED WITH VULVAR PAIN, NOT QUALIFYING FOR THE DIAGNOSIS OF VULVODYNIA

Podophyllin overdose.
Condylox (podofilox) overdose.
Behçet disease.
Aphthous ulcers.
Herpes (simplex and zoster).
Candidiasis.
Trichomonas.
Chancroid.
Sjögren disease.
Contact dermatitis.
Endometriosis.
Pemphigus.
Pemphigoid.
Atrophy.
Lichen sclerosus.
Lichen planus.
Crohn disease.
Bartholin abscess.
Trauma.
Imperforate hymen.
Prolapsed urethra.
Vulvar intraepithelial neoplasia.
Carcinoma.

VULVITIS, GRANULOMATOUS

ICD-10CM # N76.2 Acute vulvitis
N76.3 Subacute and chronic vulvitis

Differential diagnosis of granulomatous vulvitis
Syphilis.
Lymphogranuloma venereum.
Mycobacteria.
Fungus.
Bacillary angiomatosis.
Folliculitis.
Ruptured pilosebaceous unit.
Ruptured cyst.
Crohn disease.
Vulvitis granulomatosa.
Hydradenitis suppurativa.

WEAKNESS, ACUTE, EMERGENT[60]

ICD-10CM # M62.81 Muscle weakness (generalized)

Demyelinating disorders (Guillain-Barré, chronic inflammatory demyelinating polyneuropathy [CIDP]).
Myasthenia gravis.
Infectious (poliomyelitis, diphtheria).
Toxic (botulism, tick paralysis, paralytic shellfish toxin, puffer fish, newts).
Metabolic (acquired or familial hypokalemia, hypophosphatemia, hypermagnesemia).
Metal poisoning (arsenic, thallium).
Porphyria.

WEAKNESS, GRADUAL ONSET

ICD-10CM # M62.81 Muscle weakness (generalized)

Depression.
Malingering.
Anemia.
Hypothyroidism.
Medications (e.g., sedatives, antidepressants, narcotics).
CHF.
Renal failure.
Liver failure.
Respiratory insufficiency.
Alcoholism.
Nutritional deficiencies.
Disorders of motor unit.
Basal ganglia disorders.
Upper motor neuron lesions.

WEAKNESS, NONNEUROMUSCULAR CAUSES

ICD-10CM # G93.3 Postviral fatigue syndrome
R53.1 Weakness
R53.81 Other malaise
R53.83 Other fatigue

Anxiety disorder.
Infectious process.
Anemia.
Renal insufficiency.
Hyperventilation.
Malignancy.
Hypothyroidism.
Hypotension.
Hypercapnia.
Hypoglycemia.
Cardiac arrhythmias.
Hepatic insufficiency.
Electrolyte imbalance.
Malnutrition.
Cerebrovascular insufficiency.

WEIGHT GAIN

ICD-10CM # R63.5 Abnormal weight gain
E66.9 Obesity, unspecified

Sedentary lifestyle.
Fluid overload.
Discontinuation of tobacco abuse.
Endocrine disorders (hypothyroidism, hyperinsulinism associated with maturity-onset DM, Cushing syndrome, hypogonadism, insulinoma, hyperprolactinemia, acromegaly).
Medications (nutritional supplements, oral contraceptives, glucocorticoids, etc.).
Anxiety disorders with compulsive eating.
Laurence-Moon-Biedl syndrome, Prader-Willi syndrome, other congenital diseases.
Hypothalamic injury (rare; <100 cases reported in medical literature).

WEIGHT LOSS

ICD-10CM # R63.4 Abnormal weight loss

Malignancy.
Psychiatric disorders (depression, anorexia nervosa).
New-onset DM.
Malabsorption.
COPD.
AIDS.
Uremia, liver disease.
Thyrotoxicosis, pheochromocytoma, carcinoid syndrome.
Addison disease.
Intestinal parasites.
Peptic ulcer disease.
Inflammatory bowel disease.
Food faddism.
Postgastrectomy syndrome.

WHEEZING

ICD-10CM # R06.2 Wheezing

Asthma.
COPD.
Interstitial lung disease.
Infections (pneumonia, bronchitis, bronchiolitis, epiglottitis).
Cardiac asthma.
GERD with aspiration.
Foreign body aspiration.
Pulmonary embolism.
Anaphylaxis.
Obstruction of airway (neoplasm, goiter, edema or hemorrhage from trauma, aneurysm, congenital abnormalities, strictures, spasm).
Carcinoid syndrome.

WHEEZING, PEDIATRIC AGE[9]

ICD-10CM # R06.2 Wheezing

Reactive airways disease.
Atopic asthma.
Infection-associated airway reactivity.
Exercise-induced asthma.
Salicylate-induced asthma and nasal polyposis.
Asthmatic bronchitis.
Other hypersensitivity reactions:
- Hypersensitivity pneumonitis.
- Tropical eosinophilia.
- Visceral larva migrans.
- Allergic bronchopulmonary aspergillosis.

Aspiration:
- Foreign body.
- Food, saliva, gastric contents.
- Laryngotracheoesophageal cleft.
- Tracheoesophageal fistula, H-type.
- Pharyngeal incoordination or neuromuscular weakness.

Cystic fibrosis.
Primary ciliary dyskinesia.
Cardiac failure.
Bronchiolitis obliterans.
Extrinsic compression of airways:
- Vascular ring.
- Enlarged lymph node.
- Mediastinal tumor.
- Lung cysts.

Tracheobronchomalacia.
Endobronchial masses.
Gastroesophageal reflux.
Pulmonary hemosiderosis.
Sequelae of bronchopulmonary dysplasia.
"Hysterical" glottic closure.
Cigarette smoke, other environmental insults.

WRIST AND HAND PAIN[42]

ICD-10CM # S69.90XA Unspecified injury of unspecified wrist, hand and finger(s), initial encounter

Articular

Arthritis of the wrist, MCP, PIP, or DIP as a result of:	Trauma, hypermobility, sprain. RA (wrist, MCP, PIP joints). Osteoarthritis (first CMC, PIP, and DIP joints). Other forms of arthritis: gout, psoriatic arthritis, infection. Joint neoplasm.

Periarticular

Subcutaneous.	RA nodules, gouty tophi, painful subcutaneous calcific nodules in scleroderma, glomus tumor of the nail bed.
Palmar fascia.	Dupuytren contracture.
Tendon sheath.	Wrist extensor tenosynovitis, including de Quervain tenosynovitis and extensor carpi radialis tenosynovitis. Wrist volar flexor tenosynovitis (including carpal tunnel syndrome). Thumb flexor tenosynovitis (trigger or snapping thumb). Finger flexor tenosynovitis (trigger finger). Pigmented villonodular tenosynovitis (giant cell tumor of the tendon sheath).
Acute calcific periarthritis ganglion.	Wrist, MCP, and rarely the PIP and DIP joints.

Osseous

Bone lesions.	Fractures; neoplasm; infection; osteonecrosis, including Kienböck disease (lunate) and Preiser disease (scaphoid).

Neurologic

Nerve entrapment syndromes

Median nerve.	Carpal tunnel syndrome (at the wrist). Pronator teres syndrome (at the pronator teres). Anterior interosseous nerve syndrome.
Ulnar nerve.	Cubital tunnel syndrome (at the elbow). Guyon canal (at the wrist).
Posterior interosseous nerve syndrome.	Radial nerve palsy (spiral groove syndrome).
Lower brachial plexus.	Thoracic outlet syndrome, Pancoast tumor.
Cervical nerve roots.	Herniated cervical disk, tumors.

Spinal cord lesion

Spinal tumors, syringomyelia.	

Vascular

Vasoplastic disorders with Raynaud phenomenon.	Scleroderma, occupational vibration syndrome.
Small- or large-vessel vasculitis.	With digital ischemia, ischemic ulcers (e.g., SLE, RA, and Takayasu arthritis).

Referred pain

Cervical spine disorders.	Shoulder–hand syndrome and causalgia.
Reflex sympathetic dystrophy syndrome.	
Cardiac.	Angina pectoris.

CMC, Carpometacarpal; *DIP,* distal interphalangeal; *MCP,* metacarpophalangeal; *PIP,* proximal interphalangeal; *RA,* rheumatoid arthritis; *SLE,* systemic lupus erythematosus.

WRIST AND HAND PAIN, IN DIFFERENT AGE GROUPS[18]

ICD-10CM # S69.80XA Other specified injuries of unspecified wrist, hand and finger(s), initial encounter
S69.90XA Unspecified injury of unspecified wrist, hand and finger(s), initial encounter

COMMON CAUSES OF WRIST AND HAND PAIN IN DIFFERENT AGE GROUPS

Childhood (2 to 10 yr)
Intraarticular
Infection.
Periarticular
Fracture.
Osteomyelitis.

Adolescence (10 to 18 yr)
Intraarticular
Infection.
Periarticular
Trauma.
Osteomyelitis.
Tumors.
Ganglion.
Idiopathic wrist pain.

Early Adulthood (18 to 30 yr)
Intraarticular
Inflammatory arthritis.
Infection.
Osteoarthritis.
Periarticular
Peripheral nerve entrapment.
Tendonitis.
Referred
Cervical.

Adulthood (30 to 50 yr)
Intraarticular
Inflammatory arthritis.
Infection.
Osteoarthritis.
Periarticular
Peripheral nerve entrapment.
Tendonitis.
Referred
Cervical.
Chest.
Cardiac.

Old age (>50 yr)
Intraarticular
Inflammatory arthritis.
Osteoarthritis.
Periarticular
Peripheral nerve entrapment.
Tendonitis.
Referred
Cervical.
Chest.
Cardiac.

WRIST PAIN

ICD-10CM # S69.80XA Other specified injuries of unspecified wrist, hand and finger(s), initial encounter
S69.90XA Unspecified injury of unspecified wrist, hand and finger(s), initial encounter

MECHANICAL

Osteoarthritis.
Ligament tear.
Fracture.
Ganglion.
De Quervain tenosynovitis.
Avascular necrosis (scaphoid, lunate).
Nonunion of scaphoid or lunate.
Neoplasm.

METABOLIC

Pregnancy.
Diabetes.
Gout.
Pseudogout.
Paget disease.
Acromegaly.

Hypothyroidism.
Hyperparathyroidism.

INFECTIOUS
Osteomyelitis.
Septic arthritis.
Cat-scratch disease.
Tick bite (Lyme disease, babesiosis).
Tuberculosis.

NEUROLOGIC
Peripheral neuropathy.
Nerve injury (median, ulnar, radial nerve).
Thoracic outlet compression syndrome.
Distal posterior interosseous nerve syndrome.

RHEUMATOLOGIC
Psoriasis.
RA.
SLE, mixed connective tissue disorder (MCTD).
Scleroderma.

MISCELLANEOUS
Granulomatous (sarcoidosis).
Amyloidosis.
Multiple myeloma.
Leukemia.

XEROPHTHALMIA[65]

ICD-10CM #		
	H11.149	Conjunctival xerosis, unspecified, unspecified eye

MEDICATIONS
Tricyclic antidepressants: amitriptyline, doxepin.
Antihistamines: diphenhydramine, chlorpheniramine, promethazine, and many cold and decongestant preparations.
Anticholinergic agents: antiemetics such as scopolamine, antispasmodic agents such as oxybutynin chloride.

ABNORMALITIES OF EYELID FUNCTION
Neuromuscular disorders.
Aging.
Thyrotoxicosis.

ABNORMALITIES OF TEAR PRODUCTION
Hypovitaminosis A.
Stevens-Johnson syndrome.
Familial diseases affecting sebaceous secretions.

ABNORMALITIES OF CORNEAL SURFACES
Scarring from past injuries and herpes simplex infection.

XEROSTOMIA[65]

ICD-10CM #		
	K11.7	Disturbances of salivary secretion
	R68.2	Dry mouth, unspecified

MEDICATIONS
Tricyclic antidepressants: amitriptyline, doxepin.
Antihistamines: diphenhydramine, chlorpheniramine, promethazine, and many cold and decongestant preparations.
Anticholinergic agents: antiemetics such as scopolamine, antispasmodic agents such as oxybutynin chloride.

DEHYDRATION
Debility.
Fever.

POLYURIA
Alcohol intake.
Arrhythmia.
Diabetes.

PREVIOUS HEAD AND NECK IRRADIATION SYSTEMIC DISEASES
Sjögren syndrome.
Sarcoidosis.
Amyloidosis.
HIV infection.
Graft-versus-host disease.

YELLOW URINE

ICD-10CM #		
	R82	Other abnormal findings in urine

Normal coloration.
Concentrated urine.
Use of multivitamin supplements.
Diet rich in carrots.
Use of Cascara.
Urinary tract infection

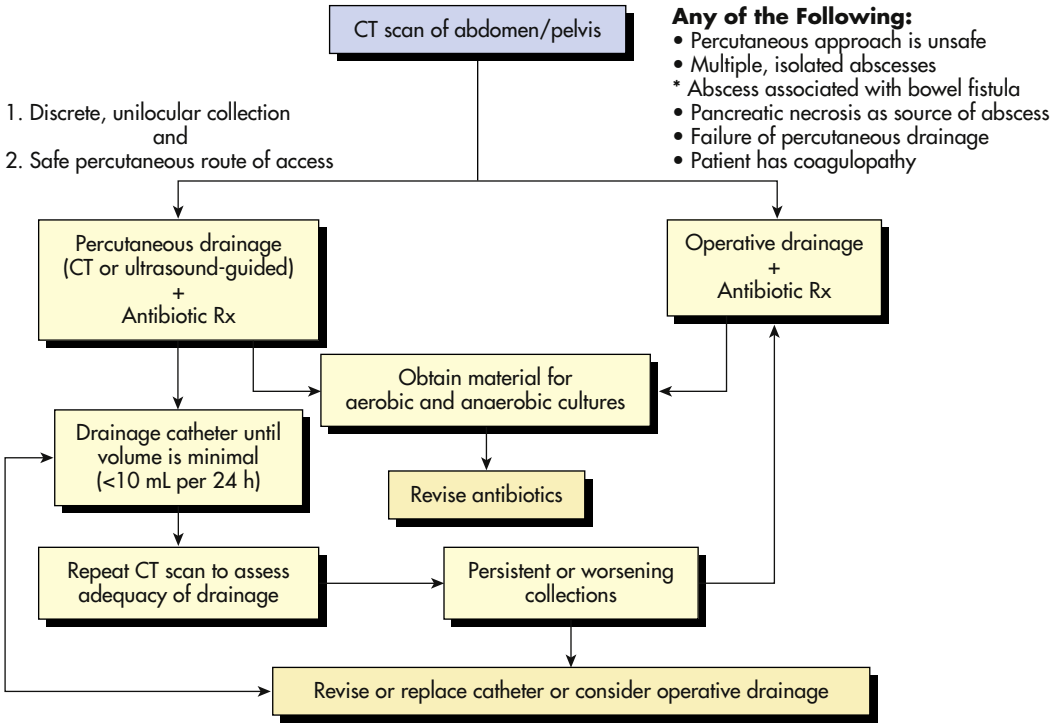

FIG. 1 Approach to management of intraabdominal abscesses including indications for consideration of percutaneous versus operative drainage. *CT,* Computed tomography; *Rx,* treatment. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.)

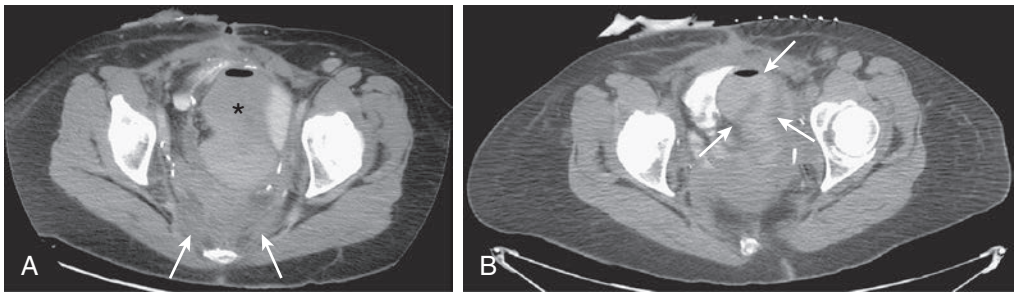

FIG. 2 A, Axial computed tomography *(CT)* image shows an apparently rim-enhancing structure containing gas (*asterisk*) in the deep pelvis adjacent to tethered bowel loops in a patient with prior pelvic irradiation. The structure could represent an abscess or a dilated loop of small bowel. The presacral inflammation *(arrows)* is related to radiation change. **B,** CT image obtained 2 hours later shows ingested oral contrast in this structure *(arrows)* confirming that this is a bowel loop rather than an abscess. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.)

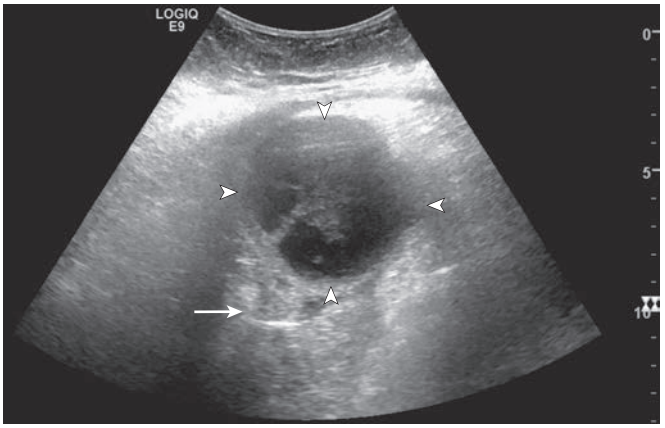

FIG. 3 Abdominal ultrasound of a typical abscess *(arrowheads)* demonstrating central decreased echogenicity, thickened wall, and debris arising anterior to the descending colon *(arrow)* in a patient with diverticulosis compatible with a diverticular abscess. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.)

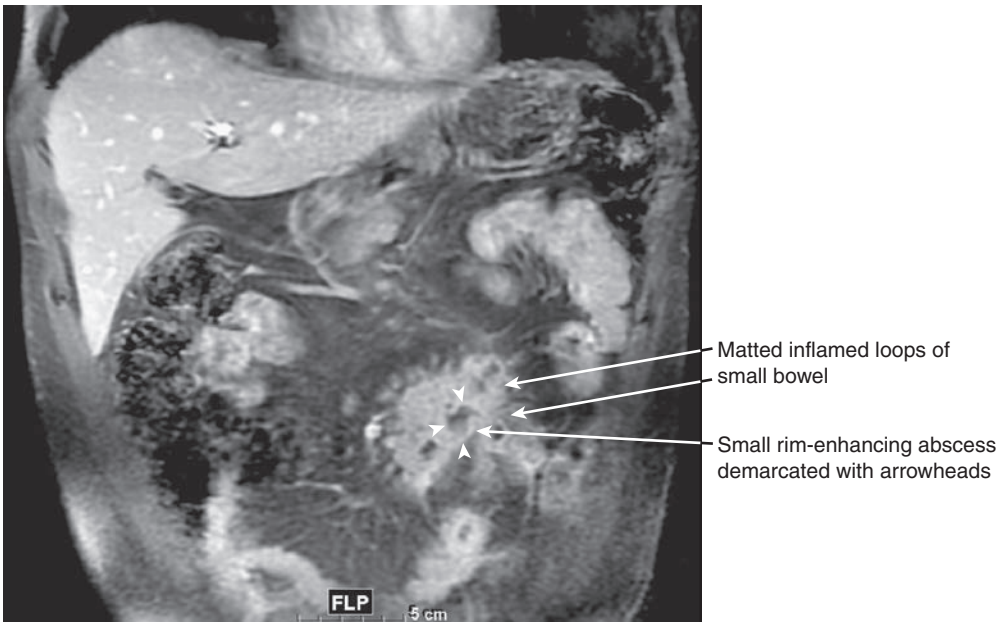

FIG. 4 Coronal magnetic resonance image with gadolinium contrast of a patient with Crohn disease showing a small rim-enhancing collection *(arrowheads)* interposed between several loops of inflamed bowel *(arrows)* compatible with an interloop abscess. Interloop abscesses are not amenable to percutaneous drain placement. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.)

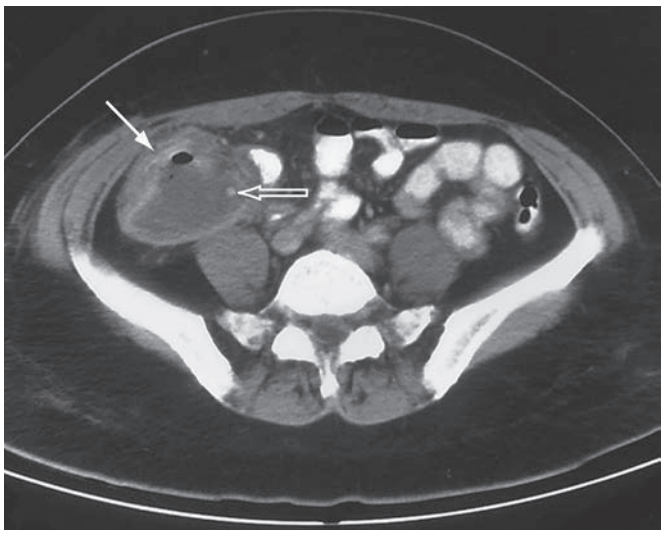

FIG. 5 Axial computed tomography demonstrating a right lower quadrant abscess *(closed arrow)* with an appendicolith *(open arrow).* Such extraluminal appendicoliths may predict clinical failure with percutaneous drainage. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.)

BOX 1 Causes of Intraabdominal Abscesses

Abdominal trauma
Appendicitis
Cholecystectomy and other operations or invasive procedures
Crohn disease
Diverticulitis
Neoplastic disease
Pancreatitis
Perforated hollow viscus (e.g., duodenal or gastric ulcer)

From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.

BOX 2 Clinical Risk Factors for Intraabdominal Abscess

Chronic glucocorticoid use
Increasing age
Malnutrition
Preexisting organ dysfunction
Transfusion
Underlying malignancy

From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.

BOX 3 Antibiotic Choices in the Treatment of Intraabdominal Infections

Single-Agent Therapy

Second-Generation Cephalosporins
Cefoxitin

Carbapenems
Imipenem-cilastatin
Meropenem
Doripenem
Ertapenem (no *Pseudomonas* coverage)

Extended-Spectrum Penicillin–β-Lactamase Inhibitor Combinations
Piperacillin sodium-tazobactam
Ticarcillin disodium-clavulanate

Glycylcyclines
Tigecycline

Combination Therapy (Antiaerobe[a] + Antianaerobe)

Third- or Fourth-Generation Cephalosporins
Ceftriaxone + metronidazole
Cefotaxime + metronidazole
Ceftazidime (*Pseudomonas* coverage) + metronidazole
Cefepime (*Pseudomonas* coverage) + metronidazole

Fluoroquinolones
Ciprofloxacin + metronidazole
Levofloxacin + metronidazole
Moxifloxacin[b]

[a]Aminoglycoside therapy as an antiaerobic drug should not be used in routine practice owing to an increase in nephrotoxicity and possible worsened patient outcomes with its use.
[b]Moxifloxacin has adequate anaerobic coverage, making metronidazole unnecessary.
From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.

TABLE 1 Comparison of Common Causes of Acute Abdominal Pain

Cause	Onset	Location	Character	Descriptor	Radiation	Intensity
Appendicitis	Gradual	Periumbilical area early; RLQ late	Diffuse early; localized later	Aching	None	++
Cholecystitis	Acute	RUQ	Localized	Constricting	Scapula	++
Pancreatitis	Acute	Epigastrium, back	Localized	Boring	Midback	++ to +++
Diverticulitis	Gradual	LLQ	Localized	Aching	None	++ to +++
Perforated peptic ulcer	Sudden	Epigastrium	Localized early, diffuse later	Burning	None	+++
Small bowel obstruction	Gradual	Periumbilical area	Diffuse	Cramping	None	++
Mesenteric ischemia, infarction	Sudden	Periumbilical area	Diffuse	Agonizing	None	+++
Ruptured abdominal aortic aneurysm	Sudden	Abdomen, back, flank	Diffuse	Tearing	None	+++
Gastroenteritis	Gradual	Periumbilical area	Diffuse	Spasmodic	None	+ to ++
Pelvic inflammatory disease	Gradual	Either LQ, pelvis	Localized	Aching	Upper thigh	++
Ruptured ectopic pregnancy	Sudden	Either LQ, pelvis	Localized	Sharp	None	++

+, Mild; ++, moderate; +++, severe; *LLQ,* left lower quadrant; *LQ,* lower quadrant; *RLQ,* right lower quadrant; *RUQ,* right upper quadrant.
From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, 2016, Elsevier.

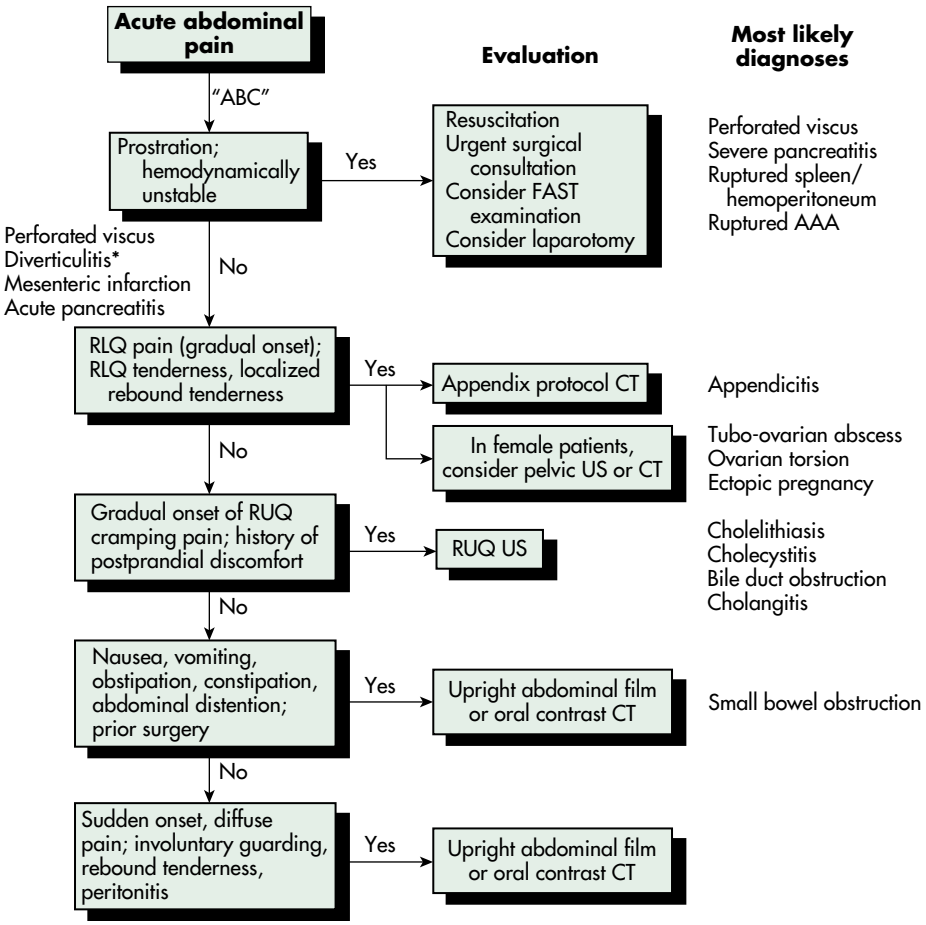

FIG. 6 An approach to the urgent evaluation of abdominal pain. Specific complaints and physical examination findings are coupled with appropriate radiologic imaging. *For left lower quadrant pain, the most likely diagnosis is diverticulitis. *AAA,* Abdominal aortic aneurysm; *ABC,* airway, breathing, circulation; *CT,* computed tomography; *FAST,* focused abdominal sonogram for trauma; *RLQ,* right lower quadrant; *RUQ,* right upper quadrant. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, 2016, Elsevier.)

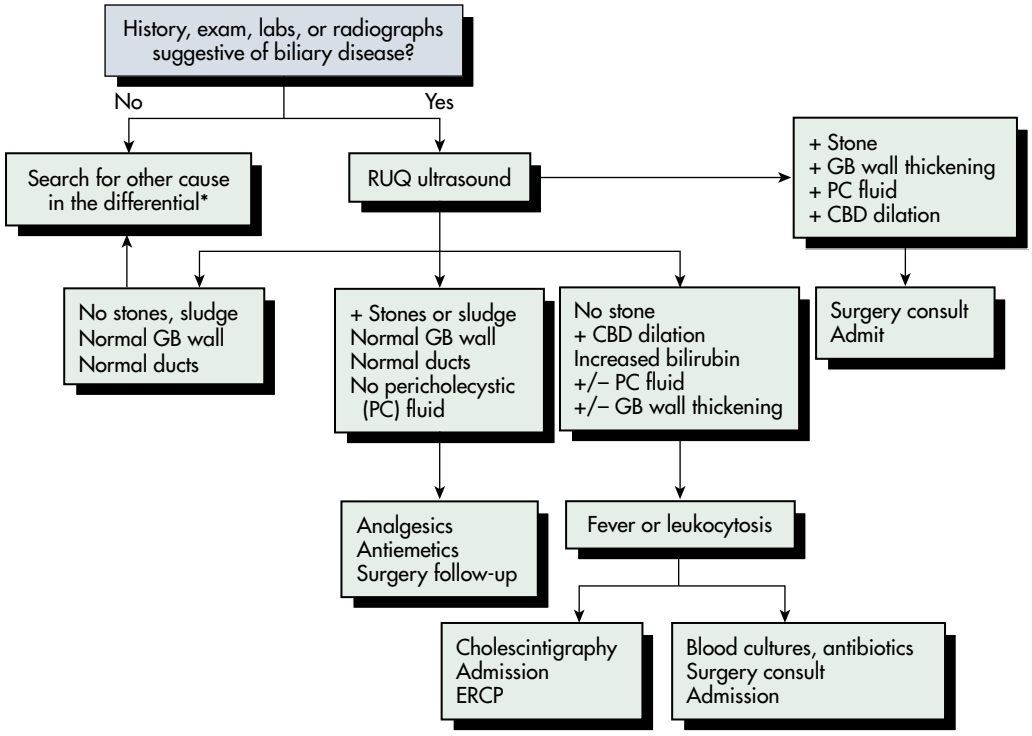

FIG. 7 Treatment algorithm for right upper quadrant *(RUQ)* pain. *Refer to Section II, Differential Diagnosis: Abdominal Pain, Right Upper Quadrant. *CBD,* Common bile duct; *ERCP,* endoscopic retrograde cholangiopancreatography; *GB,* gallbladder; *RUQ,* right upper quadrant; +, with; –, without; ±, with or without. (From Adams JG et al: *Emergency medicine, clinical essentials,* ed 2, Philadelphia, 2013, Elsevier.)

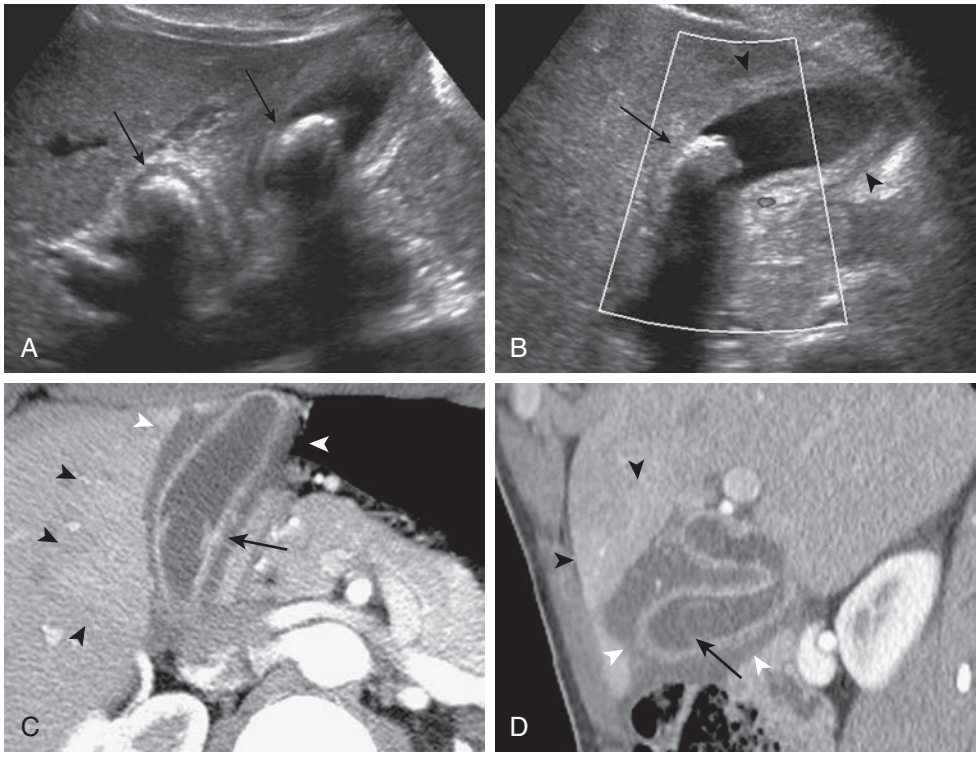

FIG. 8 A 43-year-old man with acute cholecystitis. Ultrasound images **(A** and **B)** demonstrate echogenic, shadowing gallstones *(arrows)* with gallbladder wall thickening *(arrowheads)* in a patient in whom a sonographic Murphy sign was elicited. Axial **(C)** and sagittal **(D)** portal venous phase computed tomography images reveal a gallstone *(arrows)*, as well as a thickened gallbladder wall *(white arrowheads).* Although not acquired in the arterial phase of contrast, hepatic hyperenhancement consistent with secondary inflammation is nevertheless seen *(black arrowheads).* These findings are specific for this life-threatening complication and should be recognized and treated urgently. (From Soto JA, Lucey BC: *Emergency radiology, the requisites,* ed 2, 2017, Elsevier.)

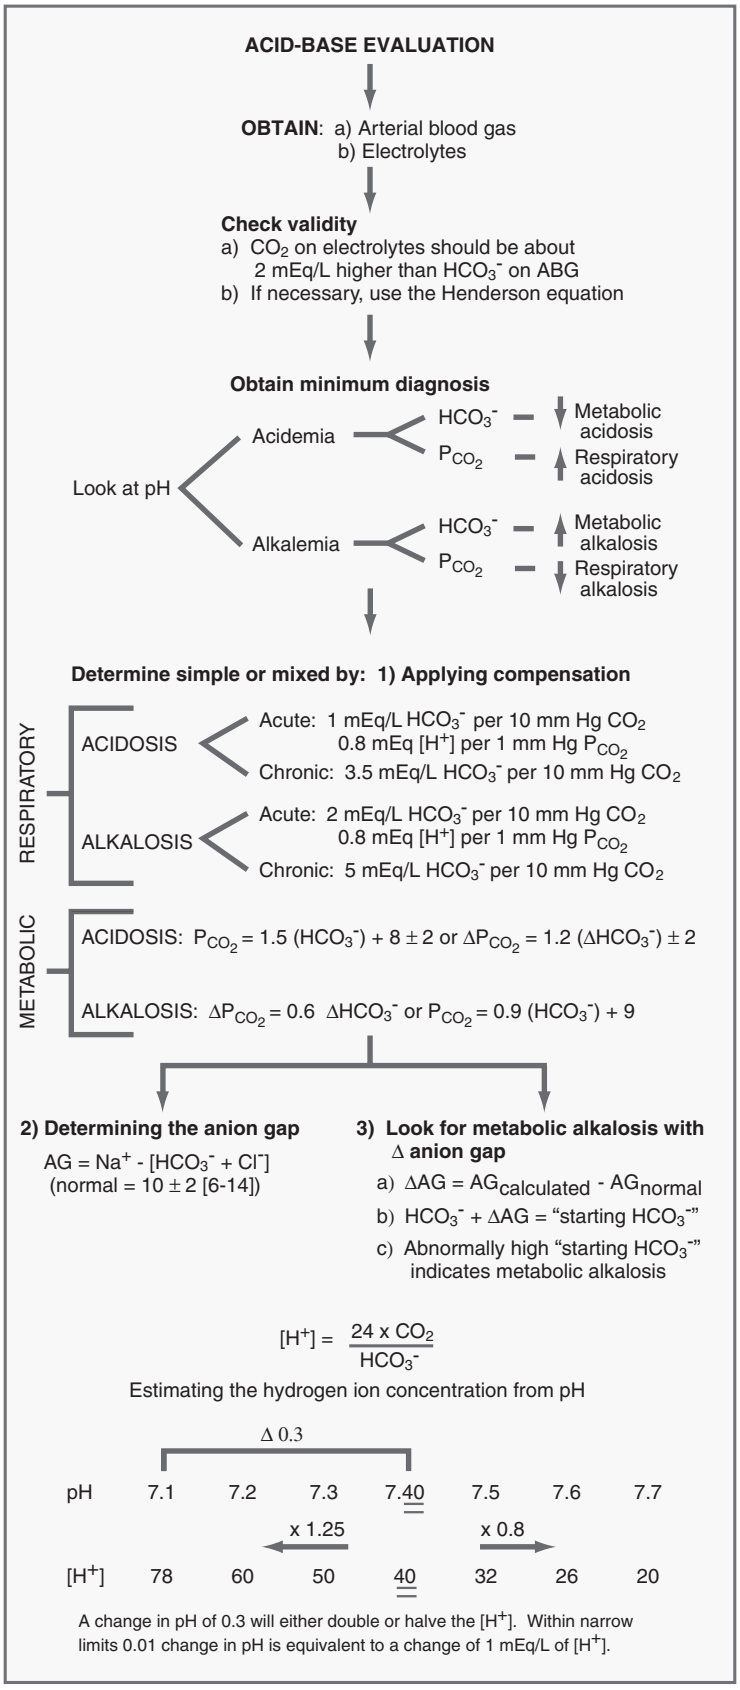

FIG. 9 Scheme for assessing acid-base homeostasis. (Modified from Andreoli TE [ed]: *Cecil essentials of medicine,* ed 7, Philadelphia, 2008, Saunders.)

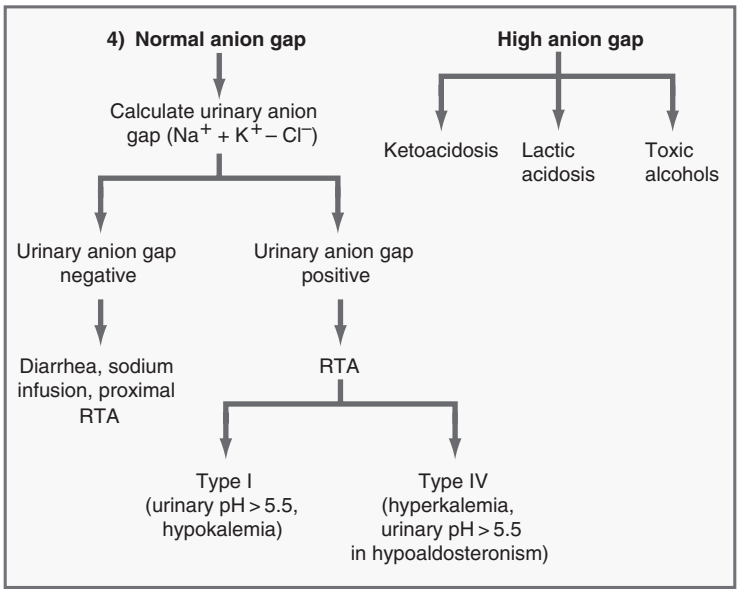

FIG. 9 (Continued)

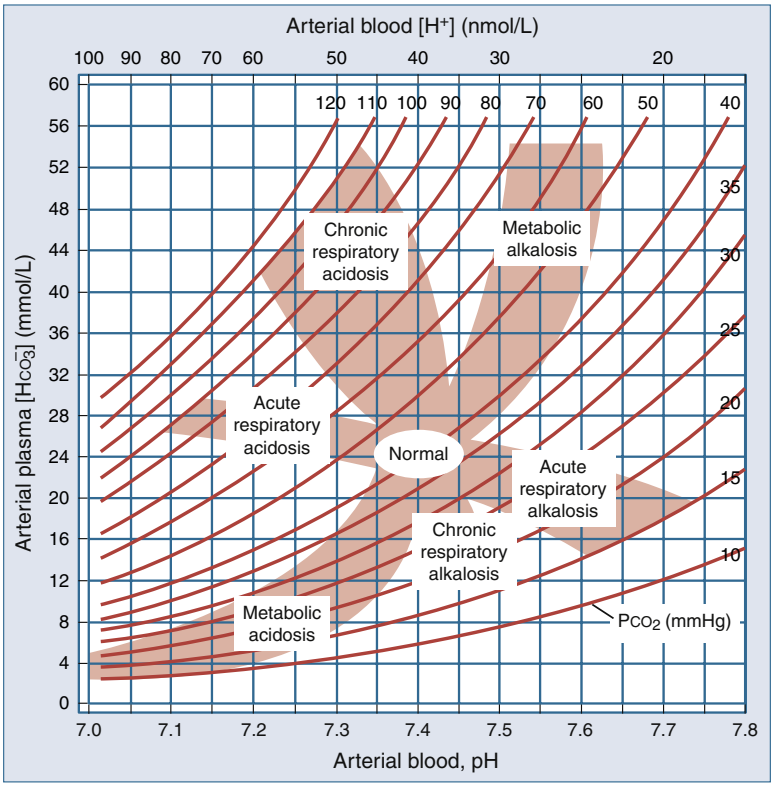

FIG. 10 Acid base normogram. Shaded areas represent 95% confidence limits of normal respiratory and metabolic compensations for primary disturbances. Points outside shaded areas represent a mixed disorder, assuming absence of laboratory error. (From Vincent JL et al: *Textbook of critical care*, ed 6, Philadelphia, 2011, Saunders.)

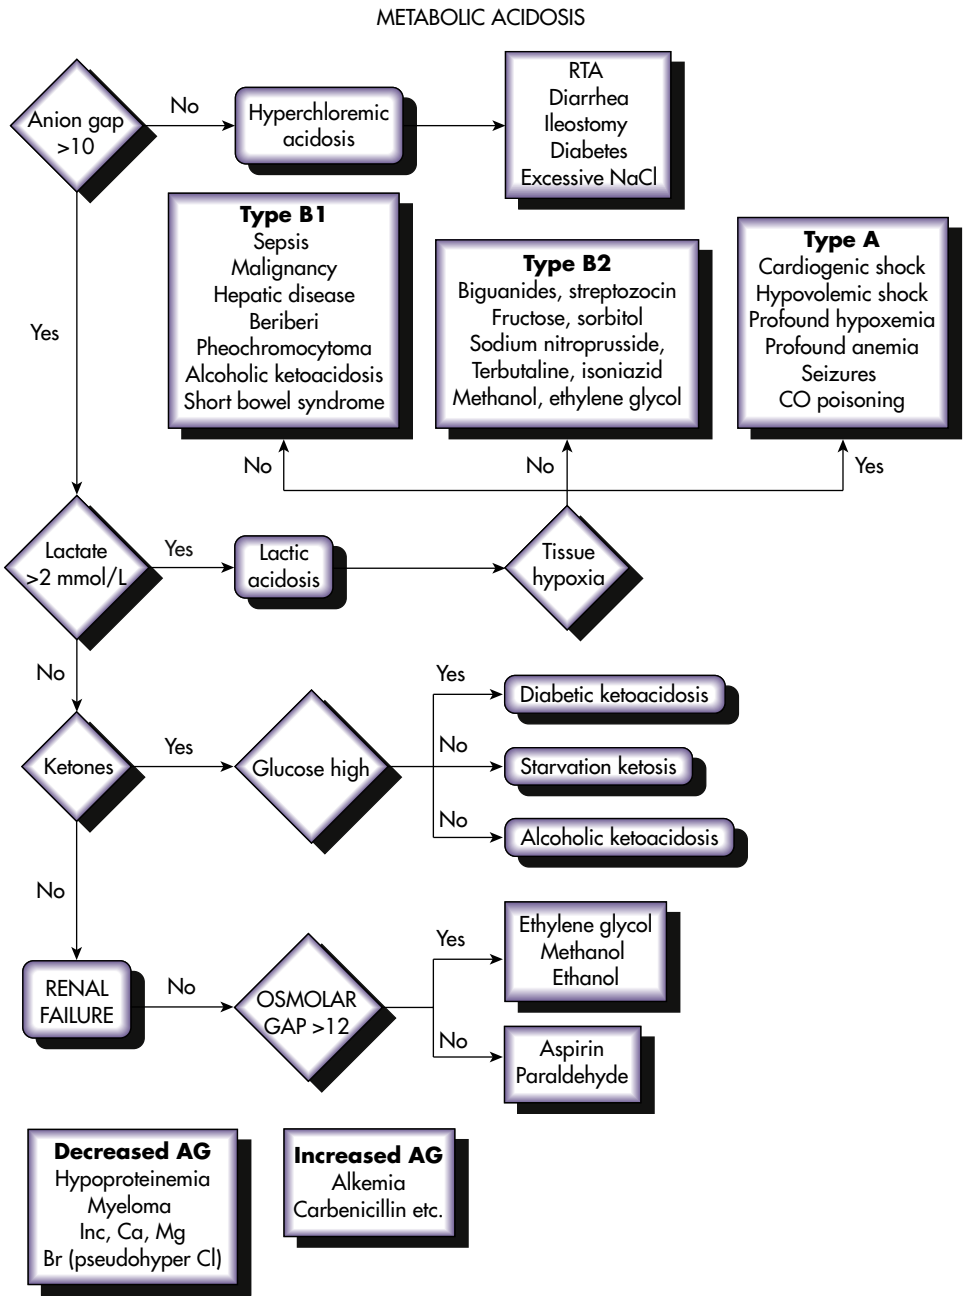

FIG. 11 Diagnostic approach to metabolic acidosis. *CO,* Carbon monoxide; *RTA,* renal tubular acidosis. (From Vincent JL et al: *Textbook of critical care,* ed 7, Philadelphia, 2017, Elsevier.)

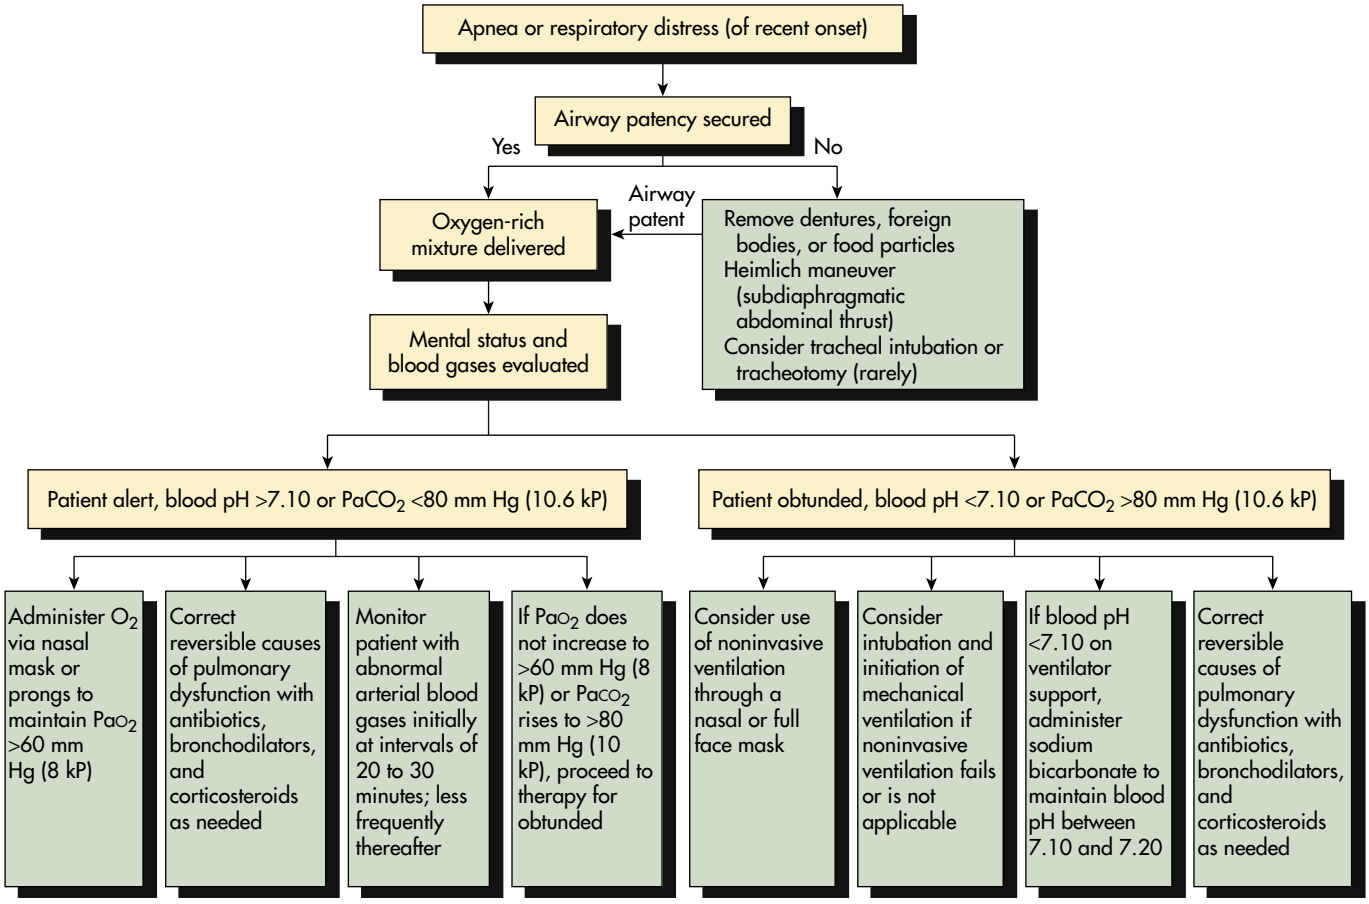

FIG. 12 Algorithm for management of acute respiratory acidosis. (From Johnson R et al: *Comprehensive clinical nephrology*, ed 5, Philadelphia, 2015, Saunders.)

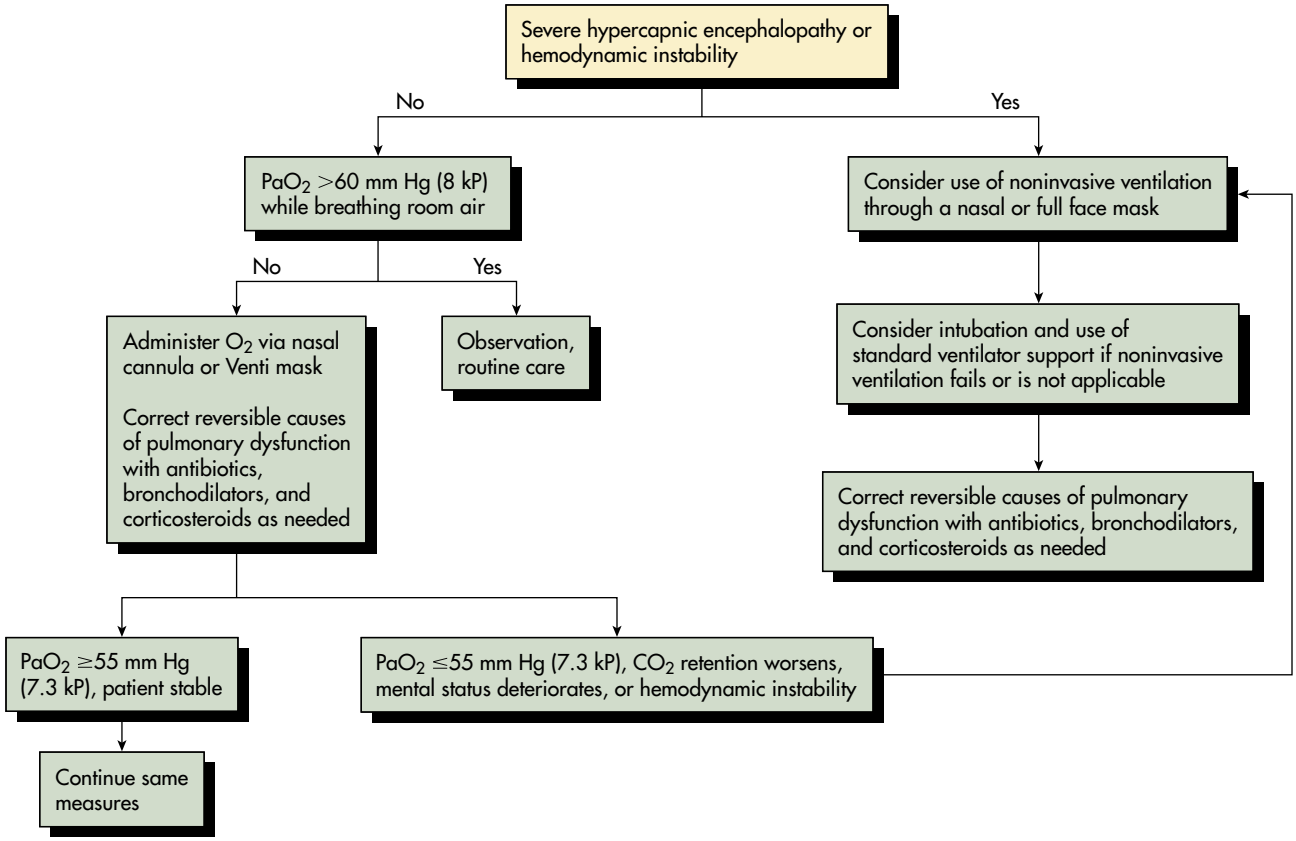

FIG. 13 Algorithm for management of chronic respiratory acidosis. *PaO_2,* Partial pressure of oxygen. (From Johnson R et al: *Comprehensive clinical nephrology*, ed 5, Philadelphia, 2015, Saunders.)

TABLE 2 Causes of Chronic Alveolar Hypoventilation/Respiratory Acidosis

	Site of Defect	Condition
Defects in respiratory drive	Central and peripheral chemoreceptors	Brainstem lesions Primary alveolar hypoventilation syndrome (Ondine's curse), extreme obesity (Pickwickian syndrome) Spinal cord lesions
Neuromuscular defects	Neuromuscular	*Motor neuron disease:* critical illness polyneuropathy, multiple sclerosis, amyotrophic lateral sclerosis
	Muscular disease	Myasthenia gravis, critical illness myopathy
Defects in respiratory mechanics and gas exchange	Lung	*Increased dead space:* chronic obstructive pulmonary disease, chronic pulmonary embolism *Increased lung elastance*: pulmonary fibrosis *Increased chest wall elastance:* extreme obesity, fibrothorax, kyphoscoliosis *Increased respiratory resistance*: airway stenosis, chronic obstructive pulmonary disease

From Ronco C: *Critical care nephrology,* ed 3, Philadelphia, 2019, Elsevier.

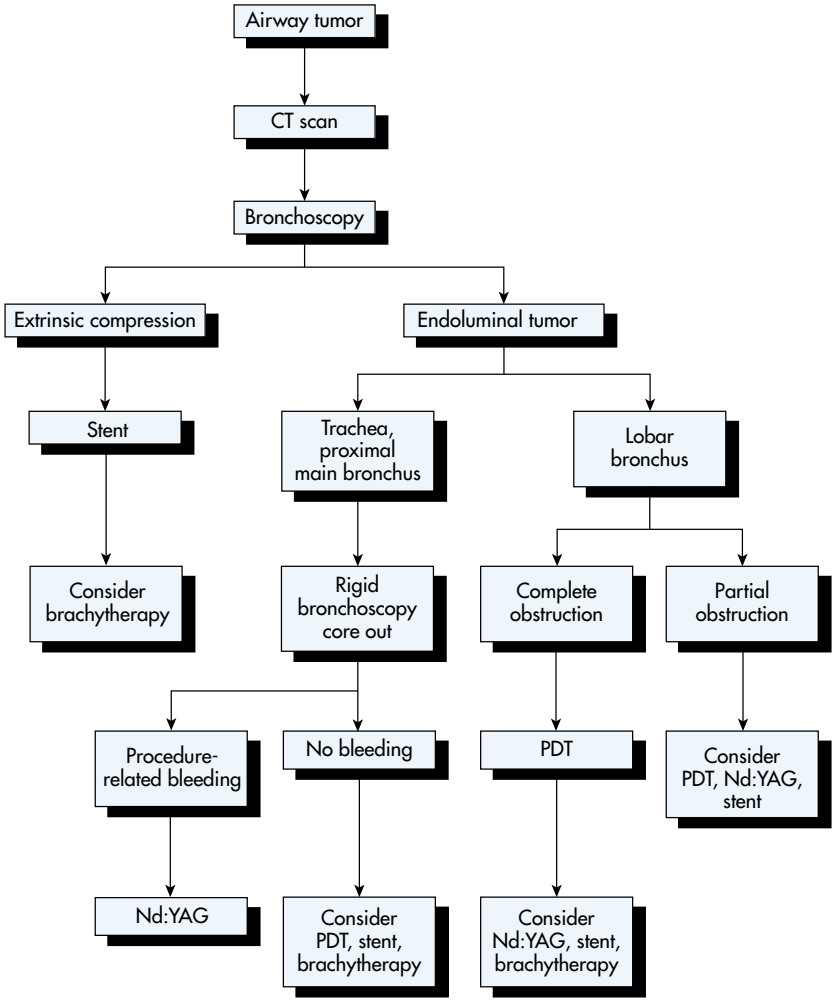

FIG. 14 Approach to malignant obstruction of the airway. *CT,* Computed tomography; *Nd:YAG,* neodymium:yttrium-aluminum-garnet; *PDT,* photodynamic therapy. (From Sellke FW, del Nido PJ, Swanson SJ: *Sabiston & Spencer surgery of the chest,* ed 9, 2016, Elsevier.)

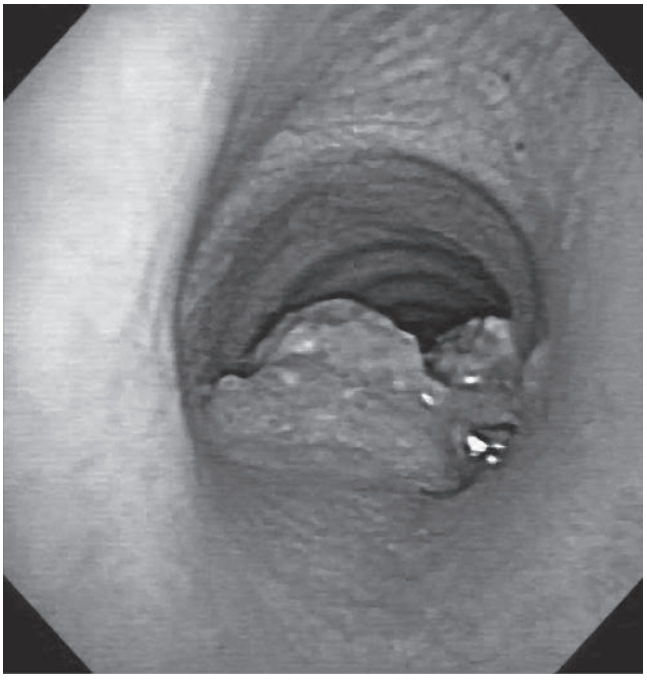

FIG. 15 An exophytic squamous cell carcinoma of the trachea. (From Sellke FW, del Nido PJ, Swanson SJ: *Sabiston & Spencer surgery of the chest,* ed 9, 2016, Elsevier.)

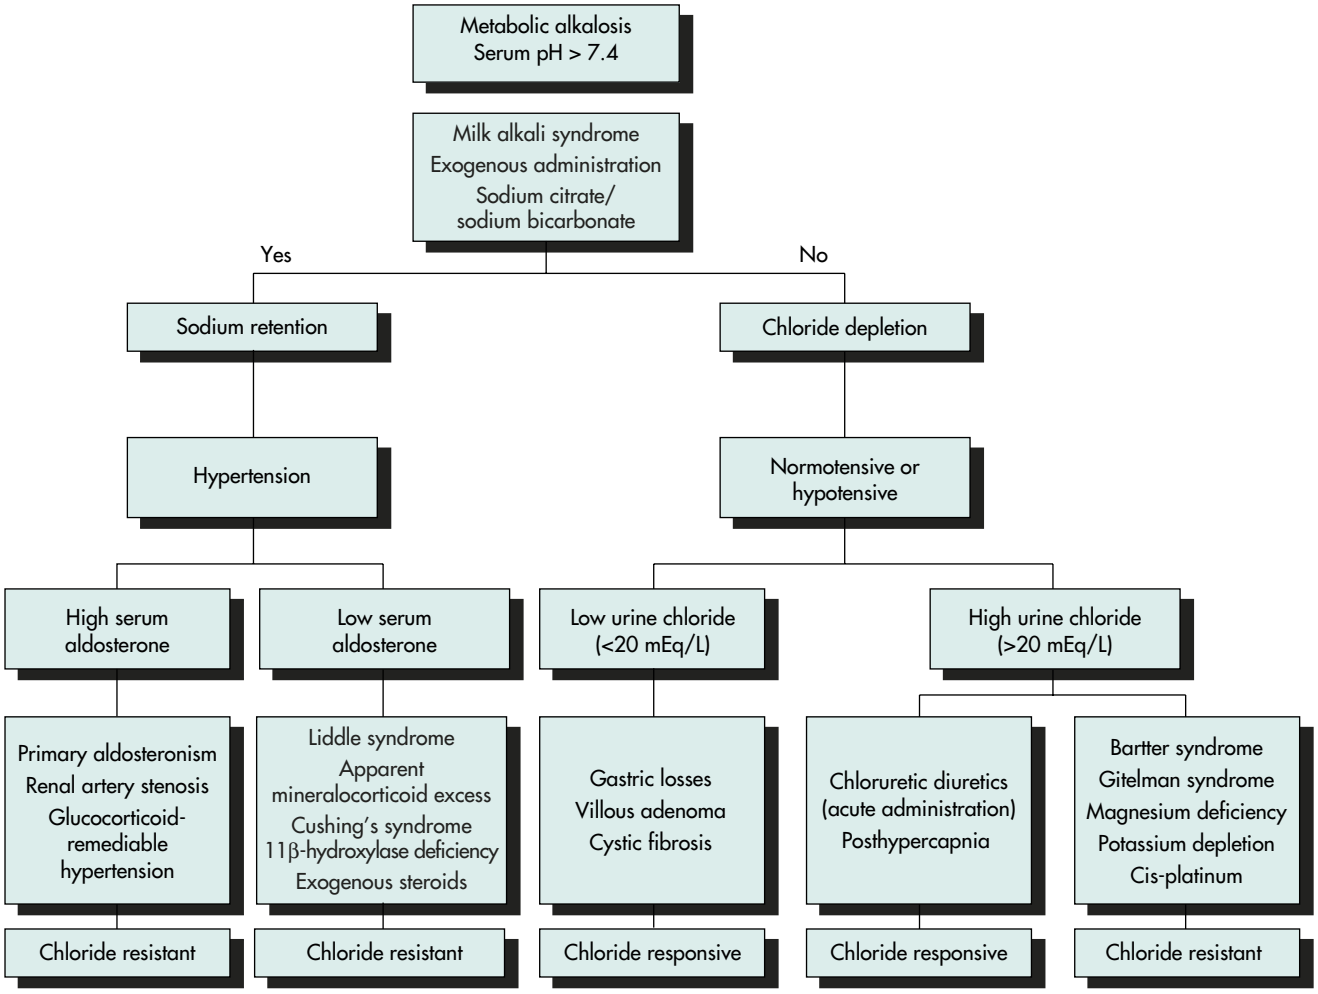

FIG. 16 Differential diagnosis of metabolic alkalosis. (From Ronco C: *Critical care nephrology,* ed 3, Philadelphia, 2019, Elsevier.)

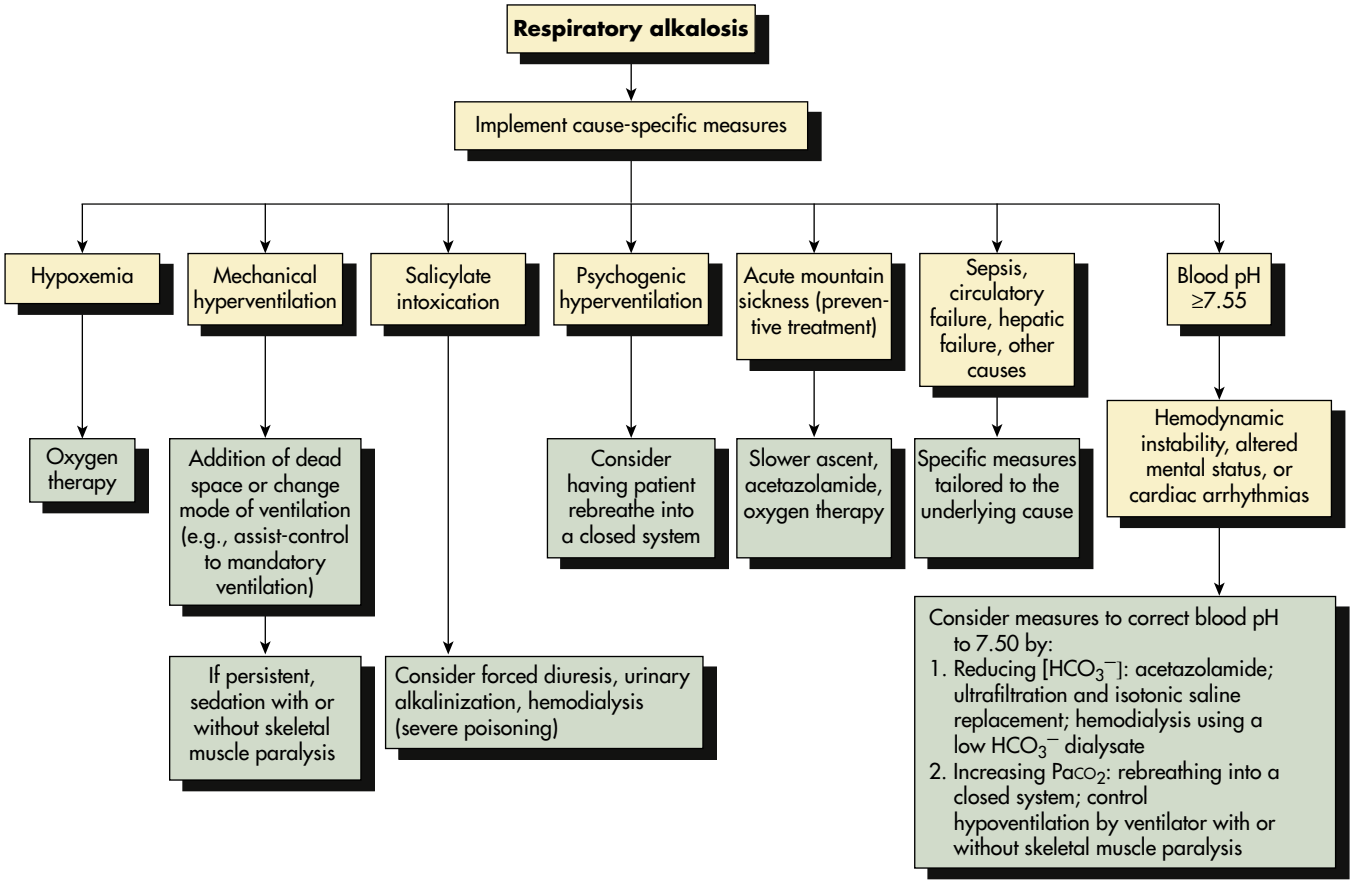

FIG. 17 Recommended treatment of respiratory alkalosis. (From Johnson R et al: *Comprehensive clinical nephrology*, ed 5, Philadelphia, 2015, Saunders.)

TABLE 3 Causes of Alveolar Hyperventilation/Respiratory Alkalosis

	Site of Defect	Condition
Defects in respiratory drive	Central chemoreceptors	*Voluntary hyperventilation psychogenic:* pain, panic attack *Central neurogenic hyperventilation:* brainstem injuries, brain tumors *Hormonal:* increased progesterone levels in pregnancy and liver cirrhosis *Infectious:* meningitis, encephalitis *Thermal hyperpnea:* fever, hyperthermia *Intoxication:* salicylate, topiramate *Therapeutic:* doxapram
	Peripheral chemoreceptors	*Increased activity of peripheral chemoreceptors:* hypoxic pulmonary disease, high altitude *Increased activity of lung receptors*, e.g., pulmonary edema, pneumonia, pulmonary embolism, interstitial fibrosis
Iatrogenic		*Mechanical ventilation:* excessive mechanical ventilation (accidental, or therapeutic for traumatic brain injury) *Extracorporeal gas exchange:* excessive extracorporeal CO_2 removal

From Ronco C: *Critical care nephrology,* ed 3, Philadelphia, 2019, Elsevier.

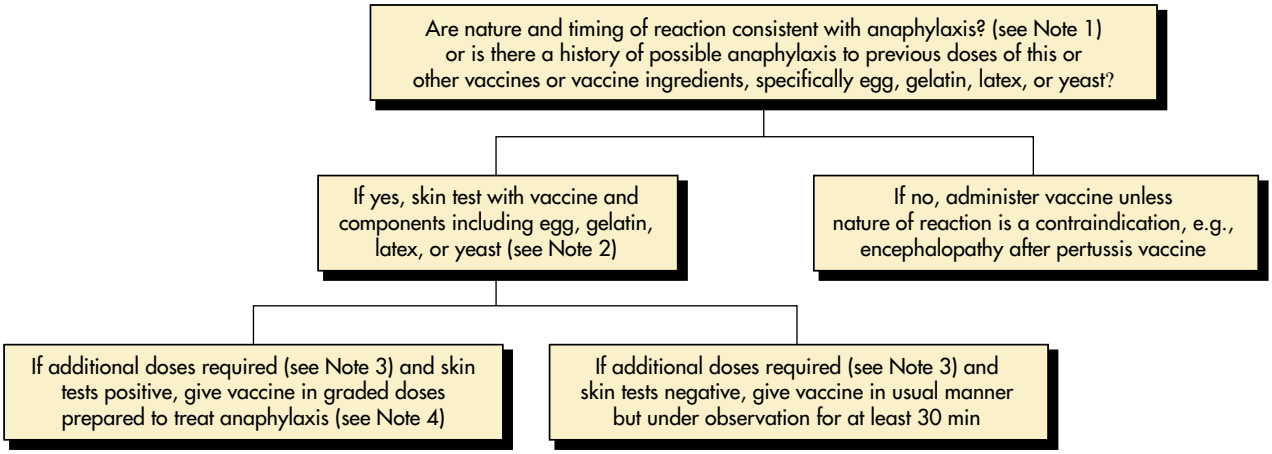

FIG. 18 Suggested approach to suspected immediate-type allergic reactions to vaccines.

Note 1. Are nature and timing of reaction consistent with a systemic IgE-mediated reaction? Probable systemic IgE-mediated reaction: reaction occurring within 4 hours of vaccine administration to include signs and/or symptoms from more than one of the following systems:

- Dermatologic: urticaria, flushing, angioedema, pruritus
- Respiratory: rhinoconjunctivitis (red, watery, itchy eyes; stuffy, runny, itchy nose; sneezing), upper airway edema (change in voice, difficulty swallowing, difficulty breathing, stridor), bronchospasm/asthma (cough, wheeze, shortness of breath, chest tightness)
- Cardiovascular: hypotension, tachycardia, palpitations, light-headedness, loss of consciousness (NOTE: Hypotension or loss of consciousness with pallor and bradycardia is much more likely to be due to a vasovagal reaction)
- Gastrointestinal: cramping, nausea, vomiting, diarrhea

Possible systemic IgE-mediated reaction:

- Signs and/or symptoms from only one system (as previously)
- Signs and/or symptoms from more than one system (as previously) but occurring more than 4 hours after vaccination

Note 2. Skin tests with vaccine and components including egg, gelatin, latex, or yeast. Vaccine skin tests:

- Prick test with full-strength vaccine; consider 1:10 dilution if patient has a history of life-threatening reaction.
- If results of prick test with full-strength vaccine are negative, perform intradermal testing with 0.02 ml of vaccine at 1:100 dilution.
- Vaccine skin tests may cause false (or clinically irrelevant) positive reactions. Thus, if skin testing gives a positive reaction, also perform on normal control subjects.

Vaccine component skin tests:

- Prick tests with commercial extracts of egg (influenza and yellow fever vaccines) or *Saccharomyces cerevisiae* yeast (hepatitis B and quadrivalent human papillomavirus vaccines).
- Prick test with sugared gelatin (e.g., Jell-O): dissolve 1 teaspoon of gelatin powder in 5 ml of normal saline.
- Vaccines that contain gelatin: influenza (some brands), measles, mumps, rabies (some brands), rubella, typhoid (capsule), varicella, yellow fever, zoster.
- Prick test with latex: soak two fingers of latex glove or a toy balloon in 5 ml of normal saline. Vaccines that contain latex in packaging; available at www.cdc.gov/vaccines/pubs/pinkbook/downloads/appendices/B/latex-table.pdf.
- In vitro assays for specific IgE antibody to egg, gelatin, latex, and yeast are also commercially available as an alternative or complement to skin testing.

Note 3. If fewer than the recommended number of doses are received, consider measuring level of IgG antibodies to immunizing agent. If the measured level is associated with protection from disease, consider withholding additional doses, although magnitude and duration of immunity may be less than if all doses received.

Note 4. Vaccine administration in graded doses:

- With a vaccine for which the usual dose is 0.5 ml, administer graded doses of vaccine at 15-minute intervals: 0.05 ml of 1:10 dilution, 0.05 ml of full strength, 0.10 ml of full strength, 0.15 ml of full strength, and 0.20 ml of full strength. (From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, Saunders.)

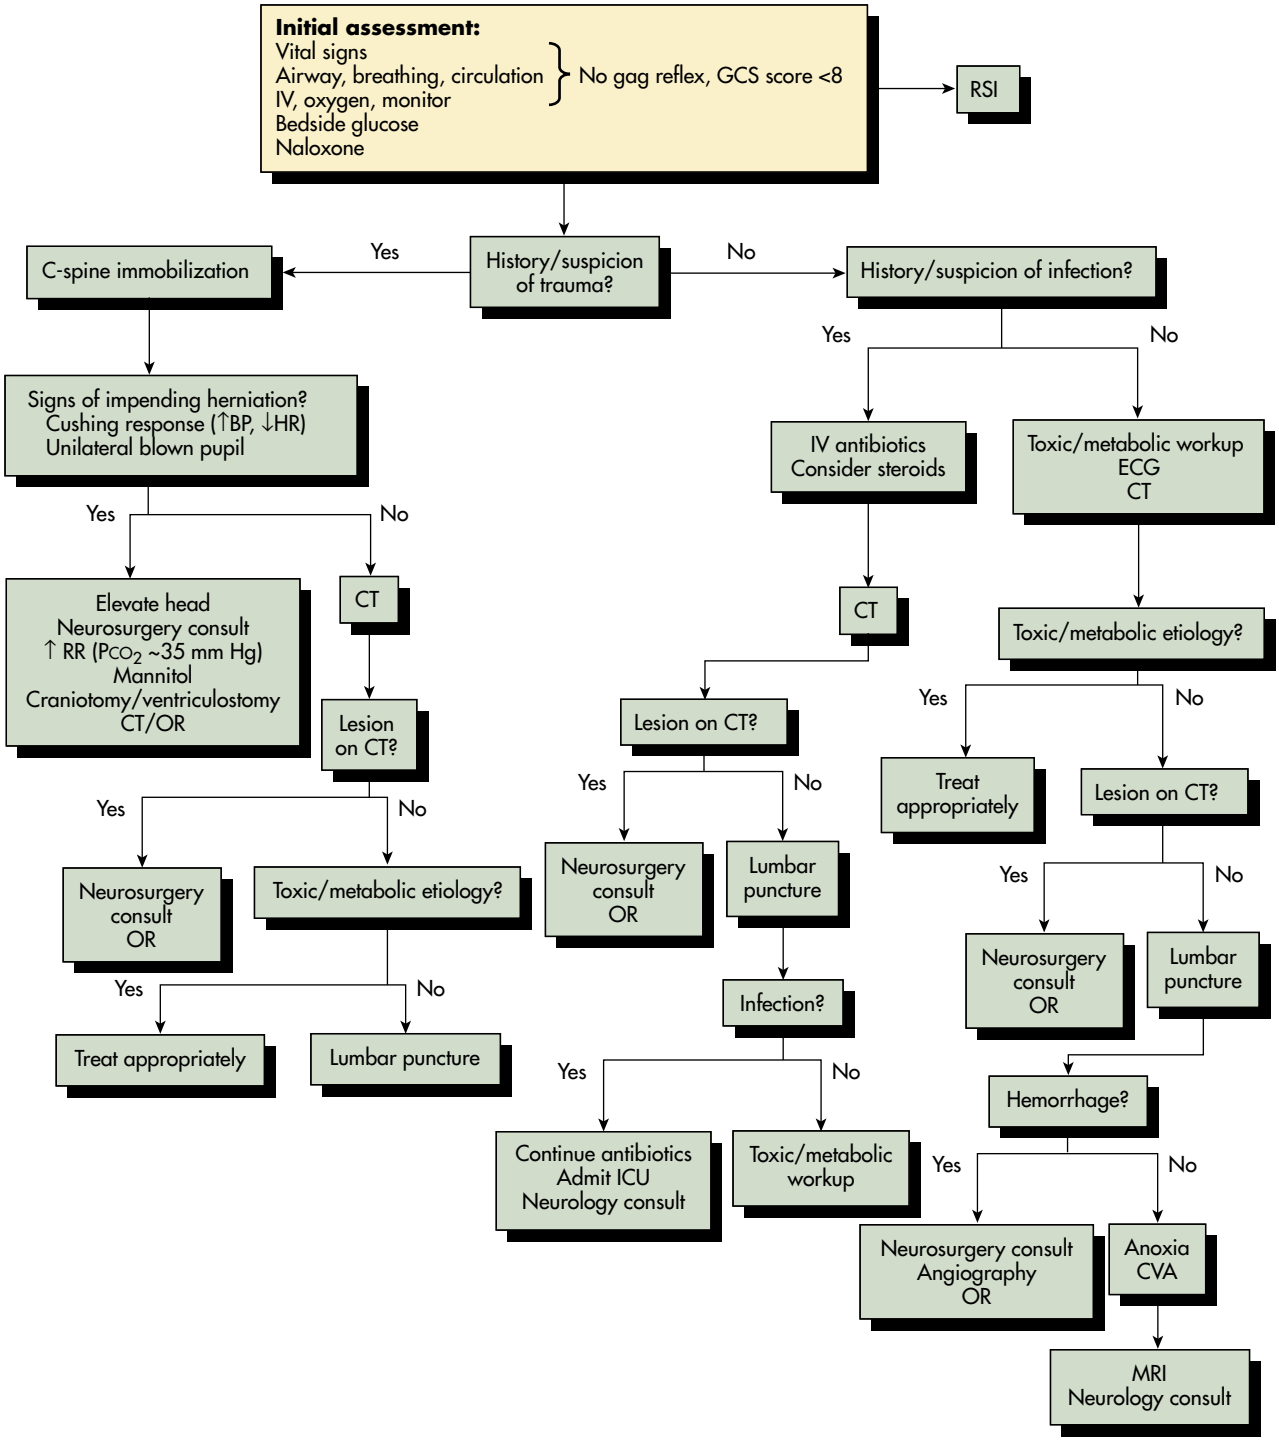

FIG. 19 Diagnostic approach to altered mental status and coma. *BP,* Blood pressure; *CT,* computed tomography; *CVA,* cerebrovascular accident; *ECG,* electrocardiography; *GCS,* Glasgow Coma Scale; *HR,* heart rate; *ICU,* intensive care unit; *MRI,* magnetic resonance imaging; *OR,* operating room; *RR,* respiratory rate; *RSI,* rapid-sequence intubation. (From Adams JG et al: *Emergency medicine, clinical essentials,* ed 2, Philadelphia, 2013, Elsevier.)

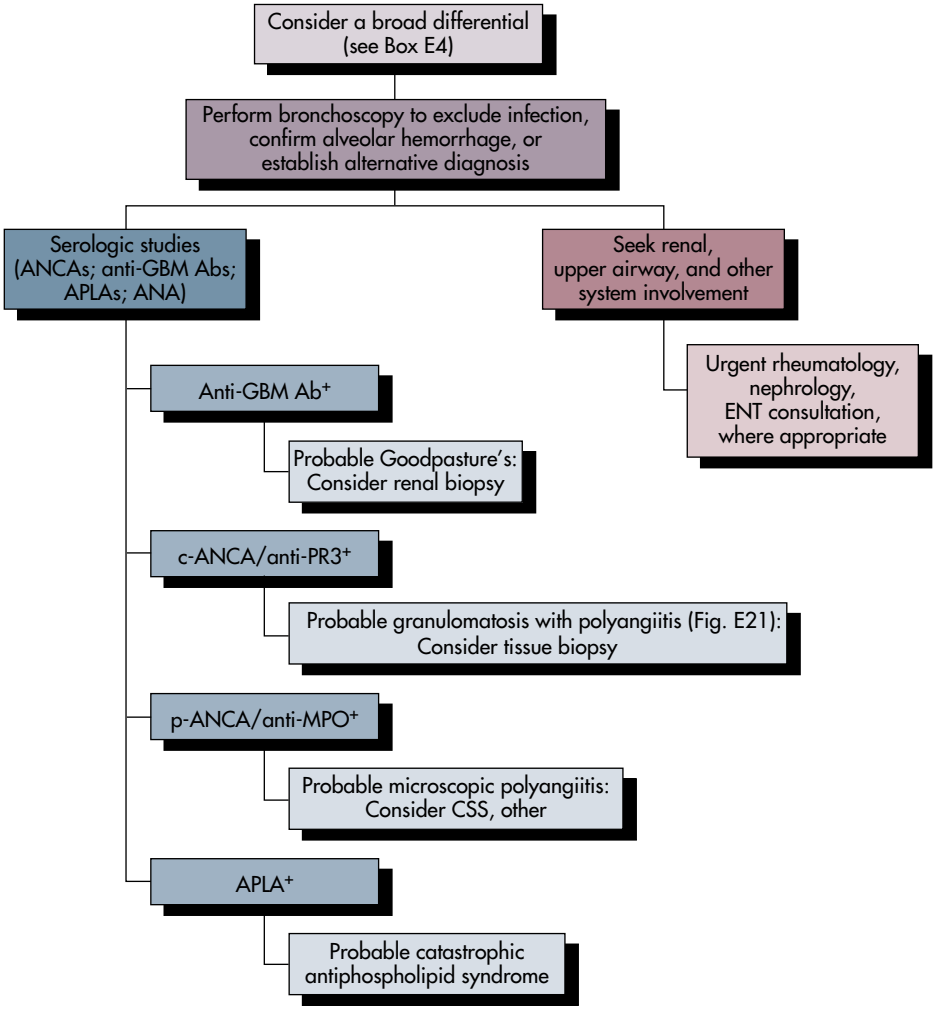

FIG. E20 Diagnosis and management of alveolar hemorrhage syndromes. *ANA,* Antinuclear antibodies; *ANCA,* antineutrophil cytoplasmic antibody; *anti-GBM Abs,* antiglomerular basement membrane antibodies; *anti-MPO,* antimyeloperoxidase antibodies; *anti-PR3,* antiproteinase antibodies; *APLAs,* antiphospholipid antibodies; *CSS,* Churg-Strauss syndrome; *ENT,* ear, nose, and throat. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 4, 2014, Elsevier.)

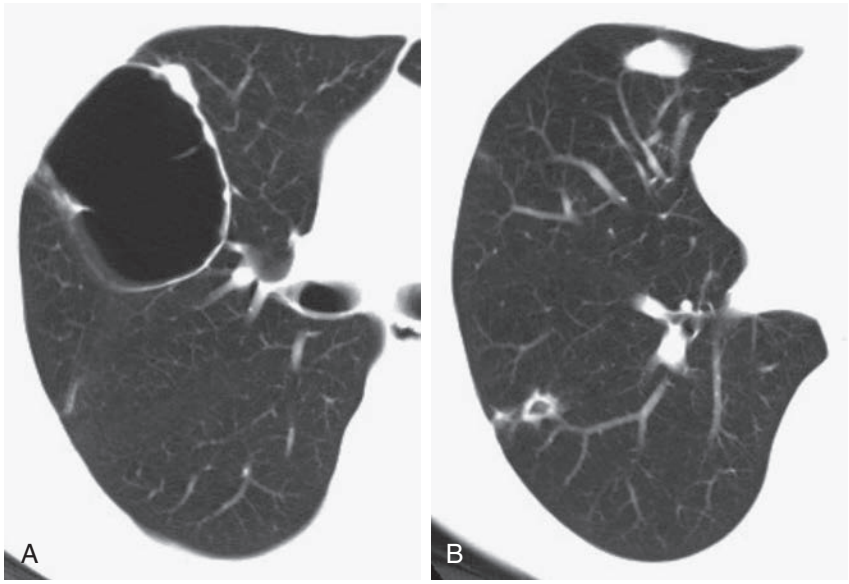

FIG. E21 Granulomatosis with polyangiitis (Wegener granulomatosis). A and **B,** Thin-walled cavities and nodules are present. (From Webb WR, Brandt WE, Major NM: *Fundamentals of body CT,* ed 4, Philadelphia, 2015, Elsevier.)

BOX E4 Causes of Diffuse Alveolar Hemorrhage

Immunologic Diseases
- Antiglomerular basement membrane antibody disease (Goodpasture syndrome)
- Vasculitides associated with circulating or in situ immune complexes
  - Systemic lupus erythematosus
  - Mixed connective tissue disease
  - Schönlein-Henoch purpura
  - Essential mixed cryoglobulinemia
  - Tumor-related vasculitis
  - Endocarditis-related vasculitis
  - Polyarteritis nodosa
  - Systemic necrotizing vasculitis
- Vasculitides associated with antineutrophil cytoplasmic antibodies
  - Granulomatosis with polyangiitis
  - Microscopic polyangiitis
  - Idiopathic necrotizing crescentic glomerulonephritis
- Rapidly progressive glomerulonephritis
- Associated with other connective tissue diseases, pathophysiology unknown
  - Rheumatoid arthritis
  - Progressive systemic sclerosis
  - Behçet disease
- Associated with other renal diseases
- IgA nephropathy
- Diabetic nephropathy
- Associated with precipitating antibodies to milk (Heiner syndrome)
- Idiopathic pulmonary hemosiderosis
- Primary antiphospholipid antibody syndrome

Chemical or Drug-Related Causes
- Amiodarone
- D-Penicillamine
- Isocyanates
- Nitrofurantoin
- Retinoic acid
- Trimellitic anhydride
- "Crack" cocaine
- Sirolimus
- Everolimus
- Propylthiouracil-induced vasculitis
- Erlotinib
- Bevacizumab
- Gemcitabine
- Infliximab

Transplant-Related Causes
- Bone marrow transplant
- Renal transplant
- Lung transplant

Bleeding Diathesis
- Thrombocytopenia
- Leukemia with diffuse alveolar damage
- Viral pneumonia
- Bacterial or fungal sepsis
- Radiation
- Chemotherapy toxic to lung
- Blast counts >80,000/μL
- Extrinsic anticoagulants/thrombolytics
- Warfarin overdose
- Tissue plasminogen activator
- Platelet glycoprotein IIb/IIIa inhibitors
- Coagulopathies
- Cirrhosis
- DIC

Infections
- Legionnaires disease

Pulmonary Venous Hypertension
- Mitral stenosis
- Mitral regurgitation
- Pulmonary capillary hemangiomatosis
- Pulmonary venoocclusive disease
- Fibrosing mediastinitis
- Congenital heart disease

Diffuse Lung Injury
- Negative-pressure pulmonary hemorrhage
- Breath-hold diving
- Postictal neurogenic pulmonary edema

DIC, Disseminated intravascular coagulation; *IgA,* immunoglobulin A.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 4, Philadelphia, 2014, Elsevier.

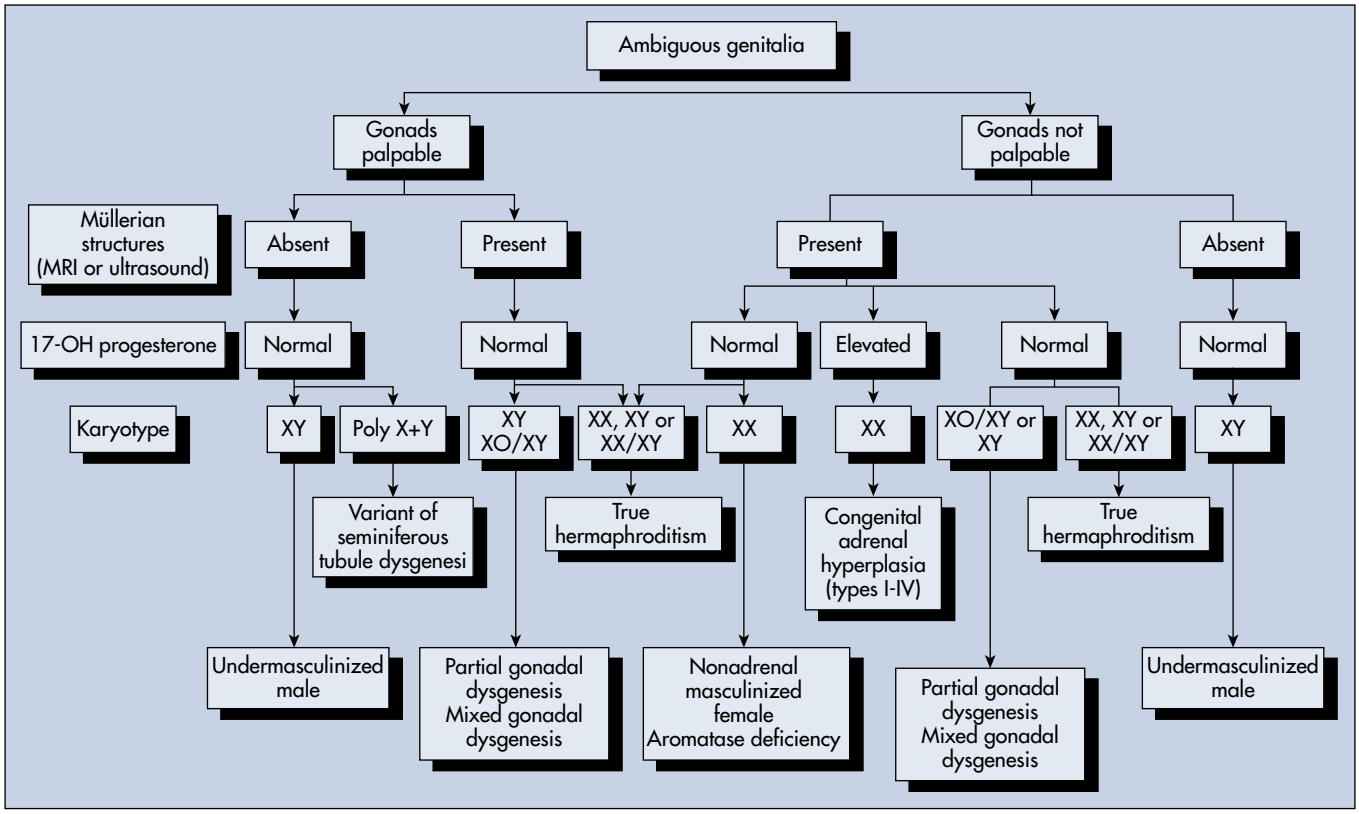

FIG. E22 Diagnostic algorithm for a newborn with ambiguous genitalia based on gonadal palpability, presence or absence of Müllerian structures, 17-hydroxyprogesterone concentration, and karyotype. *MRI,* Magnetic resonance imaging. (Modified from Grumbach MM, Conte FH. Disorders of sex differentiation. In Wilson JD, Foster DW, editors. *Williams textbook of endocrinology.* Philadelphia, 1998, Saunders.)

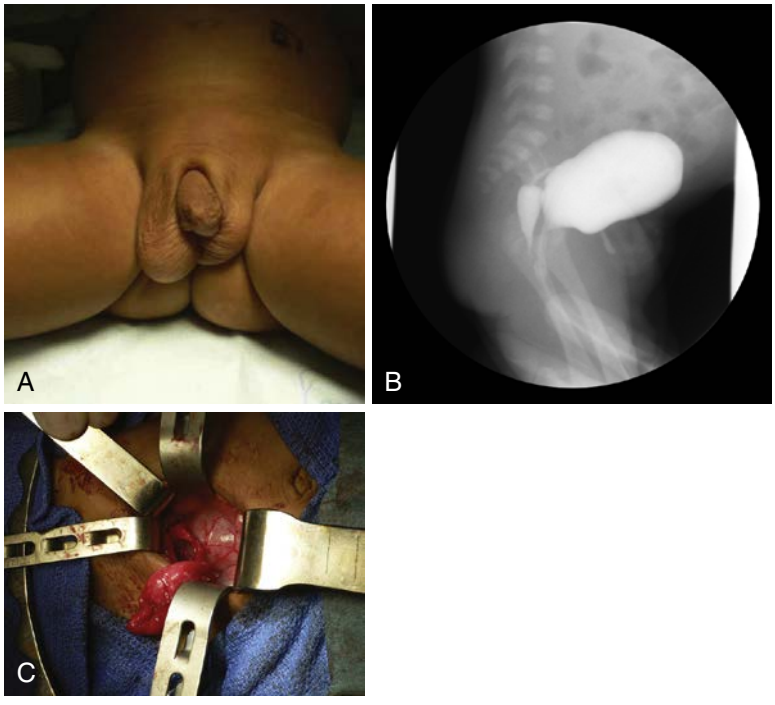

FIG. E23 A, Patient with mixed gonadal dysgenesis showing asymmetrical anatomy. **B,** Hemiuterus and opacified fallopian tube in left inguinal hernia. **C,** Structures noted in **B** shown at surgical exploration. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

BOX E5 Ambiguous Genitalia and Their Causes

Female pseudohermaphrodism
Congenital adrenal hyperplasia (excess fetal androgens)
- 21-Hydroxylase deficiency
- 11-Beta-hydroxylase deficiency
- 3-Beta-hydroxysteroid dehydrogenase deficiency

Exogenous androgens
- Maternal ingestion of androgens, progestogens
- Maternal congenital adrenal hyperplasia
- Virilizing adrenal or ovarian tumor

Excess placental androgen production
- Placental P450 aromatase deficiency

Iatrogenic fetal virilization
Female pseudohermaphrodism with associated congenital malformations
Idiopathic

Male pseudohermaphrodism
- Impaired Leydig cell activity
- Defects in testosterone biosynthesis
- Leydig cell hypoplasia; luteinizing hormone receptor defect
- 20,22-Desmolase (congenital lipoid adrenal hyperplasia)
- 3-Beta-hydroxysteroid dehydrogenase
- 17,20-Hydroxylase (17,20-desmolase)
- 17-Beta-hydroxysteroid dehydrogenase (17-ketosteroid reductase)

Defects of testis development or maintenance
- XY gonadal dysgenesis
- Mixed gonadal dysgenesis
- Rudimentary testis syndromes

End-organ resistance to androgens (androgen insensitivity syndrome)
- Complete
- Partial
- Defects in the intracellular metabolism of testosterone (5-alpha-reductase deficiency)

Others
- Persistent Müllerian duct syndrome
- Iatrogenic male pseudohermaphrodism
- Idiopathic male pseudohermaphrodism

True hermaphrodism

From Crum CP et al: *Diagnostic gynecologic and obstetric pathology,* ed 3, Philadelphia, 2018, Elsevier.

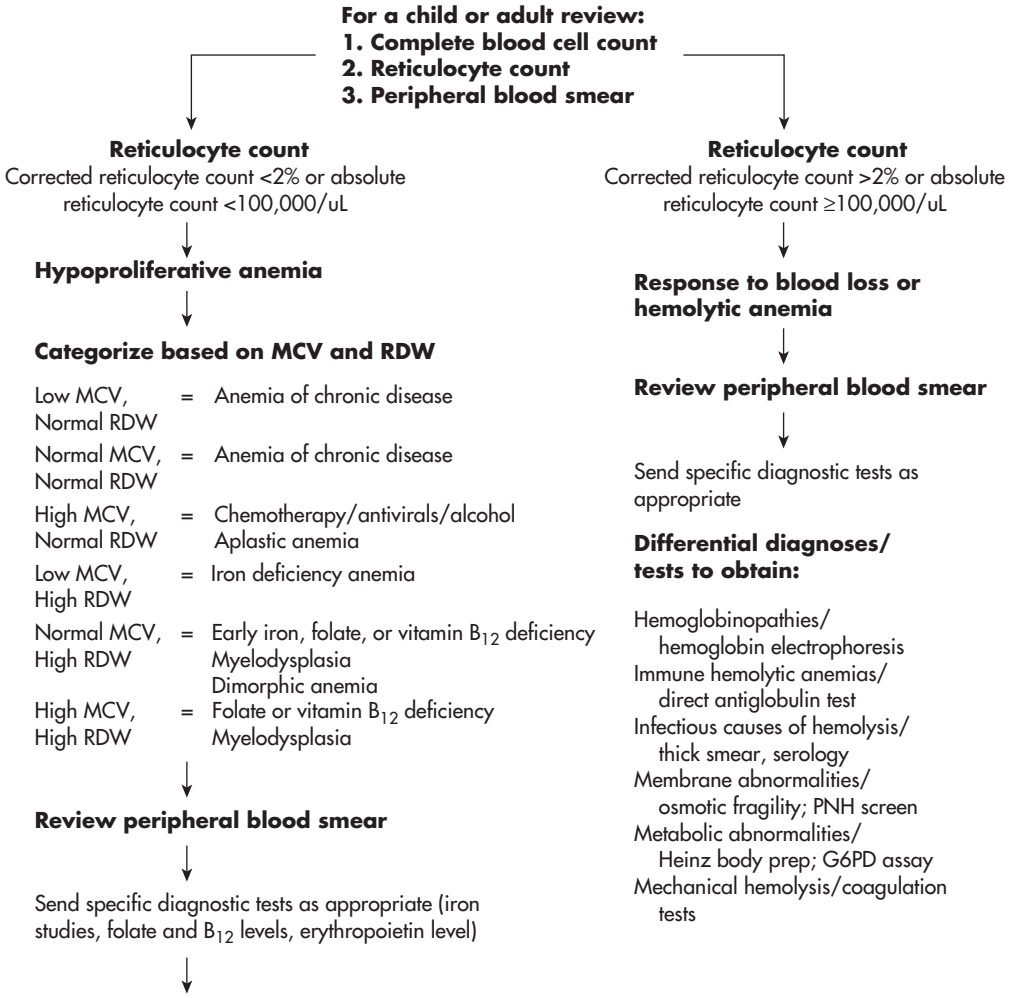

FIG. 24 Approach to the differential diagnosis of anemia in adults and children. *G6PD,* Glucose-6-phosphate dehydrogenase; *MCV,* mean corpuscular volume; *PNH,* paroxysmal nocturnal hemoglobinuria; *RDW,* red blood cell distribution width. (From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.)

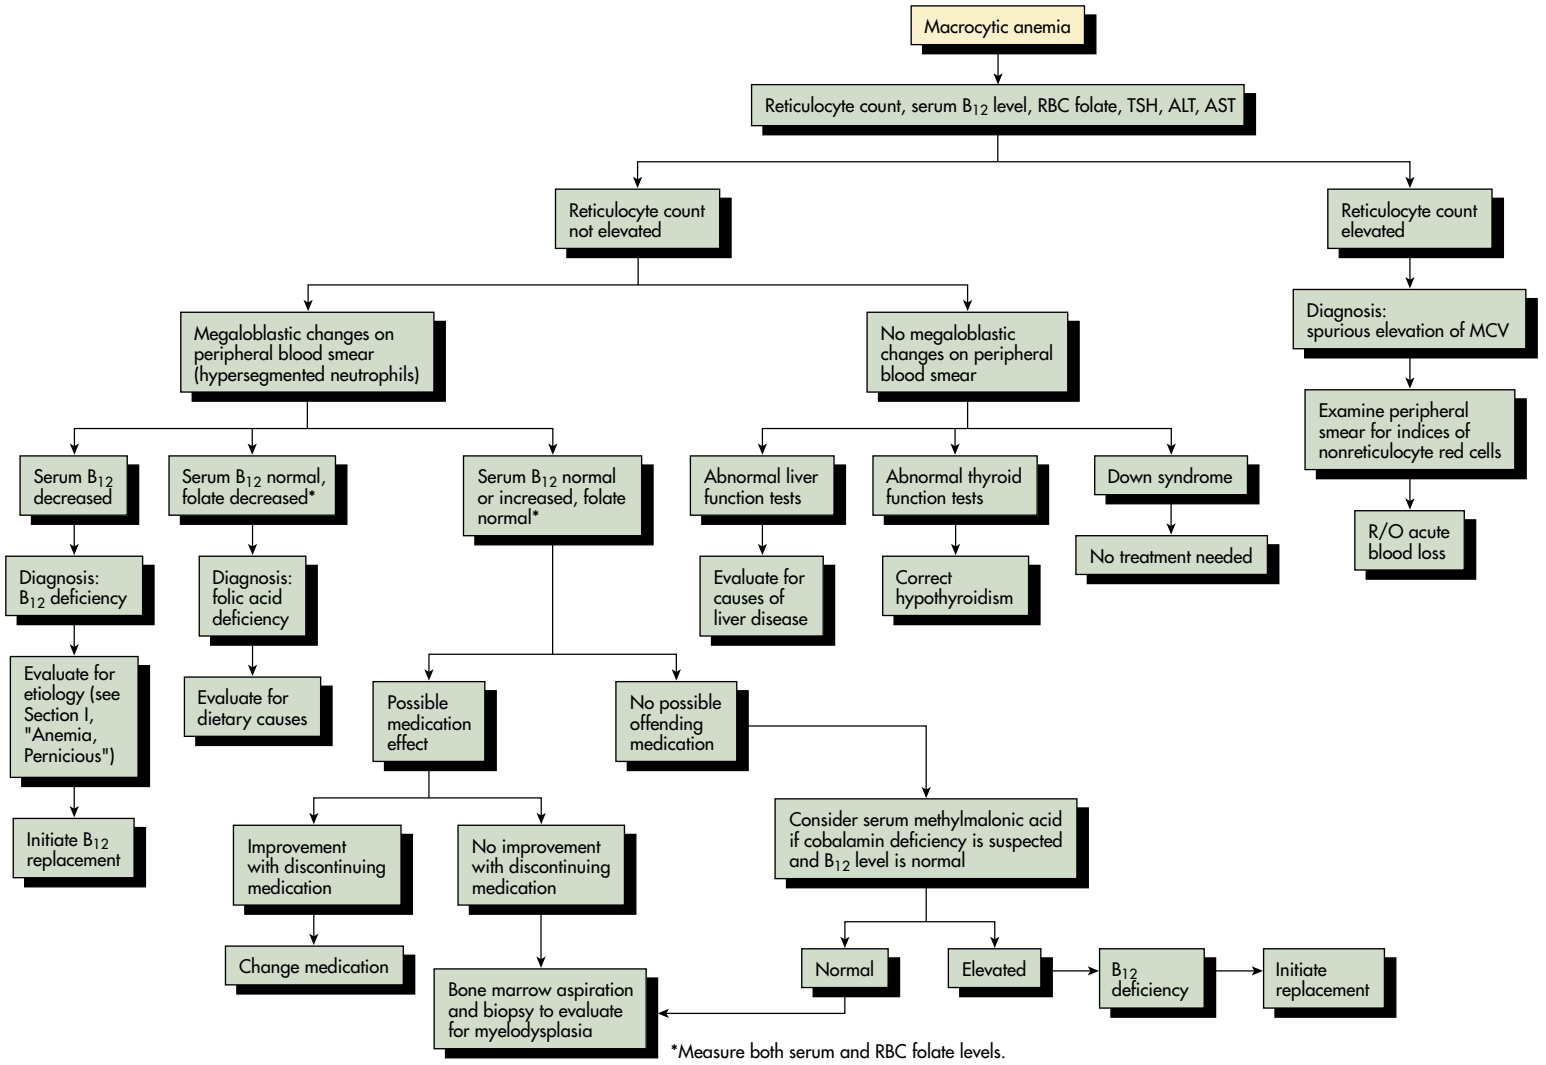

FIG. 25 Differential diagnosis of macrocytic anemia. *MCV,* Mean corpuscular volume. (Modified and updated from Rakel RE [ed]: *Principles of family practice*, ed 7, Philadelphia, 2007, Saunders.)

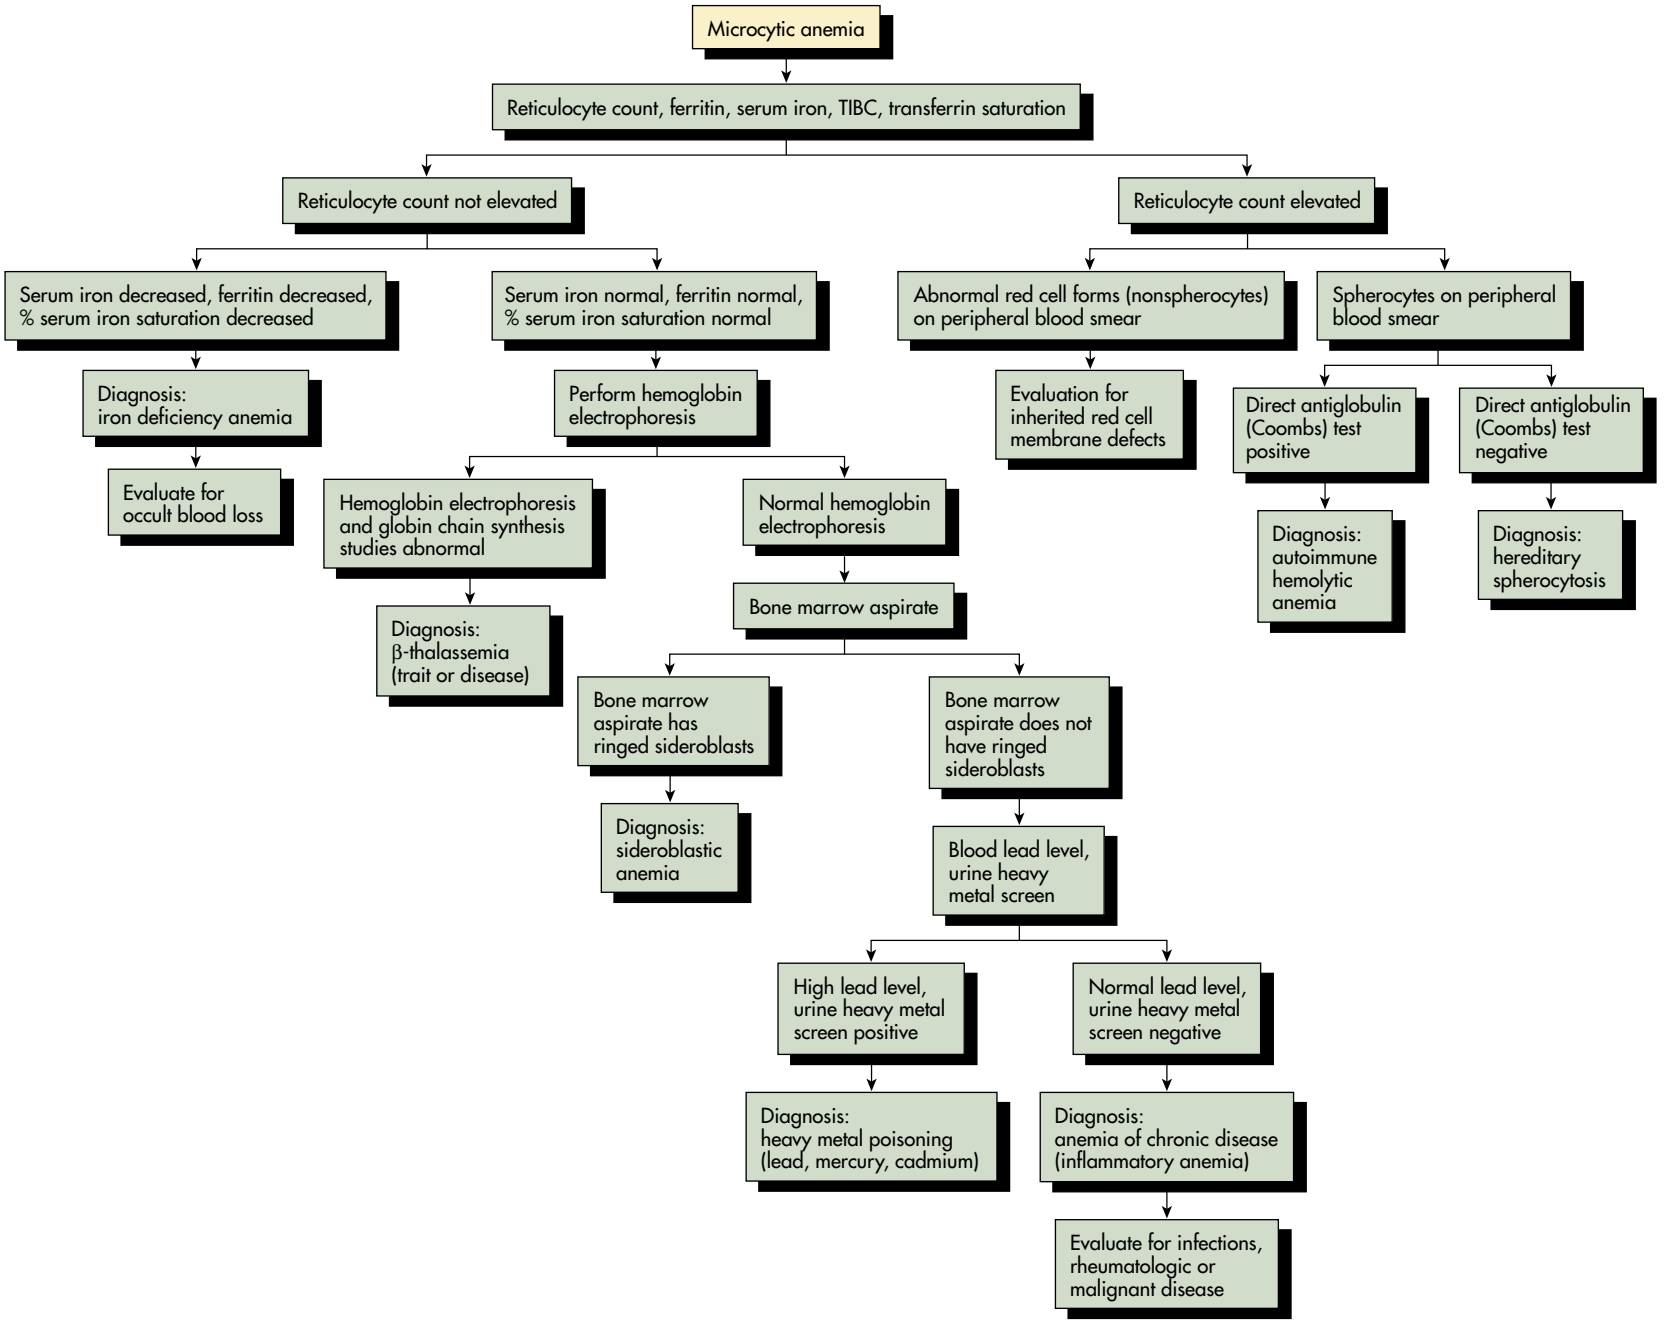

FIG. 26 Differential diagnosis of microcytic anemia. *TIBC*, Total iron binding capacity. (Modified and updated from Rakel RE [ed]: *Principles of family practice*, ed 7, Philadelphia, 2007, Saunders.)

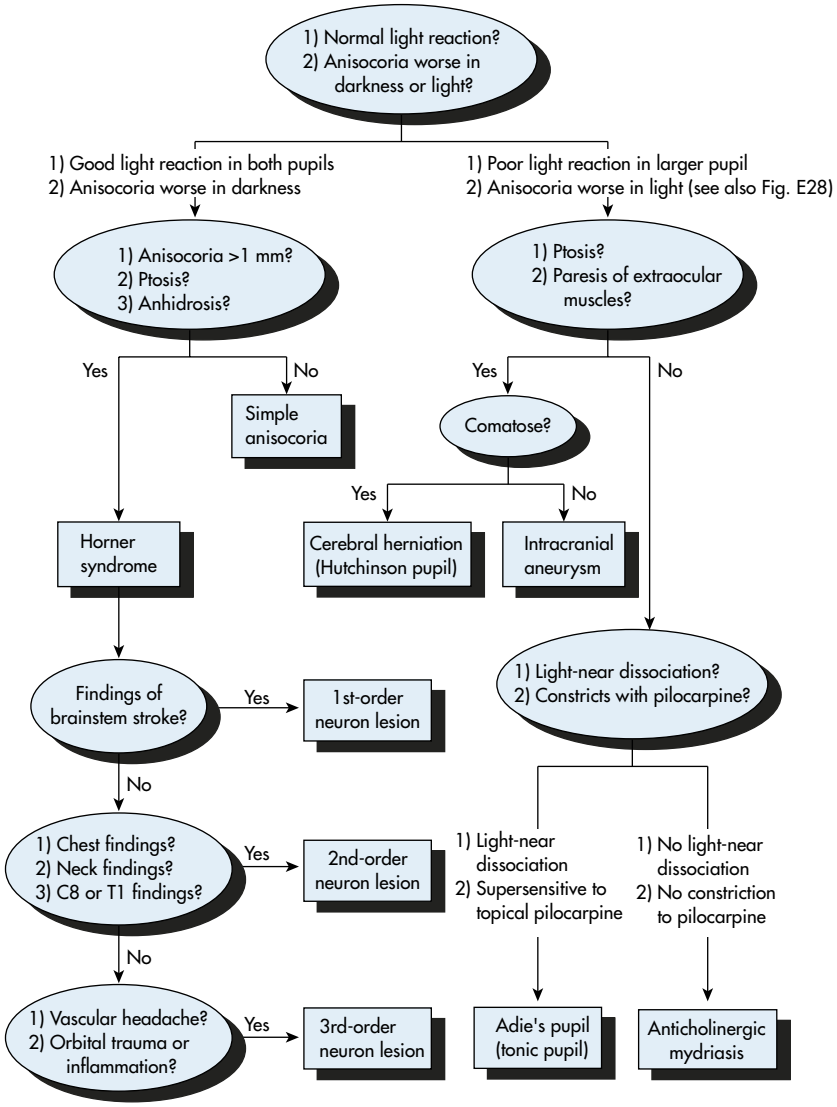

FIG. 27 Summary of approach to anisocoria. The first two questions (Is there a normal light reaction? and Is anisocoria worse in darkness or light?) distinguish problems with the pupillary dilator muscle (i.e., Horner syndrome, simple anisocoria; *left side* of the figure) from problems with the pupillary constrictor muscle (i.e., third cranial nerve, iris; *right side* of the figure). Two other tests distinguish Horner syndrome from simple anisocoria: the cocaine or apraclonidine eyedrop tests and pupillary dilator lag (i.e., the pupil dilates slowly in darkness, as documented by photographs). (From McGee S: *Evidence-based physical diagnosis,* ed 4, Philadelphia, 2018, Elsevier.)

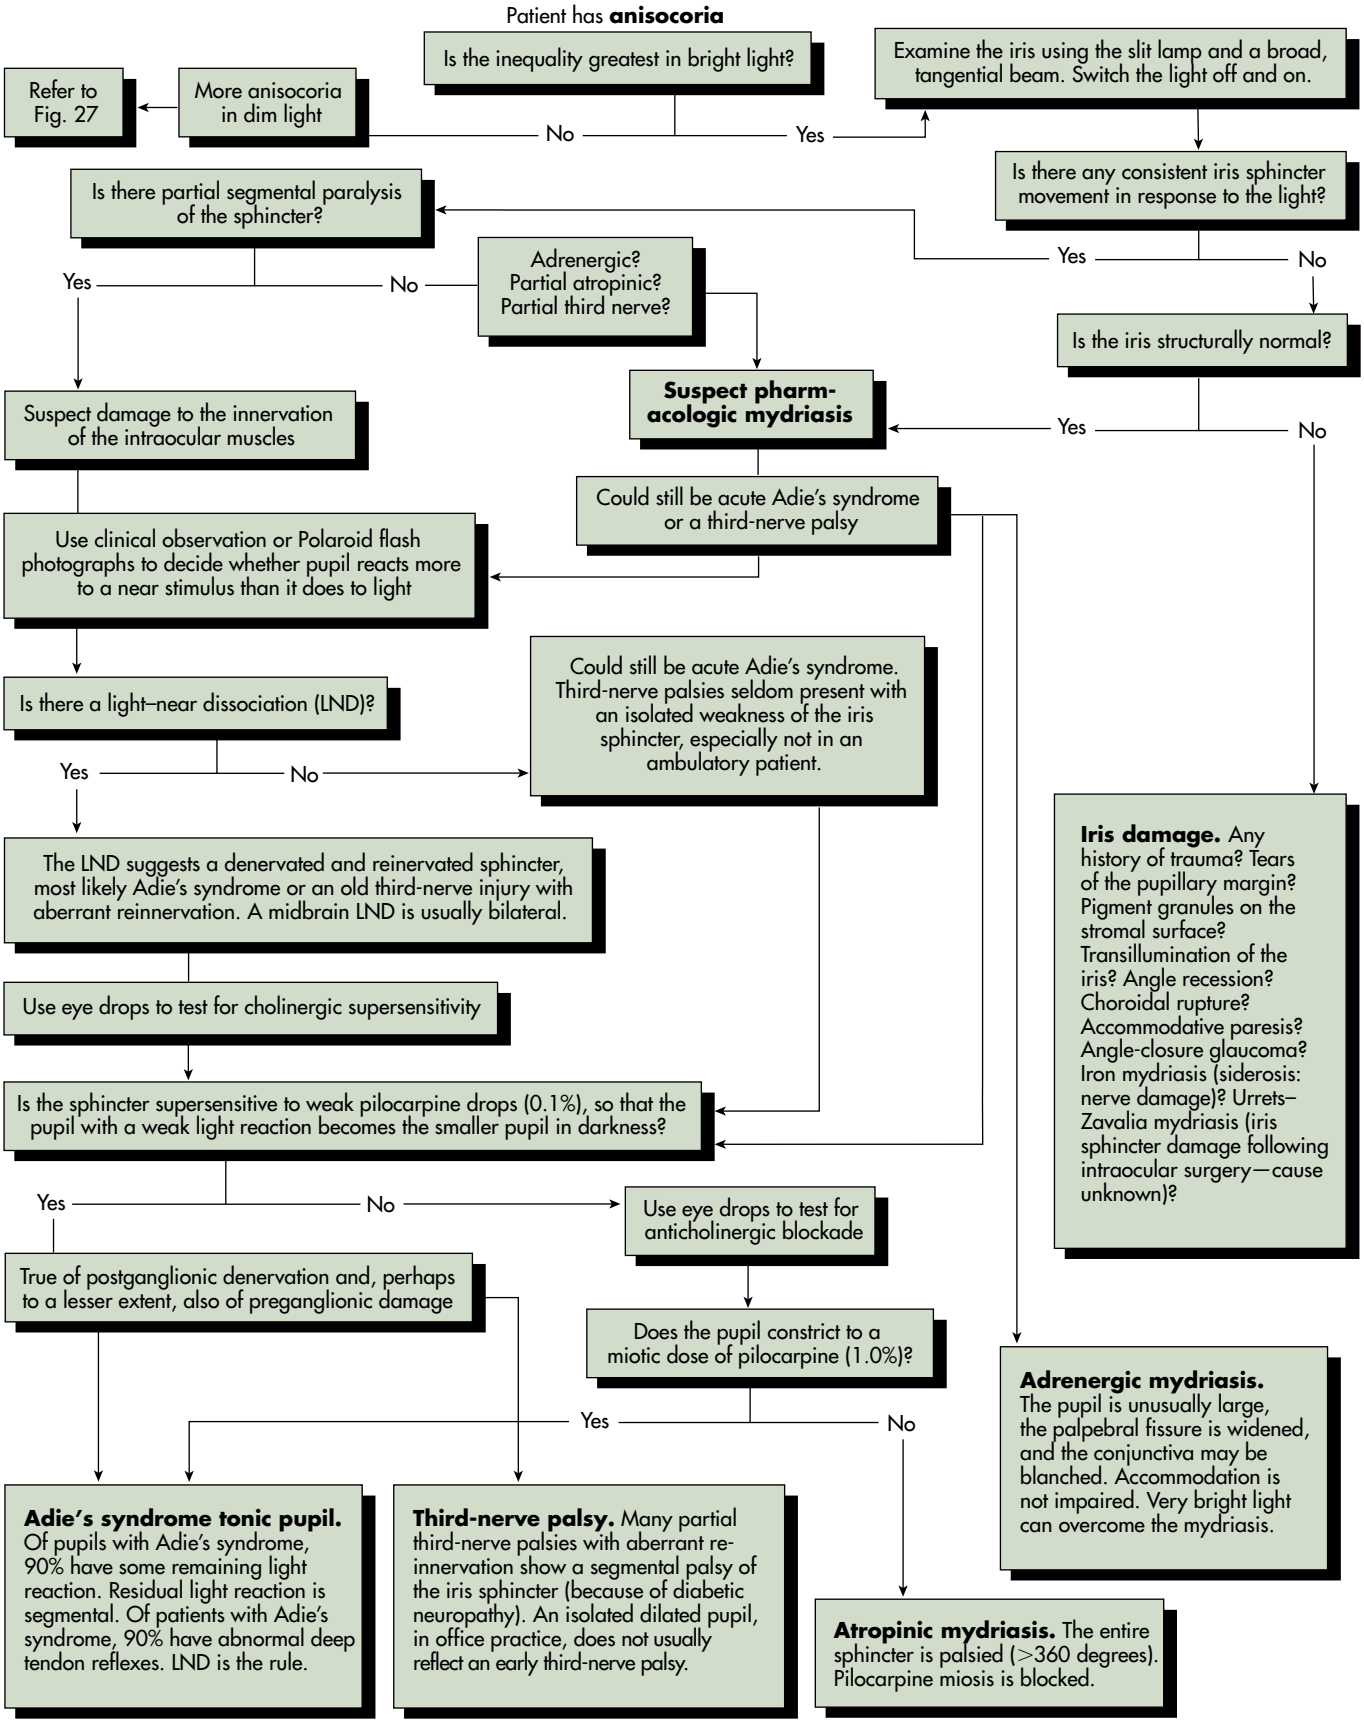

FIG. E28 Diagnosis of pupillary abnormalities in which anisocoria increases in bright light. Initial pupillary inequality is greater in bright light than in darkness, which indicates that the sphincter of the large pupil is weak or that a parasympathetic lesion is present on that side. (From Yanoff M, Duker JS: *Ophthalmology*, ed 2, St Louis, 2004, Mosby.)

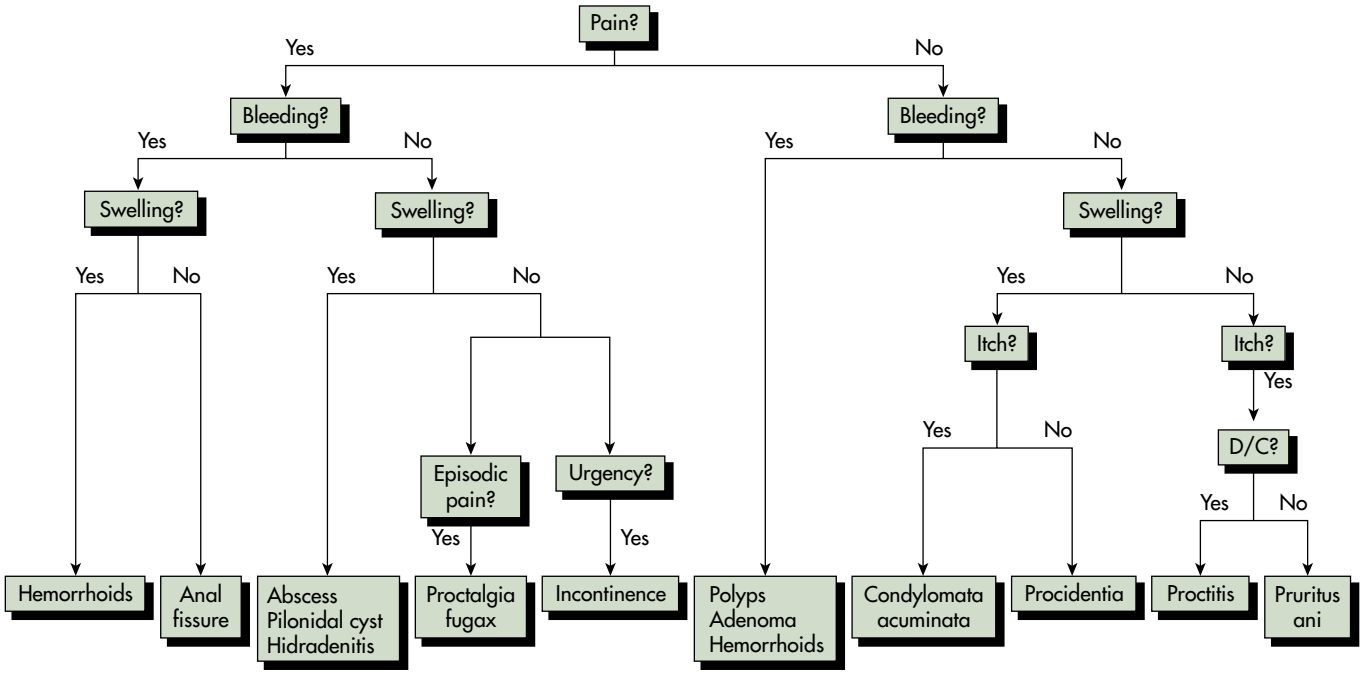

FIG. 29 Algorithm for anorectal complaints. *D/C,* Discharge. (From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

BOX 6 The WASH Regimen for Management of Hemorrhoids

- *W*arm water
- *A*nalgesic agents
- *S*tool softeners
- *H*igh-fiber diet

From Marx JA et al: *Rosen's emergency medicine,* ed 8, Philadelphia, 2014, Saunders.

BOX 7 Medical History in Diagnosis of Anorectal Disorders

Anorectal History
- Pain
- Bleeding
- Swelling
- Itching
- Discharge
- Urgency

Gastrointestinal History
- Change in bowel habits (straining, flatus, color, consistency, frequency)
- Nausea or vomiting
- Incontinence of stool
- Underlying GI disease (Crohn disease, cancer, polyps)

Systemic Disease History
- Diabetes mellitus
- Coagulopathy
- Cancer
- HIV infection

Sexual History of the Anus
- Penetration
- Known STDs
- Assault

GI, Gastrointestinal; *HIV,* human immunodeficiency virus; *STD,* sexually transmitted disease.
From Marx JA et al: *Rosen's emergency medicine,* ed 8, Philadelphia, 2014, Saunders.

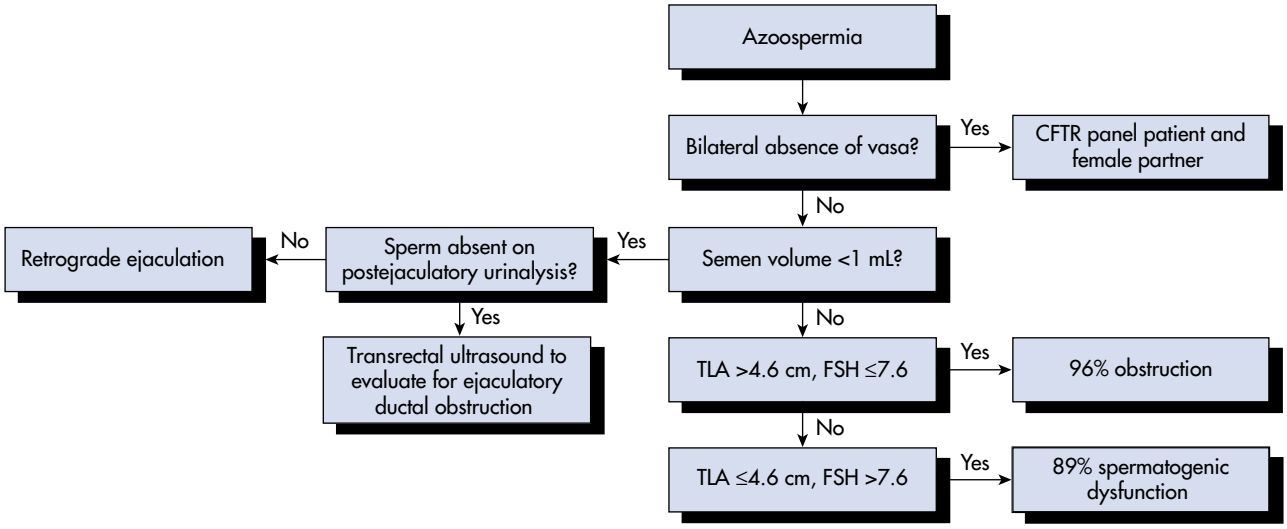

FIG. E30 Algorithm for evaluation of azoospermia. *CFTR,* Cystic fibrosis transmembrane conductance regulator; *FSH,* follicle-stimulating hormone; *TLA,* testis longitudinal axis measured by caliper orchidometer. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, 2016, Elsevier.)

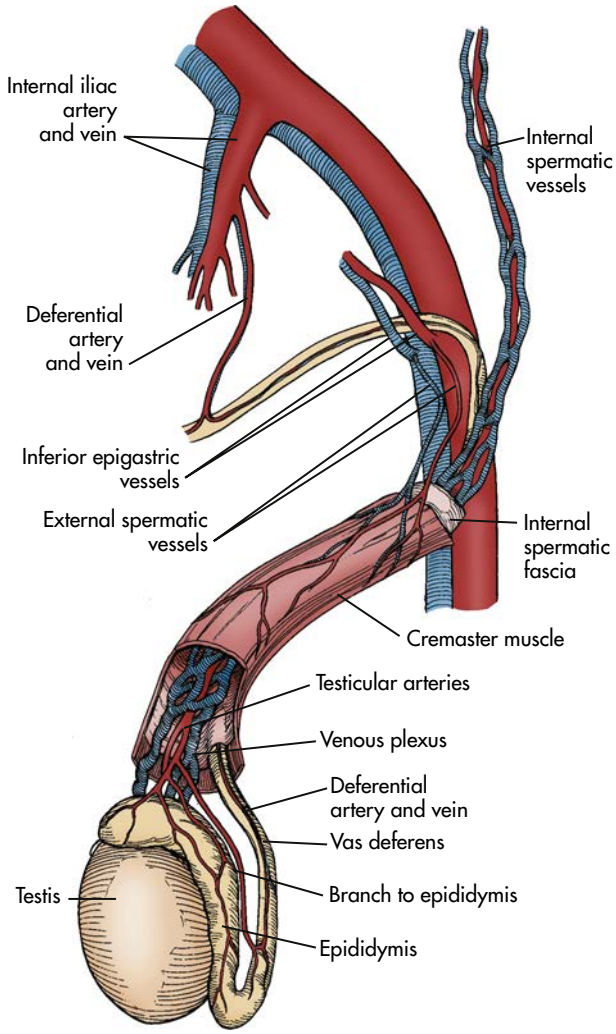

FIG. E31 Schematic illustration of interconnections between internal spermatic, external spermatic (cremasteric), and deferential vessels in the peritesticular region and spermatic cord. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, 2016, Elsevier.)

ICD-10CM #		
	L29	Pruritus
	M54.89	Other dorsalgia
	M54.9	Dorsalgia, unspecified
	M54.5	Low back pain
	F45.42	Pain disorder with related psychological factors
	M54.08	Panniculitis affecting regions of neck and back, sacral and sacrococcygeal region
	S23.9XXA	Sprain of unspecified parts of thorax, initial encounter
	M43.27	Fusion of spine, lumbosacral region
	M43.28	Fusion of spine, sacral and sacrococcygeal region
	M53.2X7	Spinal instabilities, lumbosacral region
	M53.3	Sacrococcygeal disorders, not elsewhere classified

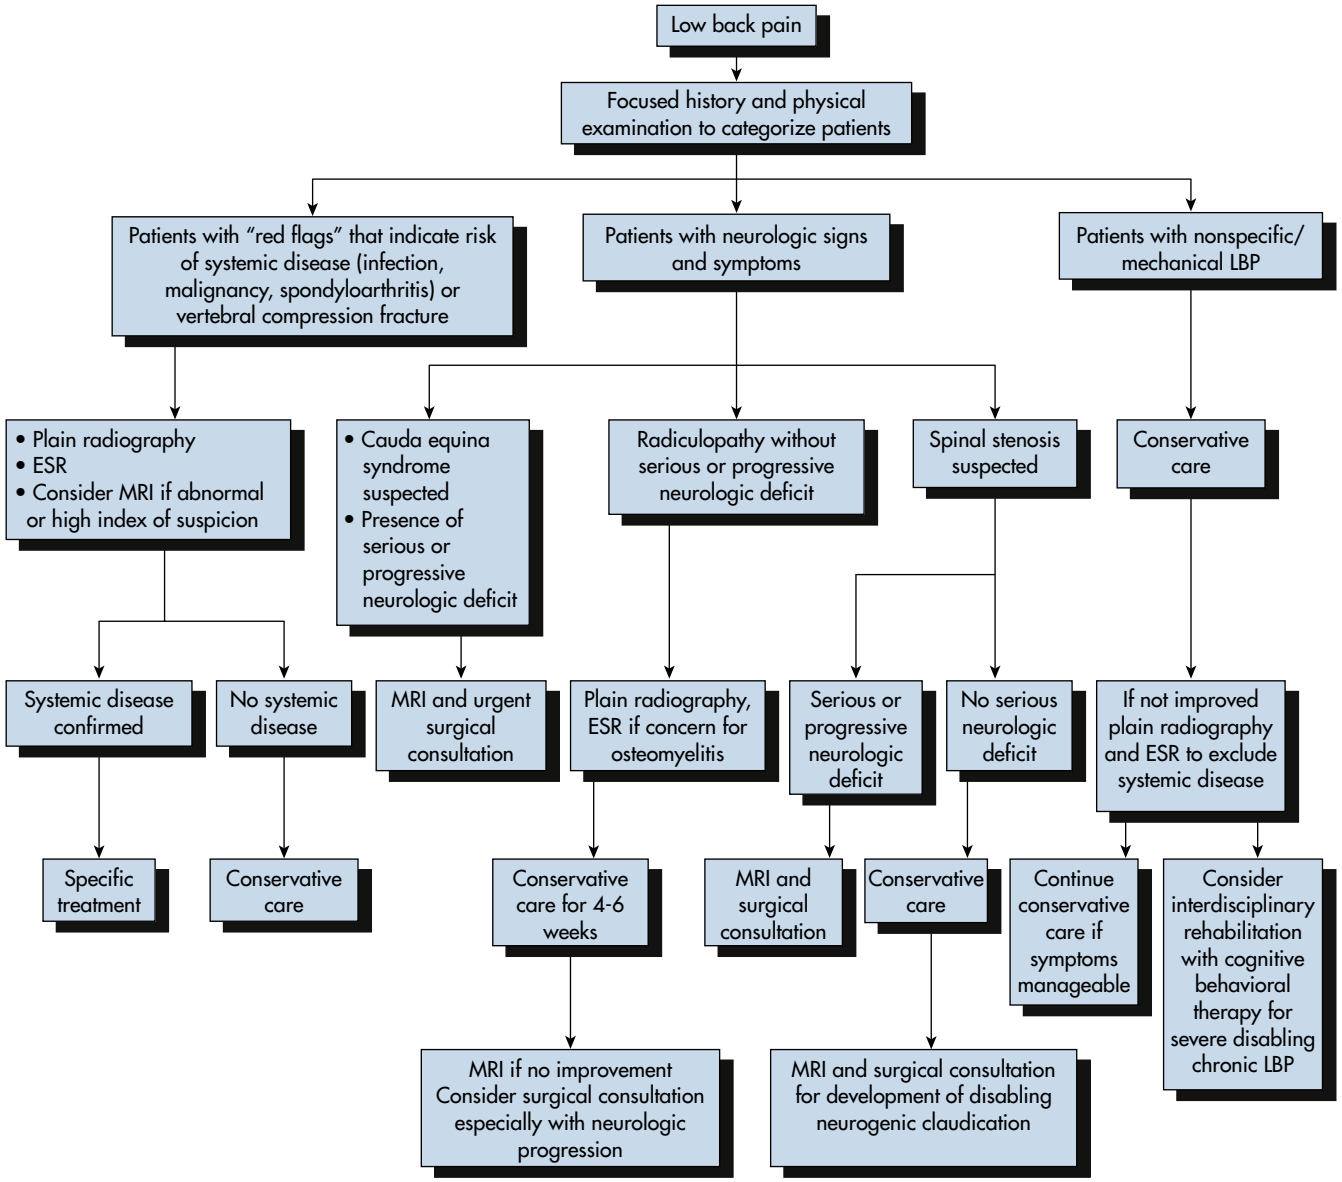

FIG. 32 Algorithm for the differential diagnosis and treatment of low back pain. *ESR*, Erythrocyte sedimentation rate; *LBP*, low back pain; *MRI*, magnetic resonance imaging. (From Firestein GS et al: *Kelley and Firestein's textbook of rheumatology,* ed 10, Philadelphia, 2017, Elsevier.)

TABLE 4 Red Flags for Potentially Serious Conditions

Possible Fracture	Possible Tumor or Infection	Possible Cauda Equina Syndrome
From Medical History		
Major trauma, such as vehicle accident or fall from height	Age over 50 or under 20 yr	Saddle anesthesia
Minor trauma or even strenuous lifting (in older or potentially osteoporotic patient)	History of cancer	Recent onset of bladder dysfunction, such as urinary retention, increased frequency, or overflow incontinence
	Constitutional symptoms, such as recent fever or chills or unexplained weight loss	Severe or progressive neurologic deficit in the lower extremity
	Risk factors for spinal infection: recent bacterial infection (e.g., urinary tract infection), intravenous drug abuse, or immune suppression (from steroids, transplant, or human immunodeficiency virus)	
	Pain that worsens when supine; severe nighttime pain	

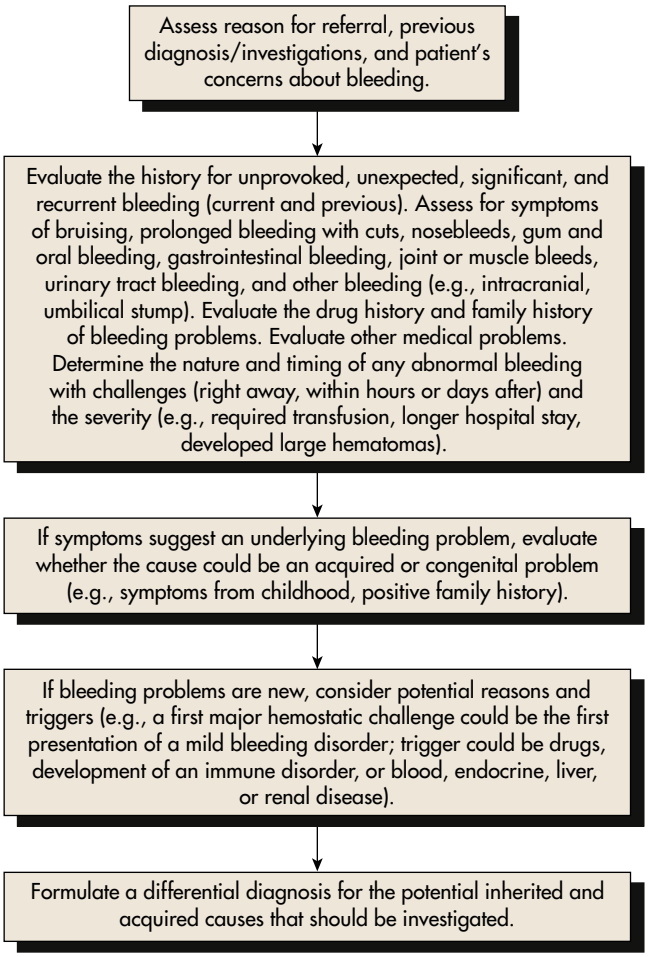

FIG. 33 Steps to evaluate bleeding and bruising problems. (From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.)

TABLE 5 Differential Diagnosis of Bleeding Problems

Major Categories	Comments
No bleeding disorder	Symptoms do not reflect a bleeding disorder and have another explanation (e.g., a surgical bleed, not caused by a bleeding disorder).
Possible bleeding disorder	The laboratory findings are nondiagnostic, and the bleeding history is considered equivocal (e.g., unexplained serious bleed with one surgical procedure; unexplained menorrhagia without other bleeding problems).
Definite bleeding disorder, undefined or indeterminate type	The bleeding history is consistent with a bleeding disorder; however, the laboratory findings are nondiagnostic. Commonly the bleeding history resembles mild to moderate defects in platelet function or von Willebrand factor. The diagnosis should only be made once an adequate evaluation for common bleeding disorders (e.g., for von Willebrand disease and platelet aggregation and release defects) is completed. If testing is not complete, the classification should indicate the types of conditions excluded or not excluded, for example mild mucocutaneous bleeding problem, von Willebrand disease excluded, mild mucocutaneous bleeding problem, platelet release defects not yet excluded.
Definite bleeding disorder with cause	The symptoms and laboratory findings are considered diagnostic of a bleeding disorder. Tables 6 and 7 summarize many of a define the potential inherited and acquired causes.

From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

ICD-10CM # D68.9 Coagulation defect, unspecified
D68.8 Other specified coagulation defects

TABLE 6 Differential Diagnosis of Congenital Bleeding Disorders

Disorder	Comments
Fibrinogen deficiency or dysfunction	Deficiencies can be mild-moderate hypofibrinogenemia or severe afibrinogenemia. Fibrinogen function is abnormal in dysfibrinogenemias, which can present with bleeding, thrombosis, or both. Fibrinogen levels can be reduced in some dysfibrinogenemias.
X-linked coagulation factor deficiencies—hemophilia	Presentation is influenced by the degree of deficiency. Factor VIII deficiency is more common than factor IX deficiency. If factor VIII is low, von Willebrand disease needs to be excluded as the cause.
Rarer, coagulation factor deficiencies	Deficiencies can affect factors XI, V, II, VII, or X, and the presentation is dependent on the severity of the deficiency. Hereditary deficiencies of multiple coagulation factors are rare (e.g., of factors V and VIII, or multiple vitamin K-dependent coagulation factors for congenital defects impairing γ-carboxylation) and can easily be excluded by measuring multiple factors.
Fibrinolytic defects	Causes include disorders caused by loss of function, such as α2-antiplasmin or PAI-1 deficiency, and by gain-of-function defects, such as Quebec platelet disorder (overexpression of urokinase plasminogen activator in megakaryocytes).
von Willebrand disease	Causes include quantitative (partial type 1 to severe type 3) and qualitative defects (loss of function in type 2M and 2A, gain of function in type 2B and platelet-type). Type 1 von Willebrand disease can be confused with low von Willebrand factor levels (e.g., because of blood group O).
Platelet disorders	These conditions can affect platelet number, function, or both. The most common type of platelet function disorder is a platelet secretion defect, which may or may not also impair aggregation responses. Disorders of platelet function are commonly subclassified by the nature of the defect, such as the following: 1. Defects of membrane receptors for adhesive proteins (e.g., Glanzmann thrombasthenia and Bernard-Soulier syndrome) or agonists (e.g., $P2Y_{12}$ deficiency) 2. Defects of signaling or secretion (the largest subcategory) 3. Cytoskeletal defects (e.g., MYH9-related disorders) 4. Storage pool disorders (e.g., gray platelet syndrome, dense granule deficiency, $\alpha\gamma$-storage pool deficiency, Quebec platelet disorder) 5. Defects of procoagulant function (e.g., Scott syndrome)
Vascular disorders	Congenital vascular malformation, including hereditary hemorrhagic telangiectasia, Ehlers-Danlos syndrome

MYH9, Myosin heavy polypeptide 9; *PAI-1,* plasminogen activator inhibitor 1.
From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

TABLE 7 Differential Diagnosis of Acquired Bleeding Problems

Disorder	Comments
Drug induced	Aspirin, NSAIDs, other platelet function inhibitors (e.g., $P2Y_{12}$ and $\alpha_{IIb}\beta_3$ inhibitors), anticoagulants, fibrinolytic drugs, and antidepressants are common causes.
Acquired factor deficiencies	The causes can be immune (e.g., acquired factor VIII deficiency, acquired factor V deficiency) or nonimmune. Reductions in multiple factors can result from vitamin K deficiency, treatment with vitamin K antagonists, liver disease, hemodilution, and rarely snakebites. Severe acquired hypofibrinogenemia is commonly caused by a postpartum coagulopathy or severe liver disease. Prothrombin deficiency occurs with some lupus anticoagulants. Amyloidosis can cause an acquired factor X deficiency, which may be associated with reductions in other coagulation factors synthesized in the liver if the liver is involved.
Disseminated intravascular coagulation	The manifestations can include thrombocytopenia, consumption of coagulation factors, including fibrinogen, and impairment of hemostatic mechanisms from the fibrin/fibrinogen degradation products. Causes are wide ranging and include postpartum consumptive states, prostate and other cancers, and snakebites.
Acquired von Willebrand disease	The cause can be immune (often in association with an IgG paraprotein) or nonimmune (e.g., increased proteolysis of von Willebrand factor with stenotic aortic valvular disease).
Immune thrombocytopenia	Bleeding is usually influenced by the extent of the thrombocytopenia. Some autoantibodies interfere with platelet membrane receptor function, causing bleeding disproportionate to the thrombocytopenia.
Non–drug-induced, acquired platelet function disorders	The cause can be immune (see earlier) or nonimmune, typically from bone marrow disorders, although secretion defects can be secondary to Cushing syndrome or hypothyroidism.
Liver disease	Liver disease can cause thrombocytopenia, deficiencies of coagulation factors, hypofibrinogenemia and dysfibrinogenemia, and increased fibrinolysis. In mild liver disease, factor VII and sometimes factors XI and XII are low. Fibrinogen is often increased in early liver disease, and if low, the finding suggests severe liver disease.
Renal disease	Anemia is an important predictor of uremic bleeding. Uremic bleeding is typically associated with severe renal impairment.
Hypothyroidism	Hypothyroidism can cause an acquired von Willebrand disease and acquired defects in platelet function.
Cushing syndrome	This syndrome should be suspected when there are symptoms and findings suggestive of Cushing syndrome or treatment with systemic or topical glucocorticoids.
Surgical bleeding	This is often a diagnosis of exclusion, although the procedural notes sometimes document that a technical problem was encountered that led to abnormal bleeding.
Vitamin K deficiency	Newborns are at risk, as are individuals with malabsorption and/or receiving broad-spectrum antibiotics that reduce vitamin K production by reducing gut bacteria. Older adults are also at greater risk for developing vitamin K deficiency because of reduced stores from poorer intake of vitamin K. If the patient does not respond to parenteral vitamin K, other causes should be considered.
Vitamin C deficiency (scurvy)	This diagnosis should be considered when there is lethargy with skin and gum bleeding (perifollicular hemorrhages, gum bleeding with swelling). The condition is rare in developed countries. The cause is usually a very poor diet or malabsorption.

IgG, Immunoglobulin G; *NSAID,* nonsteroidal antiinflammatory drug.
From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

BOX 8 The Laboratory Manifestations of Bleeding Disorders

The laboratory manifestations of bleeding disorders can include abnormalities from the following:

1. The underlying hemostatic defect
2. Bleeding complications (e.g., anemia, iron deficiency, coagulopathy secondary to hemodilution after resuscitation for a massive bleed, development of red cell antibodies after transfusion)
3. False-positive abnormalities (e.g., prolonged aPTT caused by incidental mild factor XII deficiency, which is found in about 1 of 200 patients, or a lupus anticoagulant, which can be a transient finding in about 5% of hospitalized patients)
4. Extremes of normal variation (e.g., mildly low von Willebrand factor levels in an individual who is blood group O, absent secondary aggregation with epinephrine in adjusted platelet-rich plasma aggregation studies)

From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

BOX 9 Influences on Presenting Problems

When evaluating a bleeding history, it is important to recognize that the presenting problems are influenced by the following factors:

1. The nature and severity of the defect, and the presence of single or multiple risk factors for bleeding
2. Whether the bleeding problem is congenital or acquired
3. Antecedent exposure to hemostatic challenges (such as surgery, dental extraction, menses, and childbirth) and the risk for bleeding with each of these challenges
4. The presence of other medical problems (e.g., renal, hepatic, or thyroid disease), including anemia
5. Variability in the bleeding symptoms experienced by individuals without bleeding disorders (e.g., nosebleeds, bruising) and by individuals with known bleeding disorders, even within families with the same defect
6. Local factors (e.g., sun-damage to the skin, vascular lesions, diverticular disease, or cancerous lesions in the gastrointestinal tract) and the possibility of nonaccidental trauma
7. Treatments that increase the risk for bleeding (e.g., antiplatelet drugs, such as aspirin and nonsteroidal antiinflammatory drugs used for pain control, anticoagulant therapy, etc.)
8. Whether treatments were used to prevent or control bleeding
9. Whether treatments prescribed for other reasons may have reduced bleeding (e.g., reduced menstrual bleeding while on oral contraceptives to prevent pregnancy)

From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

BOX 10 Case 1: Illustration of a Mild, Inherited Bleeding Problem

A 77-year-old man who is starting treatment for multiple myeloma was discovered to have a prolonged activated partial thromboplastin time. Review of his records indicated that the abnormality was present on a previous admission for spinal cord compression, which was treated with surgery. He required 4 units of packed red blood cells several days after this surgery because of delayed postoperative bleeding. There was no other bleeding history. He was found to have mild factor IX deficiency, unrelated to the myeloma, and his daughter proved to be a carrier of this defect.

From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

BOX 11 Case 2: Illustration of the Importance of Assessing Both Personal and Familial Bleeding Problems

A 22-year-old woman was referred for evaluation of a possible platelet disorder. She had a history of menorrhagia (4 days out of 7 days of menstrual flow were heavy when not on treatment), prolonged nosebleeds in childhood, and hematuria with urinary tract infections. She did not have thrombocytopenia, and she had no exposure to major hemostatic challenges. Her father, uncle, and grandfather had a striking bleeding history, and two of them had thrombocytopenia. The bleeding in her relatives included joint bleeds with trauma and severe, delayed-onset bleeding after trauma and surgery (usually more than a day later), which continued for weeks despite platelet transfusions. One of these relatives reported no bleeding when he had a tooth extracted while receiving fibrinolytic inhibitor therapy. Although menorrhagia is not specific to any one type of bleeding disorder, the delayed bleeding in affected relatives suggests a possible autosomal dominant disorder and either a fibrinolytic defect of a factor defect or deficiency (e.g., affected relatives). Because of the family history of thrombocytopenia, joint bleeds, and delayed bleeding, which did not respond well to platelet transfusions, testing was done for the Quebec platelet disorder. Genetic testing for duplication mutation of the urokinase plasminogen activator gene confirmed this diagnosis in the patient and her relatives. The case illustrates the importance of evaluating both the personal and family bleeding history and highlights the fact that bleeding-symptom severity can vary among affected family members, in part because of their different exposures to challenges and treatments.

From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

BOX 12 Case 3: Illustration of the Importance of Assessing Bleeding Problems Over Time

A 72-year-old man was referred for evaluation of a severe bleed after receiving a single dose of low-molecular-weight heparin for unconfirmed deep vein thrombosis. He had a history of a similar bleeding episode several years previously while on warfarin treatment for atrial fibrillation. There was no other bleeding history, and the patient subsequently developed a spontaneous iliopsoas bleed. He had undergone numerous surgeries earlier in life without any bleeding problems, and there was no family history of bleeding. The bleeding history suggested the possibility of an acquired bleeding problem, possibly acquired von Willebrand disease or an acquired factor XIII deficiency. Diagnostic testing indicated that he had acquired factor XIII deficiency. This case illustrates the fact that there may be more than one risk factor for bleeding: in this case, several exposures to anticoagulants triggered bleeding in a patient with an acquired factor deficiency. On initial treatment of his iliopsoas bleed with factor XIII concentrate, there was partial neutralization of the infused factor followed by accelerated clearance, consistent with acquired factor XIII deficiency secondary to an autoantibody.

CPR Quality
- Push hard (2 inches [5 cm]) and fast (100–120/min) and allow complete chest recoil
- Minimize interruptions in compressions
- Avoid excessive ventilation
- Rotate compressor every 2 min or sooner if fatigued
- If no advanced airway, 30:2 compression-ventilation ratio
- Quantitative waveform capnography
  - If P_{ETCO_2} <10 mm Hg, attempt to improve CPR quality
- Intraarterial pressure
  - If relaxation phase (diastolic) pressure <20 mm Hg, attempt to improve CPR quality

Shock Energy for Defibrillation
- **Biphasic:** Manufacturer recommendation (e.g., initial dose of 120–200 J); if unknown, use maximum available. Second and subsequent doses should be equivalent, and higher doses may be considered
- **Monophasic:** 360 J

Drug Therapy
- **Epinephrine IV/IO Dose:** 1 mg every 3–5 min
- **Amiodarone IV/IO Dose:** First dose: 300 mg bolus Second dose: 150 mg

Advanced Airway
- Endotracheal intubation or supraglottic advanced airway
- Waveform capnography or capnometry to confirm and monitor ET tube placement
- Once advanced airway in place, give 1 breath every 6 s (10 breaths/min) with continuous chest compressions

Return of Spontaneous Circulation (ROSC)
- Pulse and blood pressure
- Abrupt sustained increase in P_{ETCO_2} (typically ≥40 mm Hg)
- Spontaneous arterial pressure waves with intraarterial monitoring

Reversible Causes
- **H**ypovolemia
- **H**ypoxia
- **H**ydrogen ion (acidosis)
- **H**ypo-/hyperkalemia
- **H**ypothermia
- **T**ension pneumothorax
- **T**amponade, cardiac
- **T**oxins
- **T**hrombosis, pulmonary
- **T**hrombosis, coronary

I51.7 Cardiomegaly
Q24.8 Other specified congenital malformations of heart
I11.9 Hypertensive heart disease without heart failure
I11.0 Hypertensive heart disease with heart failure
Q23.8 Other congenital malformations of aortic and mitral valves

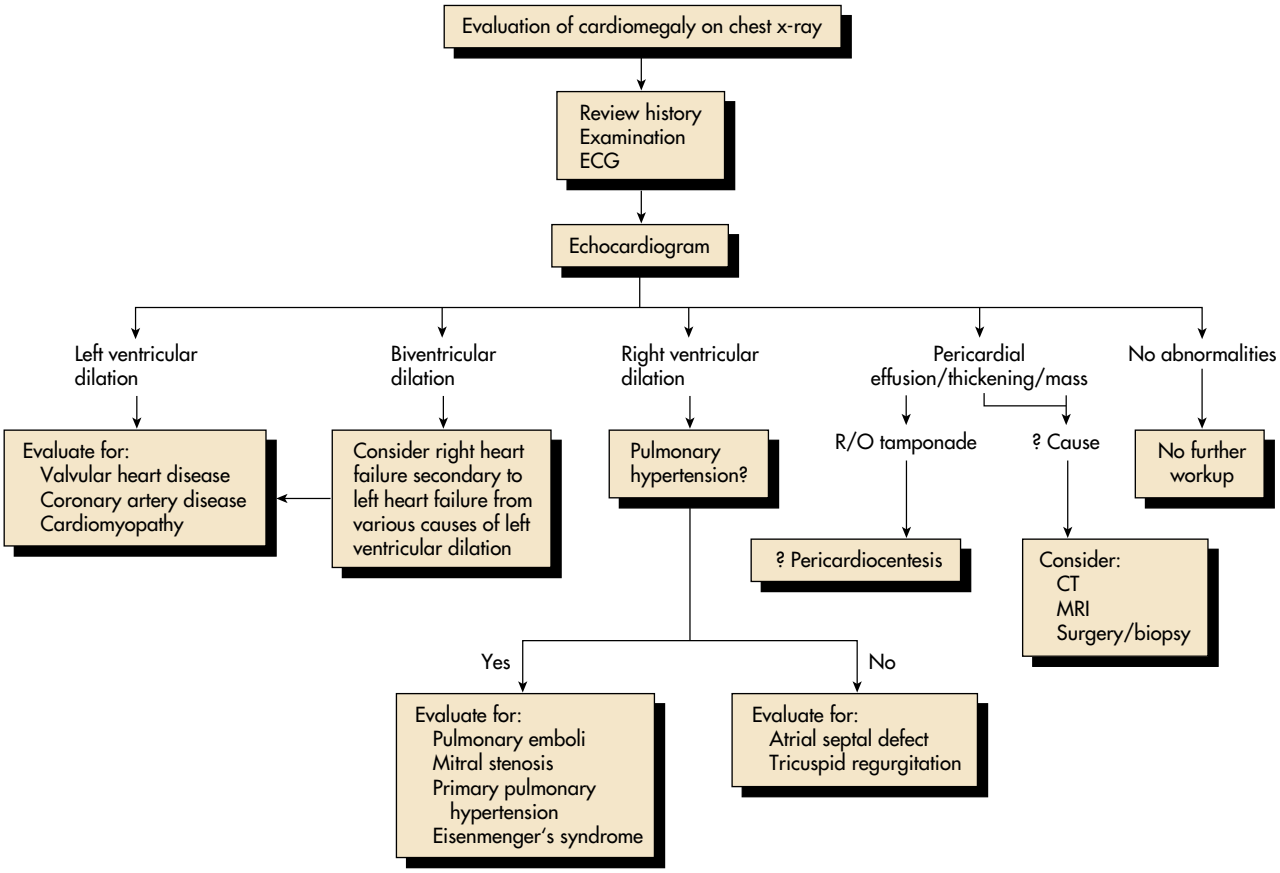

FIG. 43 Approach to the patient with cardiomegaly. When cardiomegaly is found on the chest radiograph, the history and physical examination should be reviewed and an electrocardiogram *(ECG)* performed before obtaining a two-dimensional Doppler echocardiographic study. Cardiomegaly may be explained by left ventricular dilation, biventricular dilation, right ventricular dilation, or pericardial abnormalities, or it may be found to be spurious on the echocardiogram. Rarely, isolated abnormalities of the atrium, particularly the left atrium, may cause abnormalities on the chest radiograph but will not cause true cardiomegaly. Depending on the echocardiographic findings, further tests can help elucidate the cause of echocardiographically confirmed cardiomegaly. *CT*, Computed tomography; *MRI,* magnetic resonance imaging; *R/O,* rule out. (From Goldman L, Braunwald E [eds]: *Primary cardiology,* ed 2, Philadelphia, 2003, Saunders.)

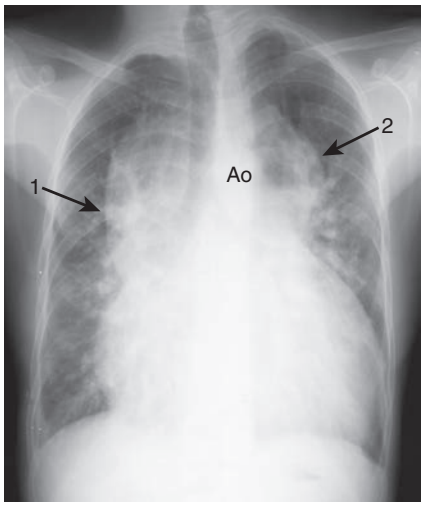

FIG. 44 "Snowman" heart in a 36-year-old man with increasing shortness of breath. Posteroanterior chest film examination shows cardiomegaly and increased pulmonary blood flow. The superior mediastinum is widened, the result of dilation of the left vertical vein *(arrow 2)* and the right-sided superior vena cava *(arrow 1)*. The trachea is displaced by a normal left-sided aortic arch *(Ao)*. (From Boxt LM, Abbara S: *Cardiac imaging: the requisites,* ed 4, Philadelphia, 2016, Elsevier.)

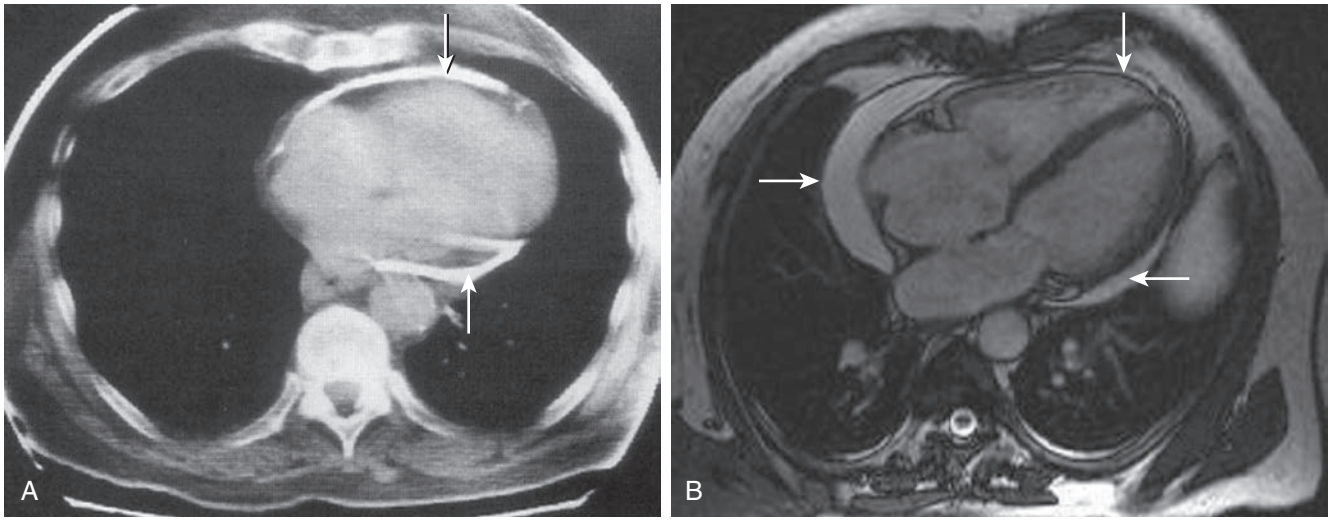

FIG. 47 A, Computed tomography findings in constrictive pericarditis. White vertical arrows are depicting thickened pericardium and pericardial calcification. **B,** The magnetic resonance imaging results of a patient with effusive-constrictive pericarditis are shown in the right image. Horizontal arrows show a loculated pericardial effusion, and the vertical arrow shows thickened pericardium. (From Vincent JL et al: *Textbook of critical care,* ed 7, Philadelphia, 2017, Elsevier.)

TABLE 8 Diagnosis of Cardiac Tamponade

Clinical presentation	Elevated systemic venous pressure,* hypotension,† pulsus paradoxus,‡ tachycardia,§ dyspnea, or tachypnea with clear lungs
Precipitating factors	Drugs (cyclosporine, anticoagulants, thrombolytics), recent cardiac surgery, indwelling instrumentation, blunt chest trauma, malignancies, connective tissue disease, renal failure, septicemia‖
ECG	Can be normal or nonspecifically changed (ST-T wave), electrical alternans (QRS, rarely T), bradycardia (end stage), electromechanical dissociation (agonal phase)
Chest radiograph	Enlarged cardiac silhouette with clear lungs
M-mode/two-dimensional echocardiogram	Diastolic collapse of the anterior RV free wall,¶ RA collapse, LA and rarely LV collapse, increased LV diastolic wall thickness "pseudohypertrophy," IVC dilation (no collapse in inspiration), "swinging heart"
Doppler	Tricuspid flow increases and mitral flow decreases during inspiration (reverse in expiration)
	Systolic and diastolic flows are reduced in systemic veins in expiration and reverse flow with atrial contraction is increased
M-mode color Doppler	Large respiratory fluctuations in mitral/tricuspid flows
Cardiac catheterization	Confirmation of the diagnosis and quantification of the hemodynamic compromise
	RA pressure is elevated (preserved systolic x descent and absent or diminished diastolic y descent)
	Intrapericardial pressure is also elevated and virtually identical to RA pressure (both pressures fall in inspiration)
	RV mid-diastolic pressure is elevated and equal to the RA and pericardial pressures (no dip-and-plateau configuration)
	Pulmonary artery diastolic pressure is slightly elevated and may correspond to the RV pressure
	Pulmonary capillary wedge pressure is also elevated and nearly equal to intrapericardial and right atrial pressure
	LV systolic and aortic pressures may be normal or reduced
	Documenting that pericardial aspiration is followed by hemodynamic improvement**
	Detection of coexisting hemodynamic abnormalities (LV failure, constriction, pulmonary hypertension)
	Detection of associated cardiovascular diseases (cardiomyopathy, coronary artery disease)
RV/LV angiography	Atrial collapse and small hyperactive ventricular chambers
Coronary angiography	Coronary compression in diastole

IVC, Inferior vena cava; *LA,* left atrium; *LV,* left ventricle; *QRS,* Q wave, R wave, S wave; *RA,* right atrium; *RV,* right ventricle.

*Jugular venous distention is less notable in hypovolemic patients or in "surgical tamponade." An inspiratory increase or lack of fall of pressure in the neck veins (Kussmaul sign), when verified by tamponade or after pericardial drainage, indicates effusive-constrictive disease.

†Heart rate is usually greater than 100 beats per minute but may be lower in patients with hypothyroidism or uremia.

‡Pulsus paradoxus is defined as a drop in systolic blood pressure greater than 10 mm Hg during inspiration, while diastolic blood pressure remains unchanged. It is easily detected by simply feeling the pulse, which diminishes significantly during inspiration. Clinically significant pulsus paradoxus is apparent when the patient is breathing normally. When this sign is present only in deep inspiration, it should be interpreted with caution. The magnitude of pulsus paradoxus is evaluated by sphygmomanometry. If pulsus paradoxus is present, the first Korotkoff sound is not heard equally well throughout the respiratory cycle but only during expiration at a given blood pressure. The blood pressure cuff is therefore inflated above the patient's systolic pressure. Then it is slowly deflated, while the clinician observes the phase of respiration. During deflation, the first Korotkoff sound is intermittent. Correlation with the patient's respiratory cycle identifies a point at which the sound is audible during expiration but disappears when the patient breathes in. As the cuff pressure drops further, another point is reached when the first blood pressure sound is audible throughout the respiratory cycle. The difference in systolic pressure between these two points is the clinical measure of pulsus paradoxus. Pulsus paradoxus is absent in tamponade complicating an atrial septal defect and in patients with significant aortic regurgitation.

§Occasional patients are hypertensive, especially if they have preexisting hypertension.

‖Febrile tamponade may be misdiagnosed as septic shock.

¶Right ventricular collapse can be absent in elevated right ventricular pressure and right ventricular hypertrophy or in right ventricular infarction.

**If after drainage of the pericardial effusion, the intrapericardial pressure does not fall below atrial pressure, effusive-constrictive disease should be considered.

From Vincent JL et al: *Textbook of critical care,* ed 7, Philadelphia, 2017, Elsevier.

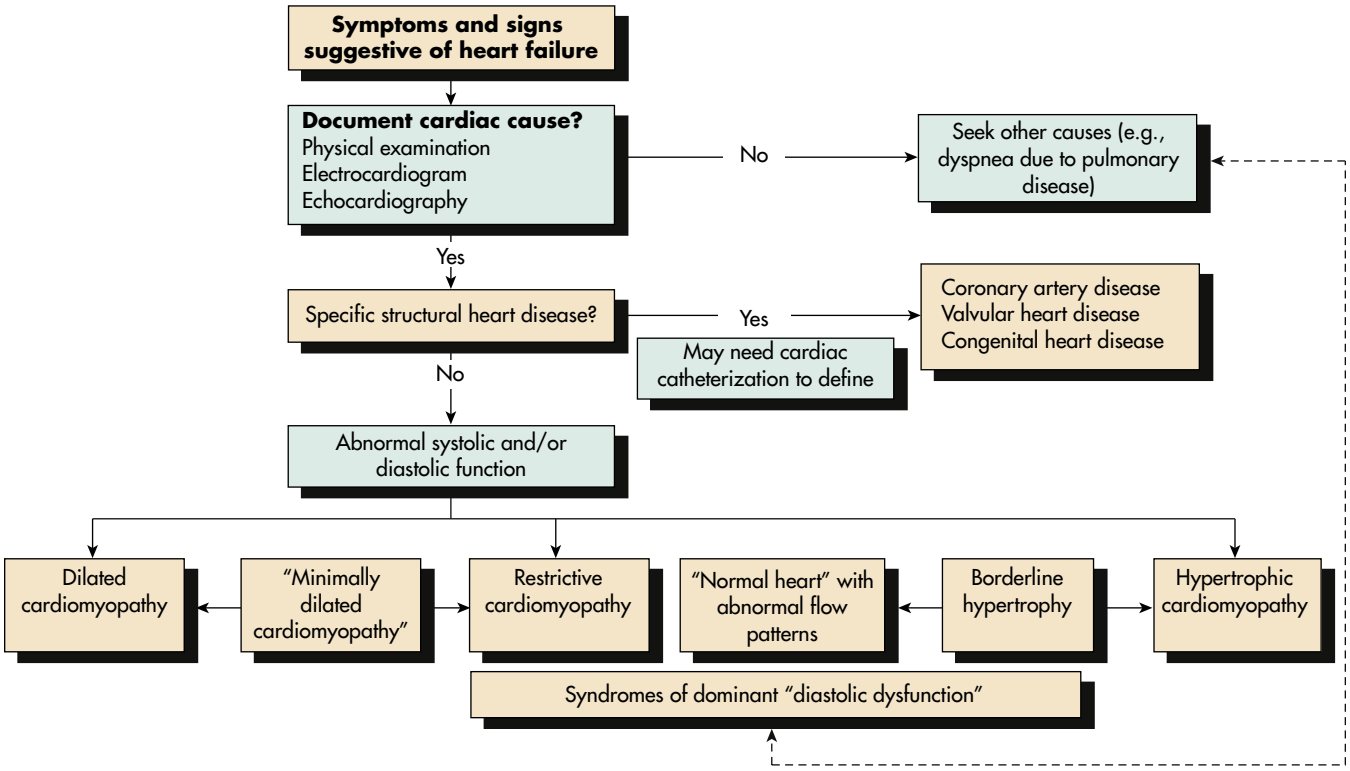

FIG. 48 Initial approach to classification of cardiomyopathy. The evaluation of symptoms or signs consistent with heart failure first includes confirmation that they can be attributed to a cardiac cause. Although this conclusion is often apparent from routine physical examination and electrocardiography, echocardiography serves to confirm cardiac disease and provides clues to the presence of other cardiac diseases, such as focal abnormalities suggesting primary valve disease or congenital heart disease. Having excluded these conditions, cardiomyopathy is generally considered to be dilated, restrictive, or hypertrophic, as shown in the figure. Patients with apparently normal cardiac structure and contraction are occasionally found to demonstrate abnormal intracardiac flow patterns consistent with diastolic dysfunction but should also be evaluated carefully for other causes of their symptoms. Most patients with so-called diastolic dysfunction also demonstrate at least borderline criteria for left ventricular hypertrophy, frequently in the setting of chronic hypertension and diabetes. A moderately decreased ejection fraction without marked dilation or a pattern of restrictive cardiomyopathy is sometimes referred to as minimally dilated cardiomyopathy, which may represent either a distinct entity or a transition between acute and chronic disease. (From Goldman L, Schafer AI: *Goldman Cecil medicine,* ed 25, Philadelphia, 2016, Saunders.)

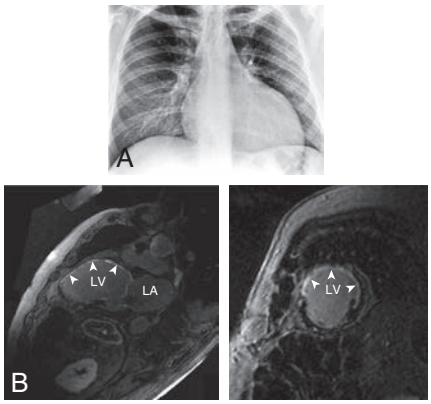

FIG. 49 Dilated cardiomyopathy. A, The heart shows enlargement of all four chambers. The azygos vein and superior vena cava are slightly dilated, reflecting high central venous pressure. **B,** Delayed enhanced magnetic resonance images demonstrate ischemic dilated cardiomyopathy. Extensive subendocardial delayed hyperenhancement *(arrowheads)* demonstrates features of old myocardial infarction—it follows a vascular territory (the left anterior descending), it is based on the subendocardium, and there is thinning of the affected myocardium. *LA,* Left atrium; *LV,* left ventricle. (Boxt LM, Abbara S: *Cardiac imaging: the requisites,* ed 4, Philadelphia, 2016, Elsevier.)

TABLE 9 Classification of the Cardiomyopathies by Phenome and Genome

	PHENOME			GENOME		
Type	**Morphology**	**Physiology**	**Pathology**	**Systemic Conditions or Diseases, Clinically Relevant Features, Classic Risk Factors, Associations**	**Nonsyndromic, Usually Single Gene**	**Syndromic**
Dilated (DCM)	LV/RV dilation with minimal or no wall thickening	Reduced contractility is the primary defect; variable degree of diastolic dysfunction	Myocyte hypertrophy; scattered fibrosis	Hypertension; alcohol use; thyrotoxicosis, myxedema; persistent tachycardia; toxins, e.g., chemotherapy, especially anthracyclines; radiation; pregnancy	Diverse gene ontology with >30 genes implicated	Diverse array of associated conditions, especially muscular dystrophies (MDs): Emery-Dreifuss MD, limb-girdle MD, Duchenne/Becker MD; Laing distal myopathy; Barth syndrome; Kearns-Sayre; others
Restrictive (RCM)	Usually normal chamber sizes; minimal wall thickening	Contractility normal or near-normal with a marked increase in end-diastolic filling pressure	Specific to type, diagnosis: amyloid, iron, glycogen storage disease, others	Endomyocardial fibrosis, amyloid, sarcoid, scleroderma, Churg-Strauss syndrome, cystinosis, lymphoma, pseudoxanthoma elasticum, hypereosinophilic syndrome, carcinoid	If not associated with a systemic genetic disease (e.g., hemochromatosis), genetic cause found most commonly to result from sarcomeric gene mutations	Gaucher disease, hemochromatosis, Fabry disease, familial amyloidosis. Mucopolysaccharidoses, Noonan syndrome
Hypertrophic (HCM)	Usually normal or reduced internal chamber dimension; wall thickening pronounced, especially septal hypertrophy	Systolic function increased or normal	Myocyte hypertrophy, classically with disarray	Severe hypertension can confound clinical, morphologic diagnosis	Mutations of genes encoding sarcomeric proteins	Noonan/Leopard, Danon, Fabry, WPW, Friedrich ataxia, MERRF, MELAS
Arrhythmogenic cardiomyopathy (ACM)	Scattered fibrofatty infiltration, classically of the right ventricle but also commonly involving the left ventricle; RV dilation, LV dilation, or both are common although not universal	Ventricular arrhythmias (VT, VF) early or late, reduced contractility with progressive disease; can mimic DCM	Islands of fatty replacement; fibrosis	Palmoplantar keratoderma, wooly hair in Naxos syndrome	Mutations of genes encoding proteins of the desmosome	Naxos syndrome
Left ventricular noncompaction (LVNC)	Ratio of noncompacted to compacted myocardium increased; normal chamber dimensions varying to a DCM phenotype	Normal to reduced systolic function	Myocardium normal and ranging to findings consistent with other coexisting cardiomyopathy	Phenotype has been observed in the setting of other types of cardiomyopathy	Various cardiomyopathy genes associated but uncertain whether genetic cause or developmental defect during organogenesis; see text	
Infiltrative	Usually thickened walls; occasional dilation	Restrictive physiology; systolic function usually mildly reduced	Specific to type, diagnosis: amyloid, iron, glycogen storage disease, others		See RCM above	See RCM above
Inflammatory	Normal or dilated without hypertrophy	Reduced systolic function	Inflammatory infiltrates	Hypereosinophilic syndrome (see text), acute myocarditis		
Ischemic	Normal or dilated without hypertrophy	Reduced systolic function	Areas of infarcted myocardium	Hypercholesterolemia, hypertension, diabetes, cigarette smoking, family history	Familial hypercholesterolemia; other heritable lipid disorders	Familial hypercholesterolemia
Infectious		Normal or dilated without hypertrophy	Reduced systolic function	Specific to infection	Viral (especially acute myocarditis); protozoal (e.g., Chagas); bacterial, direct infection (e.g., Lyme disease), or from acute cellular toxicity as a result of systemic toxins (*Streptococcus*, gram-negatives, etc.)	Genetic predisposition to infection and/or variable response to infective agent

LV, Left ventricle; *MELAS,* mitochondrial encephalopathy, lactic acidosis, and stroke-like symptoms; *MERRF,* myoclonic epilepsy associated with ragged red fibers; *RV,* right ventricle; *VF,* ventricular fibrillation; *VT,* ventricular tachycardia.

TABLE 11 Etiologies and Clinical Features of Different Causes of Impaired Consciousness

	Etiology	Clinical Features for Differential Diagnosis
Supratentorial lesion	• Destructive: ischemic infarct, hemorrhage (SAH, SDH, ICH) • Compressive lesion: ischemic infarct, hemorrhage, aneurysm, vascular malformation, tumor, venous thrombosis, abscess • Head injury, concussion	• Initial focal cerebral dysfunction • Dysfunction progresses rostral to caudal • Signs reflect cortical dysfunction, often multifocal • Often asymmetric cortical involvement and presentation
Infratentorial lesion	• Destructive: ischemic infarct, hemorrhage (SAH, ICH) • Compressive lesion: ischemic infarct, hemorrhage, aneurysm, vascular malformation, tumor, venous thrombosis	• Symptoms of brainstem dysfunction or sudden onset coma (posturing) • Brainstem signs precede/accompany coma • Cranial nerve and oculovestibular dysfunction: ocular bobbing, vertical pendular oscillation (pons), monocular movement (midbrain) • Early onset of abnormal respiratory pattern
Diffuse brain lesion	• Traumatic brain injury • Anoxic injury • Toxic encephalopathy • Seizure, nonconvulsive, postictal • Primary neuronal disorder • Infectious encephalitis (prion disease, progressive leukoencephalopathy) • Inflammatory encephalitis (ADEM) • Vasculitis	• Often asymmetric in presentation • Focal signs depending on main brain lesion

Continued on next page

TABLE 11 Etiologies and Clinical Features of Different Causes of Impaired Consciousness—cont'd

	Etiology	Clinical Features for Differential Diagnosis
Metabolic coma	• Hypoglycemia • Nutritional (thiamine, niacin, pyridoxine, cyanocobalamin, folic acid), Wernicke encephalopathy • Hepatic encephalopathy • Uremia and dialysis • CO2 narcosis • Exocrine pancreatic encephalopathy • Endocrine: Addison disease, pheochromocytoma, diabetes • Paraneoplastic • Drug poisoning • Thermal injury • Electrolyte/acid-base imbalance	• Confusion/stupor precede motor signs • Motor signs usually symmetric • Pupil responses generally preserved • Myoclonus, asterixis, tremulousness, and generalized seizures common • Acid-base imbalance common with compensatory ventilator changes • Periodic alternating gaze deviation • Systemic: altered mental state with normal brainstem function (especially normal pupils). Possible triphasic waves on EEG • Stimulant-induced coma (cocaine, amphetamine, phencyclidine, tricyclic antidepressant) • Fever, mydriasis (except miosis with phencyclidine), and seizure • Sedatives (alcohol, benzodiazepine, barbiturates, antiepileptics) • Ataxia, impaired eye movements but normal pupils • Opiate-induced miosis
Psychiatric	• Conversion disorder • Depression • Psychosis—catatonia	• Forced eye closure • Pupils reactive or dilated, nonreactive • Unpredictable oculocephalic reflex: nystagmus on caloric test • Normal or inconsistent motor tone • No pathologic reflexes • Awake-pattern EEG

ADEM, Acute disseminated encephalomyelitis; *CO_2,* carbon dioxide; *EEG,* electroencephalogram; *ICH,* intracranial hematoma; *SAH,* subarachnoid hemorrhage; *SDH,* subdural hematoma.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 5, Philadelphia, 2019, Elsevier.

TABLE 12 Types of Brain Herniation Syndromes

Syndrome	Mechanism	Imaging Findings	Clinical Presentation
Uncal	• Downward displacement of medial temporal lobe into the posterior fossa through the incisural opening • Seen in patients with unilateral hemispheric mass lesions	• Contralateral temporal horn widening • Ipsilateral ambient and prepontine cistern widening • Uncus extending into the suprasellar cistern	• Ipsilateral pupil dilation and ophthalmoplegia • Contralateral or ipsilateral hemiparesis • Decerebrate posturing
Central (transtentorial)	• Downward displacement of cerebral hemispheres and basal nuclei compressing and displacing diencephalon and midbrain rostrocaudally through the tentorial notch	• Effacement of the sulci • Obliteration of the suprasellar cistern • Compression and posterior displacement of the quadrigeminal cistern	• Medium-sized, fixed pupils • Early coma • Decorticate posturing • Cheyne-Stokes respiration • Diabetes insipidus
Cingulate (subfalcine)	• Lateral displacement of the cingulate gyrus under the anterior falx	• Attenuation of ipsilateral aspect of frontal horn • Asymmetric anterior falx • Obliteration of ipsilateral atrium of lateral ventricle • Septum pellucidum shift	• Small reactive pupils • Headache • Contralateral leg paralysis
Ascending	• Infratentorial mass effect protruding through the tentorial opening compressing the midbrain and cerebellar structures at the tentorial edges	• Spinning top appearance of midbrain • Narrowing of bilateral ambient and quadrigeminal cisterns	• Progressive stupor • Nausea and vomiting
Tonsillar	• Cerebellar tonsils protruding into the foramen magnum compressing adjacent medulla and upper cervical cord	• Cerebellar tonsils at the level of the dens on axial view and 5 mm below foramen magnum on sagittal view (7 mm in children)	• Cushing triad • Coma • Bilateral arm dysesthesia

From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 5, Philadelphia, 2019, Elsevier.

TABLE 13 Neuroimaging and Electrophysiologic Techniques and Findings in Disorders of Consciousness

Technique	Measurement	Strengths	Limitations	Vegetative State	Minimally Conscious State	Comatose
FDG-PET	Metabolic	Relatively direct measure of neuronal energy use (glucose uptake)	Ionizing (limited repeated measures)	Voxel-based: Hypometabolism in lateral and medial frontoparietal cortices	Metabolic dysfunction in left hemisphere	
Functional MRI	CBF	High-resolution structural imaging of grey-white matter (DTI) and functional imaging (spectroscopy, resting, passive, and active CBF paradigms)	Sensitive to movement artifacts requiring sedation/anesthesia Incompatible with ferromagnetic material (deprivation, pumps, electrodes)	Activation fMRI: Low-level cortical activation DMN—partially preserved	Activation fMRI: Near-normal high-level cortical activation	
EEG/ERPs	Electrical	Repeatable, portable, and inexpensive	Muscle, eye, and dysautonomia artifacts Challenging source reconstruction		EEG: slow-wave activity through night and periods of REM sleep	ERP-poor outcome with absence of a cortical response to electrical stimulation of median nerves
EEG-TMS	Electrical	Stereotaxic stimulation connectivity studies	Stimulation areas are limited by muscle artifacts	TMS triggers a simple, local EEG response similar to deep sleep/anesthesia	Complex activations in distant cortical areas	

CBF, Cerebral blood flow; *DMN,* default model network; *DTI,* diffuse tensor imaging; *EEG,* electroencephalogram; *ERPs,* event-related potentials; *FDG,* ^{18}F-fluorodeoxyglucose; *fMRI,* functional magnetic resonance imaging; *REM,* rapid eye movement; *TMS,* transcranial magnetic stimulation.

From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 5, Philadelphia, 2019, Elsevier.

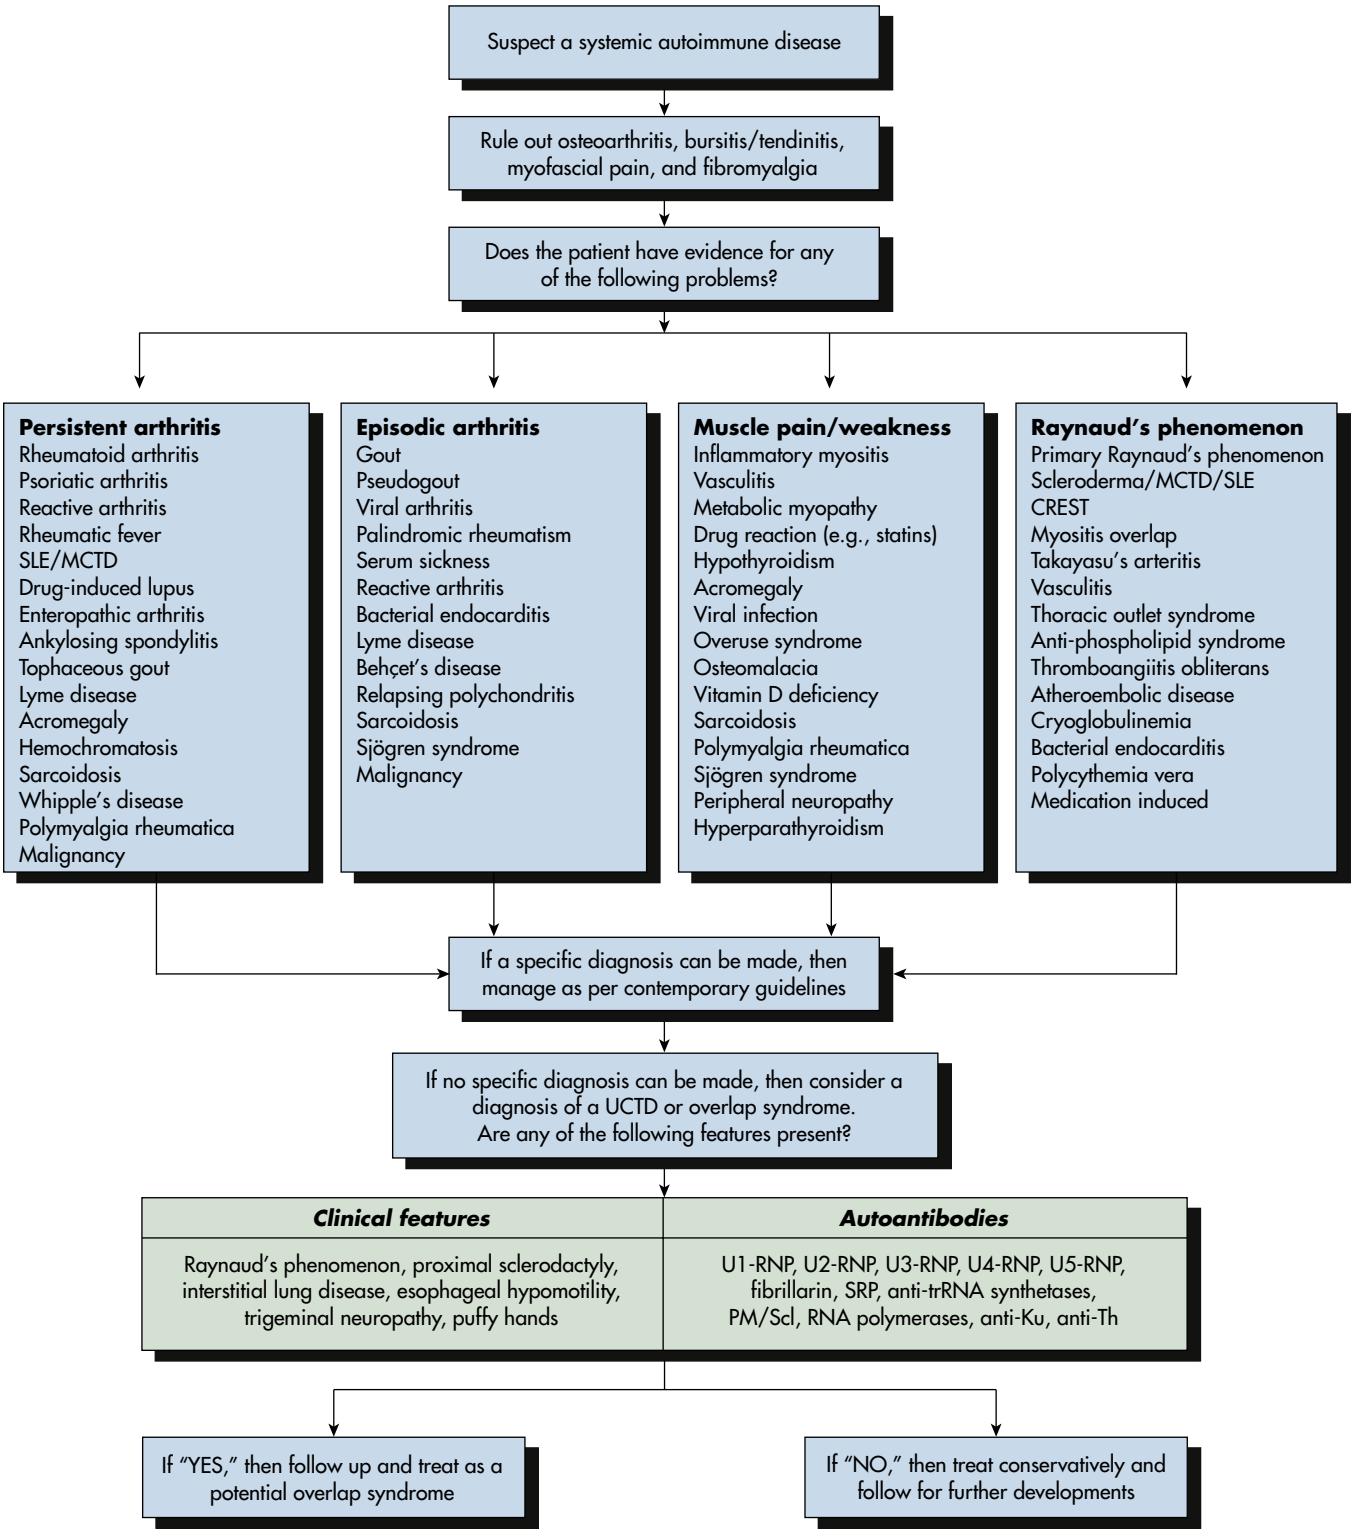

FIG. 53 Algorithm for evaluating patients with undifferentiated connective tissue disease *(UCTD).* *CREST,* Calcinosis, Raynaud phenomenon, esophageal dysmotility, sclerodactyly, and telangiectasia; *MCTD,* mixed connective tissue disease; *PM/Scl,* polymyositis/scleroderma; *SLE,* systemic lupus erythematosus; *SRP,* signal recognition particle. (From Firestein GS, Budd RC, Gabriel SE et al: *Kelley and Firestein's textbook of rheumatology,* ed 10, Philadelphia, 2017, Elsevier.)

CONNECTIVE TISSUE LABORATORY SCREENING TESTS

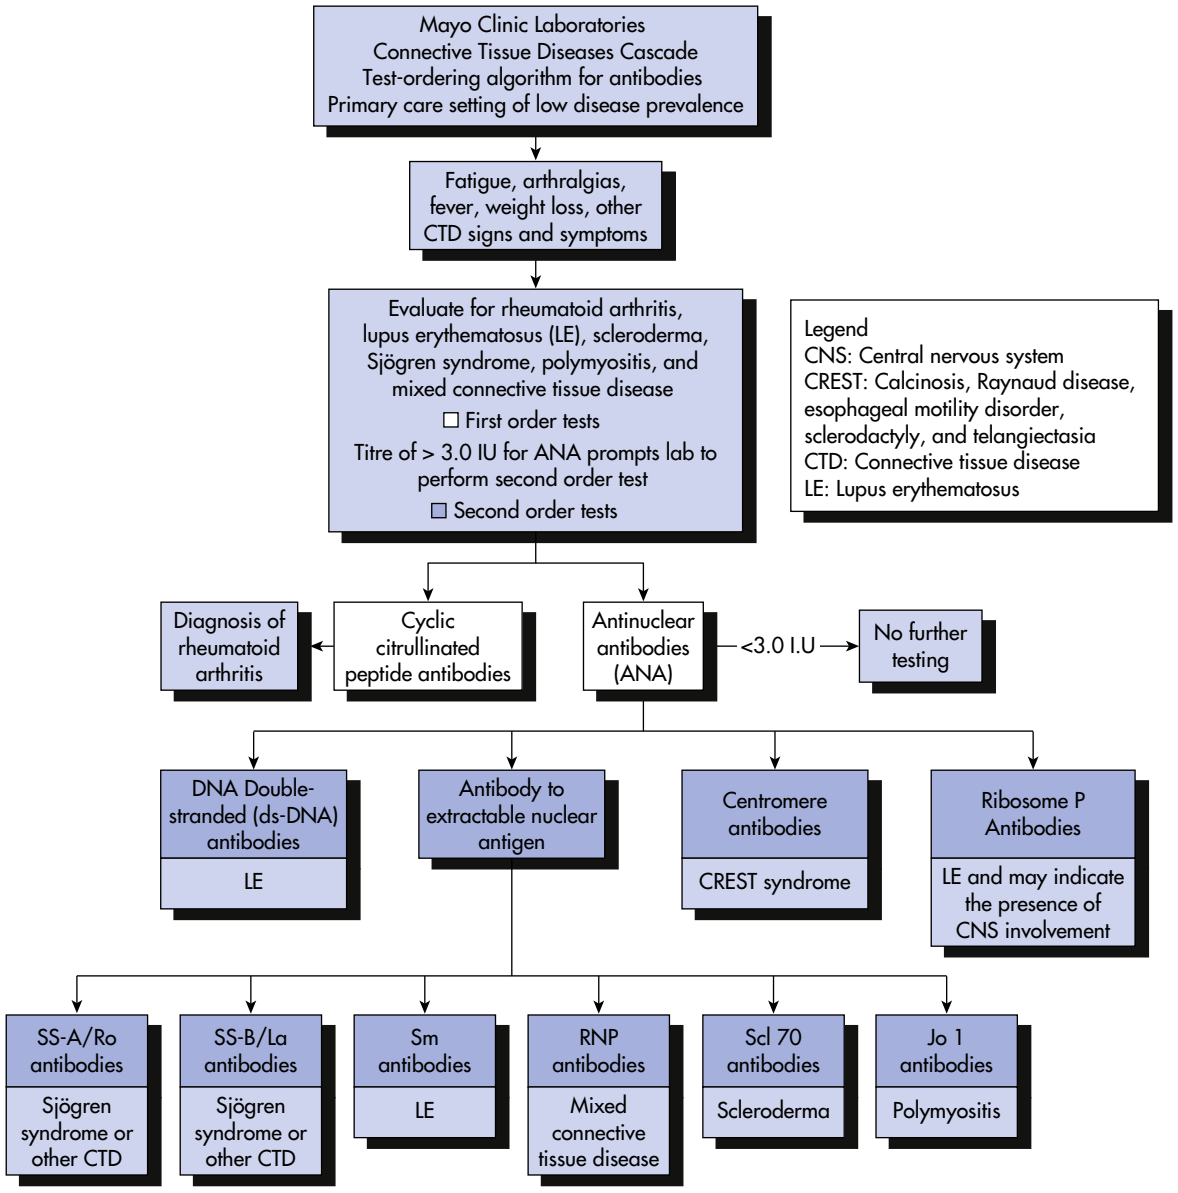

FIG. 54 Subacute cutaneous lupus erythematosus. Papulosquamous pattern. Lesions are confined to exposed areas on the upper half of the body. (From Habif TP: *Clinical dermatology, a color guide to diagnosis and therapy*, ed 6, Philadelphia, 2016, Elsevier.)

TABLE 14 Autoantibody Tests for Connective Tissue Diseases

Antibody	Clinical Significance
Antinuclear antibodies	Screening for SLE and PSS
Centromere antibodies	Marker for CREST
Histone antibodies	To exclude drug-induced LE
ENA: Sm antibodies	Marker for SLE
RNP antibodies	SLE, MCTD, scleroderma
SS-A (Ro)/SS-B (La) antibodies	SLE, Sjögren syndrome, SCLE, and others
Scl-70 antibodies	Marker for scleroderma
Jo-1 antibodies	Marker for polymyositis
Ku (Ki) antibodies	Polymyositis/scleroderma overlap, SLE
Phospholipid antibodies (lupus anticoagulant)	Marker for SLE subset with thrombosis: frequent aborters

CREST, Calcinosis, Raynaud phenomenon, esophageal dysmotility, sclerodactyly, and telangiectasia; *ENA,* extractable nuclear antigen; *LE,* lupus erythematosus; *MCTD,* mixed connective tissue disease; *PSS,* progressive systemic sclerosis; *RNP,* ribonucleoprotein; *SCLE,* subacute cutaneous lupus erythematosus; *SLE,* systemic lupus erythematosus.
From Habif TP: *Clinical dermatology, a color guide to diagnosis and therapy,* ed 6, Philadelphia, 2016, Elsevier.

ICD-10CM # Varies with specific diagnosis

TABLE 15 Diagnostic Significance of Immunologic Findings in Serum and Skin Biopsies in Connective Tissue Diseases

Disease	Biopsy Findings: Direct Immunofluorescence	Serum Findings	Relevance
Systemic LE	LE band (granular immune deposits, IgG, and/or IgM) IgA, C3 at DEJ in lesional and/or normal skin (over 90% in sun-exposed skin)	ANA elevated titers (about 95%-99%); nDNA antibodies about 50%-75%; DNP antibodies <50%; Sm antibodies in about 20%; RNP antibodies in about 5%-30%; SS-A antibodies in about 30%-40%; SS-B antibodies in about 1%-15%; phospholipid antibodies in about 30%-50%; PCNA antibodies in about 2%-10%; Ku(Ki) antibodies in about 10%	DIF, ANA, and ENA usually diagnostic; nDNA and Sm antibodies are diagnostic markers
Discoid LE	LE band, mostly IgG and C in lesion ONLY	Essentially negative; ANA titers usually in normal range	LE band highly characteristic
Subacute, cutaneous LE	LE band in lesion	ANA positive in 70%; SS-A (Ro) antibodies positive in more than 60%	DIF and anti–SS-A (Ro) highly characteristic
Neonatal LE	LE band in lesion (about 50%)	ANA positive in 30%; antibodies to SS-A (Ro) in 100%; antibodies to SS-B (La) in about 60%	DIF and anti–SS-A (Ro) highly characteristic
Drug-induced LE	LE band in lesion (rare)	ANA positive in more than 90%; histone positive about 90%; other antibodies to nDNA and ENA negative	DIF and histone antibodies in absence of other nuclear antibodies highly characteristic
Mixed connective tissue disease	Nuclear IgG or LE band in normal and/or lesional epidermis	Speckled ANA antibodies in more than 95% and RNP antibodies in more than 90%	Serology and/or DIF of nuclei diagnostic for MCTD, SLE, or PSS
Sjögren syndrome	Negative	ANA positive in about 55%; antibodies to SS-A (Ro) in 43%-88%; SS-B (La) in 14%-60%; RF positive	Positive serum results support diagnosis
Progressive systemic sclerosis (scleroderma)	Nucleolar IgG in epidermis in few cases; most negative	ANA (about 85%) speckled or nucleolar; centromere antibody in CREST (70%-90%); Scl-70 antibodies in diffuse sclerosis (45%) and in acrosclerosis (15%-20%)	DIF limited value; centromere antibodies are diagnostic marker in CREST; Scl-70 antibodies are diagnostic marker in scleroderma
Polymyositis/dermatomyositis	Negative	ANA usually positive (more than 80%); Jo-1 antibodies in 30% PM, 10% DM; SS-A (Ro) antibodies in 55% PM/scleroderma overlap; Ku (Ki) antibodies in 10% PM/scleroderma overlap	Limited value, but positive serum results support diagnosis
Rheumatoid arthritis	Negative	ANA usually negative or low titer; RF positive in about 90%; RNA positive in about 70%-90% and 95% of RF-negative cases	Positive serum results support diagnosis

ANA, Antinuclear antibodies; *CREST,* calcinosis, Raynaud phenomenon, esophageal dysmotility, sclerodactyly, and telangiectasia; *DEJ,* dermal-epidermal junction; *DIF,* direct immunofluorescence; *DM,* dermatomyositis; *DNP,* deoxyribonucleoprotein protein; *ENA,* extractable nuclear antigen; *LE,* lupus erythematosus; *MCTD,* mixed connective tissue disease; *PCNA,* proliferating cell nuclear antigen; *PM,* polymyositis; *PSS,* progressive systemic sclerosis; *RF,* rheumatoid factor; *RNA,* antibodies to rheumatoid arthritis-associated nuclear antigen; *RNP,* ribonucleoprotein; *SLE,* systemic lupus erythematosus.

From Habif TP: *Clinical dermatology, a color guide to diagnosis and therapy* ed 6, Philadelphia, 2016, Elsevier.

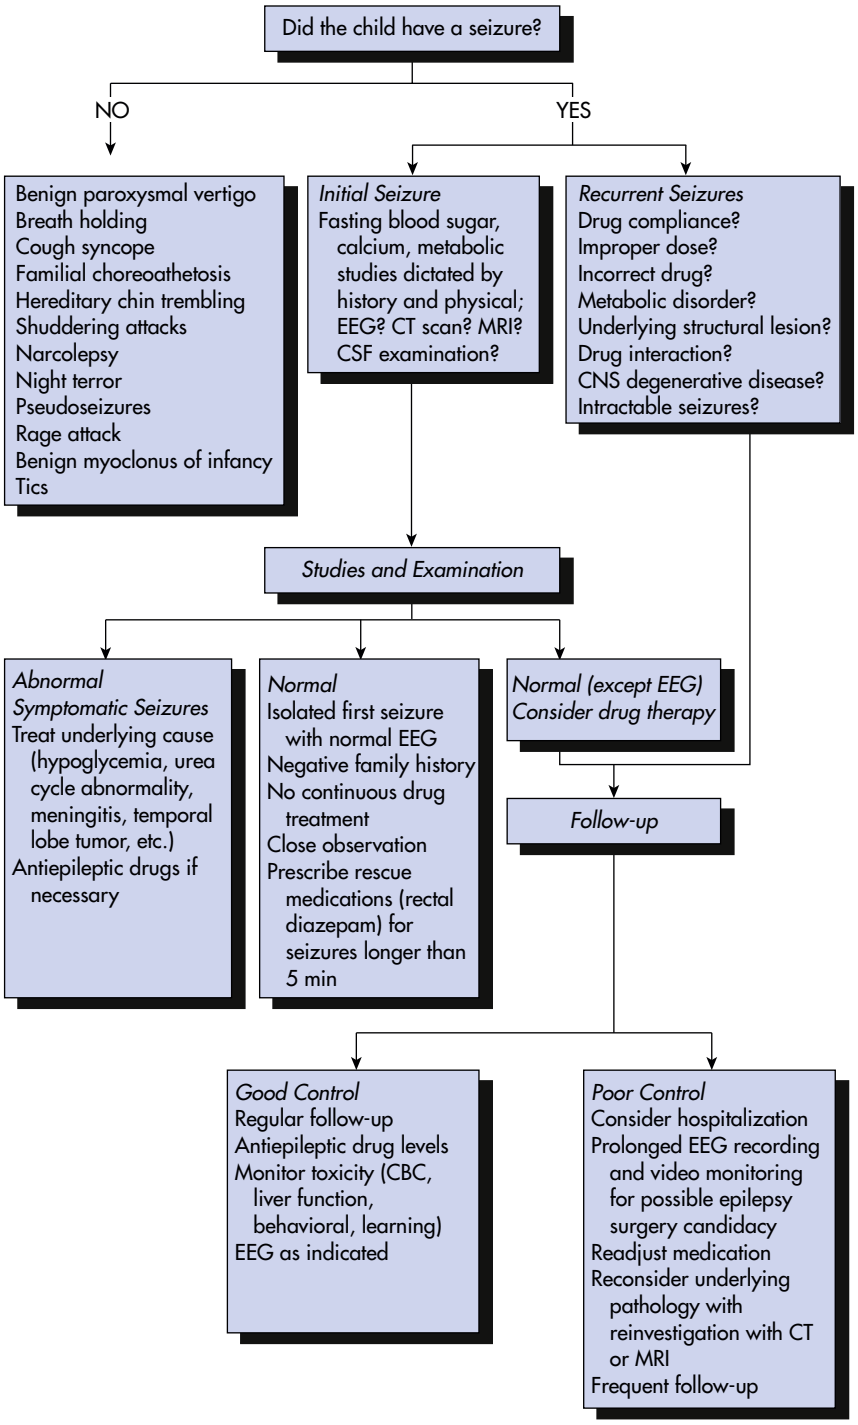

FIG. E55 Approach to the child with a suspected convulsive disorder. *CBC,* Complete blood count; *CNS,* central nervous system; *CSF,* cerebrospinal fluid; *CT,* computed tomography, *EEG,* electroencephalogram; *MRI,* magnetic resonance imaging. (From Kliegman RM et al: *Nelson textbook of pediatrics,* ed 20, Philadelphia, 2016, Saunders.)

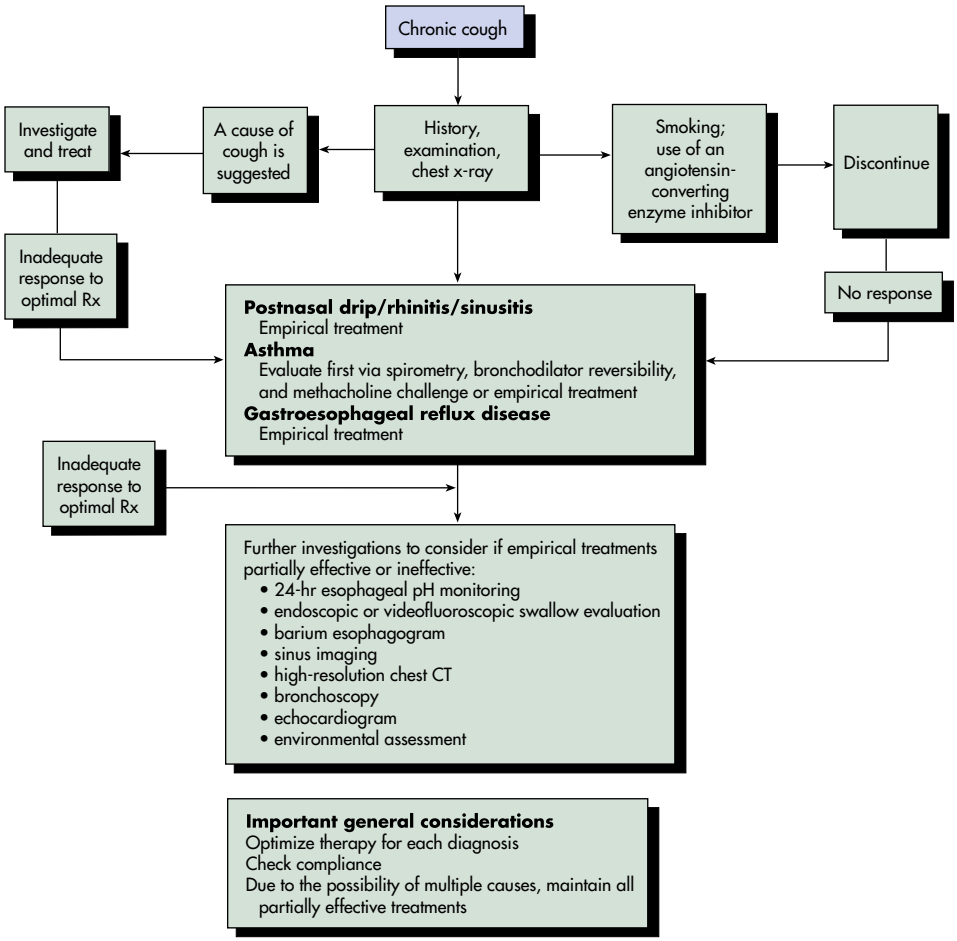

FIG. 56 Algorithm for the management of chronic cough lasting >8 weeks. *CT,* Computed tomography; *Rx,* prescription. (From Goldman L, Schafer AI: *Goldman's Cecil medicine,* ed 24, Philadelphia, 2012, Saunders.)

TABLE 16 Testing Characteristics of Diagnostic Protocol for Evaluation of Chronic Cough

Tests	Diagnosis	Positive Predictive Value (%)	Negative Predictive Value (%)
Sinus radiograph	Sinusitis	57-81	95-100
Methacholine inhalation challenge	Asthma	60-82	100
Modified barium esophagography	GERD, esophageal stricture	38-63	63-93
Esophageal pH*	GERD	89-100	>100
Bronchoscopy	Endobronchial mass/lesion	50-89	100

*24-Hour esophageal pH monitoring. *GERD,* Gastroesophageal reflux disease.
From Goldman L, Schafer AI [eds]: *Goldman's Cecil medicine,* ed 24, Philadelphia, 2012, Saunders.

TABLE 17 Definitions and Common Causes of Cough in Adults and Children

Age Group	Type of Cough	Duration	Common Causes
Adults	Acute	<3 weeks	Common cold Exacerbation of lung disease (e.g., asthma) Acute environmental exposure Acute cardiopulmonary disease
	Subacute	3-8 weeks	Postinfectious cough Pertussis infection Exacerbation of underlying lung disease (e.g., asthma, COPD, bronchiectasis)
	Chronic	>8 weeks	ACEI therapy Smoking/chronic bronchitis Underlying lung disease UACS Asthma NAEB GERD
Children	Acute	<4 weeks	Common cold Exacerbation of underlying lung disease Acute cardiopulmonary disease
	Chronic	>4 weeks	Asthma Protracted bacterial bronchitis Tracheobronchomalacia Chronic rhinosinusitis Recurrent aspiration GERD Underlying lung disease (e.g., bronchiectasis) Pulmonary infections (e.g., pertussis)

ACEI, Angiotensin-converting enzyme inhibitor; *COPD,* chronic obstructive pulmonary disease; *GERD,* gastroesophageal reflux disease; *NAEB,* nonasthmatic eosinophilic bronchitis; *UACS,* upper airway cough syndrome.
From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, Saunders.

BOX 13 Pitfalls and Errors in the Diagnosis and Management of Chronic Cough in Adults

General Considerations
- Failing to consider that UACS, asthma/NAEB, and/or GERD are likely when the chest radiograph is normal or near-normal in appearance and the patient is a nonsmoker and is not taking an ACEI
- Failing to include UACS, asthma/NAEB, and/or GERD in the differential diagnosis because clinical or radiographic evidence confirms the presence of an "obvious" cause of the patient's cough (e.g., solitary pulmonary nodule, idiopathic pulmonary fibrosis)
- Not recognizing multiple simultaneous causes of cough
- Failing to continue treatment trials long enough to accurately assess their effectiveness
- Prematurely diagnosing "unexplained" cough before a bronchoscopy has been performed to assess for unsuspected airway disease
- Mistakenly diagnosing "unexplained" cough or diagnosing psychogenic cough before a complete evaluation for cough has been performed

Upper Airway Cough Syndrome
- Failing to realize that UACS can manifest as cough productive of phlegm
- Not recognizing that chronic cough can be the sole manifestation of UACS in at least 20% of the cases
- Failing to consider sinusitis as a cause of UACS
- Mistakenly assuming that selective histamine H_1 receptor antagonists are effective in treating nonallergic causes of UACS
- Missing allergic rhinitis because symptoms are perennial
- Missing aspirin-exacerbated disease in a patient with nasal polyps

Asthma/NAEB
- Failing to realize that these conditions can sometimes manifest as cough productive of phlegm
- Not recognizing that chronic cough can sometimes be the sole manifestation of asthma (so-called cough variant asthma)
- Mistakenly assuming that a positive result on bronchial challenge (e.g., methacholine challenge) is diagnostic of asthma when it is merely *consistent* with the diagnosis
- Failing to consider NAEB when the bronchial challenge test yields a negative result
- Not recognizing that inhaled medications can sometimes provoke cough
- Failing to consider occupational and environmental causes of asthma/NAEB

Gastroesophageal Reflux Disease
- Failing to realize that GERD can sometimes manifest as cough productive of phlegm
- Not recognizing that chronic cough can sometimes be the sole manifestation of GERD (so-called silent GERD)
- Mistakenly concluding that cough cannot be due to GERD simply because cough does not resolve with relief of gastrointestinal symptoms
- Not considering nonacid reflux and mistakenly assuming that cough will always respond to acid suppression
- Failing to assess the adequacy of GERD treatment by using 24-hour monitoring of esophageal pH and impedance
- Not recognizing coexisting diseases (e.g., sleep apnea) and medications (e.g., nitrates, progesterone) that may impair the effectiveness of GERD treatment
- Failing to recognize that surgery may help when intensive medical therapy has failed

Angiotensin-Converting Enzyme Inhibitor
- Failing to consider ACEI therapy as a cause of chronic cough simply because the cough predated initiation of the ACEI
- Mistakenly concluding that ACEI therapy is not the cause of chronic cough because the cough did not resolve within 1 to 3 weeks of stopping the ACEI

ACEI, Angiotensin-converting enzyme inhibitor; *GERD,* gastroesophageal reflux disease; *NAEB,* nonasthmatic eosinophilic bronchitis; *UACS,* upper airway cough syndrome.
From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, Saunders.

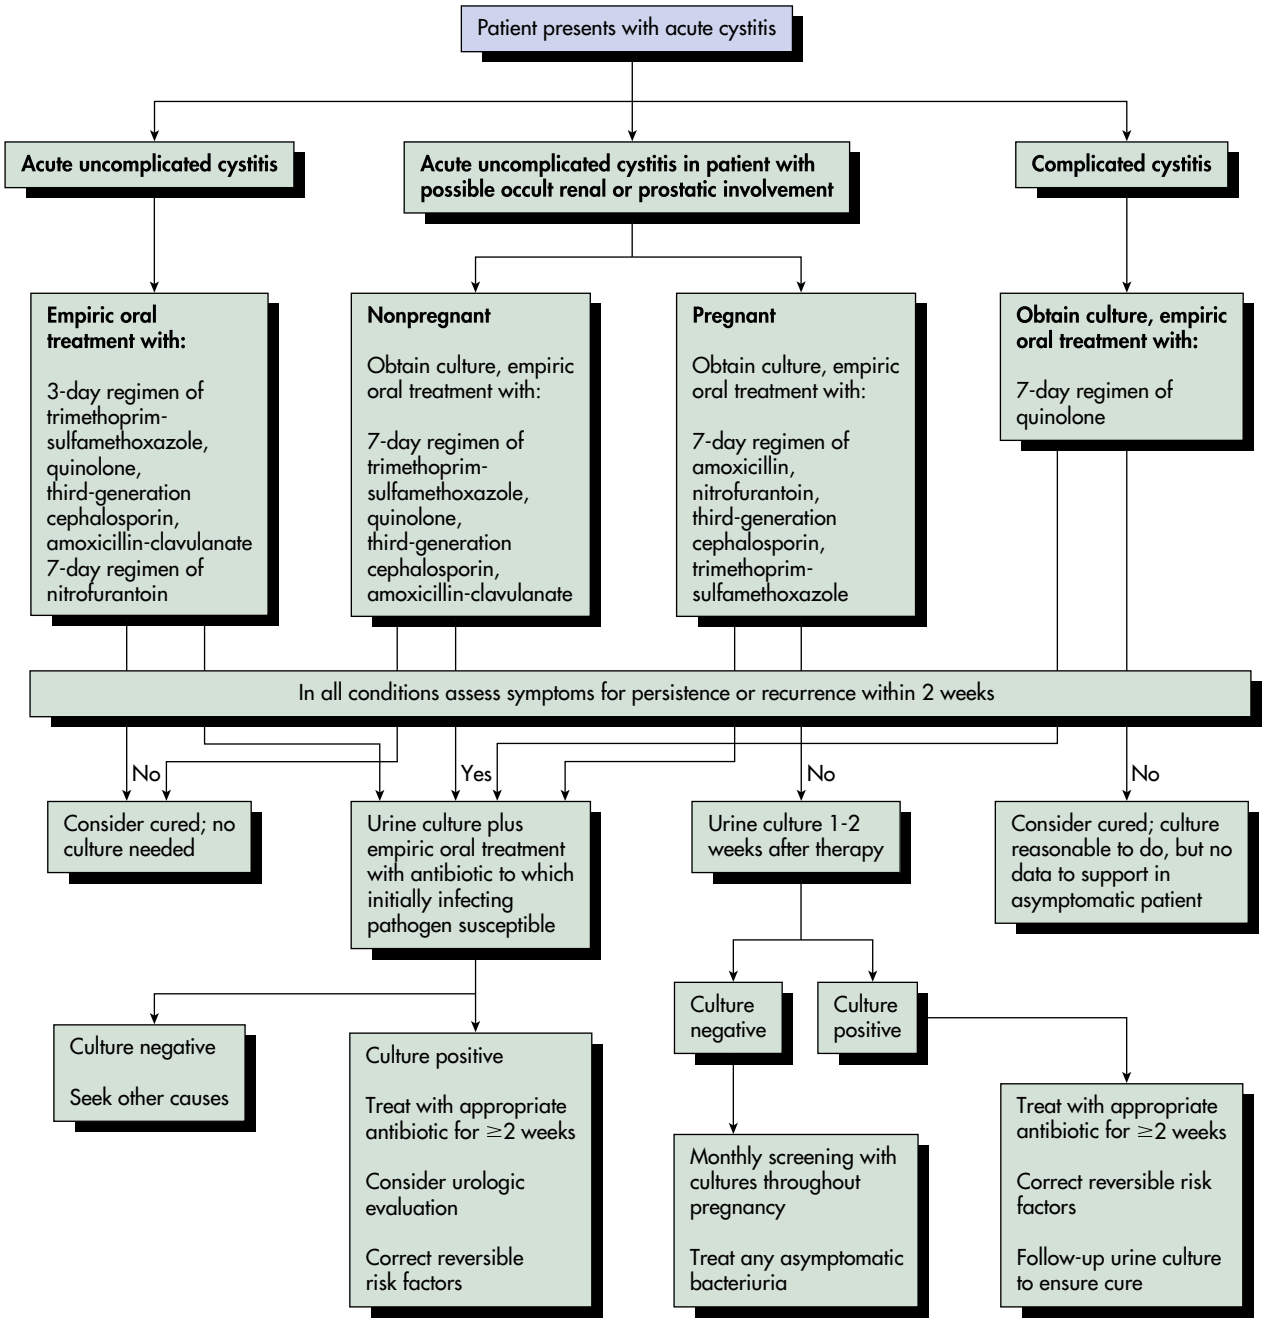

FIG. 57 Algorithm for management of acute cystitis based on severity and complicating factors. (From Johnson R et al: *Comprehensive clinical nephrology*, ed 5, Philadelphia, 2015, Saunders.)

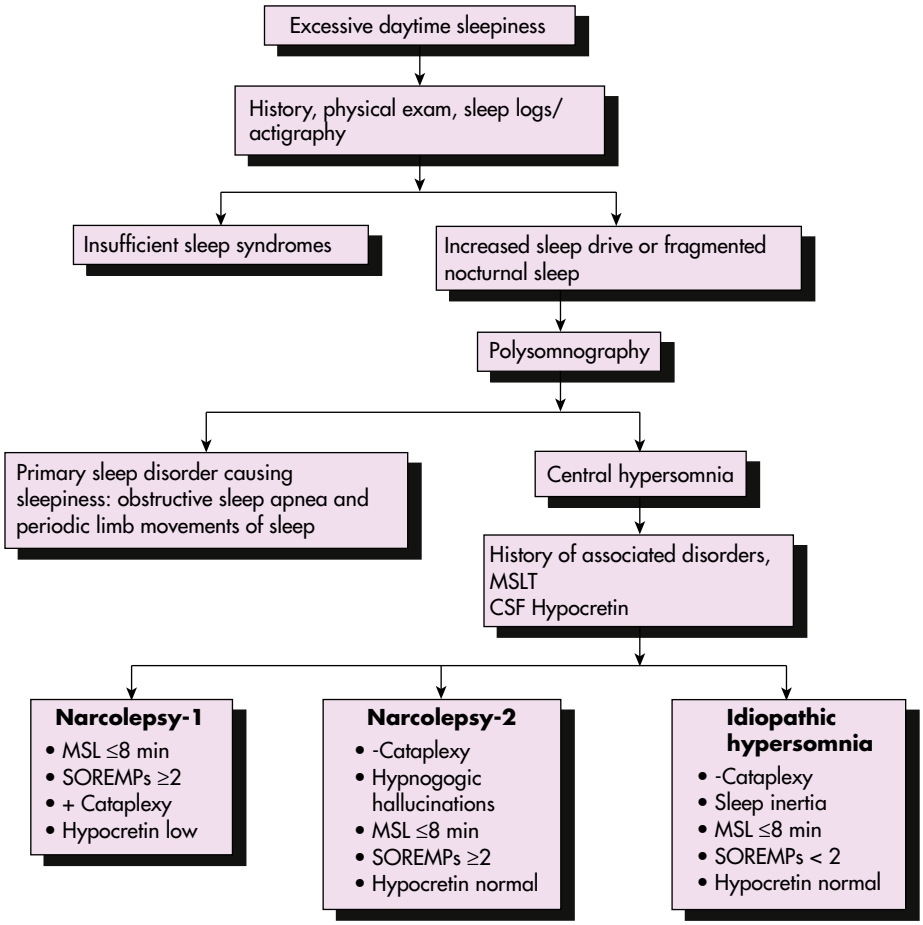

FIG. 58 Algorithm showing the approach in evaluation of children with excessive daytime sleepiness. *CSF,* Cerebrospinal fluid; *MSL,* mean sleep latency; *MSLT,* Multiple Sleep Latency Test; *SOREMPs,* sleep-onset rapid eye movement. (From Swaiman KF: *Swaiman's pediatric neurology, principles and practice,* ed 6, Philadelphia, 2017, Elsevier.)

TABLE 18 Etiologies of Excessive Sleepiness in Children

Insufficient Sleep	Increased Sleep Drive	Fragmented Nocturnal Sleep
Paradoxical insomnia	Central hypersomnias	Primary sleep disorder
Behaviorally induced insufficient sleep syndrome	Traumatic brain injury	GERD
Behavioral insomnia of children—sleep onset association type	Medications	Allergy, eczema
Behavioral insomnia of children—limit setting type	Infections	Asthma
Circadian rhythm sleep disorders	Metabolic disorders	Other medical disorders
Psychophysiological insomnia		Medications
Idiopathic insomnia		Illicit drugs, alcohol

GERD, Gastroesophageal reflux disease.
From Swaiman KF: *Swaiman's pediatric neurology, principles and practice,* ed 6, Philadelphia, 2017, Elsevier.

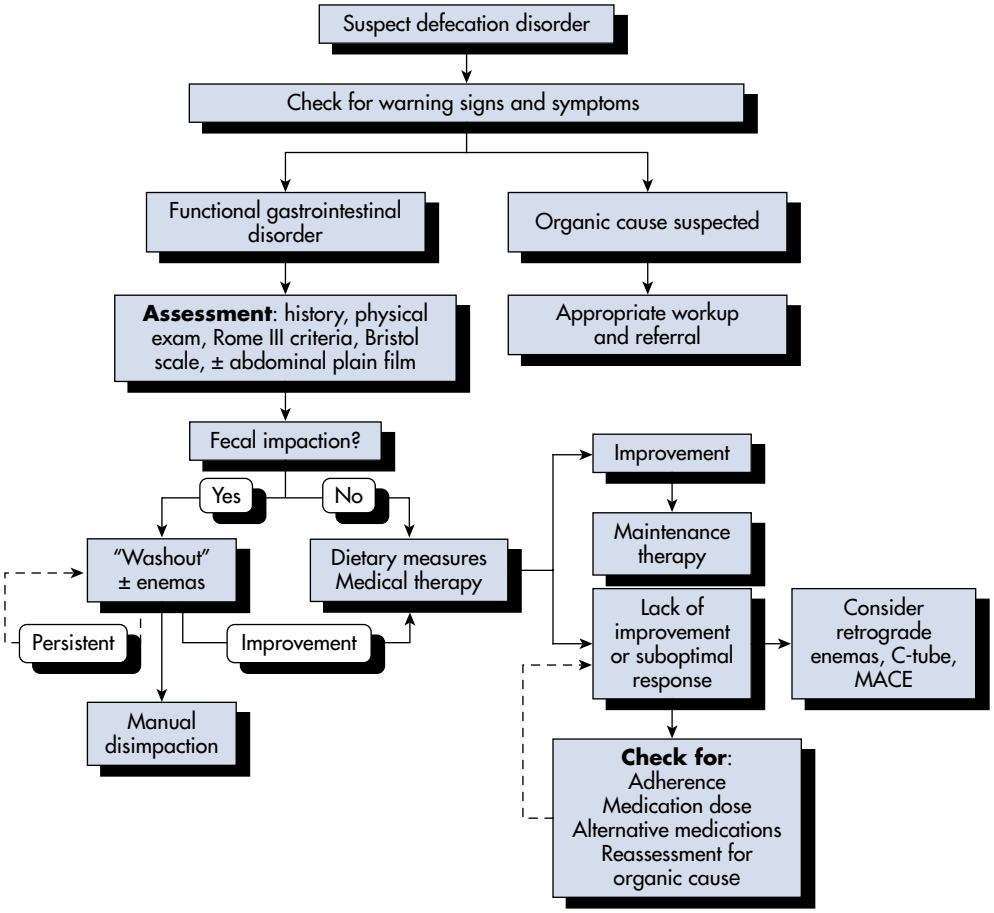

FIG. 59 Management algorithm for childhood defecation disorders seen in a pediatric urology practice. Lack of improvement or intractable constipation should be diagnosed based on worsening response, absence of response, or suboptimal response to adequate medical treatment for at least 3 months. *C-tube,* Cecostomy tube; *MACE,* Malone antegrade continence enema procedure. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

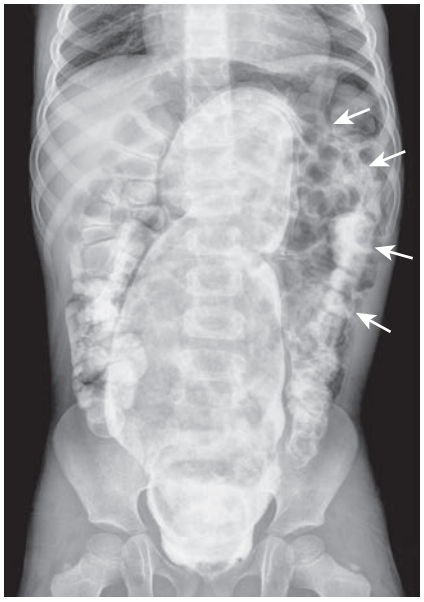

FIG. 60 Soluble contrast enema for evaluation of child with defecation problems since birth. Findings suggestive of Hirschsprung disease, including massively distended colon and rectum that can progress toward more normal-appearing large bowel *(arrows).* This child was subsequently assessed with a rectal biopsy to confirm the diagnosis. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

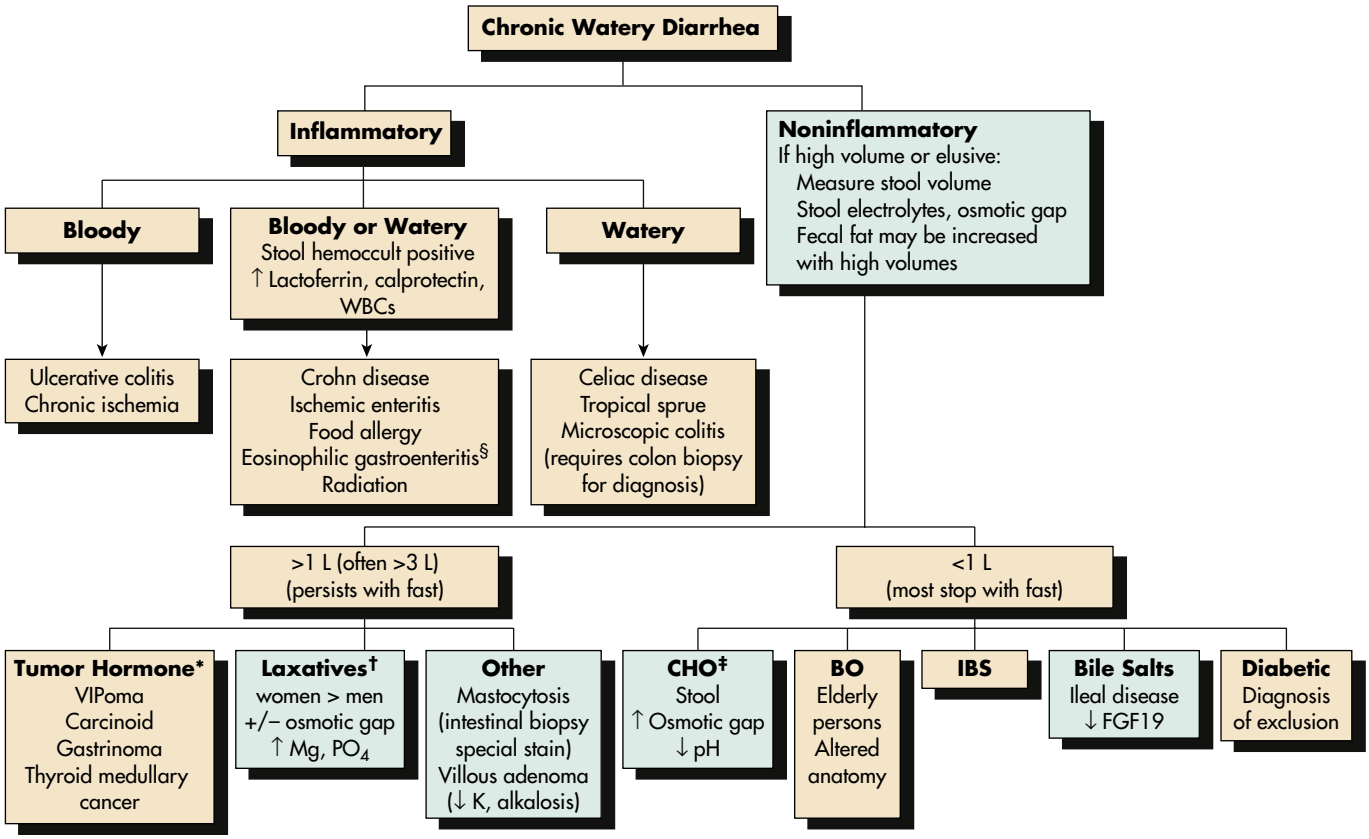

FIG. E61 Approach to the evaluation of watery diarrheas. Many diarrheas have more than one mechanism (e.g., osmotic, secretory, inflammatory). Other causes include medications, postsurgical (vagotomy, Nissan wrap, cholecystectomy), hyperthyroidism, and alcohol. *VIPoma: >3 L output daily "pancreatic cholera," elevated VIP level. Carcinoid: elevated urine 5-hydroxyindole acetic acid, positive OctreoScan. Gastrinoma (Zollinger-Ellison syndrome): elevated gastrin level, positive secretin stimulation test, diarrhea due to high volume of acid secretion. Thyroid medullary cancer: elevated calcitonin level. †May be high or low volume depending on dose ingested, may respond to fast. ‡Carbohydrate malabsorption (CHO) may be due to lactase deficiency, dietary fructose, sorbitol in diabetic candies or liquid medications. ‡Full-thickness biopsy may be needed for diagnosis. *BO,* Bacterial overgrowth; *FGF,* fibroblast growth factor; *IBS,* irritable bowel syndrome; *WBCs,* white blood cells. From Goldman L, Schafer AI: *Goldman Cecil medicine,* ed 25, Philadelphia, 2016, Saunders.

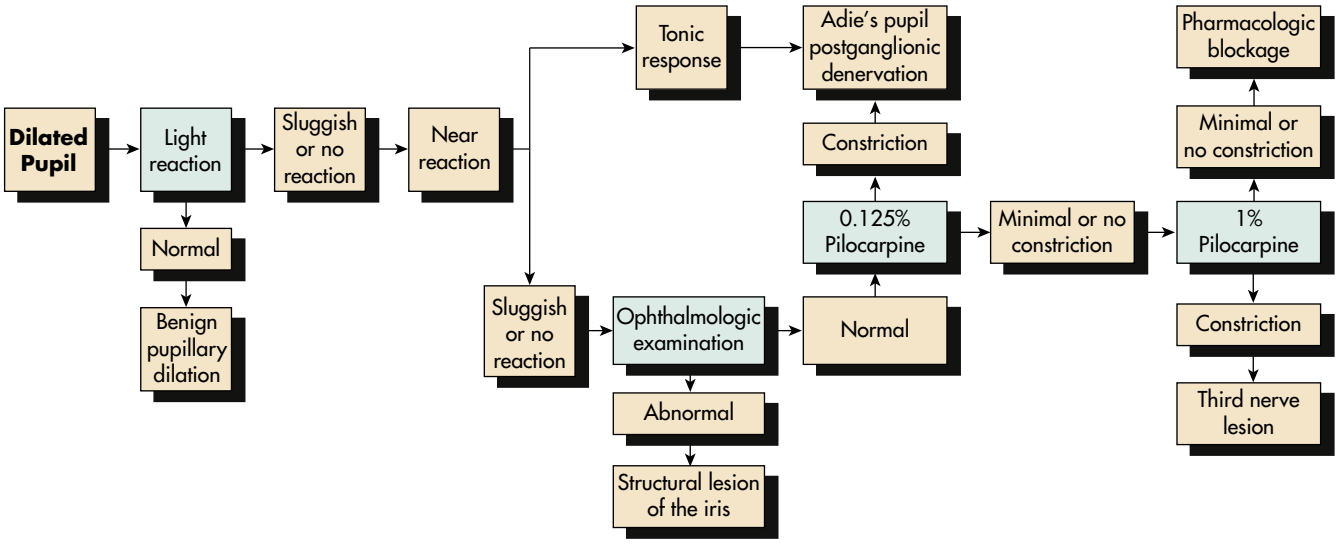

FIG. E62 Use of pilocarpine to help differentiate between different causes of a dilated pupil. (From Goldman L, Schafer AI: *Goldman Cecil medicine,* ed 25, Philadelphia, 2016, Saunders.)

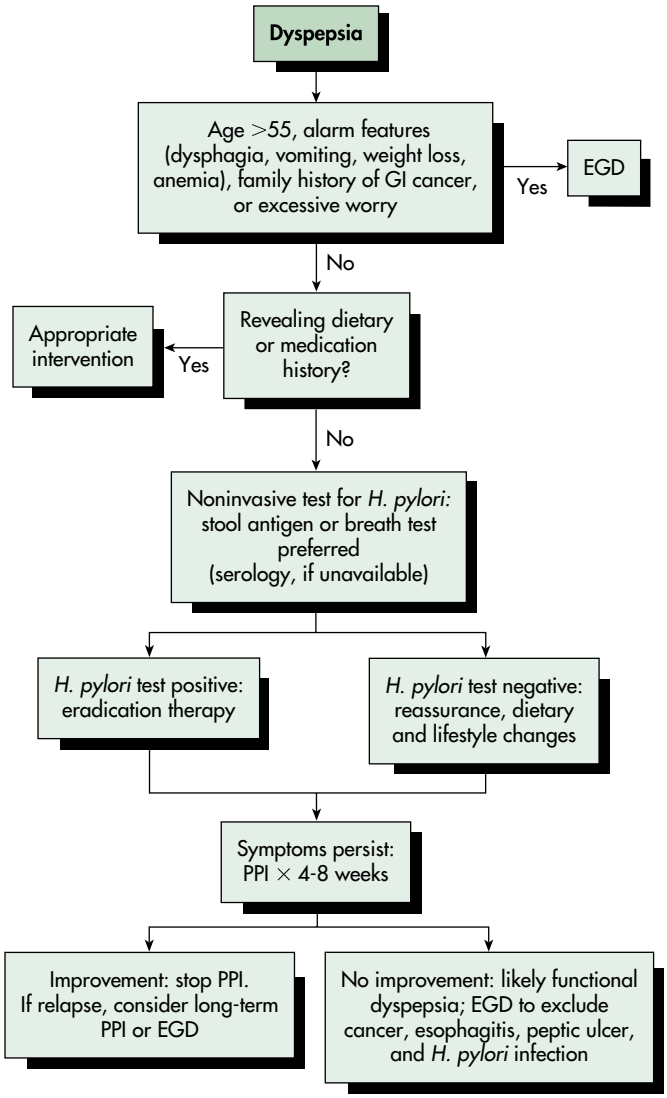

FIG. E63 Approach to the patient with dyspepsia. *EGD,* Esophagastroduodenoscopy; *GI,* gastrointestinal; *PPI,* proton pump inhibitor. (From Goldman L, Schafer AI: *Goldman's Cecil medicine,* ed 24, Philadelphia, 2012, Saunders.)

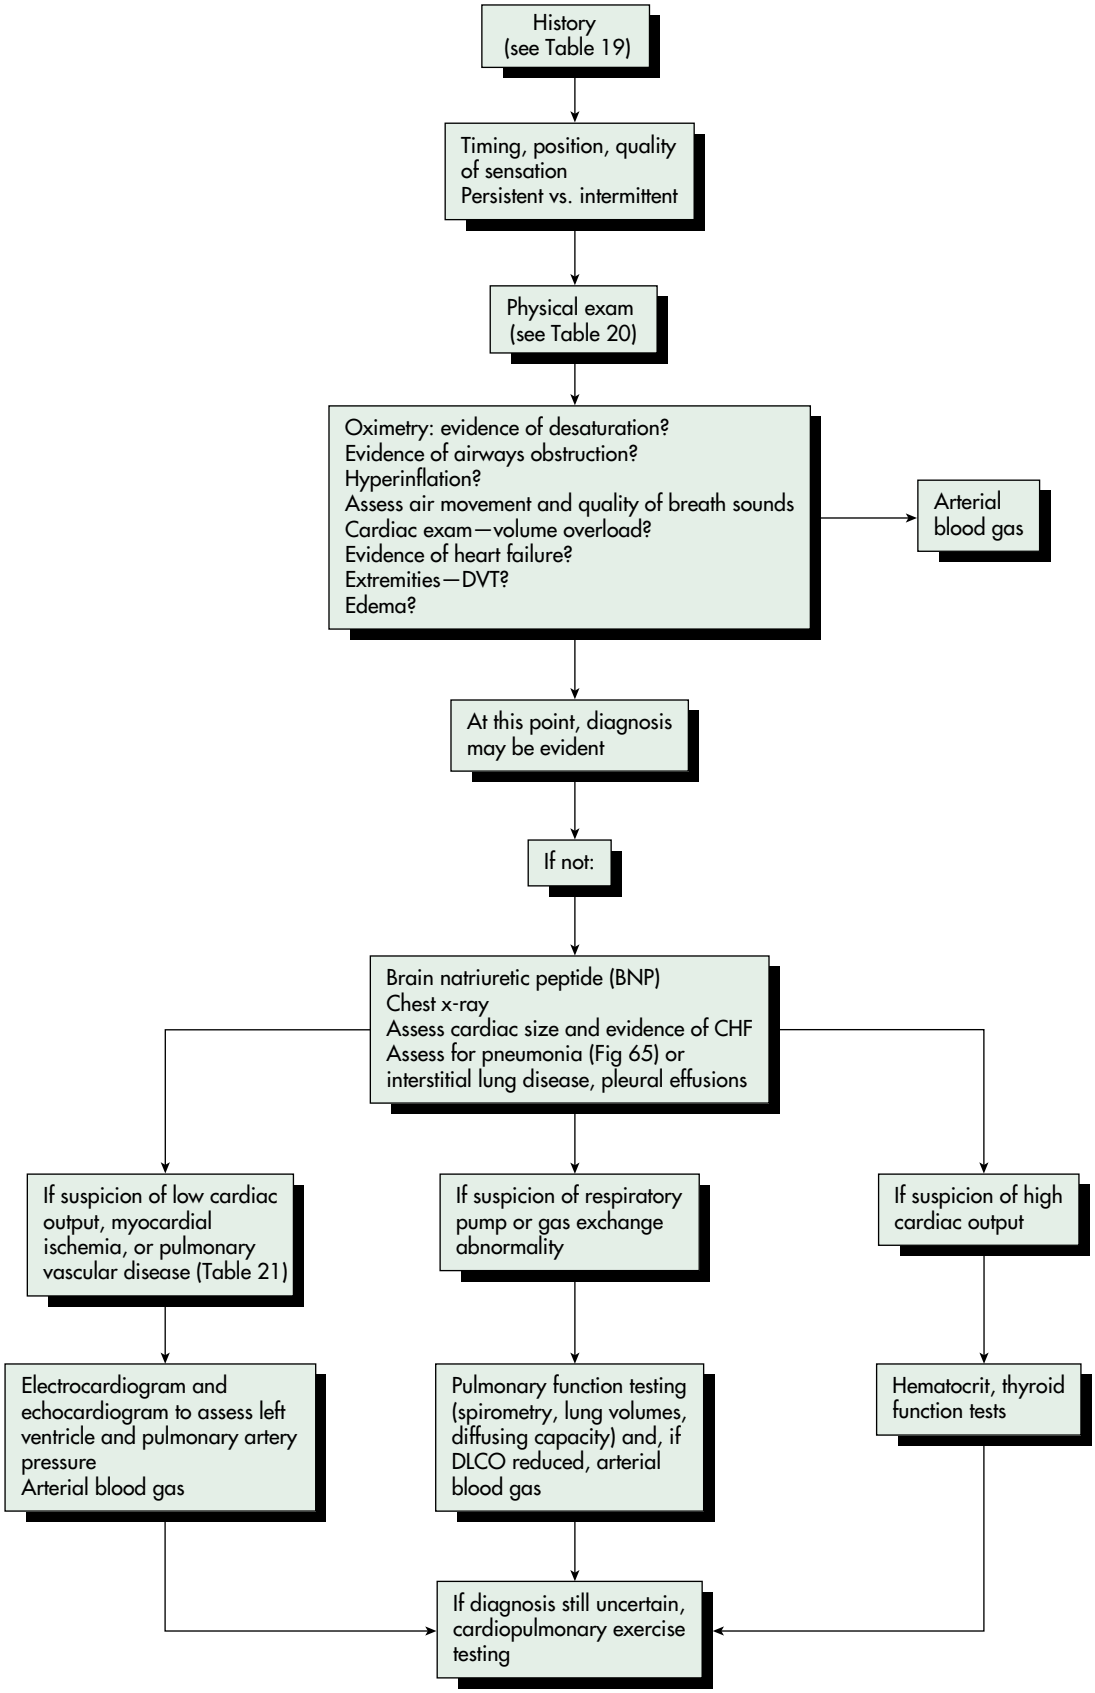

FIG. 64 Algorithm for the evaluation of the patient with dyspnea. The pace and completeness with which one approaches this framework depends on the intensity and acuity of the patient's symptoms. In a patient with severe, acute dyspnea, for example, an arterial blood gas measurement may be one of the first laboratory evaluations, whereas this measurement might not be obtained until much later in the workup in a patient with chronic breathlessness of unclear cause. A therapeutic trial of a medication, for example, a bronchodilator, may be instituted at any point if one is fairly confident of the diagnosis based on the data available at that time. *CHF,* Congestive heart failure; *DLCO,* diffusing capacity of the lung for carbon monoxide; *DVT,* deep venous thrombosis. (Modified from Schwartzstein RM, Feller-Kopman D: Approach to the patient with dyspnea. In Braunwald E, Goldman L [eds]: *Primary cardiology,* ed 2, Philadelphia, 2003, Saunders.)

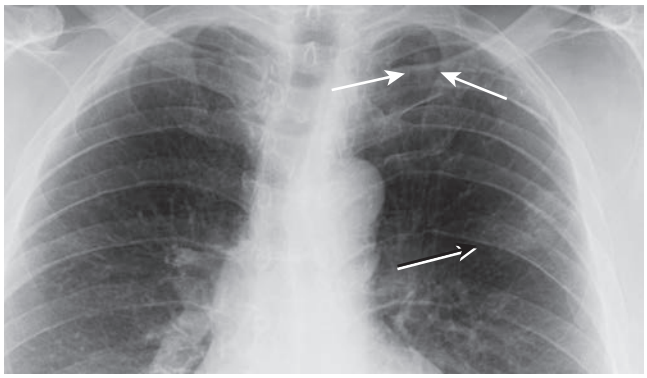

FIG. 65 Chest radiograph of a patient presenting with cough and fever. A faint area of opacification within the left midlung proved to be pneumonia *(black arrow)*. Additionally, a small left apical carcinoma was detected *(white arrows)*. Because of multiple overlying structures, including the first ribs and the clavicles, the pulmonary apices are a "danger" area in terms of risk of missed findings on chest radiographs. Close inspection of the apices is warranted on every chest radiograph. (From Soto JA, Lucey BC: *Emergency radiology: the requisites,* ed 2, Philadelphia, 2017, Elsevier.)

TABLE 19 Differential Diagnoses for Acute Dyspnea

Organ System	Critical Diagnoses	Emergent Diagnoses	Nonemergent Diagnoses
Pulmonary	Airway obstruction	Spontaneous pneumothorax	Pleural effusion
	Pulmonary embolus	Asthma	Neoplasm
	Noncardiogenic edema	Cor pulmonale	Pneumonia (CAP score ≤70)
	Anaphylaxis	Aspiration	COPD
	Ventilatory failure	Pneumonia (CAP score >70)	
Cardiac	Pulmonary edema	Pericarditis	Congenital heart disease
	Myocardial infarction		Valvular heart disease
	Cardiac tamponade		Cardiomyopathy
Primarily Associated with Normal or Increased Respiratory Effort			
Abdominal		Mechanical interference	Pregnancy
		Hypotension, sepsis from ruptured viscus, bowel obstruction, inflammatory or infectious process	Ascites obesity
Psychogenic			Hyperventilation syndrome
			Somatization disorder
			Panic attack
Metabolic or endocrine	Toxic ingestion	Renal failure	Fever
	DKA	Electrolyte abnormalities	Thyroid disease
		Metabolic acidosis	
Infectious	Epiglottitis	Pneumonia (CAP score >70)	Pneumonia (CAP score ≤70)
Traumatic	Tension pneumothorax	Simple pneumothorax, hemothorax	Rib fractures
	Cardiac tamponade	Diaphragmatic rupture	
	Flail chest		
Hematologic	Carbon monoxide poisoning	Anemia	
	Acute chest syndrome		
Primarily Associated with Decreased Respiratory Effort			
Neuromuscular	CVA, intracranial insult	Multiple sclerosis	ALS
	Organophosphate poisoning	Guillain-Barré syndrome	Polymyositis
		Tick paralysis	Porphyria

ALS, Amyotrophic lateral sclerosis; *CAP,* community-acquired pneumonia; *COPD,* chronic obstructive pulmonary disease; *CVA,* cerebrovascular accident; *DKA,* diabetic ketoacidosis.
From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.

TABLE 20 Pivotal Findings in Physical Examination

Sign	Physical Finding	Diagnoses to Consider
Vital signs	Tachypnea	Pneumonia, pneumothorax
	Hypopnea	Intracranial insult, drug or toxin ingestion
	Tachycardia	PE, traumatic chest injury
	Hypotension	Tension pneumothorax
	Fever	Pneumonia, PE
General appearance	Cachexia, weight loss	Malignancy, acquired immune disorder, mycobacterial infection
	Obesity	Hypoventilation, sleep apnea, PE
	Pregnancy	PE
	Barrel chest	COPD
	"Sniffing" position	Epiglottitis
	"Tripoding" position	COPD or asthma with severe distress
	Traumatic injury	Pneumothorax (simple, tension), rib fractures, flail chest, hemothorax, pulmonary contusion
Skin and nails	Tobacco stains or odor	COPD, malignancy, infection
	Clubbing	Chronic hypoxia, intracardiac shunts, or pulmonary vascular anomalies
	Pallid skin or conjunctivae	Anemia
	Muscle wasting	Neuromuscular disease
	Bruising	Chest wall: rib fractures, pneumothorax
		Diffuse: thrombocytopenia, chronic steroid use, anticoagulation
	Subcutaneous emphysema	Rib fractures, pneumothorax, tracheobronchial disruption
	Hives, rash	Allergic reaction, infection, tick-borne illness
Neck	Stridor	Upper airway edema or infection, foreign body, traumatic injury, anaphylaxis
	JVD	Tension pneumothorax, COPD or asthma exacerbation, fluid overload or CHF, PE
Lung examination	Wheezes	CHF, anaphylaxis
		Bronchospasm
	Rales	CHF, pneumonia, PE
	Unilateral decrease	Pneumothorax, pleural effusion, consolidation, rib fractures or contusion, pulmonary contusion
	Hemoptysis	Malignancy, infection, bleeding disorder, CHF
	Sputum production	Infection (viral, bacterial)
	Friction rub	Pleurisy
	Abnormal respiratory pattern (e.g., Cheyne-Stokes)	Intracranial insult
Chest examination	Crepitance or pain on palpation	Rib or sternal fractures
	Subcutaneous emphysema	Pneumothorax, tracheobronchial rupture
	Thoracoabdominal desynchrony	Diaphragmatic injury with herniation; cervical spinal cord trauma
	Flail segment	Flail chest, pulmonary contusion
Cardiac examination	Murmur	PE
	S_3 or S_4 gallop	PE
	S_2 accentuation	PE
	Muffled heart sounds	Cardiac tamponade
Extremities	Calf tenderness, Homans sign	PE
	Edema	CHF
Neurologic examination	Focal deficits (motor, sensory, cognitive)	Stroke, intracranial hemorrhage causing central abnormal respiratory drive; if long-standing, risk of aspiration pneumonia
	Symmetrical deficits	Neuromuscular disease
	Diffuse weakness	Metabolic or electrolyte abnormality (hypocalcemia, hypomagnesemia, hypophosphatemia), anemia
	Hyporeflexia	Hypermagnesemia
	Ascending weakness	Guillain-Barré syndrome

CHF, Congestive heart failure; *COPD,* chronic obstructive pulmonary disease; *JVD,* jugular venous distention; *PE,* pulmonary embolism.
From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.

TABLE 21 Diagnostic Table: Patterns of Diseases Often Resulting in Dyspnea

Disease	History (Dyspnea)	Associated Symptoms	Signs and Physical Findings	Tests
Pulmonary embolism	• HPI: abrupt onset, pleuritic pain, immobility (travel, recent surgery) • PMH: malignancy, DVT, PE, hypercoagulability, oral contraception, obesity	Diaphoresis, exertional dyspnea	Tachycardia, tachypnea, low-grade fever	• Pulse oximetry, ABG (A-a gradient), D-dimer • ECG (dysrhythmia, right-sided heart strain) • CXR (Westermark sign, Hampton hump), spiral CT, MRV • Pulmonary angiogram • Ultrasound positive for DVT
Pneumonia	Fever, productive cough, chest pain	Anorexia, chills, nausea, vomiting, exertional dyspnea, cough	Fever, tachycardia, tachypnea, rales, or decreased breath sounds	CXR, CBC, sputum and blood cultures
Bacterial	SH: tobacco use			Pulse oximetry Waveform capnography if altered mental status, ABG if capnography unavailable and acid-base derangement or hypercarbia suspected
Viral	Exposure (e.g., influenza, varicella)			
Opportunistic	Immune disorder, chemotherapy			
Fungal or parasitic	Exposure (e.g., birds), indolent onset	Episodic fever, nonproductive cough		
Pneumothorax	Abrupt onset: trauma, chest pain, thin males more likely to have spontaneous pneumothorax	Localized chest pain	Decreased breath sounds, subcutaneous emphysema, chest wall wounds or instability	• CXR: pneumothorax, rib fractures, hemothorax • Ultrasound: pneumothorax, pleural effusion
Simple				Ultrasound positive for pneumothorax
Tension	Decompensation of simple pneumothorax	Diaphoresis	JVD, tracheal deviation, muffled heart sounds, cardiovascular collapse	Clinical diagnosis: requires immediate decompression. May verify via bedside ultrasound
COPD or asthma	Tobacco use, medication noncompliance, URI symptoms, sudden weather change	Air hunger, diaphoresis	• Retractions, accessory muscle use, tripoding, cyanosis • "Shark fin" capnograph	• CXR: rule out infiltrate, pneumothorax, atelectasis (mucus plug) • Ultrasound: distinguish from heart failure
	PMH: environmental allergies FH: asthma			Waveform capnography
Malignancy	Weight loss, tobacco, or other occupational exposure	Dysphagia	Hemoptysis	CXR, chest CT: mass, hilar adenopathy, focal atelectasis
Fluid overload	• Gradual onset, dietary indiscretion or medication noncompliance, chest pain • PMH: recent MI, diabetes, CHF	Worsening orthopnea, PND	JVD, peripheral edema, S_3 or S_4 gallop, new cardiac dysrhythmia, hepatojugular reflux	• CXR and/or ultrasound: pleural effusion, interstitial edema, Kerley B lines, cardiomegaly • ECG: ischemia, dysrhythmia • NT-proBNP
Anaphylaxis	Abrupt onset, exposure to allergen	Dysphagia	Oral swelling, stridor, wheezing, hives	

A-a, Alveolar-arterial; *ABG,* arterial blood gas; *CBC,* complete blood count; *CHF,* congestive heart failure; *CT,* computed tomography; *CXR,* chest x-ray examination; *DVT,* deep vein thrombosis; *ECG,* electrocardiogram; *FH,* family history; *HPI,* history of present illness; *JVD,* jugular venous distention; *MI,* myocardial infarction; *MRV,* magnetic resonance venography; *NT-proBNP,* amino-terminal pro–B-type natriuretic peptide; *PE,* pulmonary embolism; *PMH,* past medical history; *PND,* paroxysmal nocturnal dyspnea; *SH,* social history; *URI,* upper respiratory infection.

From Marx JA et al: *Rosen's emergency medicine,* ed 8, Philadelphia, 2014, Saunders.

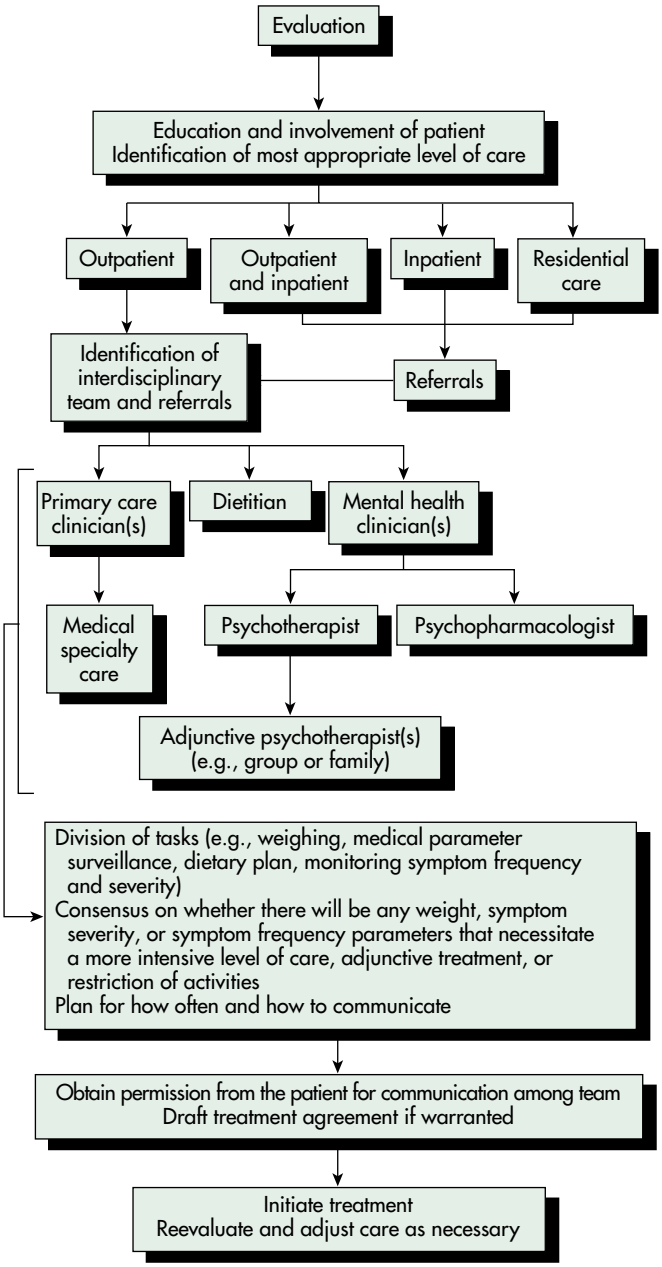

FIG. 66 Algorithm for team management of adult patients with an eating disorder. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, Philadelphia, 2016, Elsevier.)

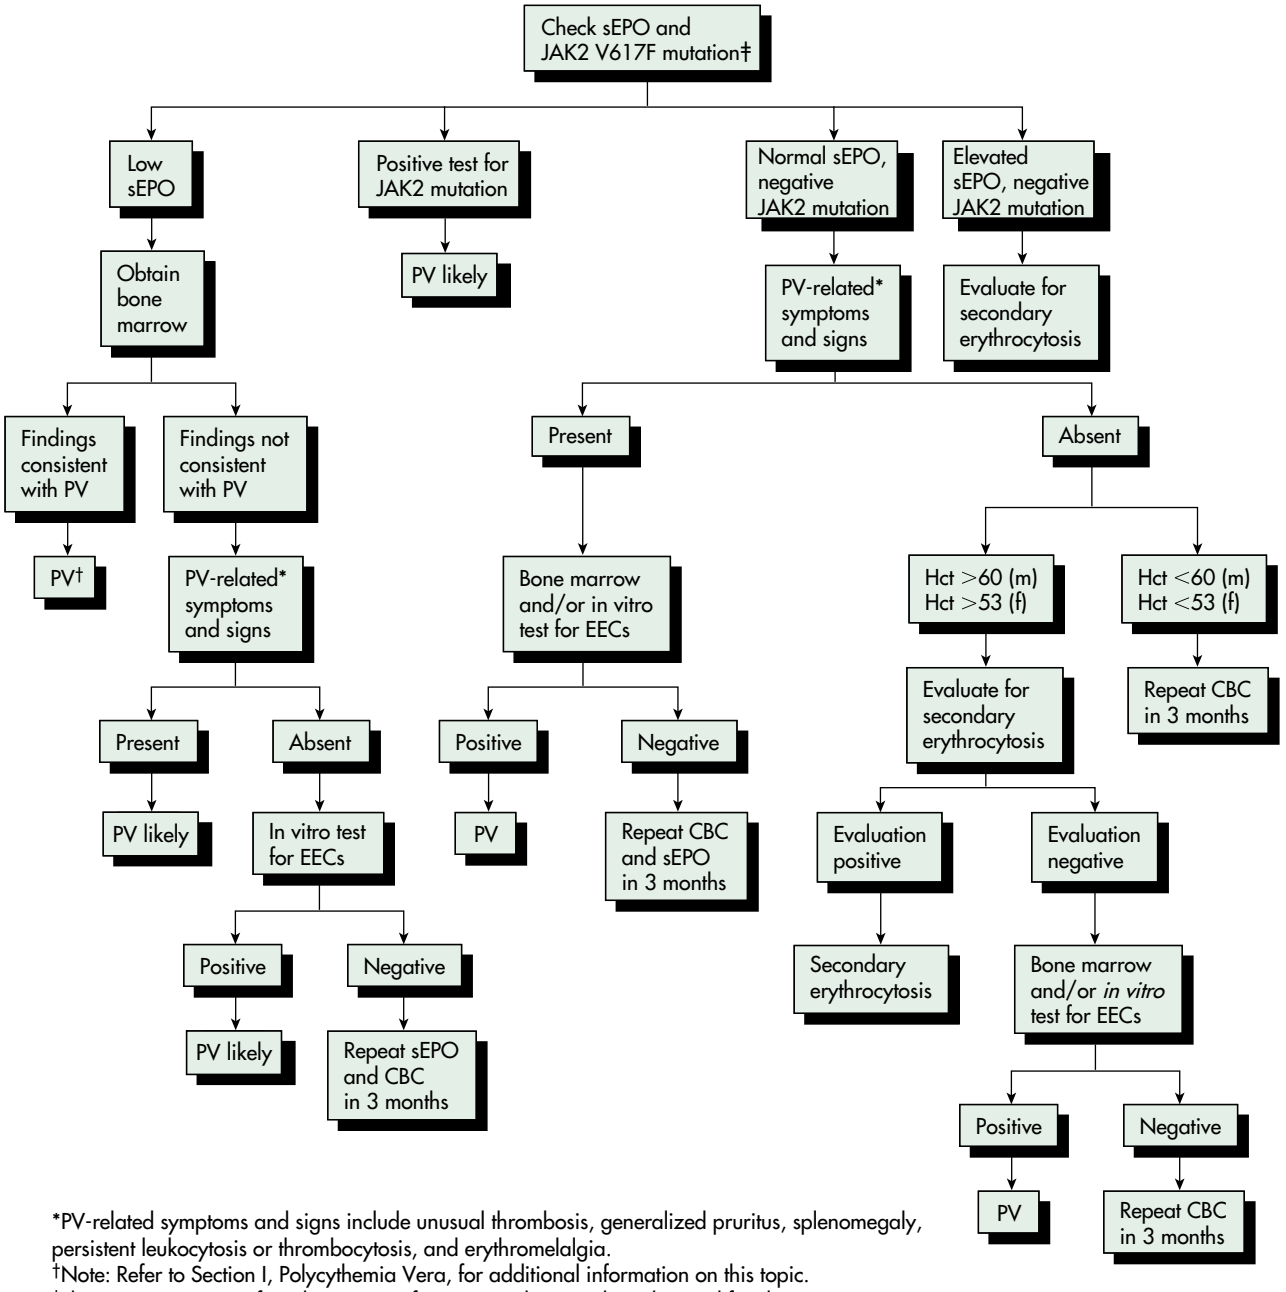
ICD-10CM #
D75.1 Secondary polycythemia
D75.0 Familial erythrocytosis
D45 Polycythemia vera
P61.1 Polycythemia neonatorum



*PV-related symptoms and signs include unusual thrombosis, generalized pruritus, splenomegaly, persistent leukocytosis or thrombocytosis, and erythromelalgia.
†Note: Refer to Section I, Polycythemia Vera, for additional information on this topic.
‡The JAK2 mutation is found in >95% of patients with PV and can be used for diagnostic purposes.

FIG. 67 A diagnostic approach to acquired erythrocytosis. *CBC,* Complete blood cell count; *EEC,* endogenous (spontaneous) erythroid colonies; *f,* female; *Hct,* hematocrit; *m,* male; *PV,* polycythemia vera; *sEPO,* serum erythropoietin level. (Modified from Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

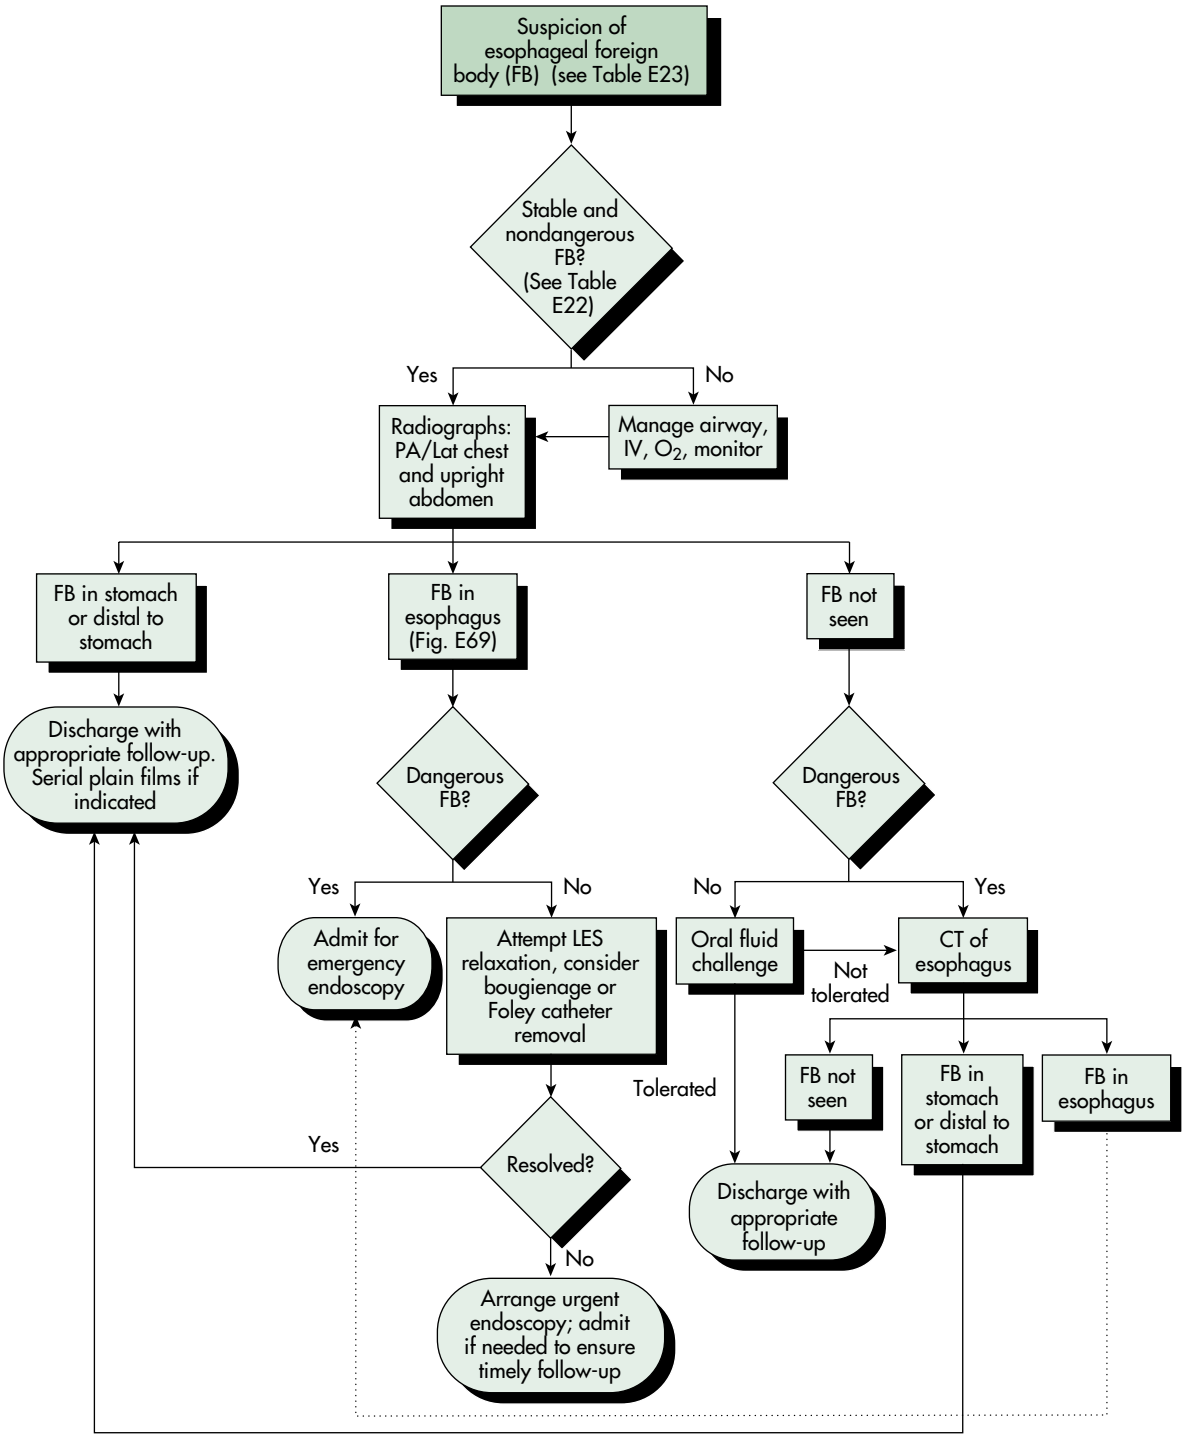


FIG. E68 Diagnostic algorithm for the evaluation of a suspected esophageal foreign body. *CT,* Computed tomography; *IV,* intravenous line; *Lat,* lateral; *LES,* lower esophageal sphincter; *PA,* posteroanterior. (From Adams JG et al: *Emergency medicine: clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.)

FIG. E69 A lateral radiograph of the neck in a child demonstrates an ingested radio-opaque foreign body lodged within the esophagus posterior to the trachea. (From Soto JA, Lucey BC: *Emergency radiology: the requisites,* ed 2, Philadelphia, 2017, Elsevier.)

TABLE E22 Most Threatening and Most Common Esophageal Foreign Bodies

Most Threatening

In Children

- Disc batteries
- Bones
- Needles
- Other sharp objects

In Adults

- Disc batteries
- Bones
- Packets of illicit drugs
- Toothpicks

Most Common

In Children

- Coins
- Marbles
- Buttons
- Toys

In Adults

- Food boluses
- Bones
- Dentures
- Oral piercings

From Adams JG et al: *Emergency medicine: clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.

TABLE E23 Differential Diagnosis for Esophageal Foreign Bodies

In Children

- Perforation
- Abrasion or laceration
- Airway foreign body
- Esophagitis
- Epiglottitis
- Globus hystericus
- Reactive airways disease

In Adults

- Perforation
- Abrasion or laceration
- Spasm
- Esophagitis
- Diverticulum
- Malignancy
- Myocardial infarction
- Globus hystericus

From Adams JG et al: *Emergency medicine: clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.

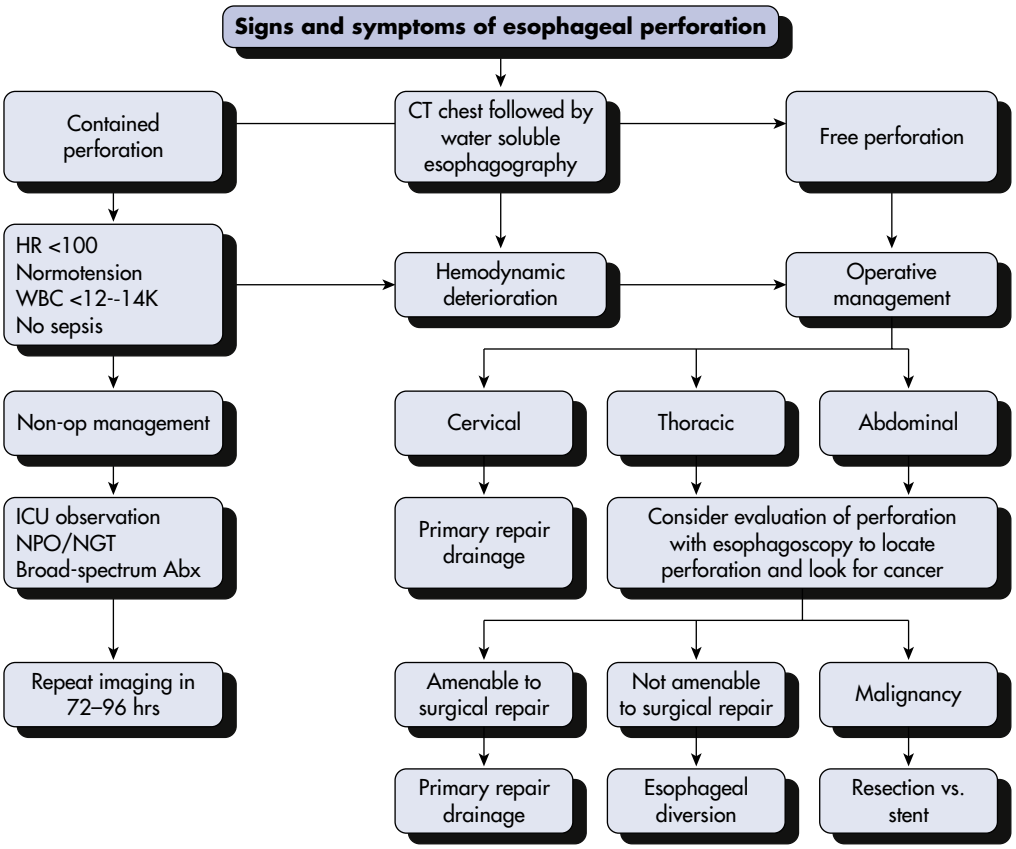

FIG. 70 Algorithm of management of esophageal perforation. *Abx,* Antibiotics; *CT,* computed tomography; *HR,* heart rate; *ICU,* intensive care unit; *NGT,* nasogastric tube; *NPO,* nothing by mouth *(nil per os)*; *WBC,* white blood cell count. (From Cameron JL, Cameron AM: *Current surgical therapy,* ed 12, Philadelphia, 2017, Elsevier.)

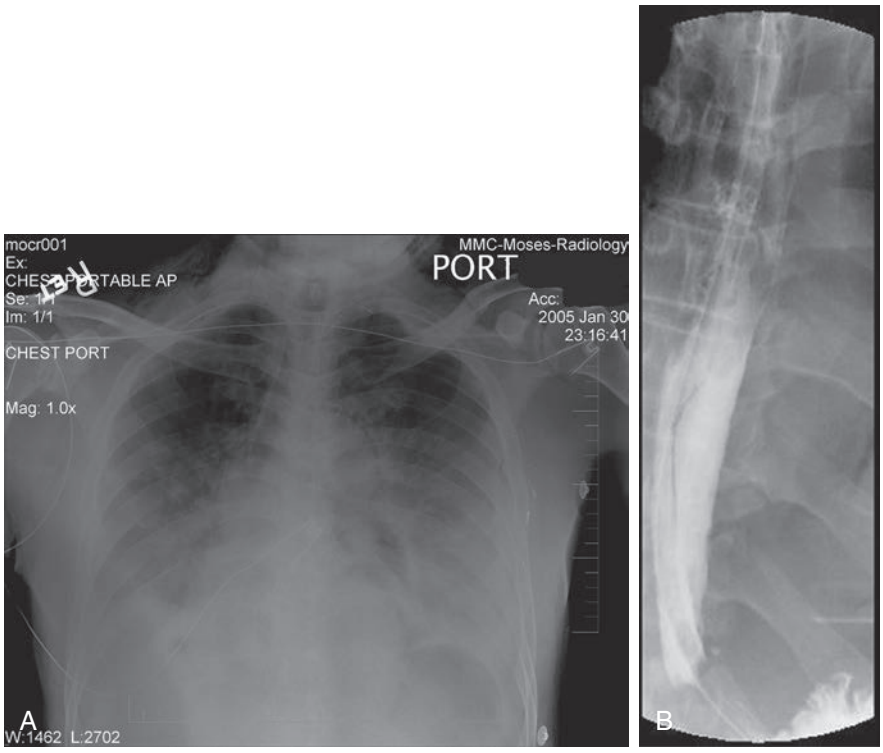

FIG. 71 A and **B,** Chest radiographs demonstrating pneumomediastinum and bilateral pleural effusions. (From Adams JG, Barton ED et al [eds]: *Emergency medicine: clinical essentials,* ed 2, Philadelphia, 2013, Saunders.)

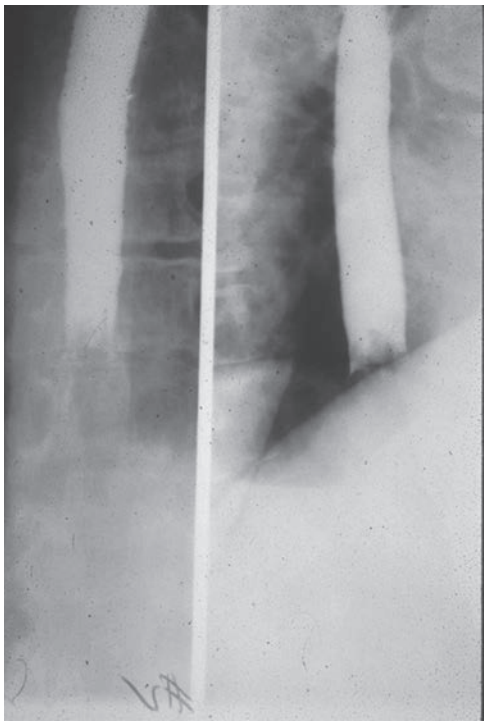

FIG. 72 Fluoroscopic swallow study showing extravasation of contrast agent (as seen from the left side of the film). (From Adams JG et al [eds]: *Emergency medicine: clinical essentials,* ed 2, Philadelphia, 2013, Saunders.)

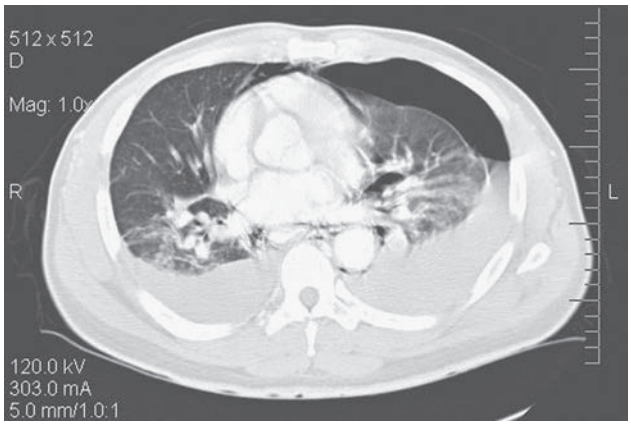

FIG. 73 Esophageal computed tomography scan demonstrating typical fluid collections in the setting of perforation. (From Adams JG et al [eds]: *Emergency medicine: clinical essentials,* ed 2, Philadelphia, 2013, Saunders.)

FEVER AND INFECTION IN HIGH-RISK HEMATOLOGY PATIENT WITHOUT OBVIOUS SOURCE

ICD-10CM # R50.81 Fever presenting with conditions classified elsewhere
R50.2 Drug-induced fever
R50.9 Fever, unspecified

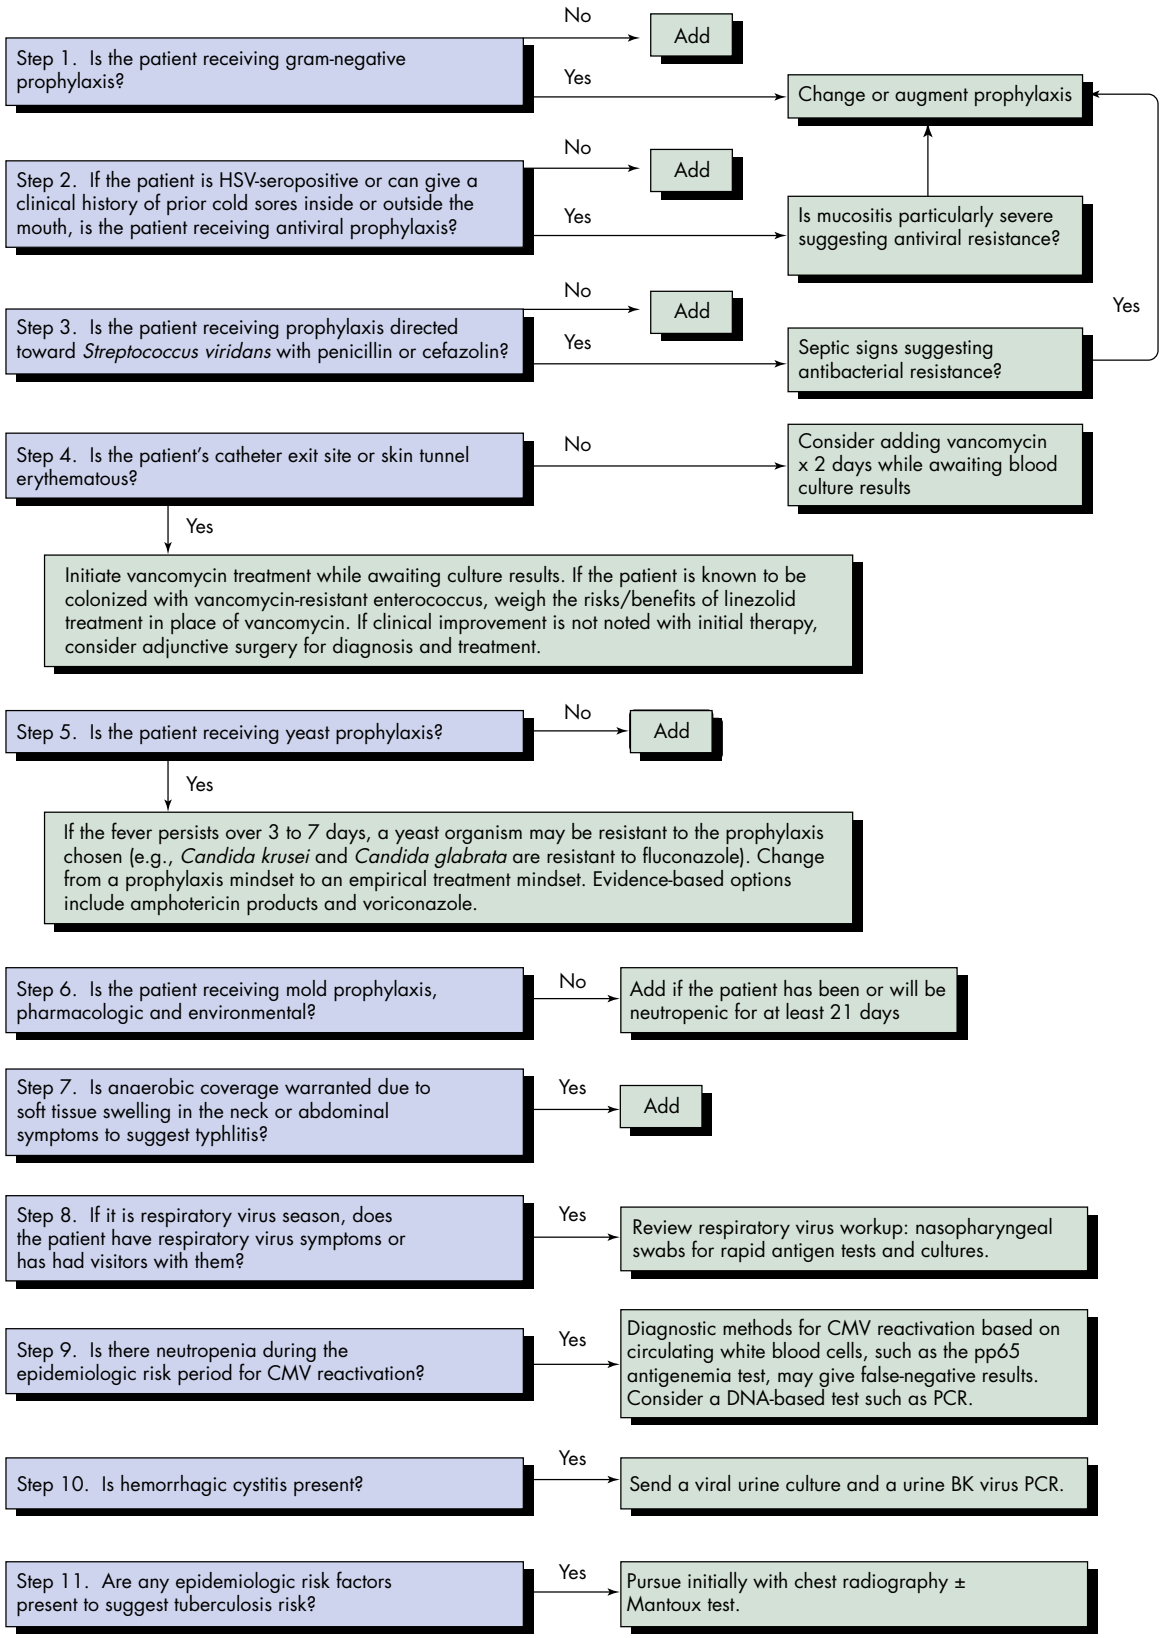

FIG. E74 Systematic approach to causes of fever and infection in the high-risk hematology patient without an obvious source. This algorithm can be used for hematopoietic cell transplantation patients before engraftment or for patients who are receiving conventional, high-dose therapy for hematologic malignancies and are profoundly neutropenic. *CMV,* Cytomegalovirus; *HSV,* herpes simplex virus; *PCR,* polymerase chain reaction. (From Hoffmann R et al: *Hematology: basic principles and practice,* ed 5, Philadelphia, 2009, Churchill Livingstone.)

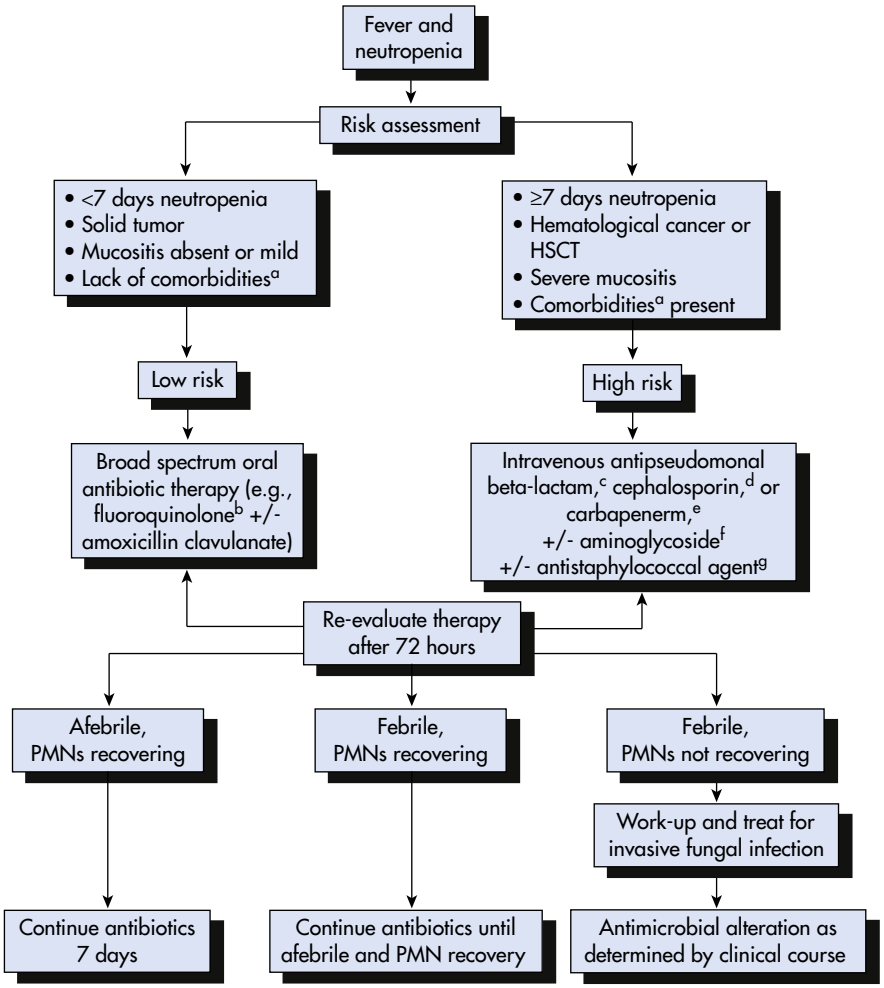
ICD-10CM # R50.9 Fever, unspecified
D70.3 Neutropenia due to infection



a Hypotension, altered mental status, neurologic changes, respiratory failure, abdominal pain, hemorrhage, cardiac compromise or new arrhythmia, catheter tunnel infection, extensive cellulitis, acute renal or liver failure
b Institution sensitivity dependent, ciprofloxacin, levofloxacin, moxifloxacin
c Drug selection and dosing institution-specific: piperacillin tazobactam, ticarcillin/clavulanate
d Drug selection and dosing institution-specific: ceftazidime
e imipenem, cefepime/cilastatin, meropenem, doripenem
f Gentamicin, tobramycin, or amikacin
g Drug selection and institution institution-specific: vancomycin, linezolid, daptomycin, ceftaroline

FIG. 75 Approach to patient with fever and neutropenia. *HSCT*, Hematopoietic stem cell transplant; *PMN*, polymorphonuclear neutrophil. (From Hoffman R: *Hematology: basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.)

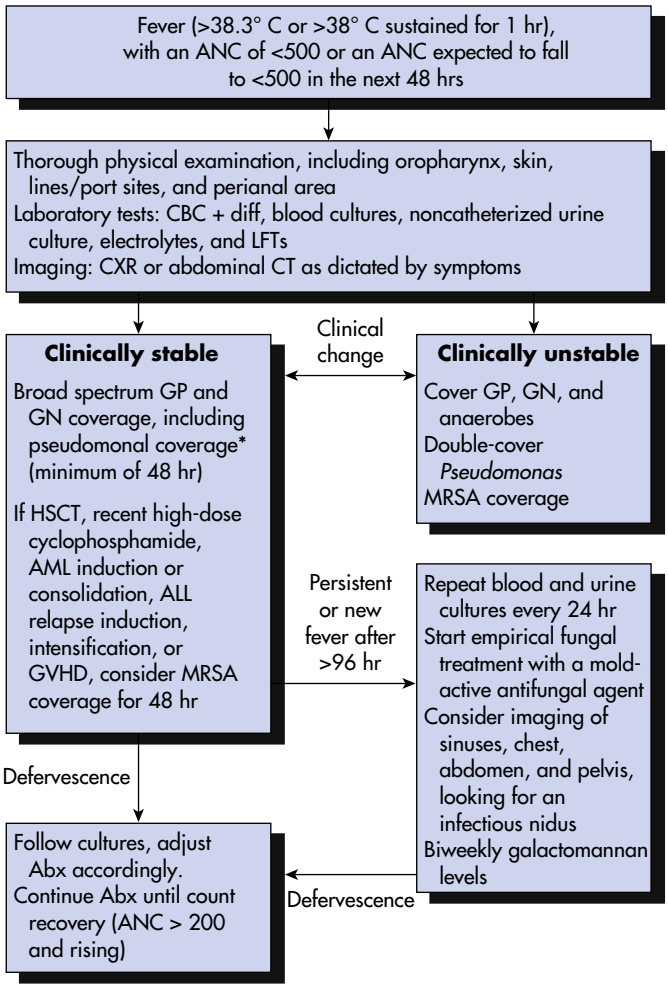


FIG. E76 Guideline for management of fever and neutropenia in children with cancer and/or undergoing hematopoietic stem cell transplantation. *Abx,* Antibiotics; *ALL,* acute lymphocytic leukemia; *AML,* acute myeloid leukemia; *ANC,* absolute neutrophil count; *CBC,* complete blood cell count; *CT,* computed tomography; *CXR,* chest x-ray; *diff,* differential; *GN,* gram-negative; *GP,* gram-positive; *GVHD,* graft-versus-host disease; *HSCT,* hematopoietic stem cell transplantation; *LFTs,* liver function tests; *MRSA,* methicillin-resistant *Staphylococcus aureus.* (Data from Lehrnbecher T et al: Guideline for the management of fever and neutropenia in children with cancer and/or undergoing hematopoietic stem-cell transplantation. *J Clin Oncol.* 2012;30:4427-4438; Freifeld AG et al: Clinical practice guideline for the use of antimicrobial agents in neutropenic patients with cancer: 2010 update by the Infectious Diseases Society of America. *Clin Infect Dis.* 2011;52:e56-e93. In The Johns Hopkins Hospital, Hughes HK, Kalh LK: *The Harriet Lane handbook,* ed 21, St Louis, 2018, Elsevier.)

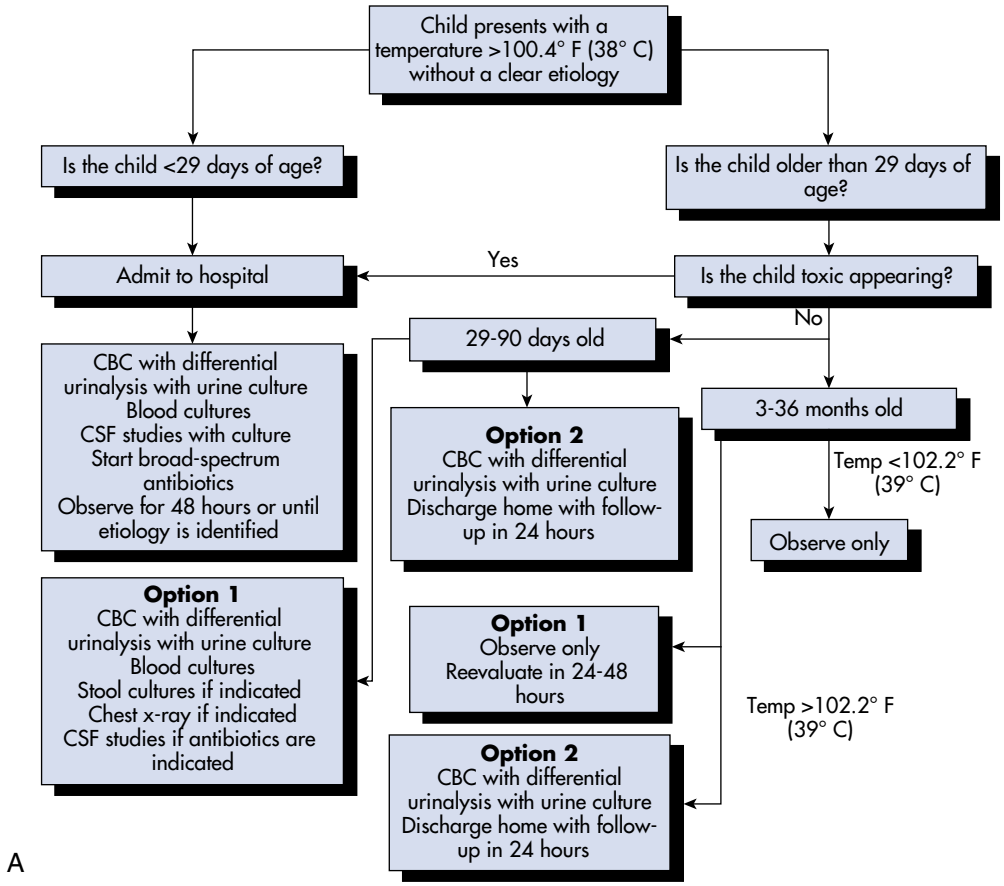

FIG. 77 A, Algorithm for the treatment of a child aged 0 to 36 months with a fever higher than 100.4° F (38° C) with no etiology for the fever. **B,** Continued considerations for the treatment of a child aged 0 to 36 months with a fever higher than 100.4° F (38° C) with no etiology for the fever. *ANC,* Absolute neutrophil count; *CBC,* complete blood count; *CSF,* cerebrospinal fluid; *IM,* intramuscular; *WBCs,* white blood cells. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

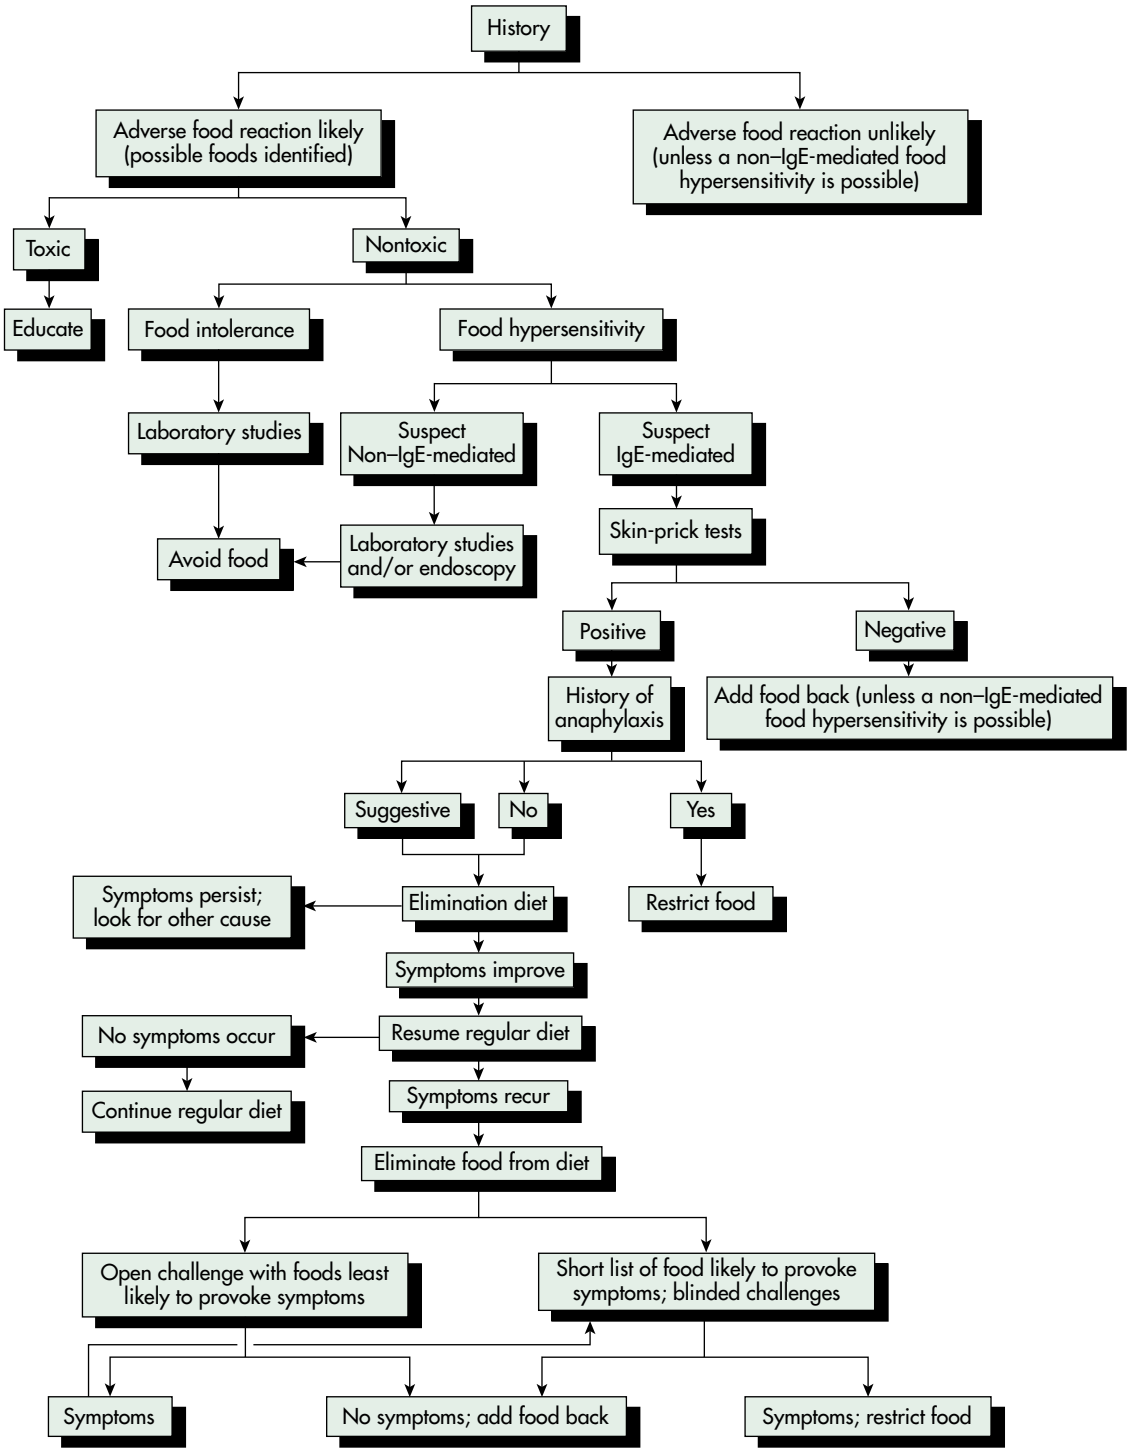

FIG. 78 Algorithm for the evaluation and management of adverse food reactions. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, Philadelphia, 2016, Elsevier.)

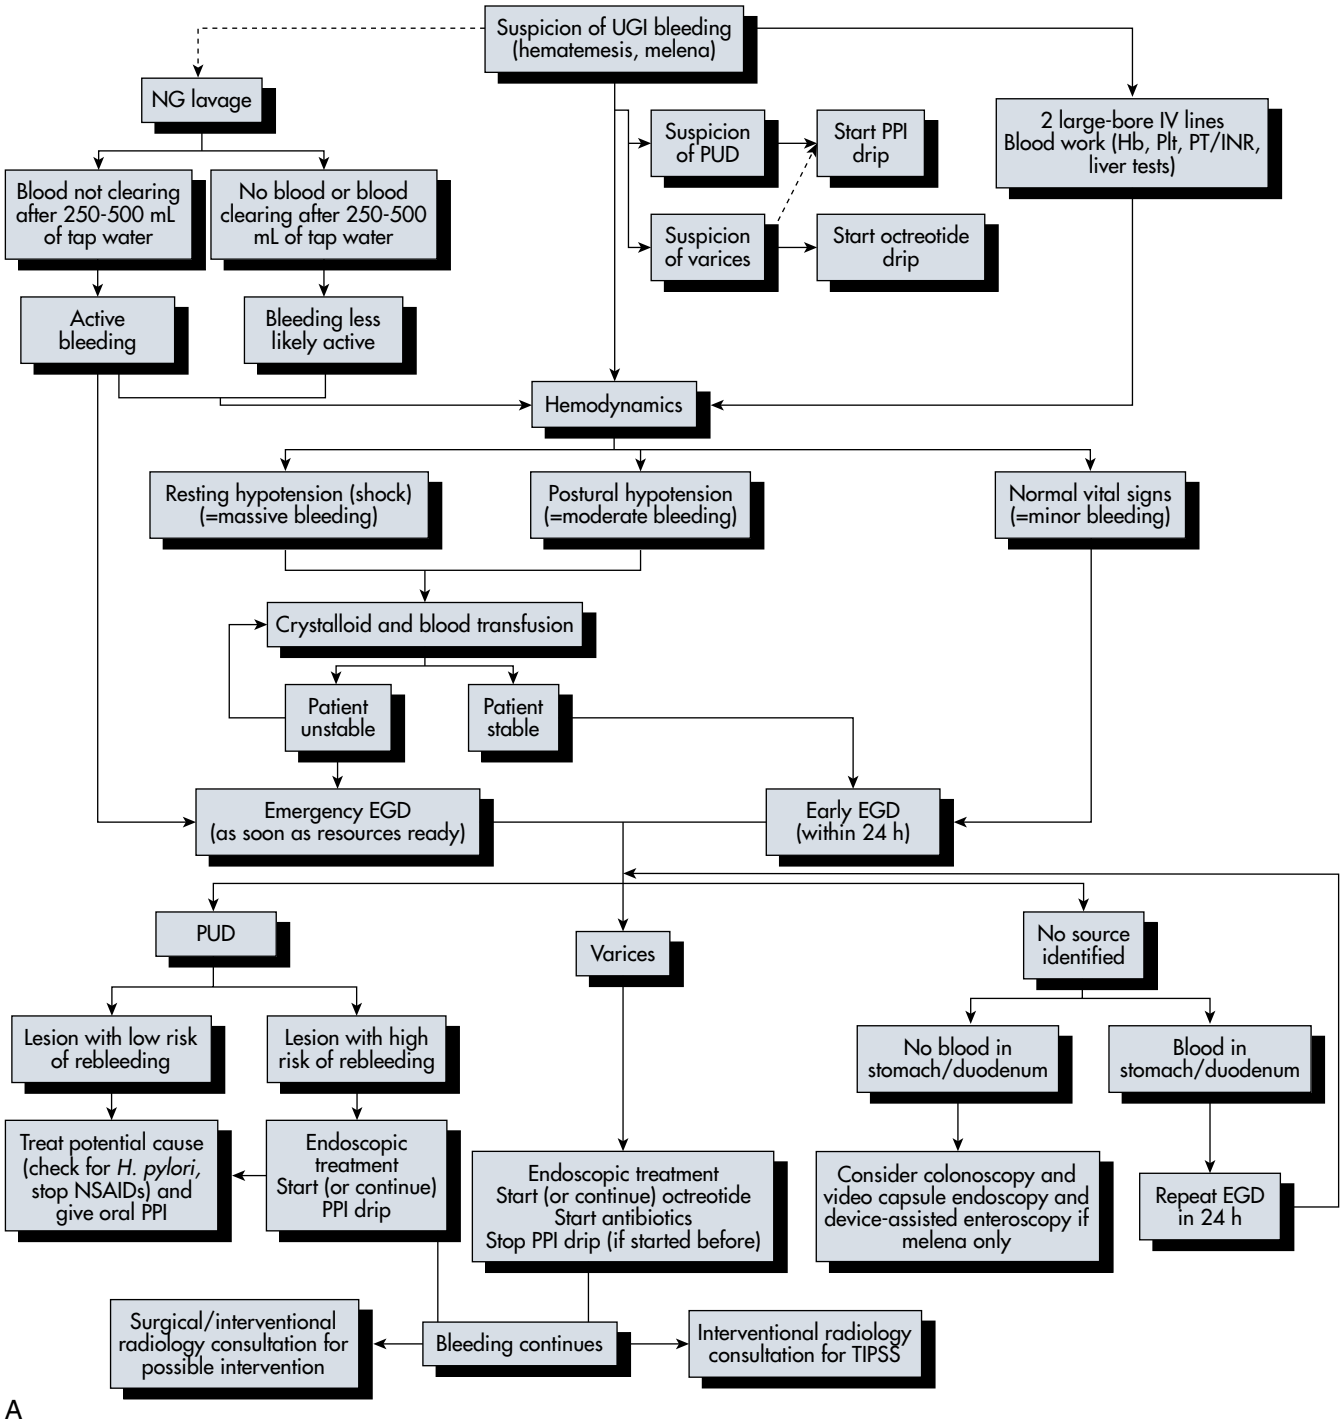

A

FIG. 79 A, Approach to managing upper gastrointestinal bleeding in critical care patients. **B,** Approach to managing lower gastrointestinal bleeding in critical care patients. *AVM,* Arteriovenous malformation; *EGD,* esophagogastroduodenoscopy; *Hb,* hemoglobin; *INR,* international normalized ratio; *LGI,* lower gastrointestinal; *NG,* nasogastric; *NSAIDs,* nonsteroidal antiinflammatory drugs; *Plt,* platelets; *PPI,* proton pump inhibitor; *PT,* prothrombin time; *PUD,* peptic ulcer disease; *RBC,* red blood cell; *TIPSS,* transjugular intrahepatic portosystemic stent shunt; *UGI,* upper gastrointestinal. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 4, 2014, Elsevier.)

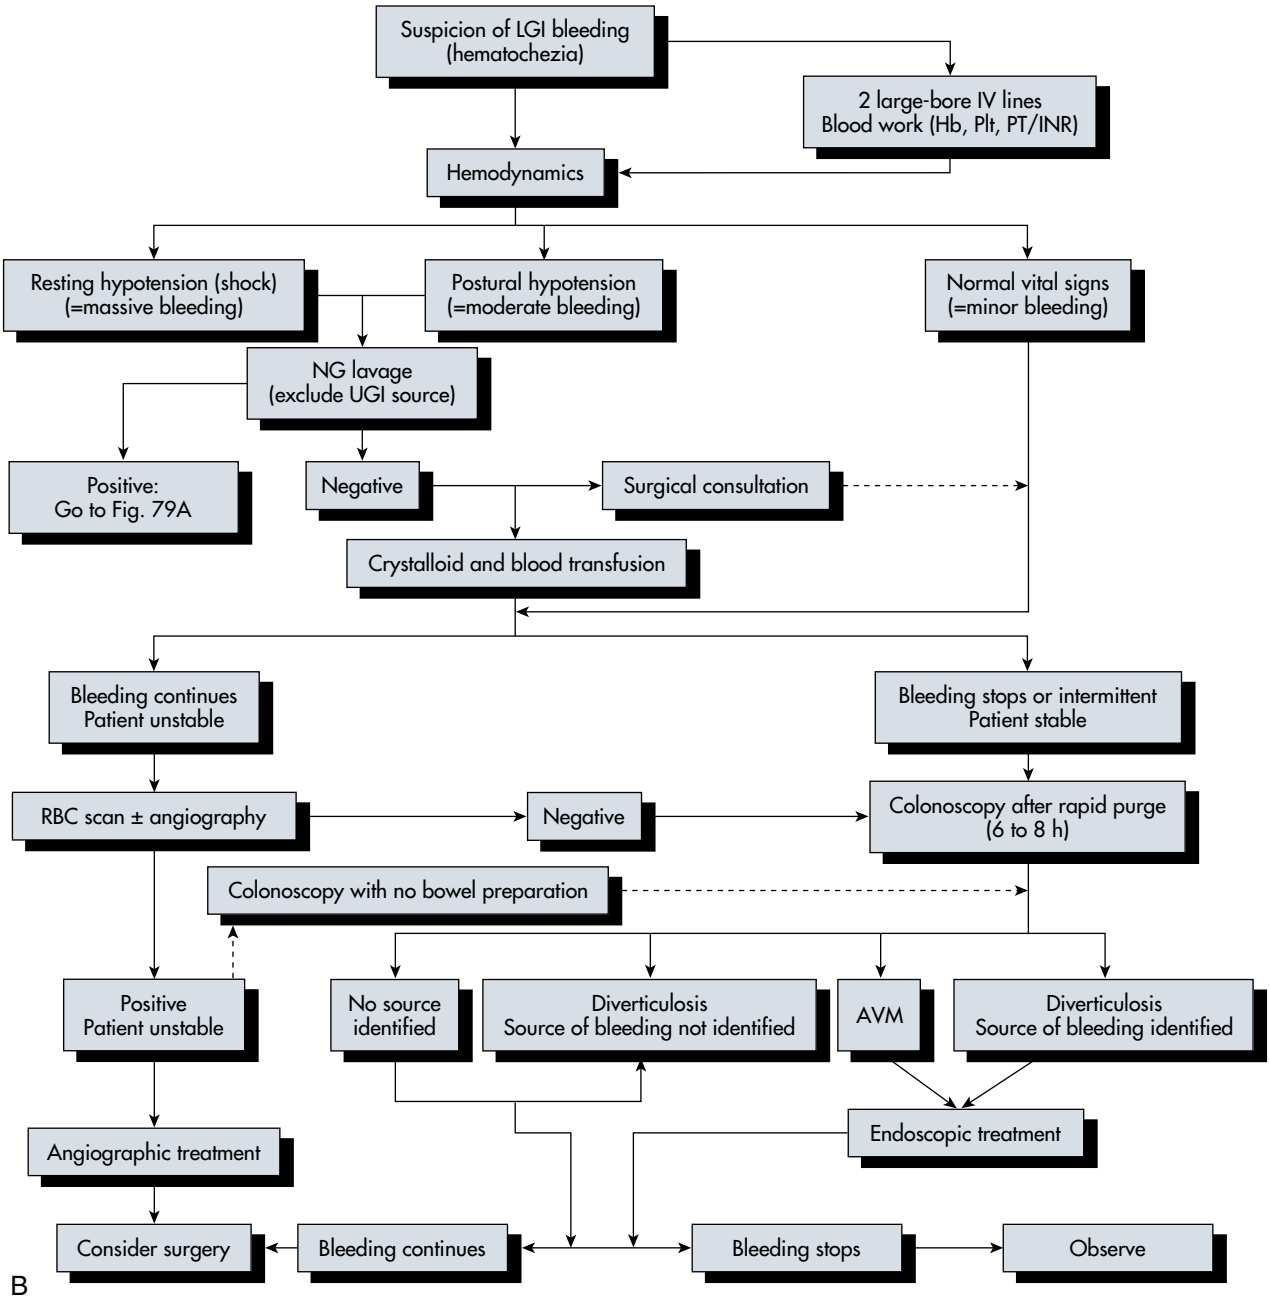

FIG. 79 (Continued)

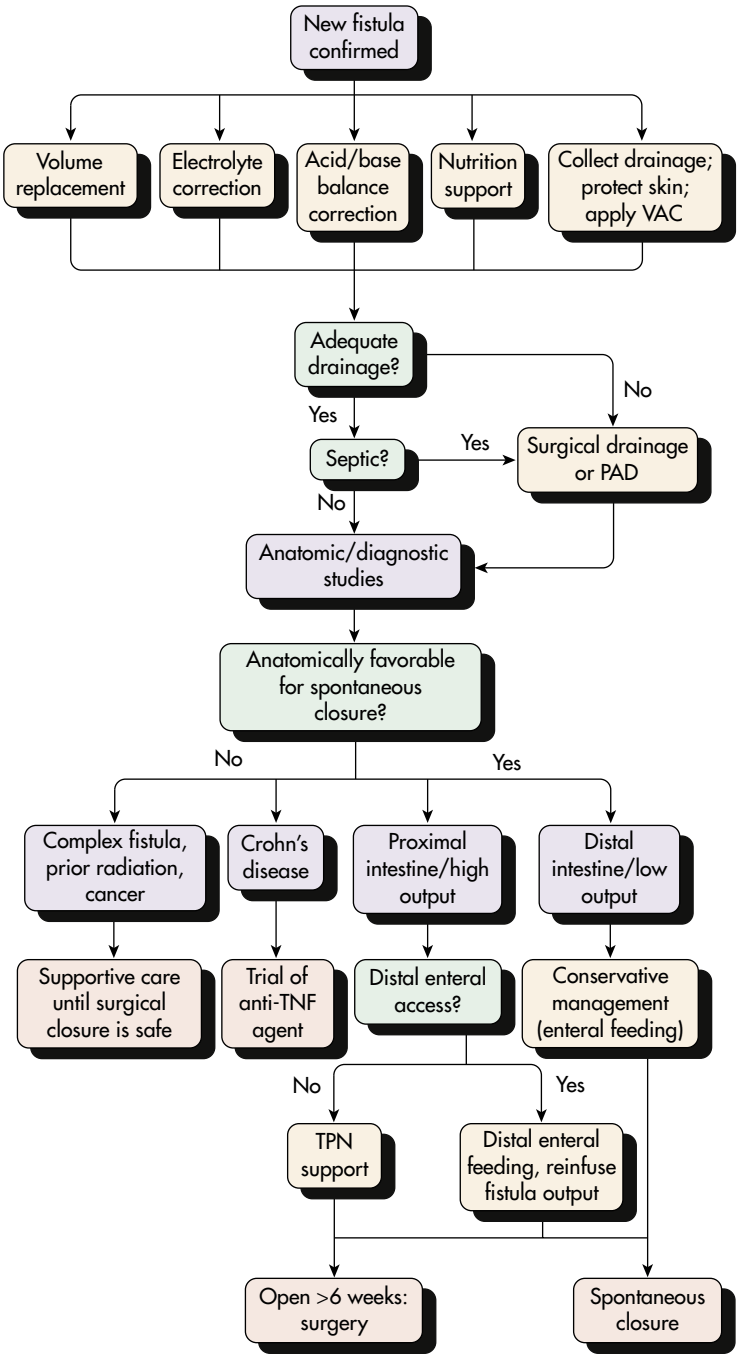

FIG. 80 Algorithm for the management of gastrointestinal fistulas. *PAD,* Percutaneous abscess drainage; *TNF,* tumor necrosis factor; *TPN,* total parenteral nutrition; *VAC,* vacuum-assisted closure. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, Philadelphia, 2016, Elsevier.)

GOITER EVALUATION AND MANAGEMENT

ICD-10CM #

E04.9	Nontoxic goiter, unspecified
E01.2	Iodine-deficiency related (endemic) goiter, unspecified
E04.0	Nontoxic diffuse goiter
E05.10	Thyrotoxicosis with toxic single thyroid nodule without thyrotoxic crisis or storm
E05.20	Thyrotoxicosis with toxic multinodular goiter without thyrotoxic crisis or storm
E07.1	Dyshormogenetic goiter

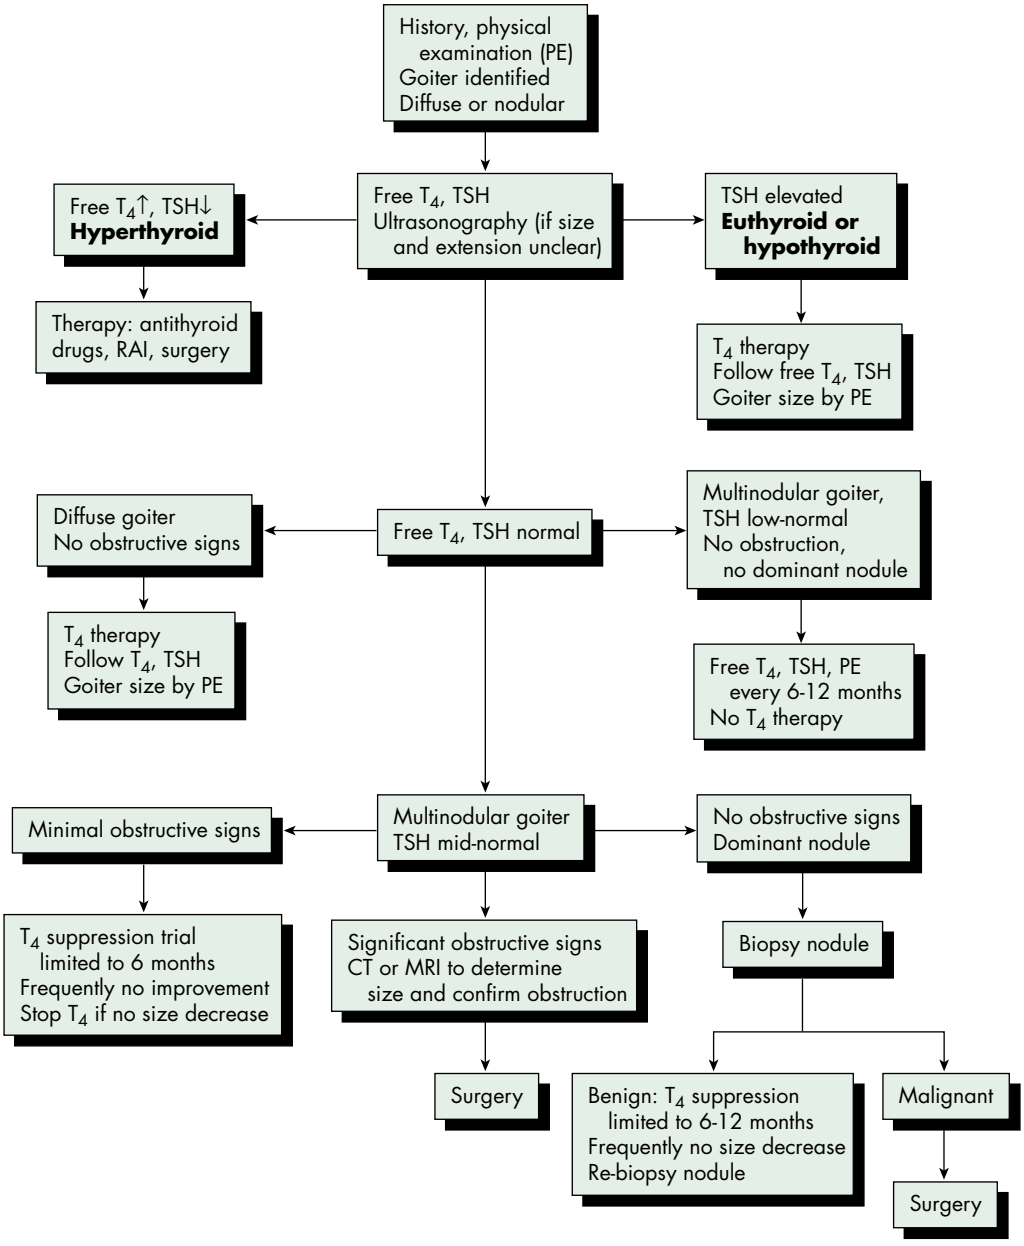

FIG. 81 Evaluation and management of patients with nontoxic diffuse and nodular goiter and undetermined thyroid status. *CT,* Computed tomography; *MRI,* magnetic resonance imaging; *RAI,* radioactive iodine; *TSH,* thyroid-stimulating hormone. (From Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

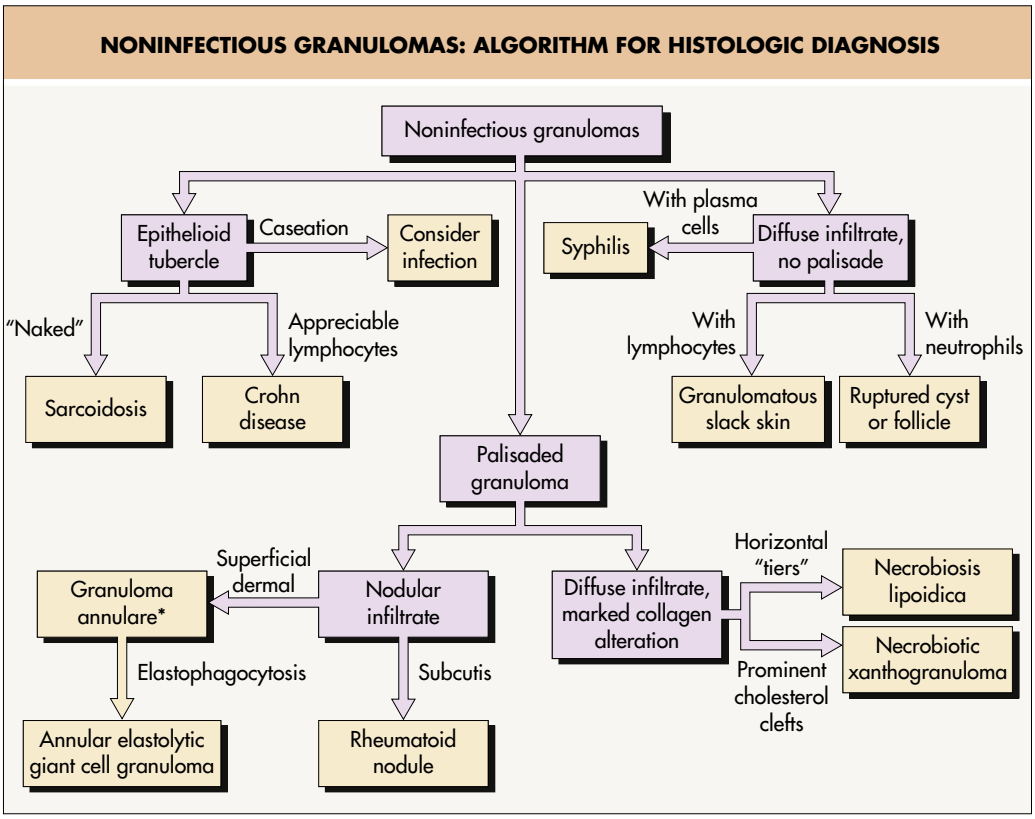

FIG. 82 Noninfectious granulomas: algorithm for histologic diagnosis. Interstitial granulomatous dermatitis and palisaded neutrophilic and granulomatous dermatitis may represent an additional diagnostic consideration. *May also have a patchy dermal interstitial pattern without palisades, or subcutaneous palisades with more mucin than rheumatoid nodules. (From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.)

TABLE 24 Clinical Features of the Major Noninfectious Granulomatous Dermatitides

	Sarcoidosis*	Classic Granuloma Annulare†	AEGCG	Necrobiosis Lipoidica	Cutaneous Crohn Disease	Rheumatoid Nodule
Average age (y)	25-35, 45-65	<30	50-70	30	35	40-50
Sex predilection	Female	Female	Female	Female	Female	Male‡
Racial/ethnic predilection in US	African American	None	Caucasian	None	Ashkenazi Jews	None
Sites	Symmetric on face, neck, upper trunk, extremities	Hands, feet, extensor aspects of extremities	Face, neck, forearms (sites of chronic sun exposure)	Anterior and lateral aspects of shins	Anogenital region, buttocks, lower > upper extremities	Juxtaarticular areas, especially elbows and hands
Appearance	Protean; most commonly red-brown or violaceous papules and plaques	Papules coalescing into annular plaques	Annular plaques	Plaques with elevated borders, telangiectasias centrally	Dusky erythema, lymphedema, ulceration, vegetating plaques	Skin-colored, firm, mobile subcutaneous nodules
Size of lesions	0.2 to >5 cm	1-3 mm papules, annular plaques usually <6 cm	2 to >10 cm	3 to >10 cm	Variable	1-3 cm
No. of lesions	Variable	1-10	1-10	1-10	1-5	1-10
Associations	Systemic manifestations of sarcoidosis can be drug-induced (e.g., IFN, TNF inhibitors) or reaction pattern to underlying lymphoma	Possible diabetes mellitus, thyroid disease, or hyperlipidemia; rare reports of HIV infection, malignancy	Actinic damage	Diabetes mellitus	Intestinal Crohn disease	Rheumatoid arthritis
Special clinical characteristics	Develop within sites of trauma, including scars and tattoos	Central hyperpigmentation	Central atrophy and hypopigmentation	Yellow-brown atrophic centers, ulceration	Draining sinuses and fistulas	Occasional ulceration, especially at sites of trauma

IFN, Interferons, *TNF,* tumor necrosis factor.
*Clinical variants include lupus pernio and subcutaneous (Darier-Roussy), psoriasiform, ichthyosiform, angiolupoid, and ulcerative sarcoidosis.
†Clinical variants include generalized/disseminated, micropapular, nodular, perforating, subcutaneous, and patch granuloma annulare.
‡Although rheumatoid arthritis has a female:male ratio of 2-3:1.
Modified from Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

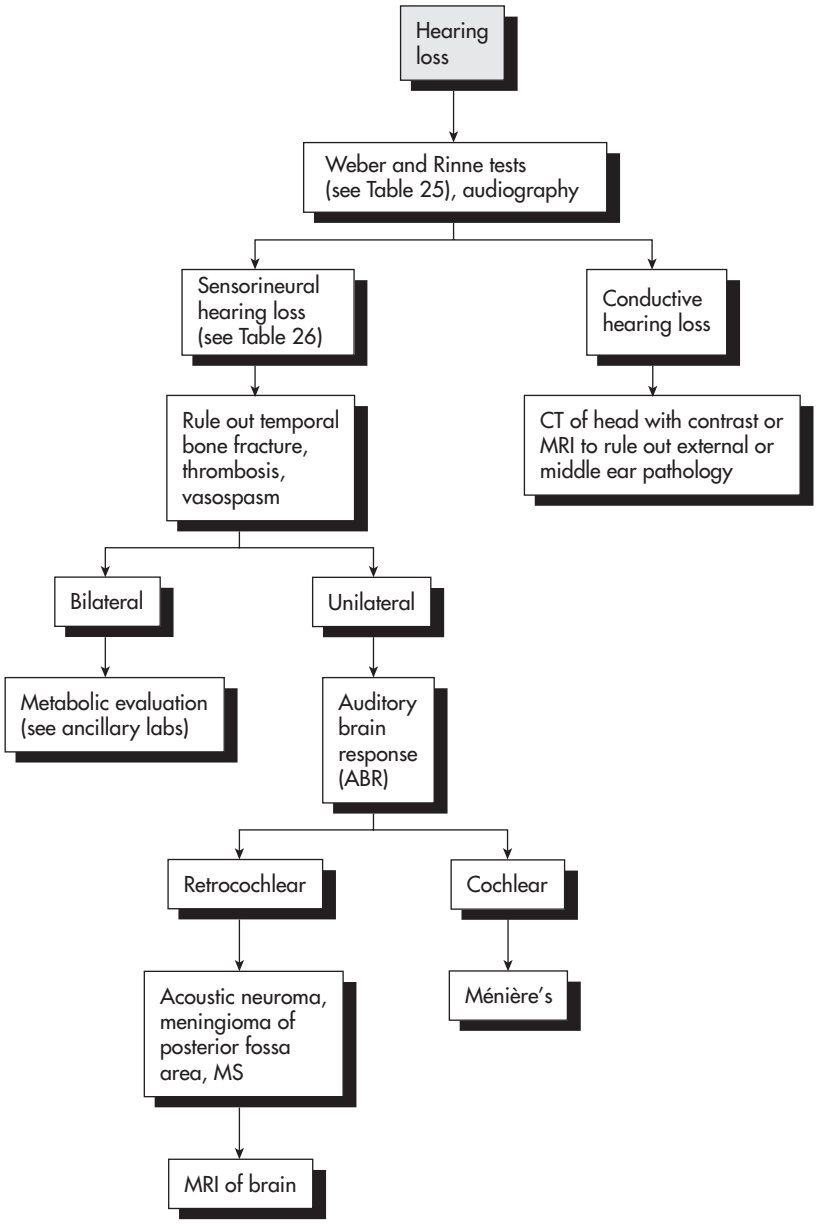

FIG. 83 Evaluation of hearing loss. *CT*, Computed tomography; *MRI*, magnetic resonance imaging; *MS*, multiple sclerosis. (From Ferri FF: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging,* ed 4, Philadelphia, 2018, Mosby.)

BOX 14 Hearing Loss

Diagnostic imaging

Best test
None

Ancillary tests
CT of head with contrast or MRI with contrast
CT of temporal bone without contrast

Lab evaluation

Best test
None

Ancillary tests
CBC
ALT, AST
ANA, VDRL
TSH

ALT, Alanine aminotransferase; *ANA,* antibody to nuclear antigens; *AST,* angiotensin sensitivity test; *CBC,* complete blood count; *CT,* computed tomography; *TSH,* thyroid-stimulating hormone; *VDRL,* Venereal Disease Research Laboratory.
From Ferri FF: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging*, ed 4, Philadelphia, 2018, Mosby.

ICD-10CM # H90.2 Conductive hearing loss, unspecified
H90.5 Unspecified sensorineural hearing loss

TABLE 25 Interpretation of the Weber and Rinne Tests

	Weber without Lateralization	Weber Lateralizes Right	Weber Lateralizes Left
Rinne both ears: AC >BC	Normal	S/N loss in the left ear	S/N loss in the right ear
Rinne left ear: BC >AC	–	Combined loss: conduction and S/N loss in the left ear	Conduction loss in the left ear
Rinne right ear: BC >AC	–	Conduction loss in the right ear	Combined loss: conduction and S/N loss in the right ear

AC Air conduction; *BC* bone conduction; *S/N,* sensorineural.
From Adams JG et al: *Emergency medicine, clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.

TABLE 26 Lesions That Cause Hearing Loss

	Description of Pathology	Onset/Course	Actions or Treatment	Prognosis
Conductive Lesion				
Foreign body	Mass in external canal blocks sound conduction	Acute onset associated or not with pain, drainage, or odor	Removal. Evaluate for infection. Evaluate for TM perforation	Excellent
Otitis externa	Edema and detritus obstruct external canal	Rapid onset. Pain, edema, swelling. Drainage, odor often present	Aural toilet to remove debris. Topical (±oral) antibiotics. Evaluate for necrotizing otitis	Excellent if treated appropriately
Exostosis	Bony growths obstruct canal. Often seen with prolonged exposure to cold water (divers)	Slow insidious onset. No pain or drainage unless causes complete obstruction	Evaluate for infection. Reassure patient. Refer to ENT	Good
Tympanosclerosis	TM scarring from perforations or infections. Decreased mobility impairs sound conduction	Slow onset following perforations, trauma, or infections	ENT referral. Reassurance	Variable
Perforated TM	Disruption of TM integrity results in impaired transmission of sound to ossicle	Acute onset. May follow direct trauma or sudden barotrauma. May have sudden relief from pain if caused by otitis media	Treat infectious causes. Counsel on importance of keeping water out of ear canal. ENT referral	Good
Sterile effusion (barotrauma)	Fluid in middle ear dampens conduction through ossicles	Often following flight, diving, or URI. Bubbles can cause intermittent pain	Decongestants. Evaluate for infection. Follow-up	Excellent
Acute otitis media	Pus (or fluid) in middle ear dampens conduction through ossicles	Acute to subacute onset, often following URI. Often associated with pain ± fever	Antibiotics (unless viral cause suspected), decongestants, pain control	Excellent if treated appropriately
Cholesteatoma	Trapped stratified squamous epithelial mass in middle ear. Interferes with ossicle conduction	Slow onset. Often history of previous perforations or chronic infections	ENT referral	Variable. May destroy ossicles or erode into surrounding structures
Glomus tumor	Vascular tumor occupies middle ear space. Interferes with ossicle conduction	Slow onset. May be associated with rushing pulsatile sensation	ENT referral	Variable
Cancer	Squamous cell most common. Obstructs external canal	Slow onset. Often noticed first by others. Painless unless occlusion causes otitis externa	ENT referral. Evaluate for secondary infection	Variable
Sensorineural Lesion				
Perilymph fistula (inner ear barotrauma)	Disruption of round or oval window allows leakage of perilymph into middle ear	Sudden onset of hearing loss often with tinnitus and vertigo. Frequently follows straining or abrupt change in pressure. Turning in direction of fistula exacerbates symptoms	Complete bed rest. Elevate head of bed and avoid increases in CSF pressure. Severe symptoms or noncompliance may require hospitalization. ENT consultation for possible oval or round window patch	Variable
Viral cochleitis	Cochlear inflammation. Often following URI	Rapid onset. Often following URI	Steroids often used (no good data)	Variable
Presbycusis	Age-related hearing loss. May be related to previous chronic noise exposure	Slow onset. Usually symmetric. High frequencies most affected. Tinnitus may occur	Hearing aid may help with both hearing loss and tinnitus	Variable

TABLE 26 Lesions That Cause Hearing Loss—cont'd

	Description of Pathology	Onset/Course	Actions or Treatment	Prognosis
Acoustic neuroma	Benign schwannoma of 8th cranial nerve	Slow onset. Usually unilateral. May exhibit tinnitus, vertigo. May exhibit facial hyperesthesias or twitching	May require surgical excision if symptoms debilitating	Variable
Ototoxic agents	Direct toxicity to inner ear structures	Variable onset. High frequency most affected. Exposure to ototoxic drugs. May have associated tinnitus	Stop use of offending agent	Variable. Hearing loss at time of stopping offending agent is usually permanent
Multiple sclerosis	Multiple demyelinating lesions interfere with nerve conduction	Often other associated neurologic findings. May wax and wane	Standard multiple sclerosis treatment (steroids, cytotoxic agents)	Variable
Stroke/CVA	Focal ischemic lesion of auditory nerve or auditory cortex	Sudden onset. Often associated with other neurologic deficits	Treat CVA risk factors (ASA, anticoagulants, glycemic control, BP control)	Variable
Meningitis	Infection enters inner ear through CNS-perilymph connection. Damages organ of Corti	Follows clinical picture of meningitis	Treat infection. Steroids may limit inflammation and damage	Variable
Ménière disease (endolymphatic hydrops)	Abnormal homeostasis of inner ear fluids (clinical diagnosis; definitive diagnosis made histologically)	Episodic spells of vertigo. Associated sensation of fullness, tinnitus, and SNHL or auditory distortion. Low-frequency ranges most affected	Reduce salt, caffeine, nicotine (vasoconstrictors) intake. Consider diuretics, antihistamines, anticholinergics. ENT referral	Variable
Chronic noise exposure	Direct mechanical damage to cochlear structures and hair cells	Slow onset. Usually high frequency most affected	Prevention measures (earplugs). Stop exposure	Usually permanent
Skull trauma	Interruption of cranial nerve VIII, ossicle disruption, or shearing effects on organ of Corti	Sudden onset after trauma	ENT consultation for possible surgical repair	Variable: ossicle disruption has better prognosis than nerve or organ of Corti damage
Autoimmune causes	Vascular or neuronal inflammatory changes	Bilateral asymmetric SNHL. May be fluctuating or progressive. Often other systemic autoimmune findings	Outpatient autoimmune evaluation. Steroids and cytotoxic agents may slow progression	Variable

ASA, Acetylsalicylic acid; *BP,* blood pressure; CNS, central nervous system; *CSF,* cerebrospinal fluid; *CVA,* cerebrovascular accident; *ENT,* ear, nose, and throat; SNHL, sensorineural hearing loss; *TM,* tympanic membrane; *URI,* upper respiratory infection.

From Adams JG et al: *Emergency medicine, clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.

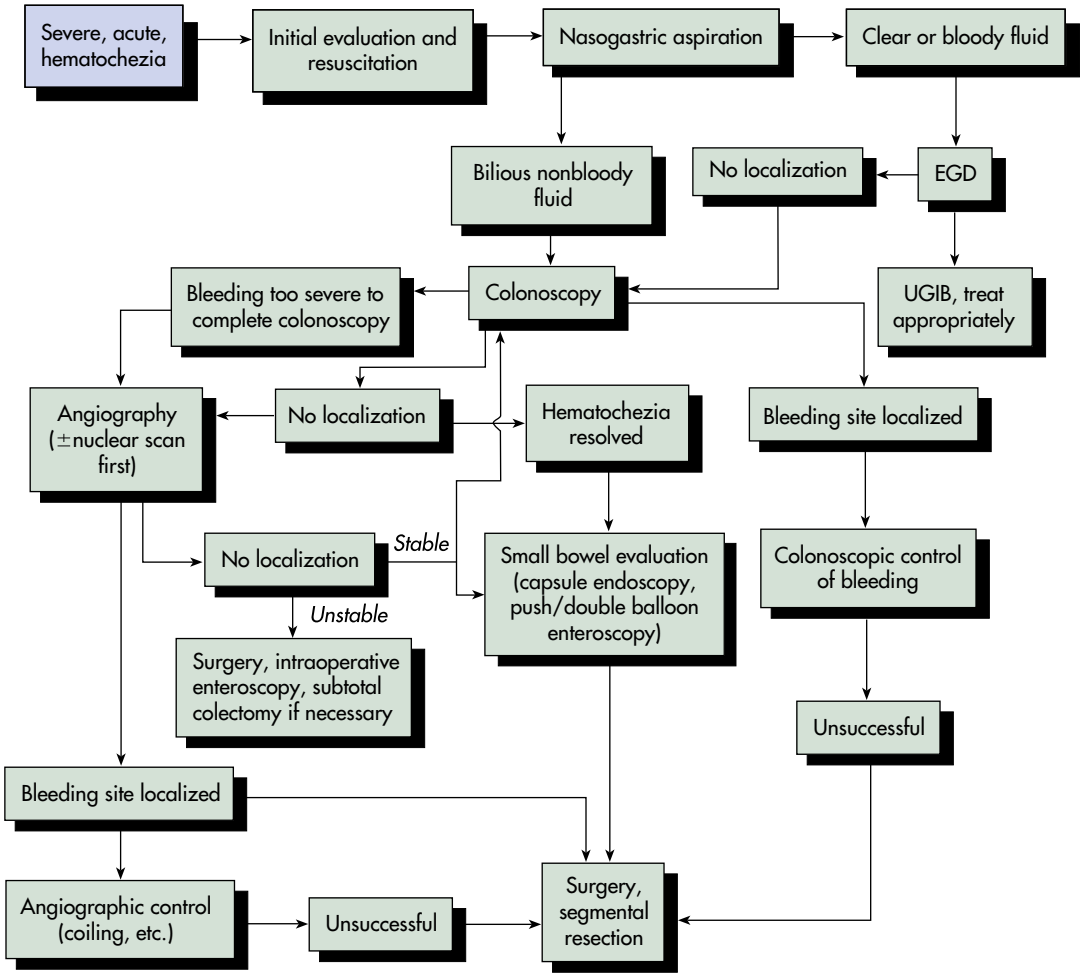

FIG. 84 Management algorithm for hematochezia. *EGD,* Esophagogastroduodenoscopy; *UGIB,* upper gastrointestinal biopsy. (From Cameron JL, Cameron AM: *Current surgical therapy,* ed 10, Philadelphia, 2011, Saunders.)

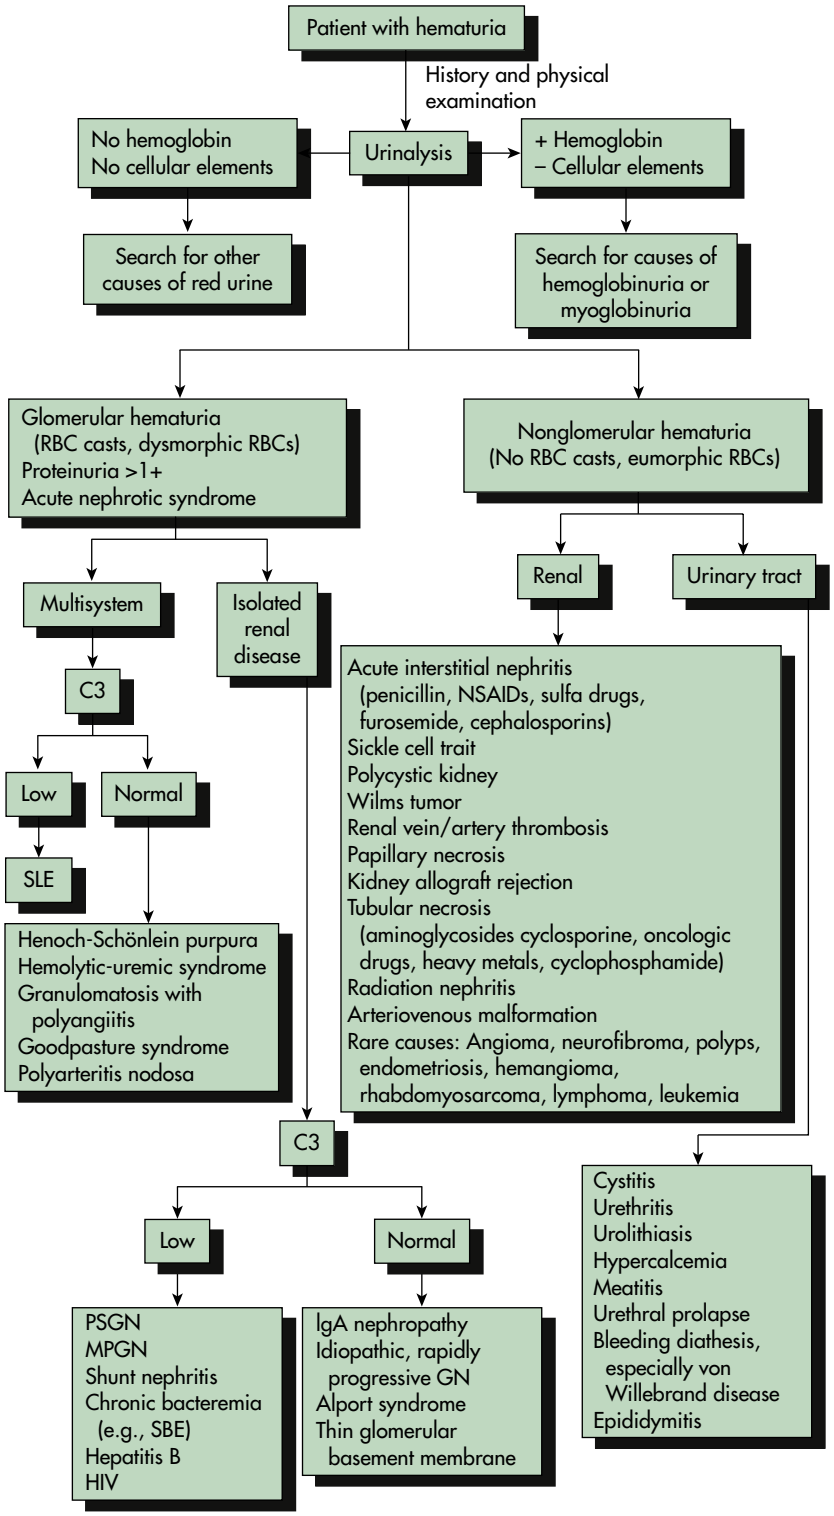

FIG. 85 Diagnostic strategy for hematuria. *GN,* Glomerulonephritis; *HIV,* human immunodeficiency virus; *MPGN,* membranoproliferative glomerulonephritis; *NSAIDs,* nonsteroidal antiinflammatory drugs; *PSGN,* post-streptococcal glomerulonephritis; *RBC,* red blood cell; *SBE,* subacute bacterial endocarditis; *SLE,* systemic lupus erythematosus. (From The Johns Hopkins Hospital, Hughes HK, Kalh LK: *The Harriet Lane handbook,* ed 21, St Louis, 2018, Elsevier.)

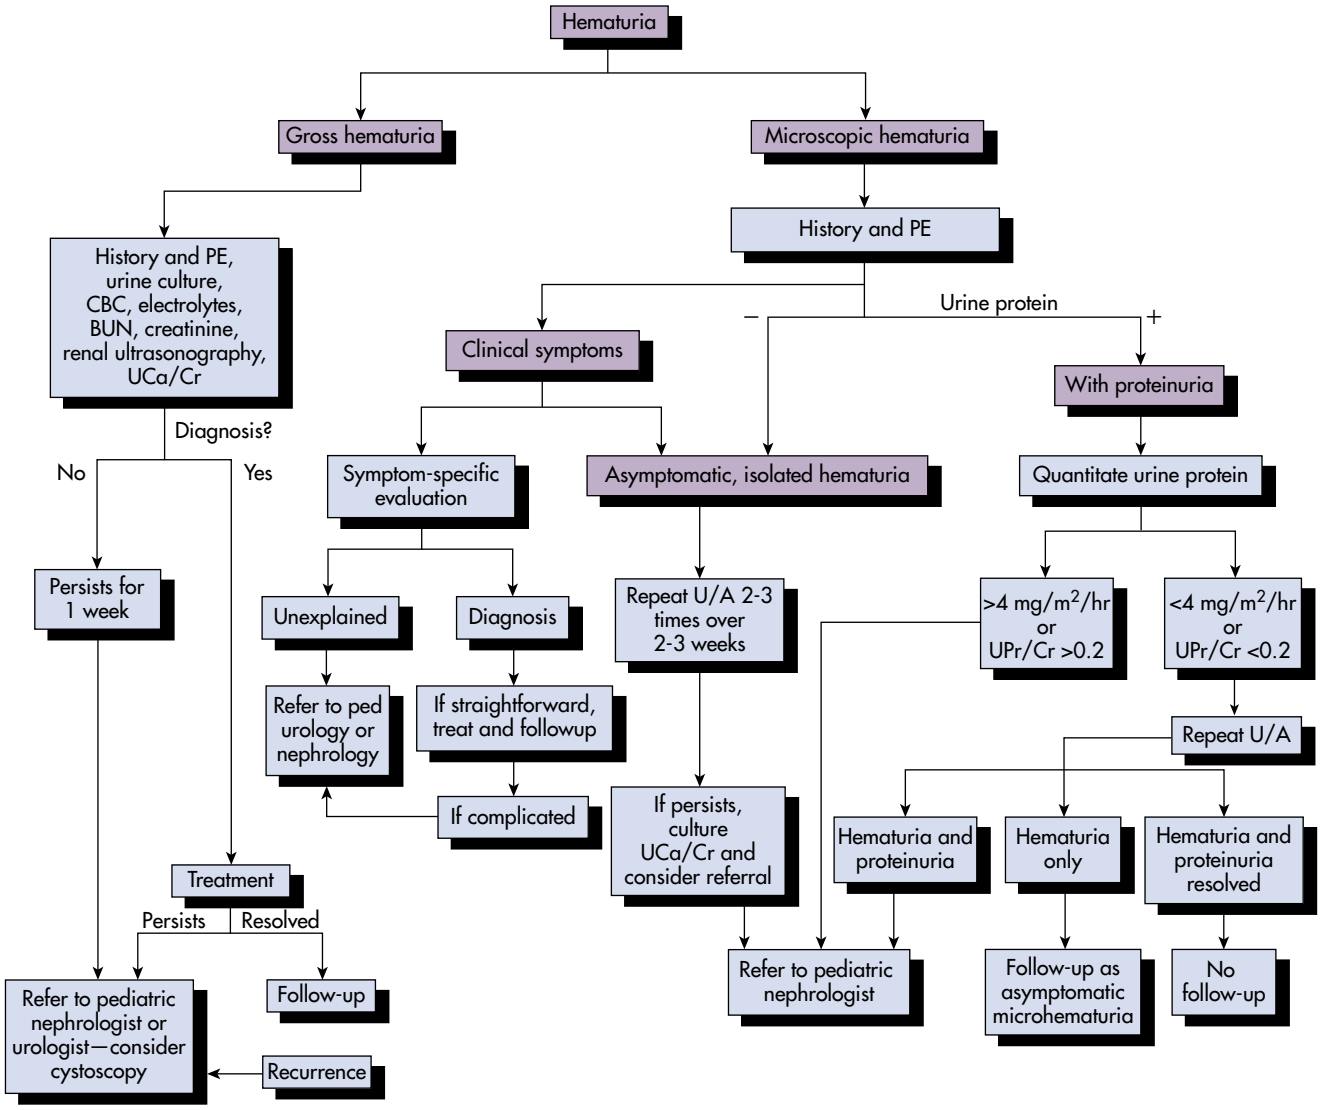

FIG. 86 Algorithm for the treatment of hematuria. *BUN,* Blood urea nitrogen; *CBC,* complete blood cell count; *PE,* physical examination; *U/A,* urinalysis; *UCa/Cr,* urinary calcium/creatinine ratio; *UPr/Cr,* urinary protein/creatinine ratio. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

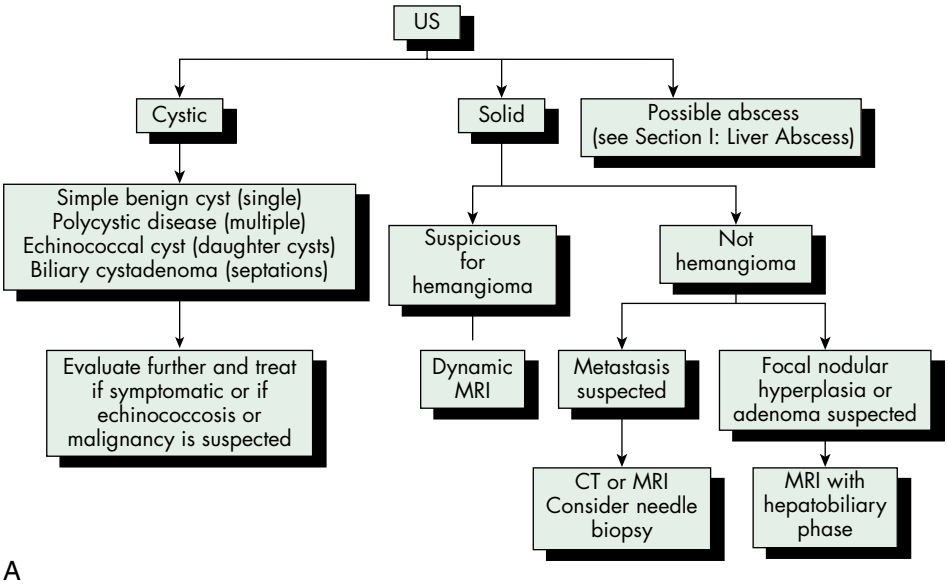
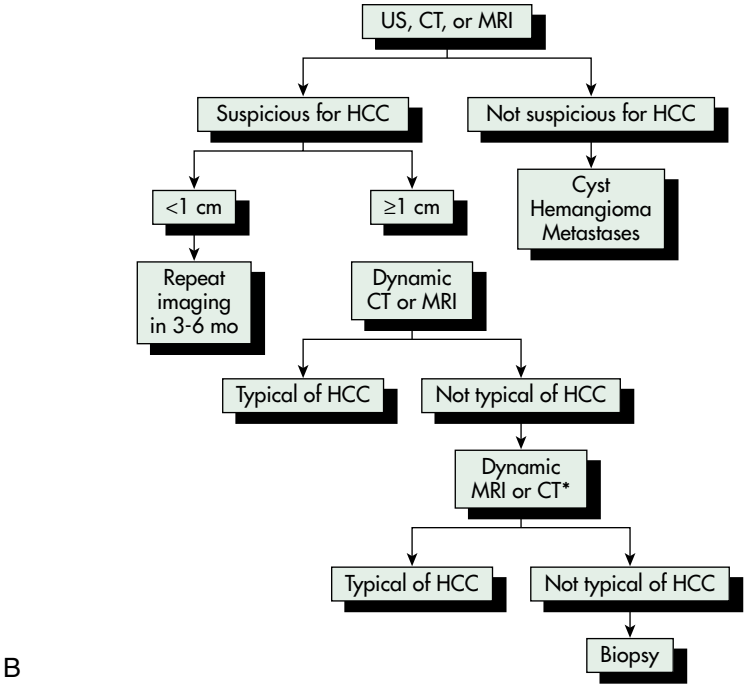


A



B

FIG. 87 A, Algorithm for the approach to the management of a patient, not known to have cirrhosis, with a hepatic mass (often incidental, possibly symptomatic). **B,** Algorithm for the approach to the management of a patient with known or suspected cirrhosis and a hepatic mass (found on routine surveillance, because of symptoms, or because of an increasing alpha-fetoprotein level). *Perform imaging modality not previously performed. *HCC,* Hepatocellular carcinoma. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, Philadelphia, 2016, Elsevier)

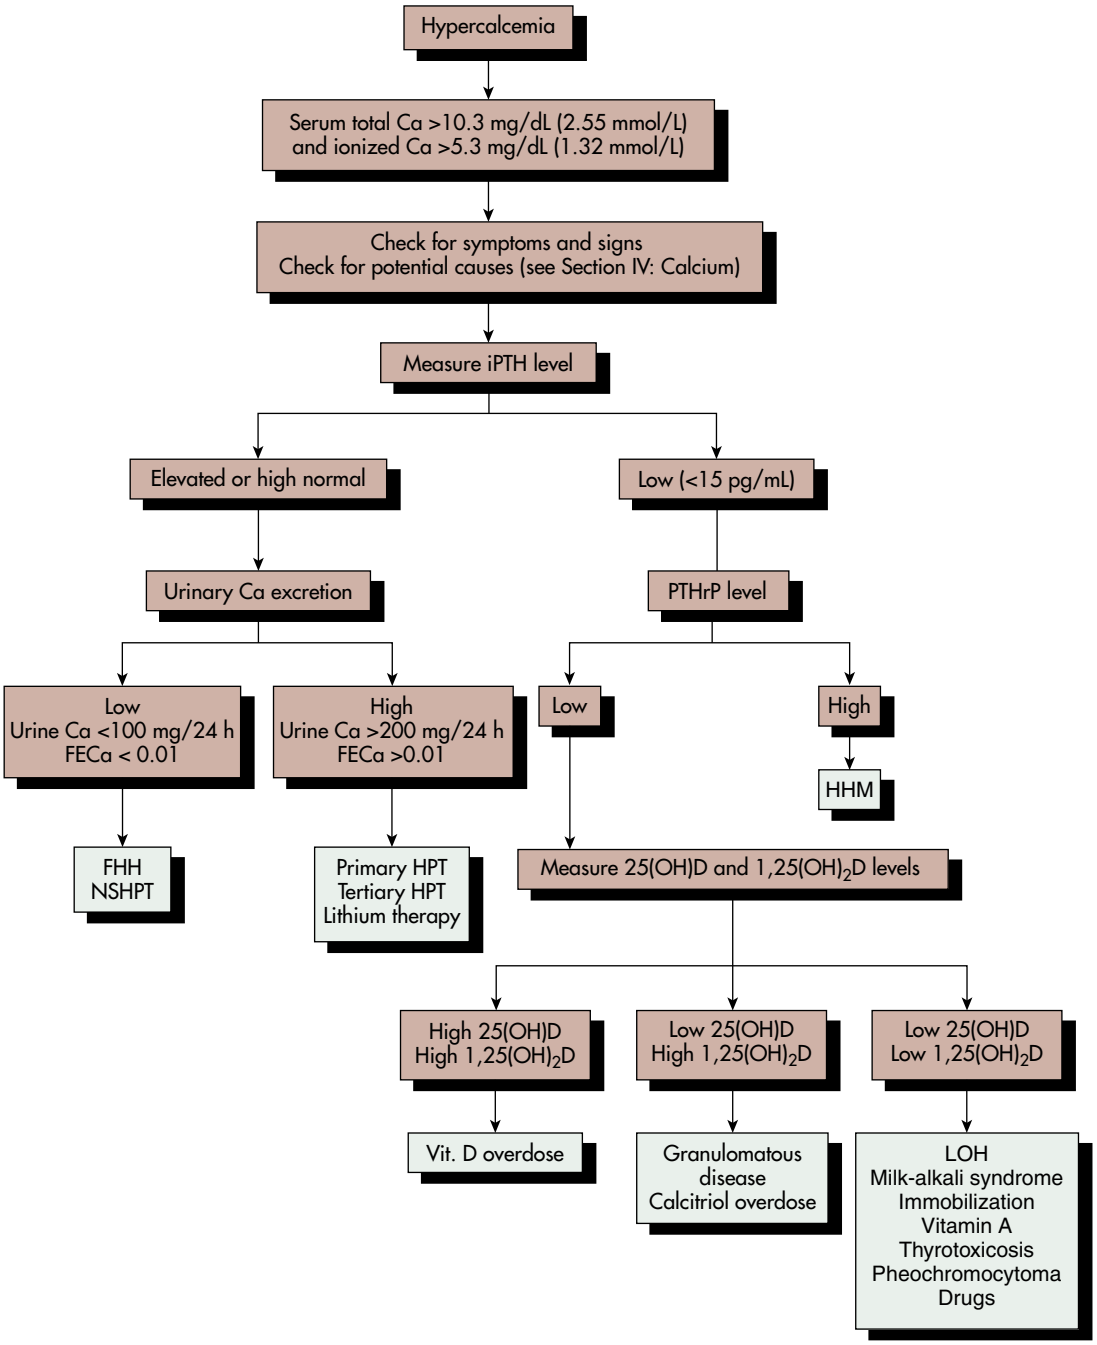


FIG. 88 Algorithm for evaluation of hypercalcemia. *FECa,* Fractional excretion of calcium; *FHH,* familial hypocalciuric hypercalcemia; *HHM,* humoral hypercalcemia of malignancy; *HPT,* hyperparathyroidism; *iPTH,* intact parathyroid hormone; *LOH,* localized osteolytic hypercalcemia; *NSHPT,* neonatal severe hyperparathyroidism; *PTHrP,* parathyroid hormone-related peptide. (From Skorecki K et al: *Brenner & Rector's the kidney,* ed 10, Philadelphia, 2016, Elsevier.)

Diagnostic Imaging

Best Test(s)
None

Ancillary Tests
Radiograph of painful bones (r/o bone neoplasm, multiple myeloma)
Tc-99m parathyroid scan (r/o parathyroid adenoma)
Ultrasound of parathyroid glands
Ultrasound of kidneys (r/o renal cell carcinoma)

Lab Evaluation

Best Test(s)
Serum calcium level
PTH level

Ancillary Tests
Serum phosphate, magnesium, alkaline phosphatase, albumin
Electrolytes, BUN, creatinine
24-hour urine collection for calcium
Urinary cyclic AMP
PSA (if prostate carcinoma is suspected)
Serum and urine protein immunoelectrophoresis (if multiple myeloma suspected)

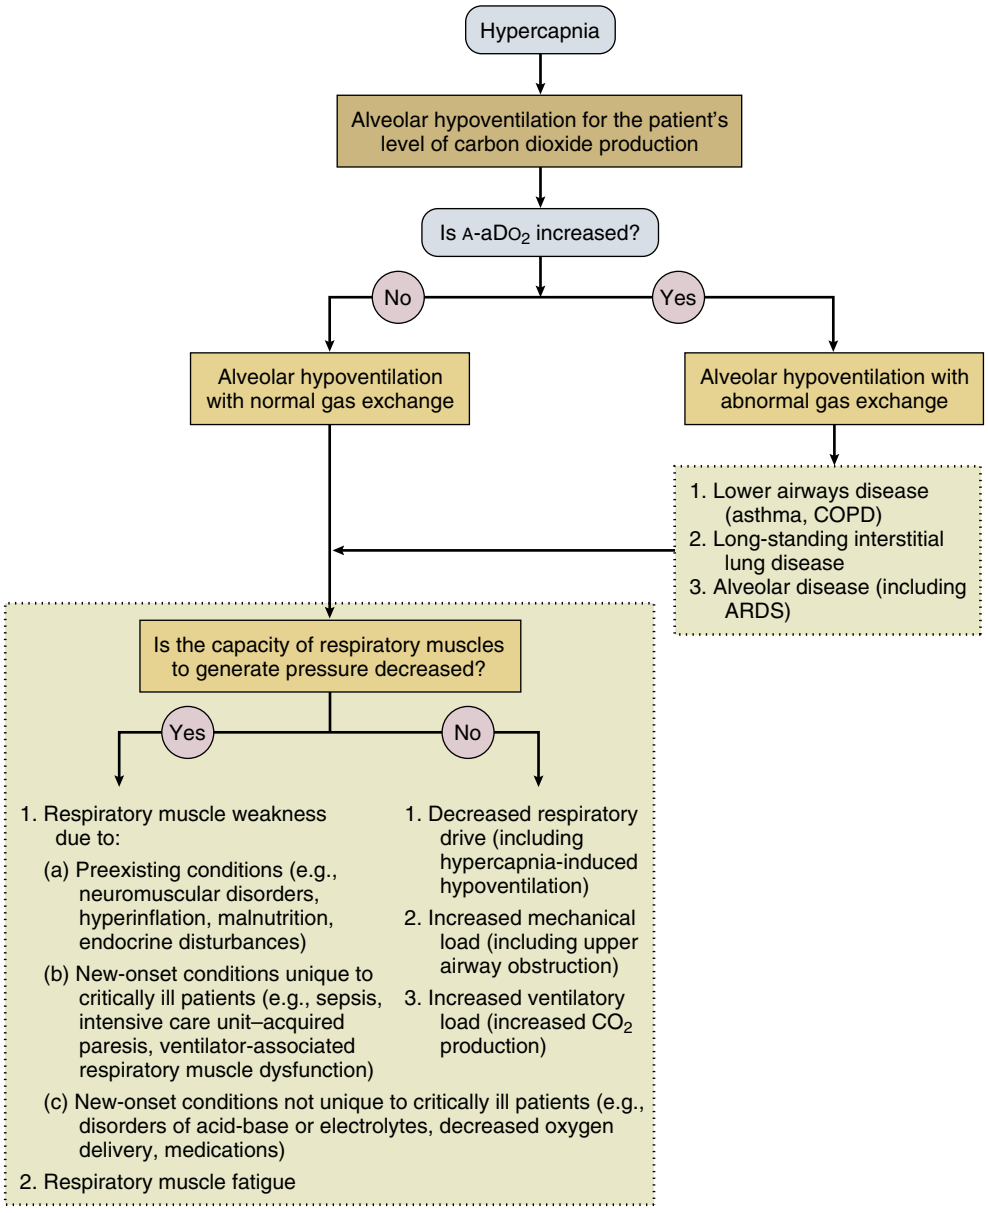

FIG. 89 Diagnostic approach to critically ill patient with hypercapnia. *A-aDO2,* Alveolar-arterial difference in partial pressure of oxygen; *ARDS,* acute respiratory distress syndrome; *COPD,* chronic obstructive pulmonary disease. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.)

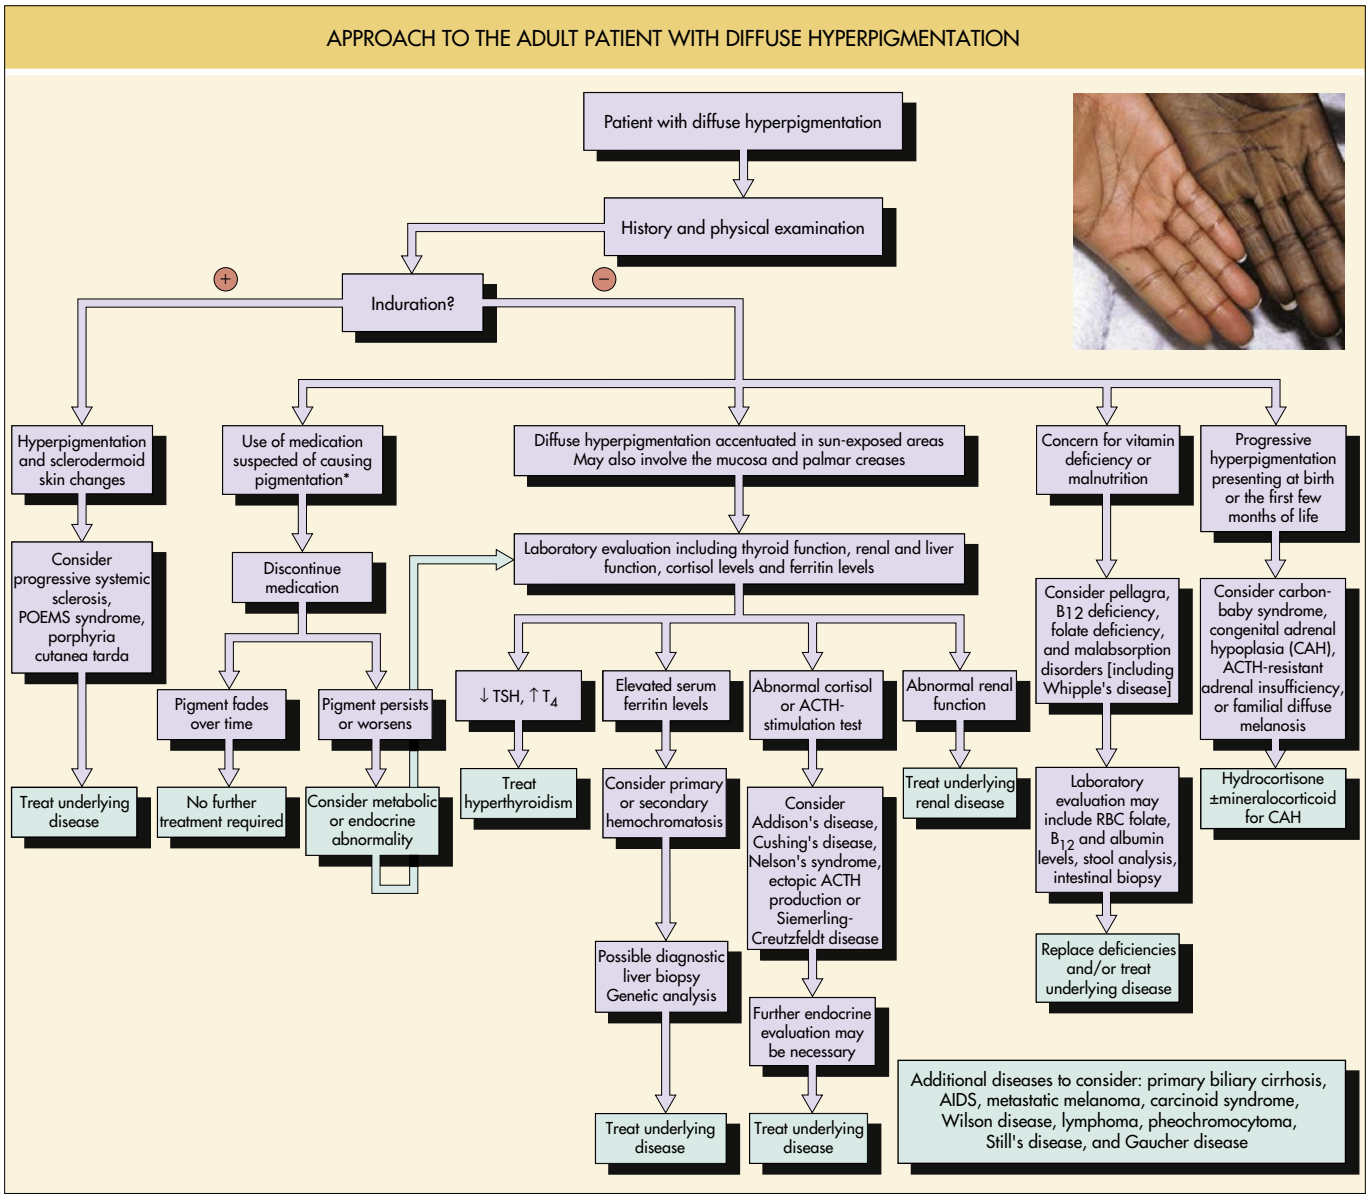

FIG. 90 Approach to the adult patient with diffuse hyperpigmentation. The palm on the right in the inset photograph shows diffuse hyperpigmentation in a patient with POEMS syndrome (*p*olyneuropathy, *o*rgano-megaly, *e*ndocrinopathy, *m*onoclonal gammopathy, and *s*kin lesions). *ACTH,* Adrenocorticotropic hormone; T_4, thyroxine; *TSH,* thyroid-stimulating hormone. *See Table 27 for a list of drugs and chemicals associated with diffuse hyperpigmentation. (From Bolognia JL, Jorizzo JL, Schaffer JV: *Dermatology,* ed 3, St Louis, 2012, Elsevier.)

TABLE 27 Drugs and Chemicals Associated with Hyperpigmentation

Drug or Chemical	Clinical Features	Histopathology/Comment
Cancer Chemotherapeutic Agents		
BCNU (Topical)	• Hyperpigmentation at site of application (no reaction seen with parenteral administration)	• Hyperplasia of basal melanocytes consistent with postinflammatory hyperpigmentation
Bleomycin	• Linear, flagellate bands, associated with minor trauma • Nails may be involved • Hyperpigmentation overlying joints	• Increased epidermal melanin • Little dermal pigment incontinence • No increase in epidermal melanocytes
Busulfan	• Generalized hyperpigmentation resembling Addison disease; sometimes seen in association with drug-induced pulmonary fibrosis	• Increased melanin in basal keratinocytes and in dermal macrophages
Cyclophosphamide	• Diffuse hyperpigmentation of the skin and mucous membranes • Localized pigment of the nails (transverse or longitudinal bands), palms and soles, or teeth	• Pigmentation usually regresses within 6 to 12 months after therapy is discontinued
Dactinomycin	• Generalized hyperpigmentation, most prominent on the face	• Pigmentation fades after treatment discontinued
Daunorubicin	• Hyperpigmentation of light-exposed areas • Transverse brown-black nail bands	• Structurally similar to doxorubicin
Doxorubicin	• Pigmentation of the nails; hyperpigmentation of the palmar creases, palms, soles, buccal mucosa, dorsae of the knuckles and tongue	• Increased epidermal melanin • Increased number of melanocytes
5-Fluorouracil	• Hyperpigmentation in sun-exposed areas • Increased pigmentation of skin overlying veins used for infusion, dorsae of the hands and trunk	• Synergistic hyperpigmentation of irradiation portal sites
Hydroxyurea	• Reversible hyperpigmentation over pressure points and the back • Nails may be involved	• Lichenoid eruption with secondary hyperpigmentation
Mechlorethamine (nitrogen mustard)	• Topical use for cutaneous lymphoma may result in generalized hyperpigmentation • More intense in lesional skin	• Disaggregation of melanosomes within keratinocytes • Increased number of melanocytes
Methotrexate	• Uniform hyperpigmentation in sun-exposed areas	• Uncommon • May be postinflammatory hyperpigmentation secondary to photosensitivity reaction
Antimalarials		
Amino quinolones (chloroquine, hydroxychloroquine, amodiaquine)	• Yellow-brown or gray to blue-black pigment, usually in pretibial areas; face, hard palate, and subungual areas may be involved	• Dyspigmentation in up to 25% of patients • Dermal deposition of melanin-drug complexes; hemosiderin around capillaries • May fade, but rarely resolves, upon discontinuation of drug
Heavy Metals		
Arsenic	• Areas of bronze hyperpigmentation ± superimposed raindrops • Keratoses on the palms and soles associated with pigmentation	• May appear 1-20 yr after exposure • Dermal and epidermal deposition of arsenic • Increased epidermal melanin synthesis
Bismuth	• Generalized blue-gray discoloration of face, neck, dorsal hands • Oral mucosa and gingivae may be involved	• Bismuth granules in the papillary and reticular dermis
Gold	• Permanent blue-gray discoloration in sun-exposed areas, mostly around the eyes (chrysiasis)	• Gold particles within macrophage lysosomes in the dermis
Iron	• Permanent brown pigment at injection or application sites	• Pigment coats collagen fibers and is deposited in dermal macrophages
Lead	• "Lead line" in gingival margin • Nail pigmentation	• Lead line is due to subepithelial deposition of lead granules
Mercury	• Slate-gray pigmentation, particularly in skin folds	• Brown-black granules free in dermis, in association with elastic fibers, and within macrophages
Silver	• Generalized slate-gray pigmentation, increased in sun-exposed areas • Nails and sclerae may also be involved • Localized at sites of application	• Silver granules in the basement membrane and on the membrana propria of eccrine glands
Hormones		
Oral contraceptives	• Melasma; increased pigment of nipples and nevi	• Increased melanocytes and increased melanin synthesis
ACTH/MSH	• Diffuse brown or bronze pigmentation; seen in Addison disease and Cushing syndrome	• Increased melanin synthesis
Miscellaneous Compounds		
Amiodarone	• Slate-gray to violaceous discoloration of sun-exposed skin	• Yellow-brown granules in dermis, mostly perivascular • Lysosomal inclusions with a lipid-like substance
Azidothymidine (zidovudine, AZT)	• Nail and mucocutaneous hyperpigmentation	• Skin biopsy shows increased epidermal and dermal melanin
Clofazimine	• Diffuse red to red-brown discoloration of skin • Violet-brown to bluish discoloration, especially lesional skin	• Redness secondary to drug in fat • Phagolysosomes with lipofuscin material

TABLE 27 Drugs and Chemicals Associated with Hyperpigmentation—cont'd

Drug or Chemical	Clinical Features	Histopathology/Comment
Dioxins	• Chloracne most common skin finding • Hyperpigmentation may occur in sun-exposed areas	• Rare, except in accidental exposure
Hydroquinone	• Hyperpigmentation in areas of application due to exogenous ochronosis	• Yellow-brown banana-shaped fibers in papillary dermis
Minocycline	• Blue-black discoloration in old acne scars or sites of inflammation as well as lower extremities • May also involve nails, sclerae, oral mucosa, bones, and teeth • Generalized "muddy brown" pigmentation pattern in some patients	• Iron-containing granules and/or increased melanin, depending on clinical type
Psoralens	• Increased pigmentation after exposure to UVA light (PUVA)	• Proliferation of follicular melanocytes • Increased synthesis and transfer of melanin
Psychotropic drugs (phenothiazine, chlorpromazine, imipramine, desipramine)	• Slate-gray discoloration in sun-exposed areas	• Golden-brown granules in the upper dermis • Electron-dense inclusion bodies

ACTH, Adrenocorticotropic hormone; *AZT,* azidothymidine, now renamed zidovudine; *MSH,* melanocyte-stimulating hormone.
From Bolognia JL et al [eds]: *Dermatology,* ed 2, St Louis, 2008, Mosby.

FIG. 91 Hyperpigmentation of the nails in a 61-year-old woman receiving paclitaxel for breast cancer. (From Callen JP et al: *Dermatologic signs of systemic disease,* ed 5, 2017, Elsevier.)

FIG. 92 Grade 1 skin (facial) hyperpigmentation in a 62-year-old woman, during treatment with imatinib for a gastrointestinal stromal tumor. (From Callen JP et al: *Dermatologic signs of systemic disease,* ed 5, 2017, Elsevier.)

ICD-10CM #
E28.310 Symptomatic premature menopause
E29.1 Testicular hypofunction
E28.39 Other primary ovarian failure
E23.6 Other disorders of pituitary gland

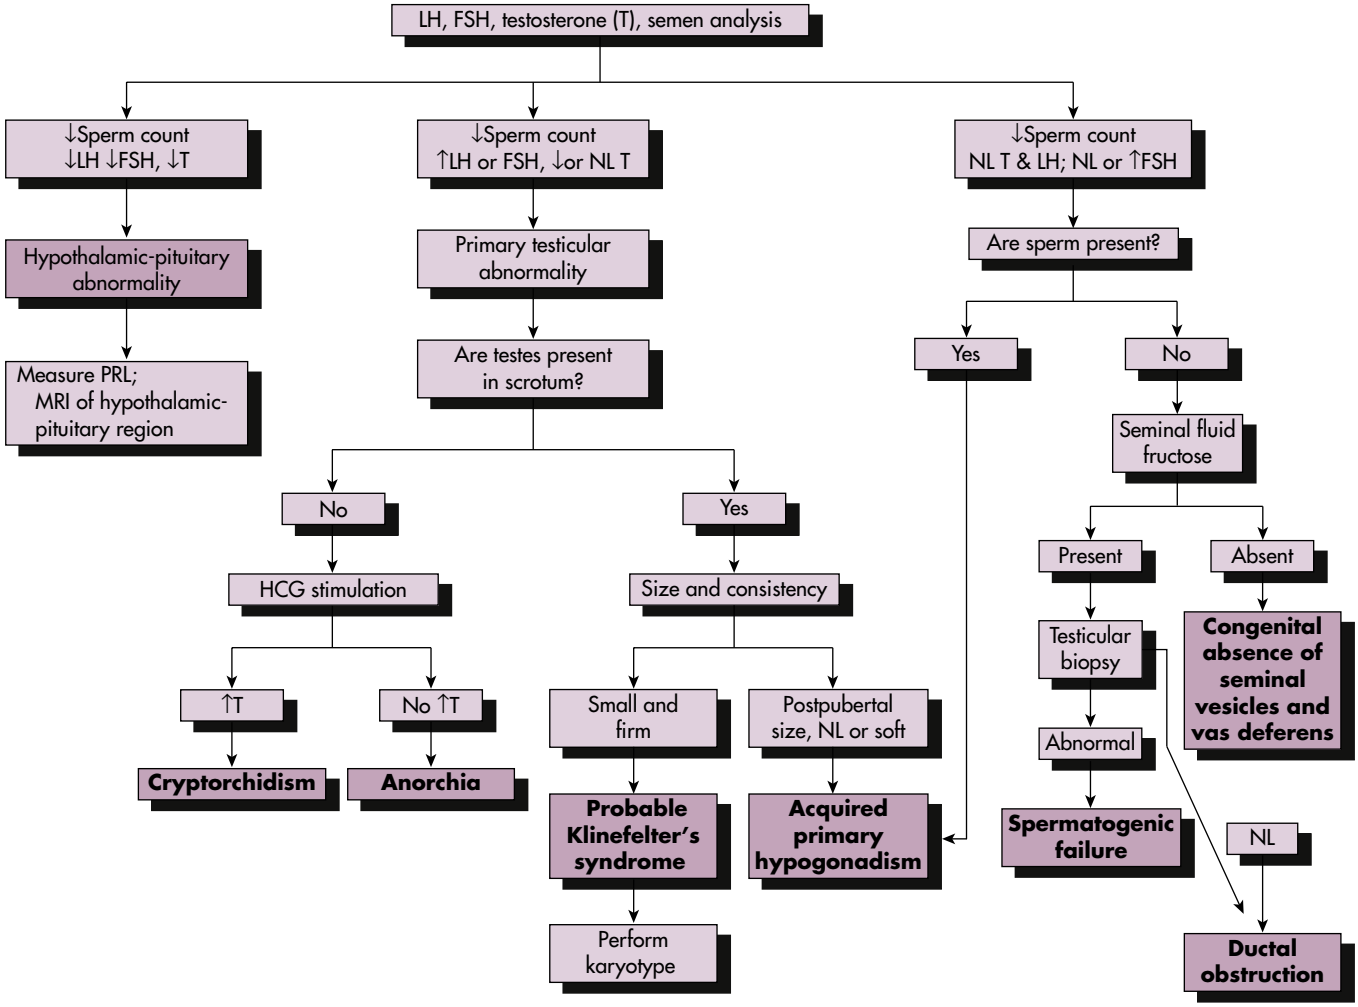

FIG. 93 Laboratory evaluation of hypogonadism. ↑, Elevated; ↓, decreased or low; *FSH,* follicle-stimulating hormone; *HCG,* human chorionic gonadotropin; *LH,* luteinizing hormone; *MRI,* magnetic resonance imaging; *NL,* normal; *PRL,* prolactin. (From Benjamin I et al: *Andreoli and Carpenter's Cecil essentials of medicine*, ed 9, Philadelphia, 2016, Saunders.)

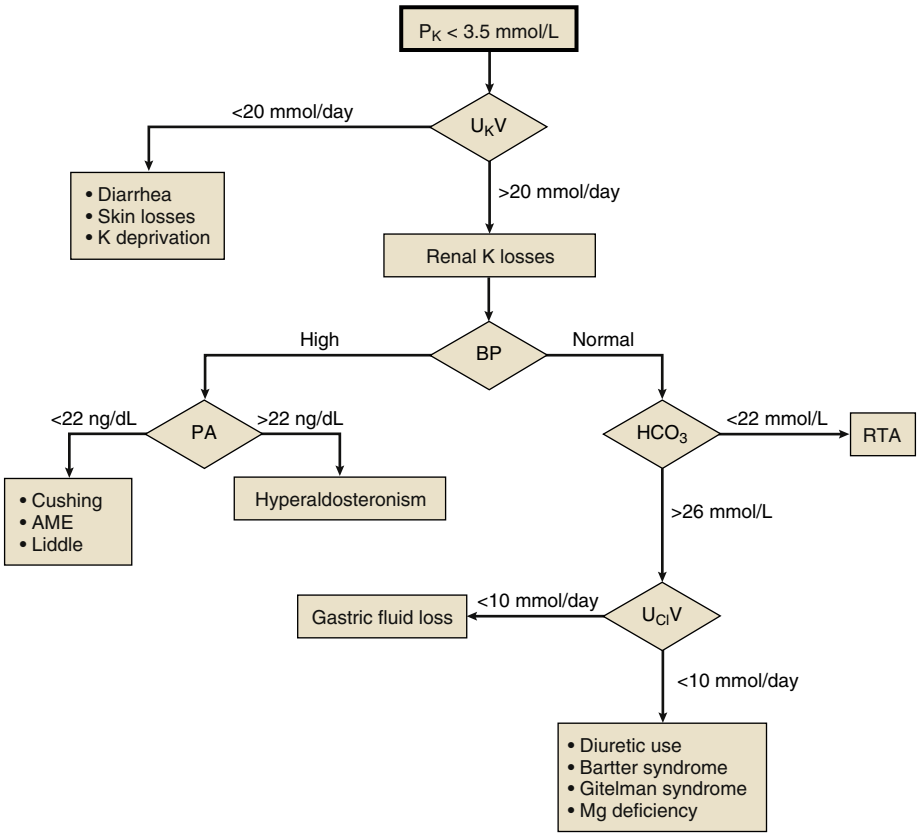

FIG. 94 Diagnostic evaluation of chronic hypokalemia. *AME,* Syndrome of apparent mineralocorticoid excess; *BP,* blood pressure; *HCO_3^-,* bicarbonate; *PA,* stimulated plasma aldosterone (see text); *RTA,* renal tubular acidosis; *$U_{Cl}V$,* urinary chloride excretion; *U_KV,* urinary potassium excretion. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.)

BOX 15 Causes of Acute Hypokalemia

- Treatment of diabetic ketoacidosis
- Refeeding syndrome
- Rapid cell production
  Vitamin B_{12} treatment of pernicious anemia
  GM-CSF treatment of leukopenia
- Pharmacologic agents
  β_2-Adrenoceptor agonists
  Epinephrine
  Soluble barium salts
- Hypokalemic periodic paralysis
  Familial
  Sporadic
  Thyrotoxic
- Pseudohypokalemia

GM-CSF, Granulocyte-macrophage colony-stimulating factor.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.

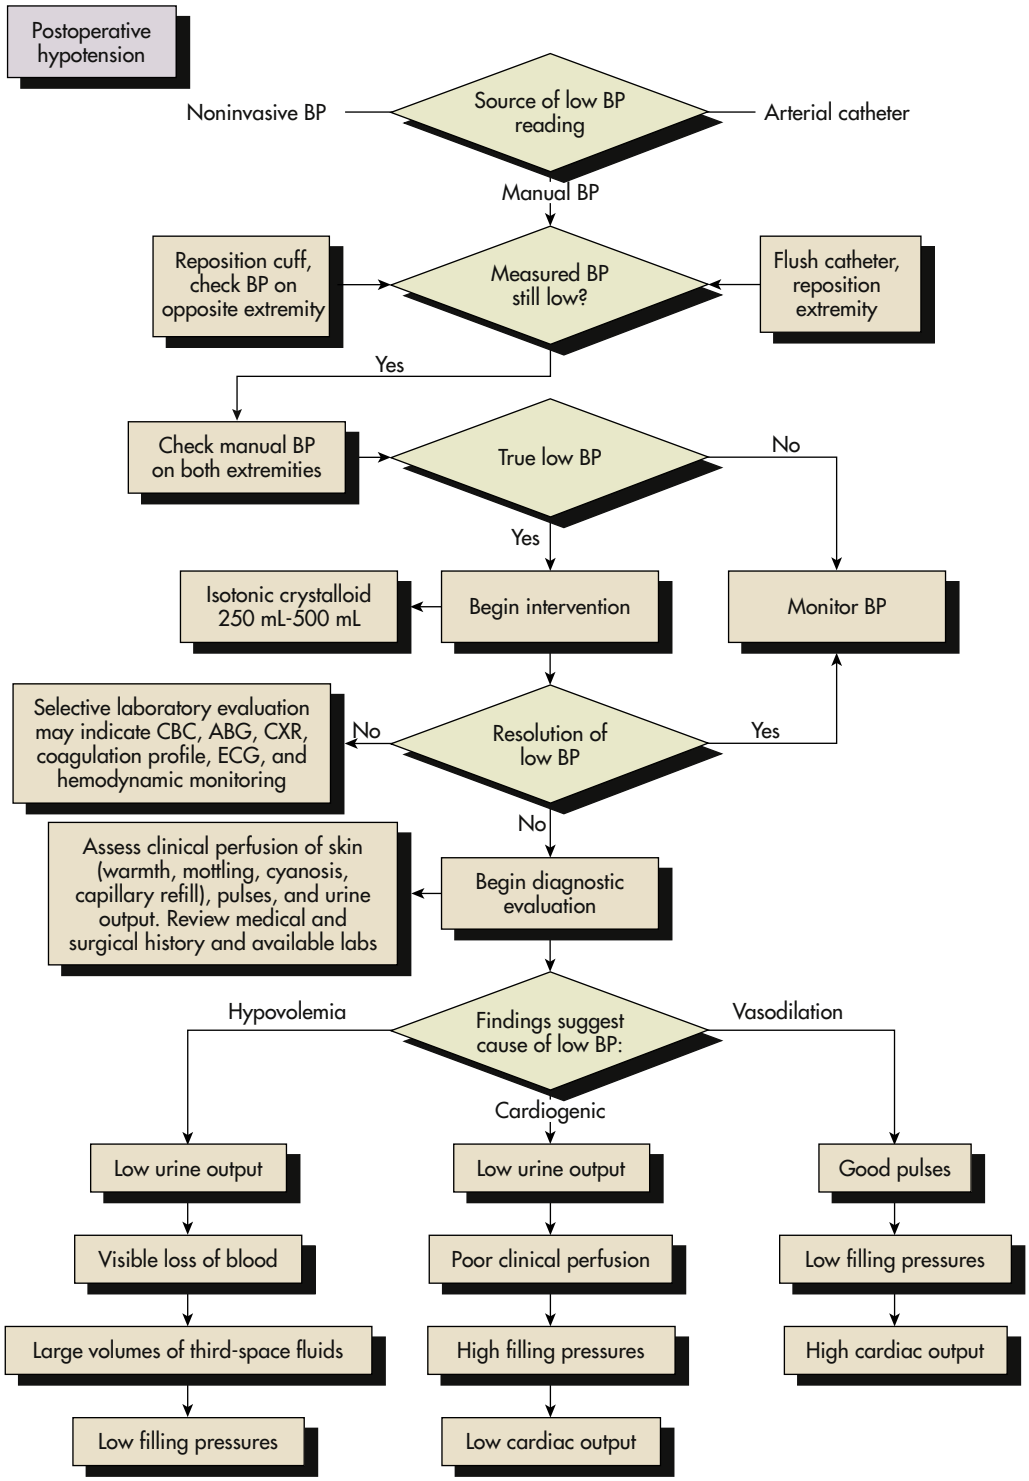

FIG. 95 Approach to managing postoperative hypotension. *ABG,* Arterial blood gases; *BP,* blood pressure; *CBC,* complete blood count; *CXR,* chest x-ray study; *ECG,* electrocardiogram. (From Parrillo JE, Dellinger RP: *Critical care medicine: principles of diagnosis and management in the adult,* ed 4, Philadelphia, 2014, Elsevier.)

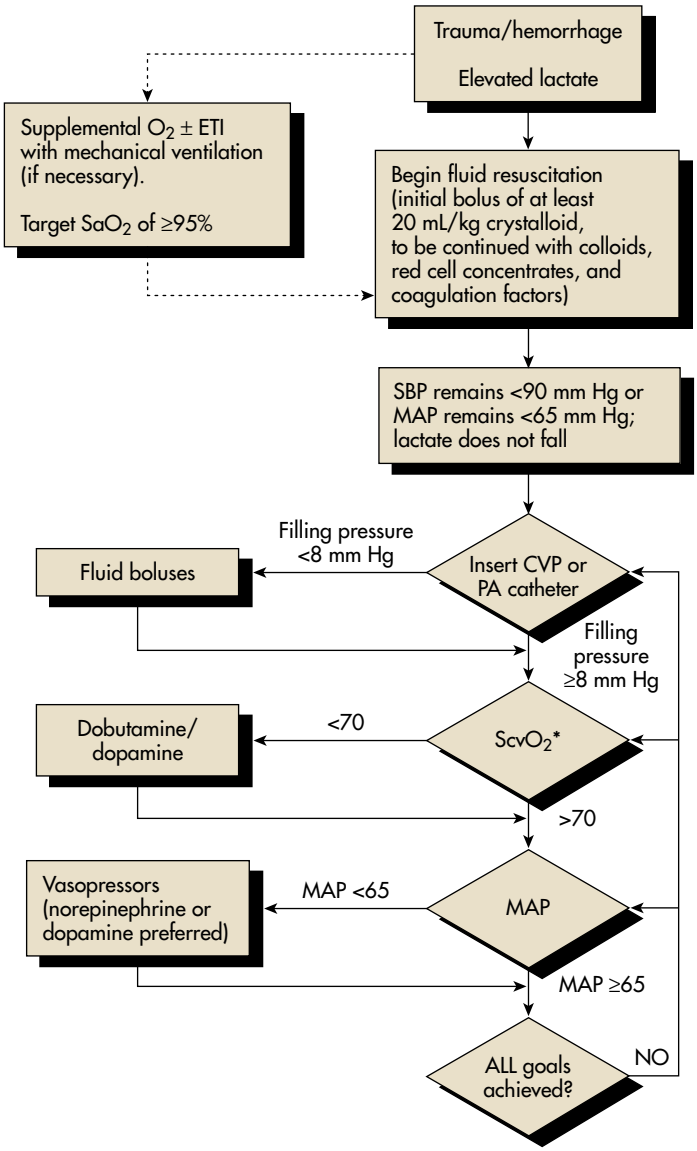

*If pulmonary artery catheter is used, a mixed venous O_2 saturation is an acceptable surrogate, and 65% would be the target.

FIG. 96 Hypovolemic shock management protocol. *CVP,* Central venous pressure; *ETI,* endotracheal intubation; *MAP,* mean arterial pressure; *PA,* pulmonary artery; *Sa_{O_2},* oxygen saturation; *SBP,* systolic blood pressure; *Scv_{O_2},* central venous oxygen saturation. (From Parrillo JE, Dellinger RP: *Critical care medicine: principles of diagnosis and management in the adult,* ed 4, Philadelphia, 2014, Elsevier.)

TABLE 28 Clinical Classification of Severity of Posthemorrhagic Hypovolemic Shock

Feature	Class I	Class II	Class III	Class IV
Blood loss				
ml	<750	750-1500	>1500-2000	>2000
%	<15	15-30	>30-40	>40
Heart rate (beats/min)	<100	>100	>120	>140
Blood pressure	Normal	Normal	Decreased	Decreased
Pulse pressure	Normal	Decreased	Decreased	Decreased
Respiratory rate	14-20	20-30	30-40	>40
Urinary output (ml/h)	>30	20-30	5-15	Negligible
Mental status	Slightly anxious	Mildly anxious	Anxious, confused	Confused, lethargic
Fluid replacement (ml/h)	Crystalloid	Crystalloid/colloid	Crystalloid and blood	Crystalloid and blood

From Parrillo JE, Dellinger RP: *Critical care medicine: principles of diagnosis and management in the adult*, ed 4, Philadelphia, 2014, Elsevier.

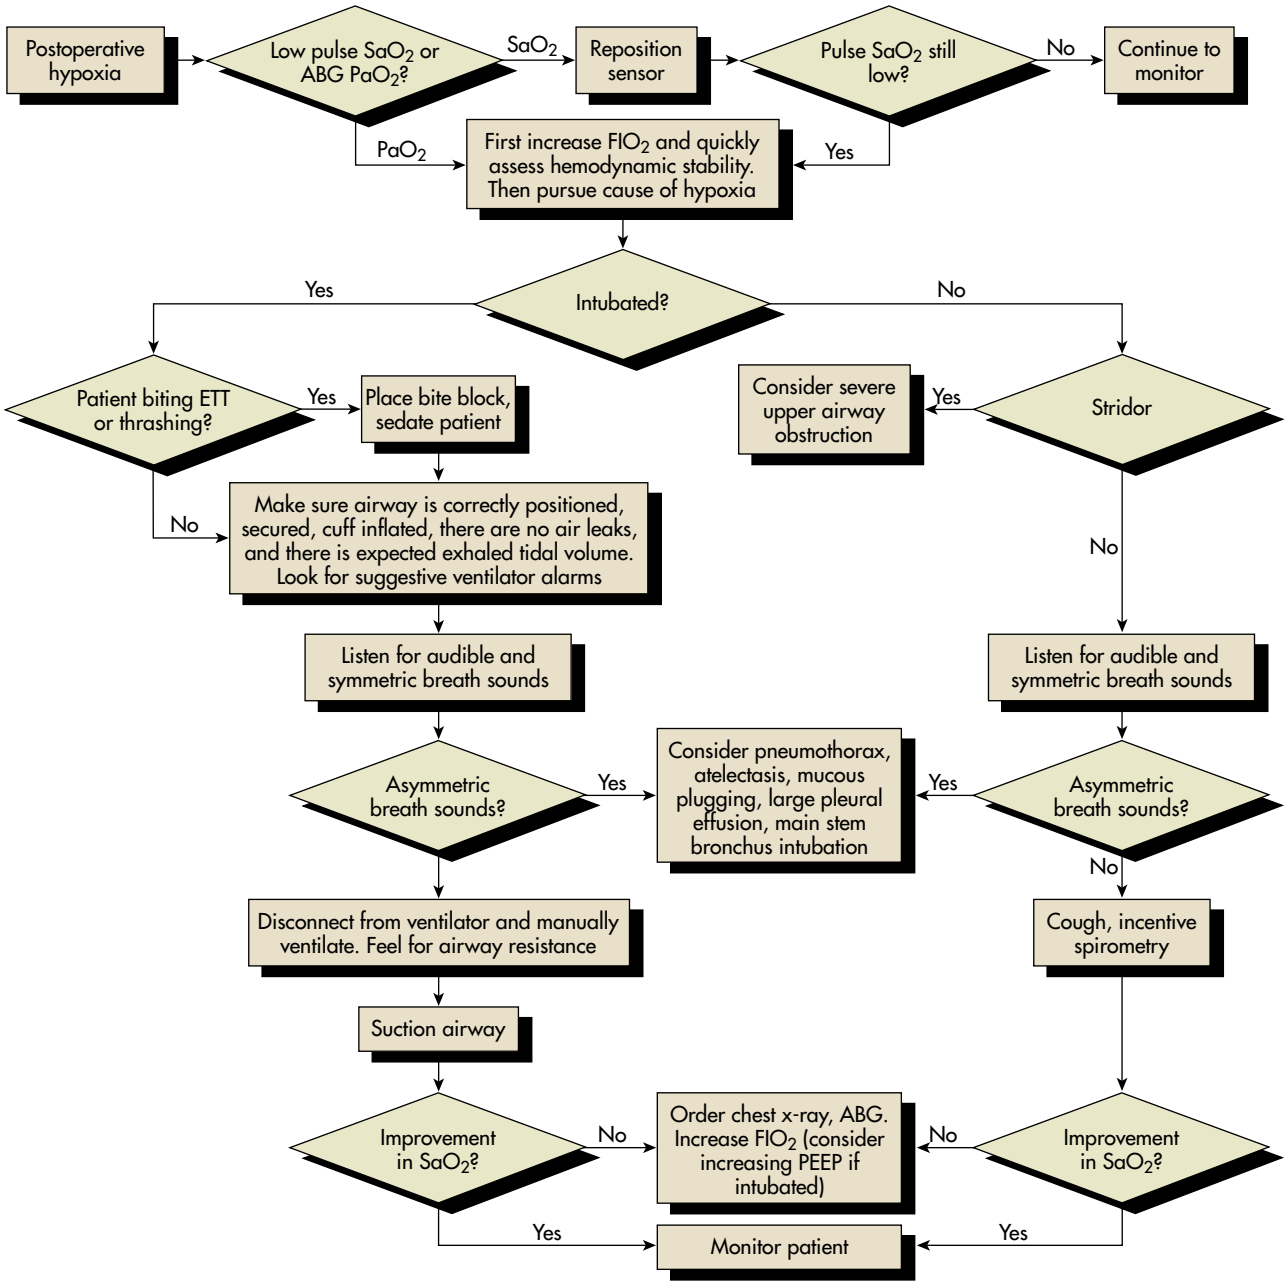

FIG. 97 Approach to managing postoperative hypoxemia. *ABG*, Arterial blood gas; *ETT*, endotracheal tube; Fi_{O_2}, fraction of inspired oxygen; Pa_{O_2}, arterial oxygen tension; *PEEP*, positive end-expiratory pressure; Sa_{O_2}, arterial oxygen saturation. (From Parrillo JE, Dellinger RP: *Critical care medicine: principles of diagnosis and management in the adult*, ed 4, Philadelphia, 2014, Elsevier.)

ICD-10CM #
M00.9 Pyogenic arthritis, unspecified
M86.9 Osteomyelitis unspecified
T84.3 Infection and inflammatory reaction
M79.9 Soft tissue disorder, unspecified

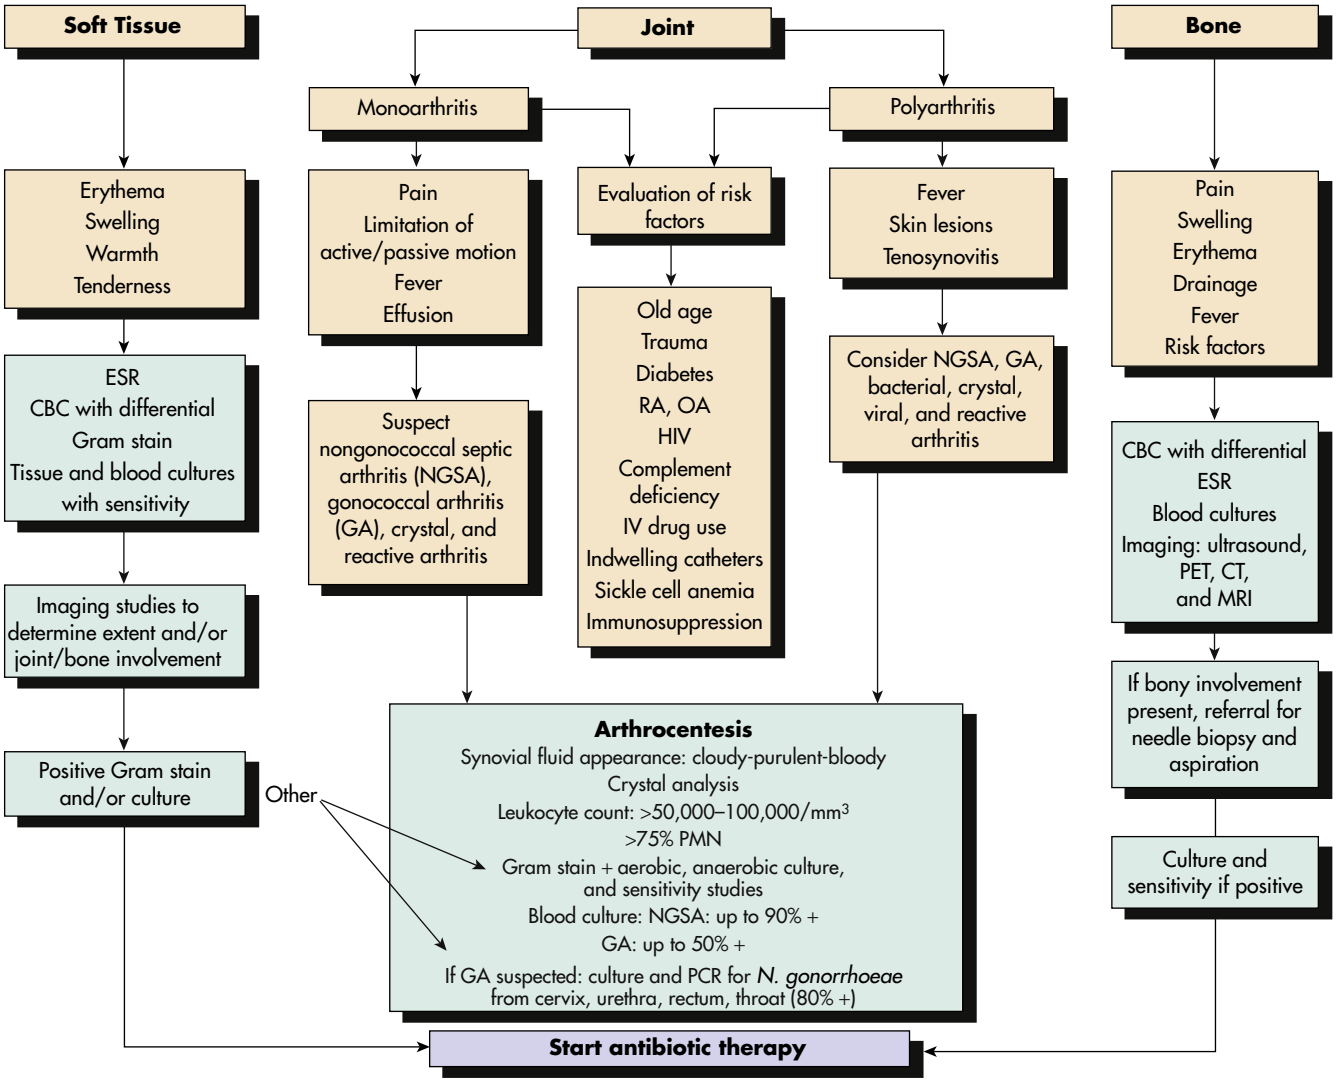

FIG. 98 Clinical evaluation of infections of soft tissues, joints, and bone. *CBC,* Complete blood count; *CT,* computed tomography; *ESR,* erythrocyte sedimentation rate; *GA,* gonococcal arthritis; *HIV,* human immunodeficiency virus; *IV,* intravenous; *MRI,* magnetic resonance imaging; *NGSA,* nongonococcal septic arthritis; *OA,* osteoarthritis; *PCR,* polymerase chain reaction; *PET,* positron emission tomography; *PMN,* polymorphonuclear leukocyte; *RA,* rheumatoid arthritis. (From Goldman L, Schafer AI: *Goldman Cecil medicine,* ed 25, Philadelphia, 2016, Saunders.)

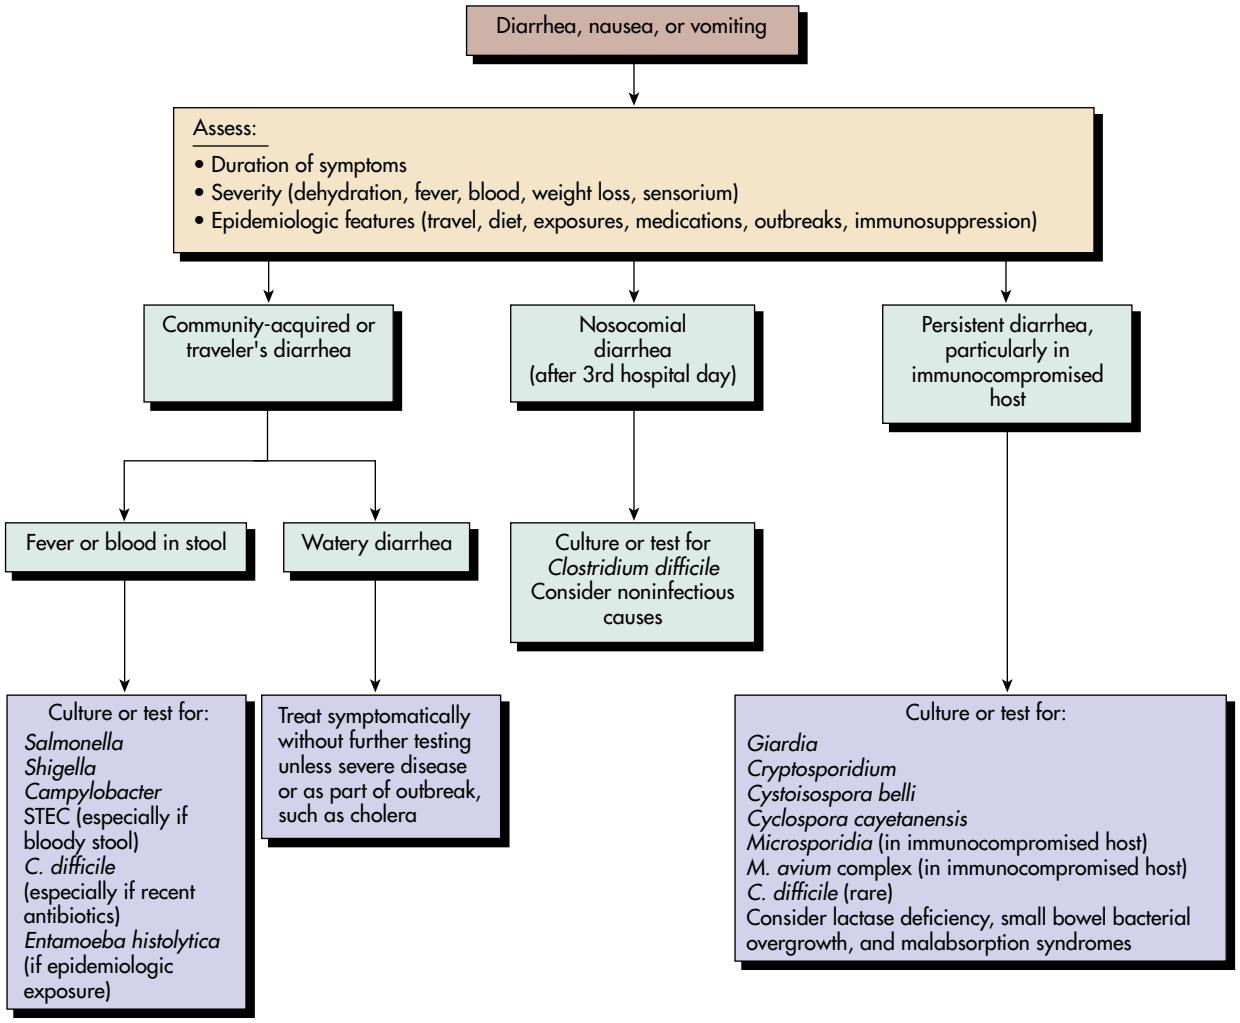

FIG. 99 Approach to diagnosis of infectious diarrhea. *STEC,* Shiga toxin-producing *Escherichia coli.* (From Bennett JE, Dolin R, Blaser MJ: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases*, ed 8, Philadelphia, 2015, Saunders.)

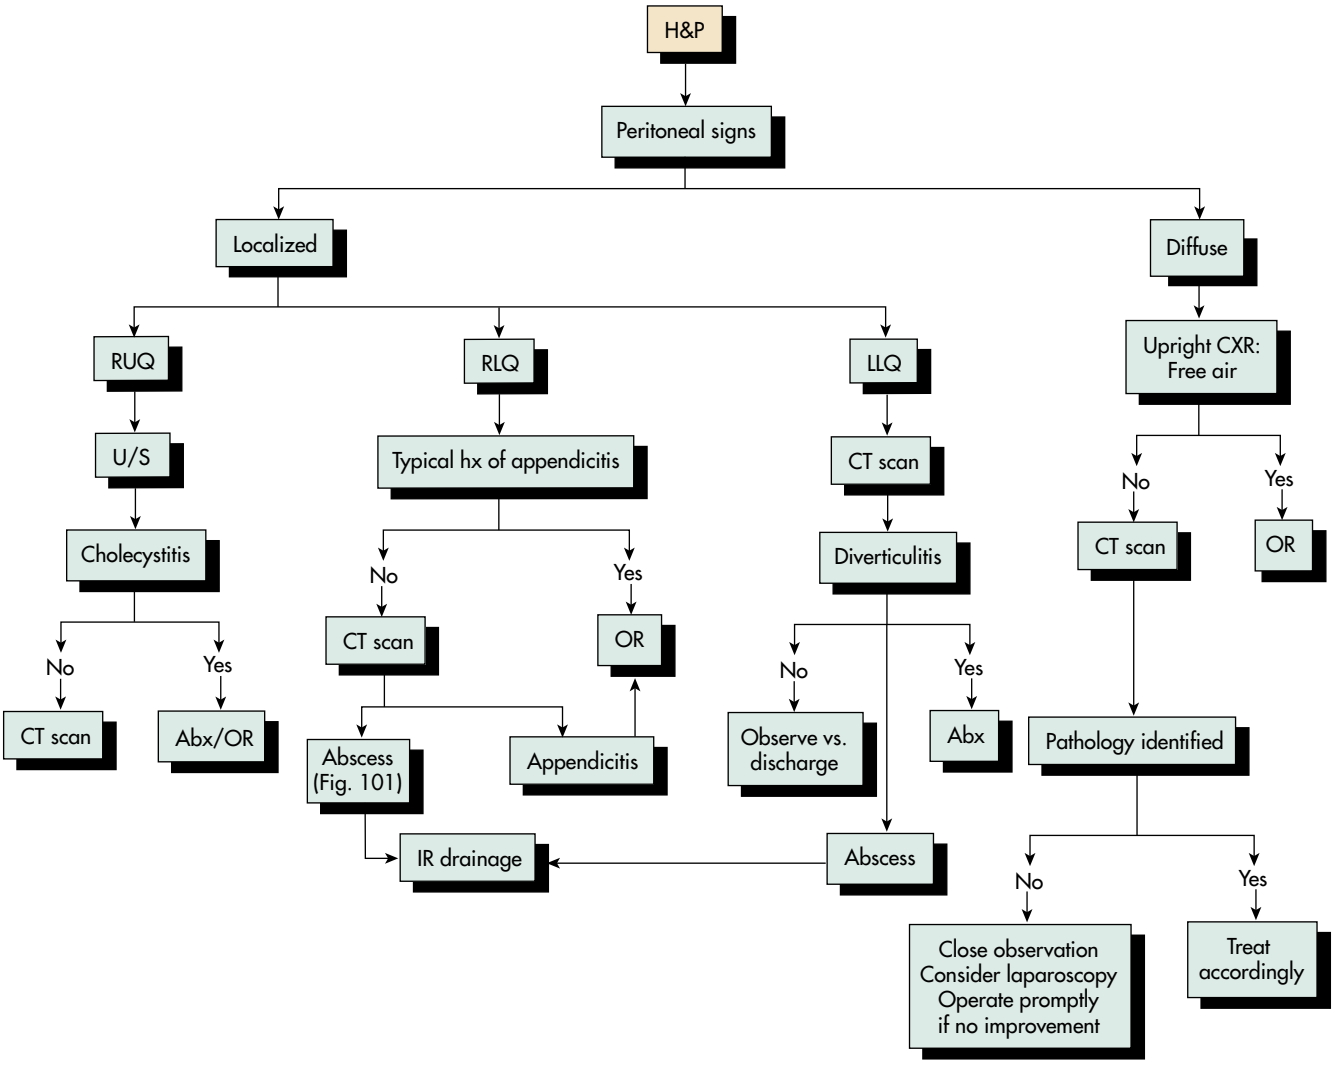

FIG. 100 Algorithm for the diagnosis and management of patients with suspected intraabdominal infection. *Abx,* Antibiotics; *CT,* computed tomography; *CXR,* chest radiograph; *H&P,* History and physical exam; *hx,* history; *IR,* interventional radiology; *LLQ,* left lower quadrant; *RLQ,* right lower quadrant; *RUQ,* right upper quadrant; *U/S,* ultrasound. (From Cameron JL, Cameron AM: *Current surgical therapy,* ed 10, Philadelphia, 2011, Saunders.)

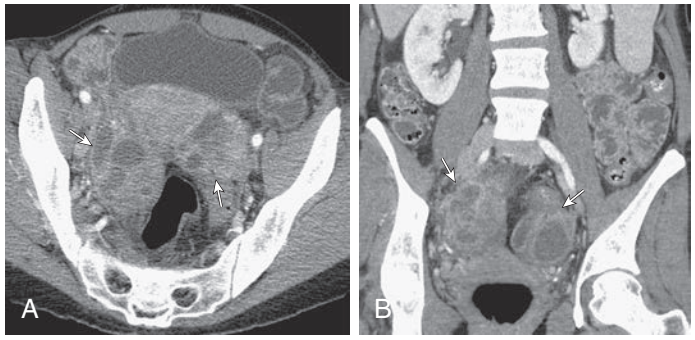

FIG. 101 Axial (A) and coronal (B) postcontrast computed tomographic images showing bilateral tuboovarian abscesses *(arrows).* (From Fielding JR et al: *Gynecologic imaging,* Philadelphia, 2011, Saunders.)

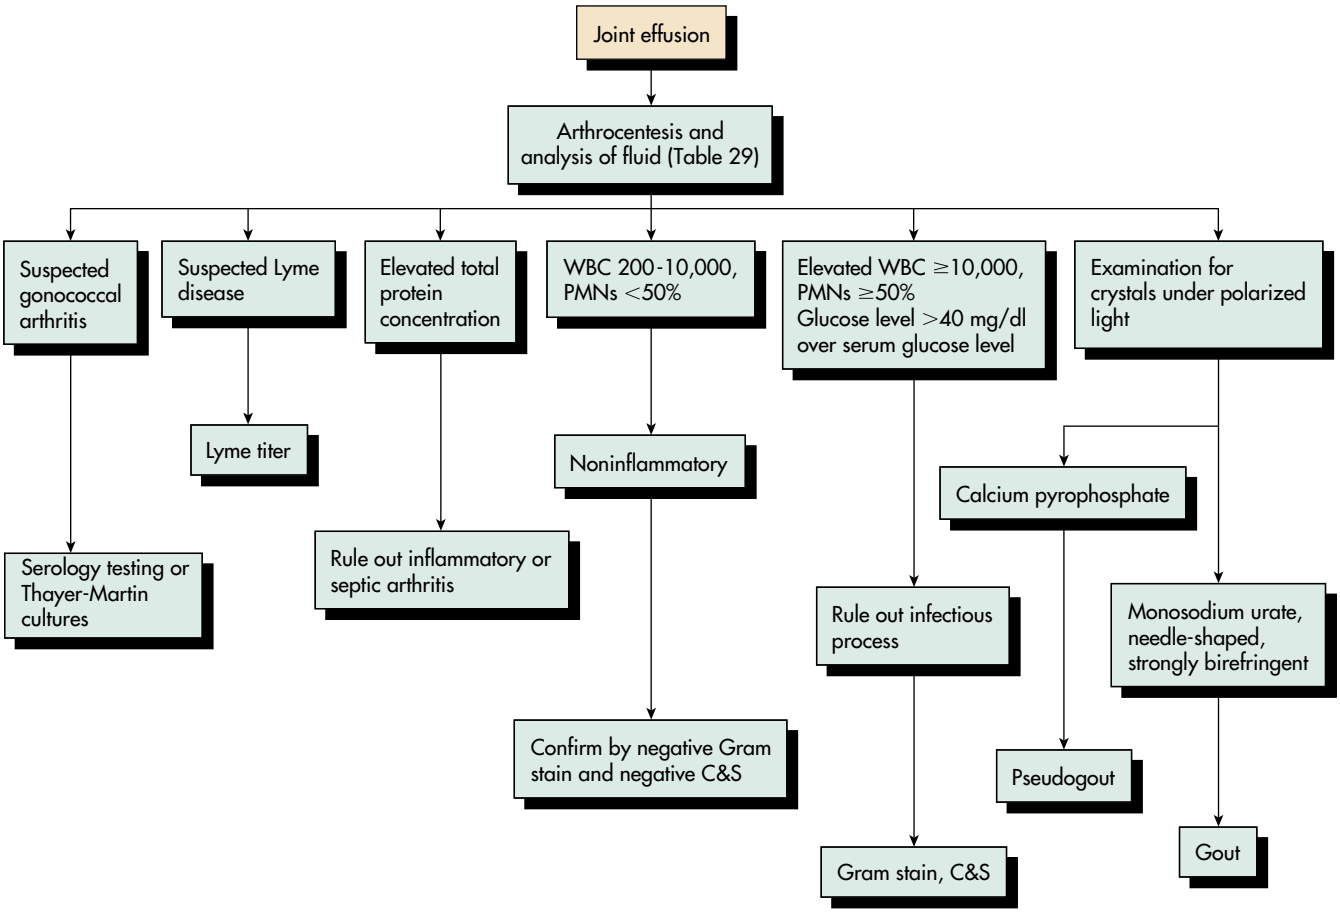

FIG. 102 Joint effusion. See also Section IV, Arthrocentesis Fluid. *C&S,* Culture and sensitivity; *PMNs,* polymorphonuclear leukocytes; *WBC,* white blood cell count.

TABLE 29 Indications for Arthrocentesis

Undiagnosed Arthritis with Effusion

Characterize type of arthritis
- Noninflammatory (WBC <2000/mm^3)
- Inflammatory (WBC >2000/mm^3)
- Septic (WBC >50,000/mm^3)
- Definitive diagnosis
- Gout (urate crystals)
- Pseudogout (calcium pyrophosphate dihydrate crystals)
- Septic arthritis (Gram stain [rare] or culture)

Undiagnosed Arthritis without Effusion

May be definitive in gout (knee, first metatarsophalangeal joint)

Patient with Known Diagnosis

Septic arthritis (repeated taps for adequate drainage)
Other types of arthritis for symptomatic relief (with or without injection)*

WBC, White blood cells.
*Most studies show improved effect if fluid is aspirated before injection.
From Firestein GS et al: *Kelley's textbook of rheumatology,* ed 9, Philadelphia, 2013, Saunders.

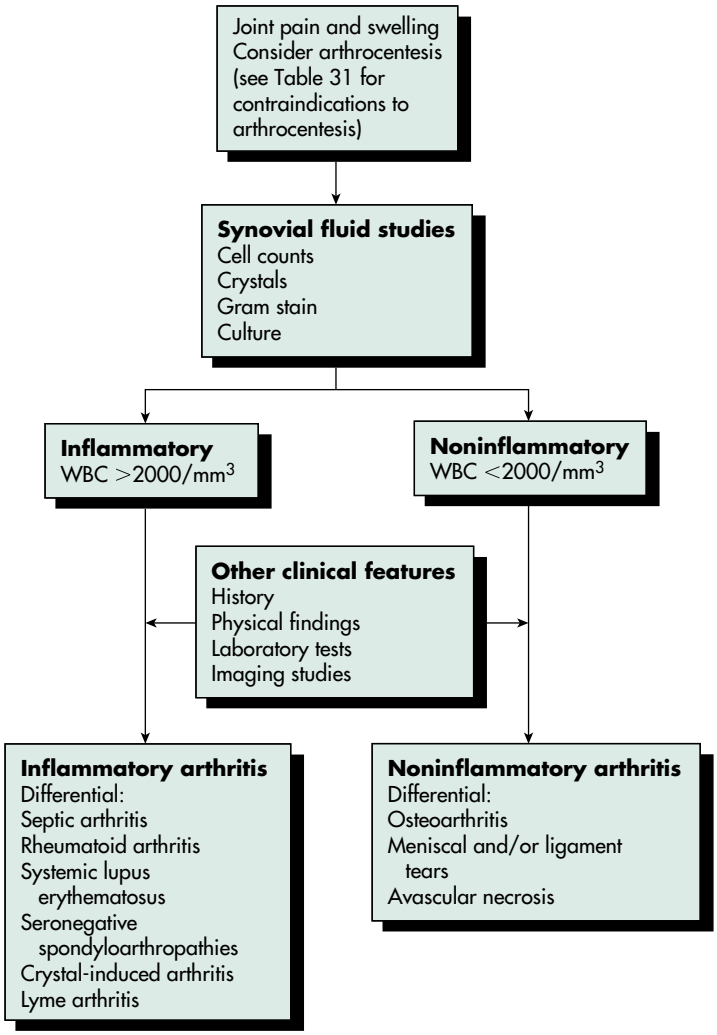

FIG. 103 Diagnostic approach for swollen joints. *WBC,* White blood cell count. (From Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

TABLE 30 Clinical and Radiological Findings in Joint Disease

Condition	Site of Involvement	Discriminatory Findings
Primary osteoarthritis (F>M • >45 years)	Hands	PIP and DIP joint involvement (Heberden and Bouchard nodes) • no osteopenia
	Large joints (e.g., hip, knee)	Joint space narrowing • subchondral sclerosis • subchondral cysts • marginal osteophytes
	Spine	Degenerative disc disease • spondylosis deformans • apophyseal joint involvement • spinal stenosis • foraminal stenosis
Erosive osteoarthritis (affects middle-aged females)	Hands	PIP and DIP joint involvement • joint ankylosis • 'gull-wing' deformities (central erosions and marginal osteophytes)
Rheumatoid arthritis (F>M • Rh factor positive)	Hand and wrist	Symmetrical arthritis • MCP and PIP joint involvement • periarticular (early) and diffuse (late) osteopenia • marginal erosions • subluxation (swan neck and boutonnière deformities) • periostitis is uncommon
	Large joints	Joint space narrowing • marginal erosions • synovial cysts • protrusio acetabulae
	Spine	Atlantoaxial subluxation

TABLE 30 Clinical and Radiological Findings in Joint Disease—cont'd

Condition	Site of Involvement	Discriminatory Findings
Juvenile idiopathic arthritis (M = F • affects children)	Hands	Joint ankylosis • florid periosteal reaction • osteopenia
	Large joints (e.g., knee)	Abnormalities of growth and maturation • epiphyseal overgrowth and premature closure of the physis • widened intercondylar notch
	Cervical spine	Apophyseal joint fusion • atlantoaxial subluxation
Psoriatic arthritis (M>F • nail changes • HLA-B27 +ve)	Upper extremities (e.g., hands)	"Sausage" digit • DIP joint involvement • terminal tuft erosion • pencil-in-cup deformity • joint ankylosis • arthritis mutilans • periosteal reaction • no osteopenia
	SI joints	Asymmetric or unilateral sacroiliitis
	Spine	Coarse syndesmophytes
Reites syndrome (affects young male adults)	Lower extremities (e.g., foot)	Hallux involvement • periosteal reaction • calcaneal erosions • osteopenia not prominent
	Spine	Coarse syndesmophytes
	SI joints	Asymmetric or unilateral sacroiliitis
Ankylosing spondylitis (M>F • affects young adults • HLA-B27 +ve in 95%)	SI joints	Bilateral symmetrical sacroiliitis • ankylosis
	Spine	Anterior vertebral body squaring • syndesmophytes • paravertebral ossification • bamboo spine
	Pelvis	"Whiskering" of the iliac crests and ischial tuberosities
Enteropathic arthropathies	SI joints	Symmetrical sacroiliitis
Gout (M>F)	Hands and feet (especially the great toe)	MTP joint of the great toe • juxta-articular erosions • punched-out lesions with an overhanging margin • no periarticular osteopenia • tophi
CPPD crystal deposition disease (M = F)	Any peripheral joint • predilection for the knee	Degenerative changes • chondrocalcinosis • paucity of subchondral sclerosis
HA crystal deposition disease (M = F)	Predilection for the shoulder (supraspinatus tendon)	Periarticular calcification
Hemochromatosis (M>F)	Hands	2nd and 3rd MCP joint involvement ("squared" metacarpal heads) • joint space narrowing • "hooklike" osteophytes • numerous subchondral cysts
Alkaptonuria (ochronosis) (M = F)	Intervertebral discs • SI joints • large joints	Degenerative changes: disc calcification • joint space narrowing • periarticular sclerosis
Systemic lupus erythematosus (F>M • affects young adults)	Hands	Reversible MCP joint subluxation
Scleroderma (F>M • affects adults)	Hands	IP joint arthritis • acroosteolysis • soft tissue calcifications
Mixed connective tissue disease (overlap syndrome)	Hands	PIP joint, MCP joint, mid-carpal involvement • soft tissue swelling, calcifications, or atrophy
Multicentric reticulohistiocytosis (F>M)	Hands and feet	DIP joint and carpal involvement • soft tissue swelling • articular erosions • no osteopenia
Polymyositis/dermatomyositis	Proximal extremities	Soft tissue calcification
	Hands	DIP joint erosions
Sarcoidosis	Distal and middle phalanges of the hands and feet	Punched-out cystlike lesions • "lacelike" appearance

TABLE 30 Clinical and Radiological Findings in Joint Disease—cont'd

Condition	Site of Involvement	Discriminatory Findings
Hemophilic arthropathy (affecting males—but with female carriers)	Predilection for large joints (e.g., knee)	Epiphyseal overgrowth • juxtaarticular osteopenia • erosion and cartilage destruction • widened intercondylar and trochlear notches • squared patella
Neuropathic arthropathy	Any joint	5 "Ds": normal bone **D**ensity • joint **D**istension • bony **D**ebris • joint **D**isorganization • **D**islocation
Hypertrophic osteoarthropathy	Tubular bones (radius and ulna > tibia and fibula)	Diaphyseal and metaphyseal painful periostitis

From Grant LA, Griffin N: *Grainger & Allison's diagnostic radiology essentials*, ed 2, Philadelphia, 2019, Elsevier.

TABLE 31 Contraindications to Arthrocentesis and Joint Injection

Contraindication	Comment
Established infection in nearby structures (e.g., cellulitis, septic bursitis)	Sometimes gout mimics cellulitis, creating a confusing picture
Septicemia (theoretic risk of introducing organism into joint)	Need to tap suspected septic joints in septic patients
Disrupted skin barrier (e.g., psoriasis)	Do not tap through lesions
Bleeding disorder (not absolute, but use more care)	Risk of bleeding very low, even in patients taking warfarin
Septic joint	Steroid injection contraindicated
Prior lack of response	Relative contraindication
Difficult-to-access joint	Relative contraindication without imaging aid

TABLE 32 Differential Diagnosis of Nausea and Vomiting

Etiologic Category	Critical Diagnoses	Emergent Diagnoses	Nonemergent Diagnoses
Gastrointestinal (GI)	• Boerhaave syndrome • Ischemic bowel • GI bleeding	• Gastric outlet obstruction • Pancreatitis • Cholecystitis or cholangitis • Bowel obstruction or ileus • Ruptured viscus • Appendicitis • Peritonitis • Spontaneous bacterial peritonitis	• Gastritis • Gastroparesis • Peptic ulcer disease • Inflammatory bowel disease • Biliary colic • Hepatitis • Gastroenteritis
Neurologic	• Intracerebral bleed • Meningitis	• Migraine • CNS tumor • Raised ICP	
Endocrine	•DKA	• Adrenal insufficiency • Uremia	• Thyroid
Pregnancy		• Hyperemesis gravidarum	• Nausea and vomiting of pregnancy
Drug toxicity		• Acetaminophen • Digoxin • Aspirin • Theophylline	
Therapeutic drug use			• Aspirin • Antibiotics • Erythromycin • Ibuprofen • Chemotherapy
Drugs of abuse			• Narcotics • Narcotic withdrawal • Alcohol
Genitourinary		• Gonadal torsion	Urinary tract infection Poisoning Nephrolithiasis
Miscellaneous	• Myocardial infarction • Sepsis	• Carbon monoxide • Electrolyte disorders • Organophosphate poisoning	• Motion sickness • Labyrinthitis

CNS, Central nervous system; *DKA,* diabetic ketoacidosis; *ICP,* intracranial pressure.
From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.

TABLE 33 Disorders Commonly Associated with Vomiting

Disorder	History	Prevalence	Physical Examination	Useful Tests	Comments
Nausea and vomiting of pregnancy (NVP)	Vomiting occurs predominantly in the morning. Associated breast tenderness. NVP typically starts in weeks 4-7, peaks in weeks 10-16, and disappears by week 20. Vomiting that begins after week 12 or continues past week 20 should prompt a search for another cause.	Very common Affects 75% of all pregnancies	Benign abdomen	Urine pregnancy test Serum electrolytes, urine ketones to exclude hyperemesis gravidarum	Consider NVP in all females of childbearing age. Prognosis for mother and infant is excellent. NVP is associated with a decreased risk of miscarriage, fetal growth retardation, and fetal mortality.
Hyperemesis gravidarum	Severe, protracted form of NVP. No universally accepted definition of the disease. Generally accepted hallmarks include 5% weight loss, ketonuria, and electrolyte disturbance. Hyperemesis is associated with multiple gestation, molar pregnancy, and nulliparity.	Uncommon Affects <1% of pregnancies	Signs of dehydration Benign abdomen	β-hCG Urinalysis for ketones Serum electrolytes Ultrasound examination to exclude molar pregnancy or multiple gestation	Most studies have found no adverse outcomes for the fetus. A few studies, however, have shown a correlation with fetal growth retardation.

TABLE 33 Disorders Commonly Associated with Vomiting—cont'd

Disorder	History	Prevalence	Physical Examination	Useful Tests	Comments
Gastroenteritis	Fever, diarrhea, and crampy abdominal pain. Vomiting and pain occur early, usually followed by diarrhea within 24 hr.	Very common	Benign abdomen	Usually not necessary	Early gastroenteritis, when only vomiting and periumbilical pain are present, may be confused with early appendicitis. Diarrhea is usually in the diagnosis of gastroenteritis.
Gastritis	Epigastric pain, belching, bloating, fullness, heartburn, and food intolerance. Use of NSAIDs or ETOH common.	Very common	Mild epigastric tenderness may be present.	Lipase and pregnancy test may be necessary to exclude other diagnoses.	Removal of inciting agent along with antacid therapy will resolve symptoms in most patients.
Peptic ulcer disease (PUD)	Epigastric pain present in 90% of cases. Classically, duodenal ulcer pain is relieved by food whereas gastric ulcer pain is made worse. Presence of severe pain should raise suspicion of perforation.	Very common	Mild epigastric tenderness	Hemoglobin if bleeding is suspected Heme-positive stool Upright abdominal film if perforation is suspected	Three major causes of PUD are NSAIDs, *Helicobacter pylori* infection, and hypersecretory states.
Biliary disease	Abdominal pain may be midepigastric or right upper quadrant (RUQ). Onset frequently after a fatty meal. May have history of similar episodes in the past.	Very common	RUQ tenderness present in most cases. If instructed to breathe deeply during palpation in the RUQ, the patient experiences heightened tenderness and inspiratory arrest (Murphy sign).	WBCs Lipase Serum bilirubin Alkaline phosphatase RUQ ultrasound examination ERCP	Normal temperature, WBCs, and spontaneous resolution of symptoms suggest biliary colic. Fever, Murphy sign, elevated WBCs, and suggestive ultrasound indicate cholecystitis.
Myocardial infarction (MI)	Patients typically have substernal chest pain that may radiate to left arm or jaw. Often associated with dyspnea, diaphoresis, or dizziness.	Common	Patients often are anxious and in distress from pain. No diagnostic examination findings.	ECG (new Q waves, ST segment changes, or T wave inversions) troponin	Not all patients have chest pain. A subset of patients, particularly diabetics and elders, may have only nausea, vomiting, and epigastric discomfort.
Diabetic ketoacidosis (DKA)	Polydipsia and polyuria occur early Without treatment, altered mental status and coma may develop. In patients with long-standing diabetes, DKA may be triggered by infection, trauma, MI, or surgery.	Common	"Fruity" breath odor results from serum acetone. Tachypnea occurs with attempts to "blow off" carbon dioxide to compensate for metabolic acidosis. Signs of dehydration may be present. Severe cases often manifest with altered mental status or coma.	Serum glucose, urine ketones, ABGs	DKA may be the first manifestation of diabetes in some patients. These patients often do not recognize the importance of polydipsia and polyuria. They often report only nausea, vomiting, and epigastric pain.
Pancreatitis	Presenting symptom is epigastric pain, which often radiates to the back. Most cases are caused by gallstones or alcoholism. Other causes include hypercalcemia, hyperlipidemia, drugs (sulfas and thiazides), ERCP.	Common	Epigastric tenderness is present. Associated paralytic ileus may cause abdominal distention and decreased bowel sounds. Frank shock may be present in severe cases.	Lipase WBCs, serum glucose, LDH, AST Hematocrit, BUN, calcium, ABGs	Criteria correlating with higher mortality: *At admission*—age >55 yr, WBCs >16,000/mm^3, glucose >200 dl, base deficit >4, LDH >350 IU/L, AST >250 U/L *Within 48 hours*—Hct drop of 10%, BUN >2 mg/dl, Po_2<60 mm Hg, calcium <8 mg, fluid sequestration >4 L
Appendicitis	Abdominal pain classically begins in periumbilical region and later moves to right lower quadrant. Anorexia is common.	Common	Localized tenderness over right lower quadrant. Low-grade fever may be present.	WBCs Ultrasound Abdominal CT	Early appendicitis can be a difficult diagnosis to make. It is still frequently missed on the first physician encounter.
Bowel obstruction	Classically, abdominal pain consists of intermittent cramps occurring at regular intervals. The frequency of the cramps varies with the level of the obstruction; the higher the level, the more frequent the cramps. The location of the pain also varies with the level of the obstruction; high obstruction causes epigastric pain, midlevel obstruction causes periumbilical pain, colonic obstruction causes hypogastric pain.	Common	Abdominal distention, mild diffuse tenderness, and high-pitched "tinkling" bowel sounds may be present. Thorough search for hernias should be performed.	Supine and upright plain abdominal films Abdominal CT	Adhesions, hernias, and tumors account for 90% of bowel obstructions. Other causes include intussusception, volvulus, foreign bodies, gallstone ileus, inflammatory bowel disease, stricture, cystic fibrosis, and hematoma.

Continued

TABLE 33 Disorders Commonly Associated with Vomiting—cont'd

Disorder	History	Prevalence	Physical Examination	Useful Tests	Comments
Carbon monoxide (CO) poisoning	Headache is usually present. CO poisoning often occurs during winter months when furnaces are turned on. Family members may have similar symptoms if they also have been exposed.	Uncommon	No reliable signs of early CO poisoning	CO level	Because CO is a tasteless, odorless gas, patients may not realize they have been exposed. It is important to keep a high index of suspicion during the cold months.
Boerhaave syndrome	Patients may have neck, chest, or epigastric pain. Forceful, protracted vomiting usually causes the tear. Most cases follow a bout of heavy eating and drinking. Other reported causes include childbirth, defecation, seizures, and heavy lifting.	Uncommon	Tachypnea, tachycardia, and hypotension may be present. Escaped air from the esophagus may produce subcutaneous emphysema. Air in the mediastinum produces a "crunching" sound as the heart beats (Hamman sign).	CXR may show pleural effusion, widened mediastinum, pneumothorax, or pneumomediastinum. Esophagogram with water-soluble contrast is definitive.	The classic presentation includes forceful vomiting, severe chest pain, subcutaneous emphysema, and multiple CXR findings. There is a growing body of evidence that most cases do not have this "classic" picture. In more subtle presentations, the diagnosis can be difficult to make.

ABGs, Arterial blood gases; *AST,* aspartate aminotransferase; *β-hCG,* β-human chorionic gonadotropin; *BUN,* blood urea nitrogen; *CT,* computed tomography; *CXR,* chest radiography; *ECG,* electrocardiogram; *ERCP,* endoscopic retrograde cholangiopancreatography; *ETOH,* ethyl alcohol; *Hct,* hematocrit; *LDH,* lactate dehydrogenase; *NSAID,* nonsteroidal antiinflammatory drug; Po_2, partial pressure of oxygen; *WBC,* white blood cell.
From Marx JA et al: *Rosen's emergency medicine,* ed 8, Philadelphia, 2014, Saunders.

TABLE 34 Etiology of Nausea and Vomiting in Pediatric Age Groups

Etiologic Category	Newborn	Infant	Child	Adolescent
Infectious	Sepsis, meningitis, UTI, thrush	Pneumonia, otitis media, thrush	Gastroenteritis	Gastroenteritis, URI
Anatomic	Atresia and webs, malrotation, stenosis, meconium ileus, Hirschsprung disease	Pyloric stenosis, intussusception, Hirschsprung disease	Bezoars, chronic granulomatous disease	PUD, superior mesenteric syndrome
Gastrointestinal	Reflux, overfeeding, gastric outlet obstruction, volvulus	Reflux, gastritis, milk intolerance	Appendicitis, pancreatic, hepatitis, other food intolerance	Achalasia, hepatitis
Neurologic	Subdural hematoma, hydrocephalus	Subdural hematoma	Neoplasia, migraine, Reye syndrome, motion sickness, hypertension	Neoplasia, migraine, motion sickness, hypertension
Metabolic	Organic or amino acidemias, urea cycle defects, galactosemia, hypercalcemia, phenylketonuria, kernicterus	Hereditary fructose intolerance, disorders of fatty acid metabolism, uremia, adrenal hyperplasia, kernicterus	Diabetes, vitamin A excess	Diabetes, pregnancy, acute intermittent porphyria
Other	Idiopathic, cardiac failure	Rumination, cardiac failure	Cyclic vomiting syndrome, toxins, food poisoning, Munchausen syndrome by proxy	Psychogenic, anorexia

PUD, Peptic ulcer disease; *URI,* upper respiratory infection; *UTI,* urinary tract infection.
Adapted from Li HK, Sunku BK: Vomiting and nausea. In Wyllie R, Hyams JS, editors: *Pediatric gastrointestinal and liver disease: pathophysiology, diagnosis, management.* Philadelphia: WB Saunders; 2005:127-149. From Marx JA et al: *Rosen's emergency medicine,* ed 8, Philadelphia, 2014, Saunders.

TABLE 35 Commonly Used Medications for the Treatment of Nausea and Vomiting

Medication	Dose	Comments
Promethazine (Phenergan)	*Adult:* 12.5-25 mg IV, IM, PO, or by rectum *Pediatric:* 0.25-1 mg/kg/dose q4-6h prn IV, IM, PO, or by rectum; max 25 mg/dose	May be repeated every 4-6 hr until cessation of vomiting. May cause dry mouth, dizziness, blurred vision. Boxed warning for use under 2 yr old.
Prochlorperazine (Compazine)	*Adult:* 5-10 mg IM or PO; 2.5-10 mg IV; 25 mg by rectum *Pediatric:* 0.4 mg/kg/24 hr tid-qid PO or by rectum; 0.1-0.15 mg/kg/dose tid-qid IM; max 40 mg/24 hr	May be repeated every 4 hr IV or IM or every 12 hr by rectum until cessation of vomiting. May cause lethargy, hypotension, extrapyramidal effects.
Metoclopramide (Reglan)	*Adult:* 10 mg IM or IV, may repeat q6h *Pediatric:* 1-2 mg/kg/dose q2-6h IV q2-3h	May cause dystonic reactions, tardive dyskinesia, neuroleptic malignant syndrome.
Ondansetron (Zofran)	*Adult:* 4 mg IV single dose *Pediatric:* up to 40 kg: 0.1 mg/kg; >40 kg: 4 mg/dose IV single dose	May cause headache, dizziness, and musculoskeletal pain.

IM, Intramuscularly; *IV,* intravenously; *PO,* orally; *prn,* as needed.
From Marx JA et al: *Rosen's emergency medicine,* ed 8, Philadelphia, 2014, Saunders.

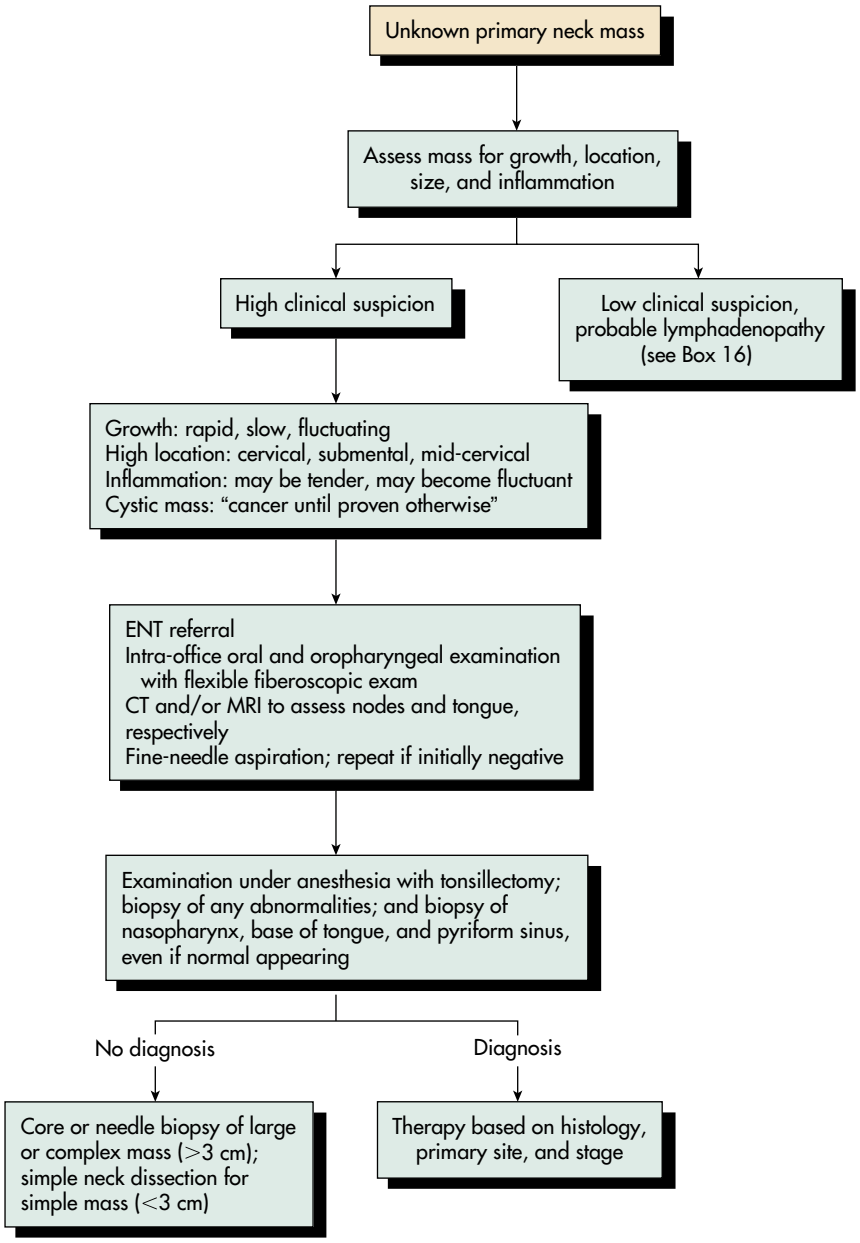

FIG. 109 Evaluation of an unknown primary neck mass. *CT,* Computed tomography; *ENT,* ear, nose, and throat; *MRI,* magnetic resonance imaging. (From Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

BOX 16 An Approach to the Patient with Lymphadenopathy

- Does the patient have a known illness that causes lymphadenopathy? Treat and monitor for resolution.
- Is there an obvious infection to explain the lymphadenopathy (e.g., infectious mononucleosis)? Treat and monitor for resolution.
- Are the nodes very large and/or very firm and thus suggestive of malignancy? Perform a biopsy.
- Is the patient very concerned about malignancy and unable to be reassured that malignancy is unlikely? Perform a biopsy.
- If none of the preceding are true, perform a complete blood cell count, and if it is unrevealing, monitor for a predetermined period (usually 2 to 6 weeks). If the nodes do not regress or if they increase in size, perform a biopsy.

From Goldman L, Ausiello D (eds): *Cecil textbook of medicine,* ed 23, Philadelphia, 2008, Saunders.

ICD-10CM # M54.2 Cervicalgia
S19.9XXA Unspecified injury of neck, initial encounter

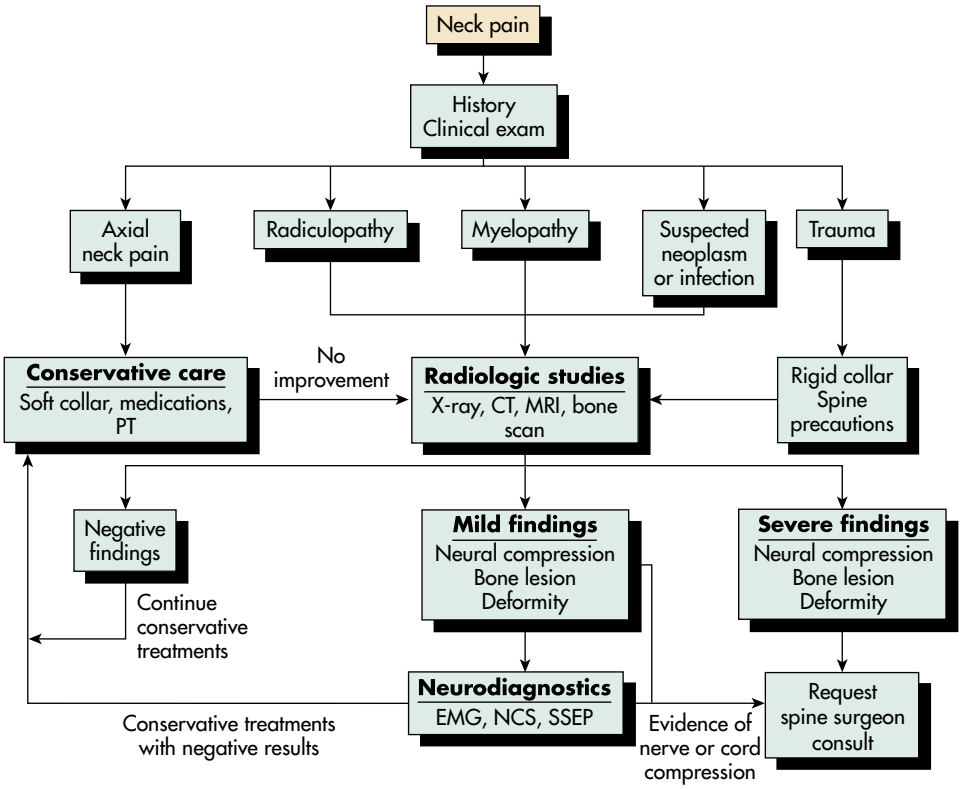

FIG. 110 Algorithm of neck pain. *CT,* Computed tomography; *EMG,* electromyogram; *MRI,* magnetic resonance imaging; *NCS,* nerve conduction study; *PT,* physical therapy; *SSEP,* somatosensory evoked potentials. (From Firestein GS et al: *Kelley's textbook of rheumatology,* ed 9, Philadelphia, 2013, Saunders.)

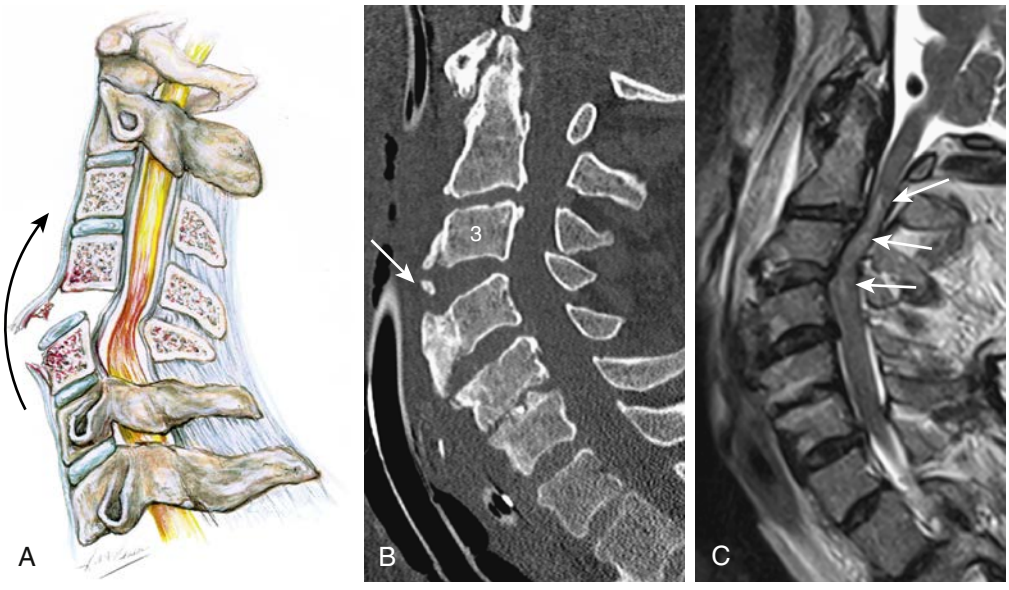

FIG. 111 Extension injury. A, Drawing shows mechanism and injury. There is a small avulsion from the anterosuperior margin of the vertebra immediately below the affected level. Note the wide disk space and retrolisthesis, hallmarks of this injury. The spinal cord is frequently injured in this setting. **B,** Sagittal reconstructed computed tomography image shows widening of the C3 disk space with an avulsed fragment of bone *(arrow)* and retrolisthesis. **C,** T2-weighted magnetic resonance image shows cord hemorrhage *(arrows).* The patient is quadriplegic. (From Pope TL et al: *Musculoskeletal imaging,* ed 2, Philadelphia, 2015, Elsevier.)

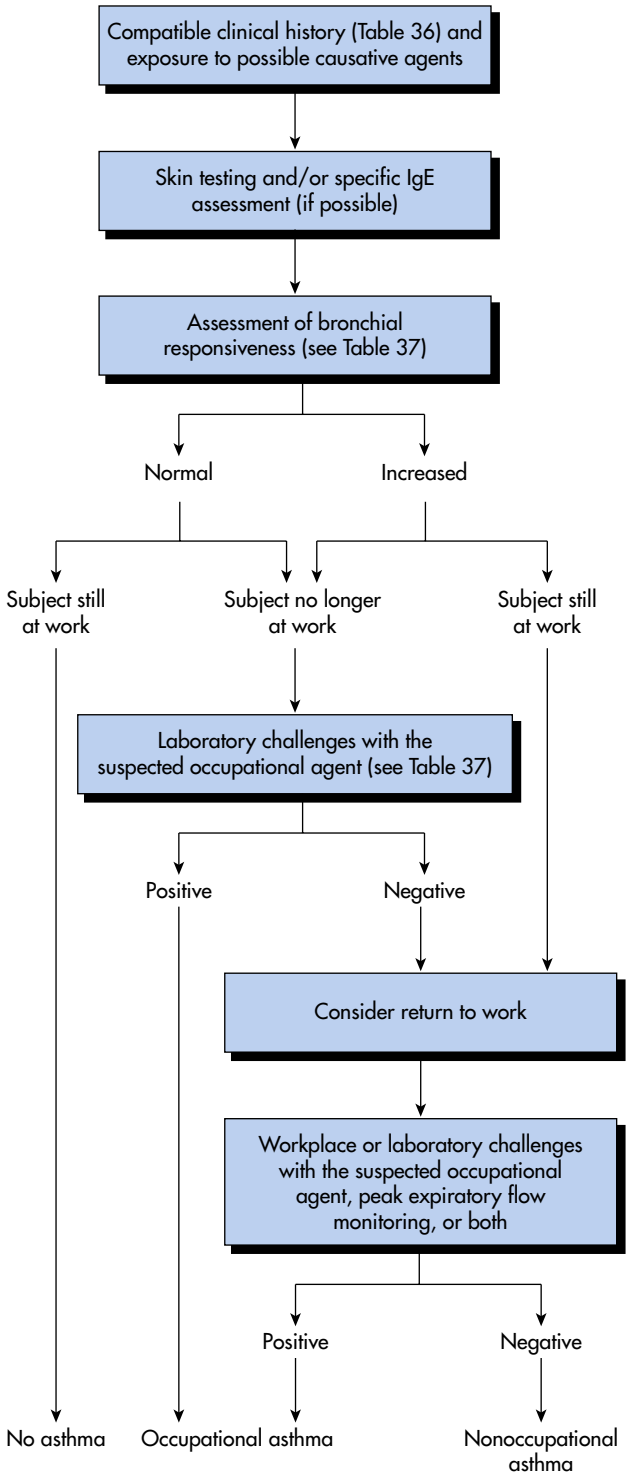

FIG. 112 Algorithm for the investigation of occupational asthma. *IgE*, Immunoglobulin E. (From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, Saunders.)

TABLE 36 Differences between Occupational Asthma with a Latency Period and Irritant-Induced Asthma

	OA with a Latency Period	IrIA
Latency period	Variable but at least a matter of weeks	Onset of symptoms within minutes or hours
Mechanisms	Immunologic sensitization	?
Physiopathology	Like common asthma	Massive epithelial desquamation with early deposition of collagen. No role of eosinophils. Oxidative process
Frequency	85%-90% of all cases of OA	10%-15% of all cases of OA
Symptoms	Wheeze predominant	Cough predominant
Function	The degree of airway hyperresponsiveness to methacholine reflects severity	Severity not reflected by the degree of responsiveness to methacholine
Response to bronchodilator	+++	++
Response to inhaled steroids	+++	++
Improvement with time	Good in general	Moderate, little, or absent

IrIA, Irritant-induced asthma; *OA,* occupational asthma.
From Mason RJ et al: *Murray & Nadel's textbook of respiratory medicine,* ed 5, Philadelphia, 2010, Saunders.

TABLE 37 Advantages and Limitations of Diagnostic Tests Used in the Investigation of Occupational Asthma (OA)

Diagnostic Test(s)	Advantages/Limitations
Assessment of bronchial responsiveness	• Simple, low cost • Allow to confirm the diagnosis of asthma • Low specificity for diagnosis of OA. The lack of NSBHR does not allow discarding the diagnosis of OA in subjects who have been removed from the workplace.
Immunologic tests	• Easy to perform, low cost • Commercial extracts are available (skin-prick tests or specific IgE for HMW agents). • Lack of standardization for a majority of occupational allergens except latex • Measure of specific IgE available for some LMW agents (anhydrides, acids, isocyanates, aldehydes), but low sensitivity • Identify the sensitization but not the disease itself
PEF monitoring	• Low cost • Requires the worker's collaboration • Low adherence (<60%) • Possible falsification of the results • Requires 2 weeks at and away from work, which are not always possible for the workers • Impossible to perform when the worker has already been removed from exposure • No standardized method for interpreting the results • Interpretation of the results requires experience.
Specific inhalation challenges in the laboratory	• Confirmation of the diagnosis of OA when the test is positive • False-negative tests are possible • Costly • Available in a small number of centers worldwide
Specific inhalation challenges at the workplace	• Exclude diagnosis if response is negative when performed in the usual work conditions • Requires usual work condition • Costly
Noninvasive measures of airway inflammation	Sputum cell counts • Impossible to falsify • Bring additional evidence to the diagnosis of OA • Costly • Not widely available • Does not allow to confirm or discard the diagnosis of OA by itself Exhaled NO measurement • Easy to perform • Inconsistent results • Difficult to interpret • Affected by many different factors

HMW, High-molecular-weight; *IgE,* immunoglobulin E; *LMW,* low-molecular-weight; *NO,* nitric oxide; *NSBHR,* nonspecific bronchial hyperresponsiveness; *PEF,* peak expiratory flow.
From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, Saunders.

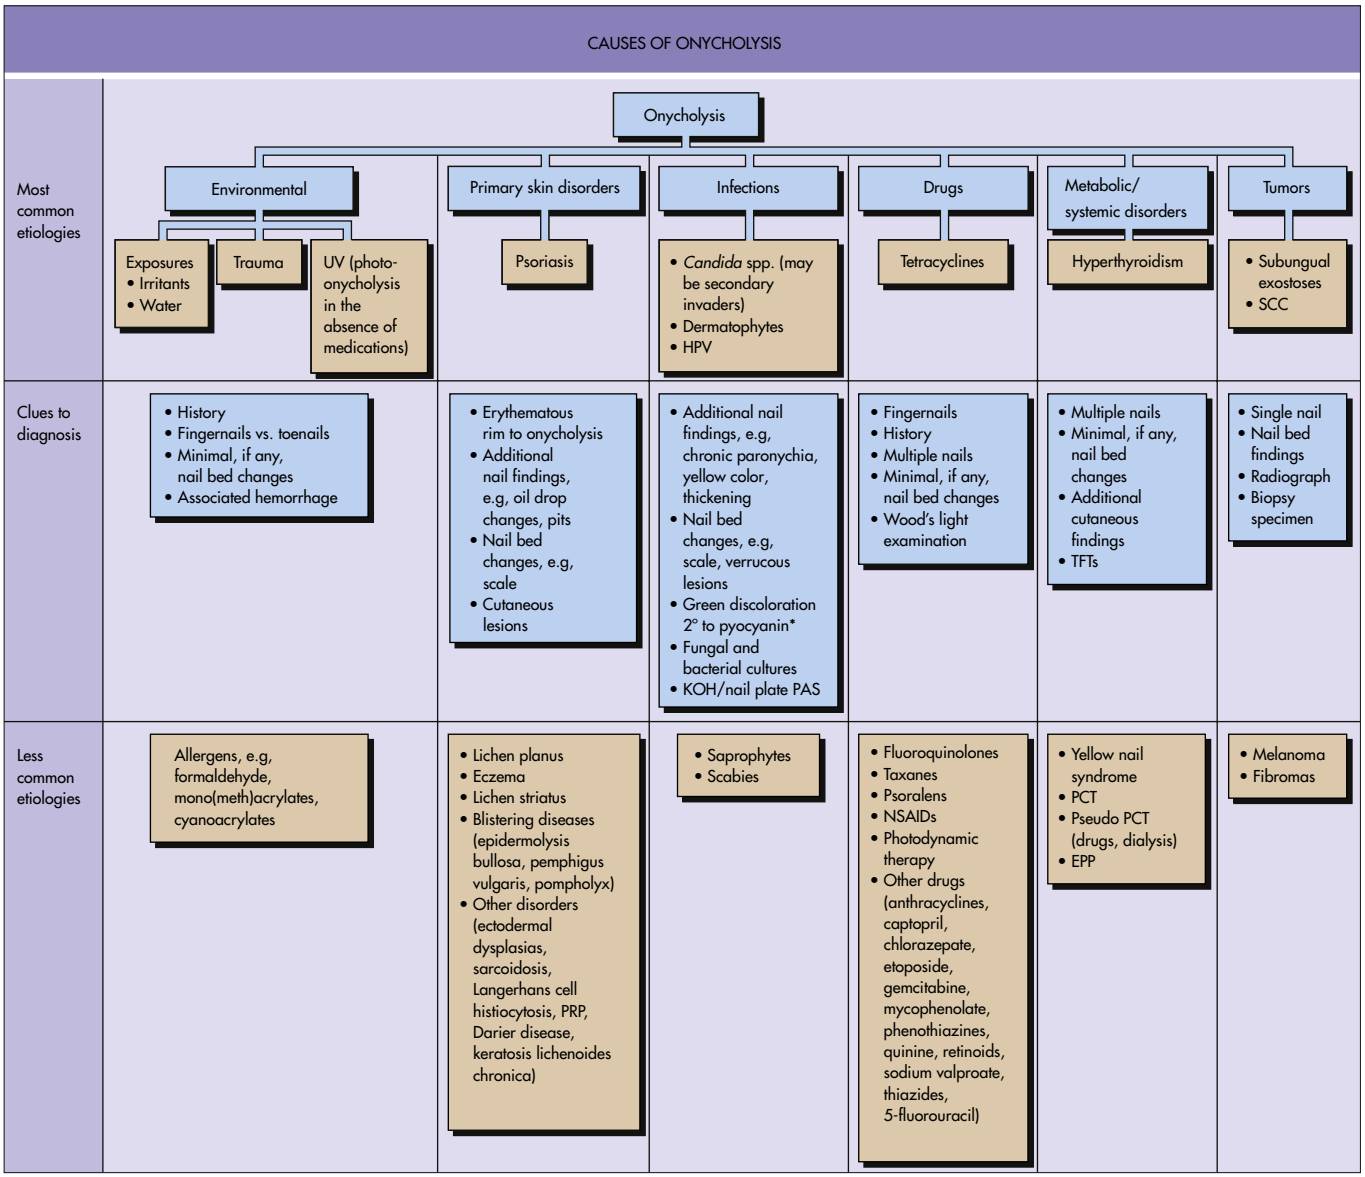

FIG. 113 Causes of onycholysis. *Due to secondary colonization with *Pseudomonas aeruginosa. EPP,* Erythropoietic protoporphyria; *HPV,* human papillomavirus infection; *NSAIDs,* nonsteroidal antiinflammatory drugs; *PAS,* periodic acid-Schiff; *PCT,* porphyria cutanea tarda; *PRP,* pityriasis rubra pilaris; *SCC,* squamous cell carcinoma; *TFTs,* thyroid function tests. (From Bolognia JL, Jorizzo JL, Schaffer JV: *Dermatology,* ed 3, St Louis, 2012, Elsevier.)

Evaluation of Patients with Palpitations, Dizziness, and/or Syncope

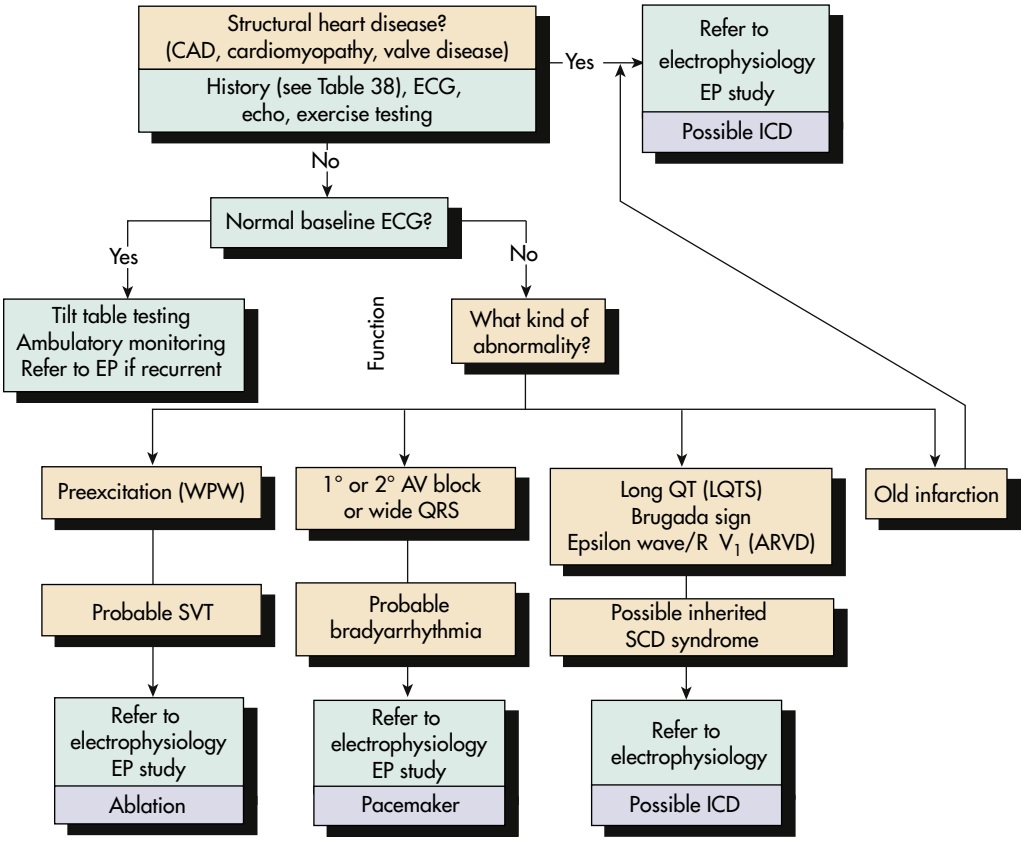

FIG. 114 Algorithm for evaluating patients with symptoms of palpitation, dizziness, or syncope. *ARVD,* Arrhythmogenic right ventricular dysplasia; *AV,* atrioventricular; *CAD,* coronary artery disease; *ECG,* electrocardiogram; *echo,* echocardiogram; *EP,* electrophysiology; *ICD,* implantable cardioverter-defibrillator; *LQTS,* long QT syndrome; *SCD,* sudden cardiac death; *SVT,* supraventricular tachycardia; *WPW,* Wolff-Parkinson-White syndrome. (From Goldman L, Schafer AI: *Goldman Cecil medicine,* ed 25, Philadelphia, 2016, Saunders.)

TABLE 38 Items to Be Covered in History of Patient with Palpitation

Does the Palpitation Occur:	If So, Suspect:
As isolated "jumps" or "skips"?	Extrasystoles
In attacks known to be of abrupt beginning, with a heart rate of 120 beats/min or over, with regular or irregular rhythm?	Paroxysmal rapid heart action
Independent of exercise or excitement adequate to account for the symptom?	Atrial fibrillation, atrial flutter, thyrotoxicosis, anemia, febrile states, hypoglycemia, anxiety state
In attacks developing rapidly, though not absolutely abruptly, unrelated to exertion or excitement?	Hemorrhage, hypoglycemia, tumor of the adrenal medulla
In conjunction with the taking of drugs?	Tobacco, coffee, tea, alcohol, epinephrine, ephedrine, aminophylline, atropine, thyroid extract, monoamine oxidase inhibitors
On standing?	Postural hypotension
In middle-aged women, in conjunction with flushes and sweats?	Menopausal syndrome
When the rate is known to be normal and the rhythm regular?	Anxiety state

From Goldman L, Braunwald E: Chest discomfort and palpitation. In Isselbacher KJ, Braunwald E et al [eds]: *Harrison's principles of internal medicine,* ed 13, New York, 1994, McGraw-Hill.

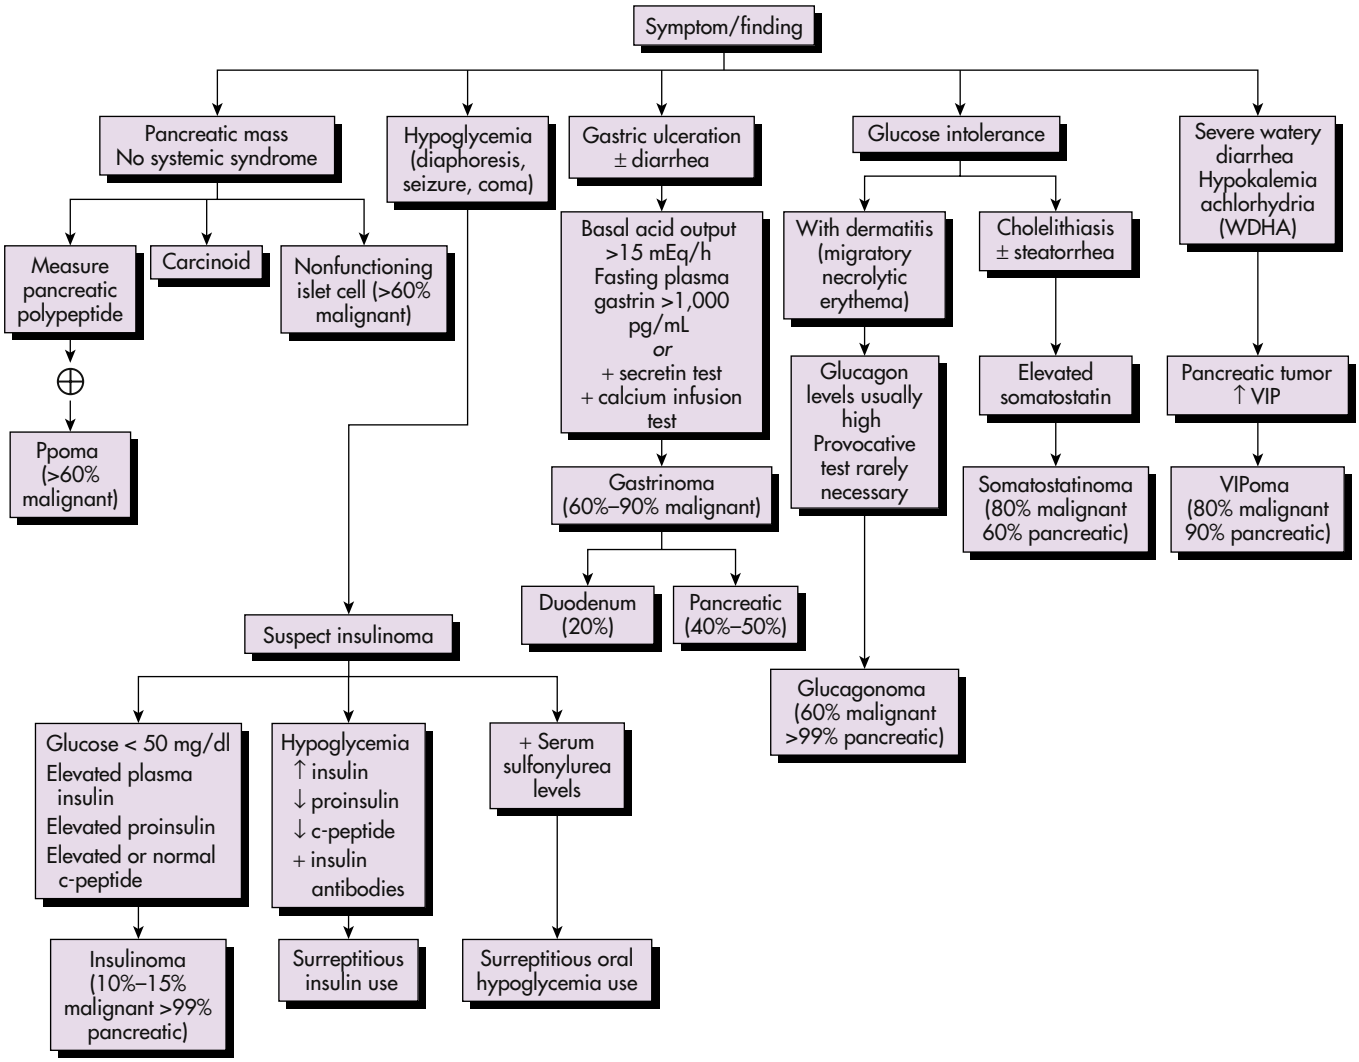

FIG. 115 Diagnosis of pancreatic islet cell tumors. *Ppoma,* Pancreatic polypeptide-secreting tumor; *VIP,* vasoactive intestinal peptide; *VIPoma,* vasoactive intestinal peptide secreted by a pancreatic islet tumor. (From Niederhuber JE: *Abeloff's clinical oncology*, ed 6, Philadelphia, 2020, Elsevier.)

ICD-10CM # C25.3 Malignant neoplasm of pancreatic duct
R19.06 Epigastric swelling, mass or lump

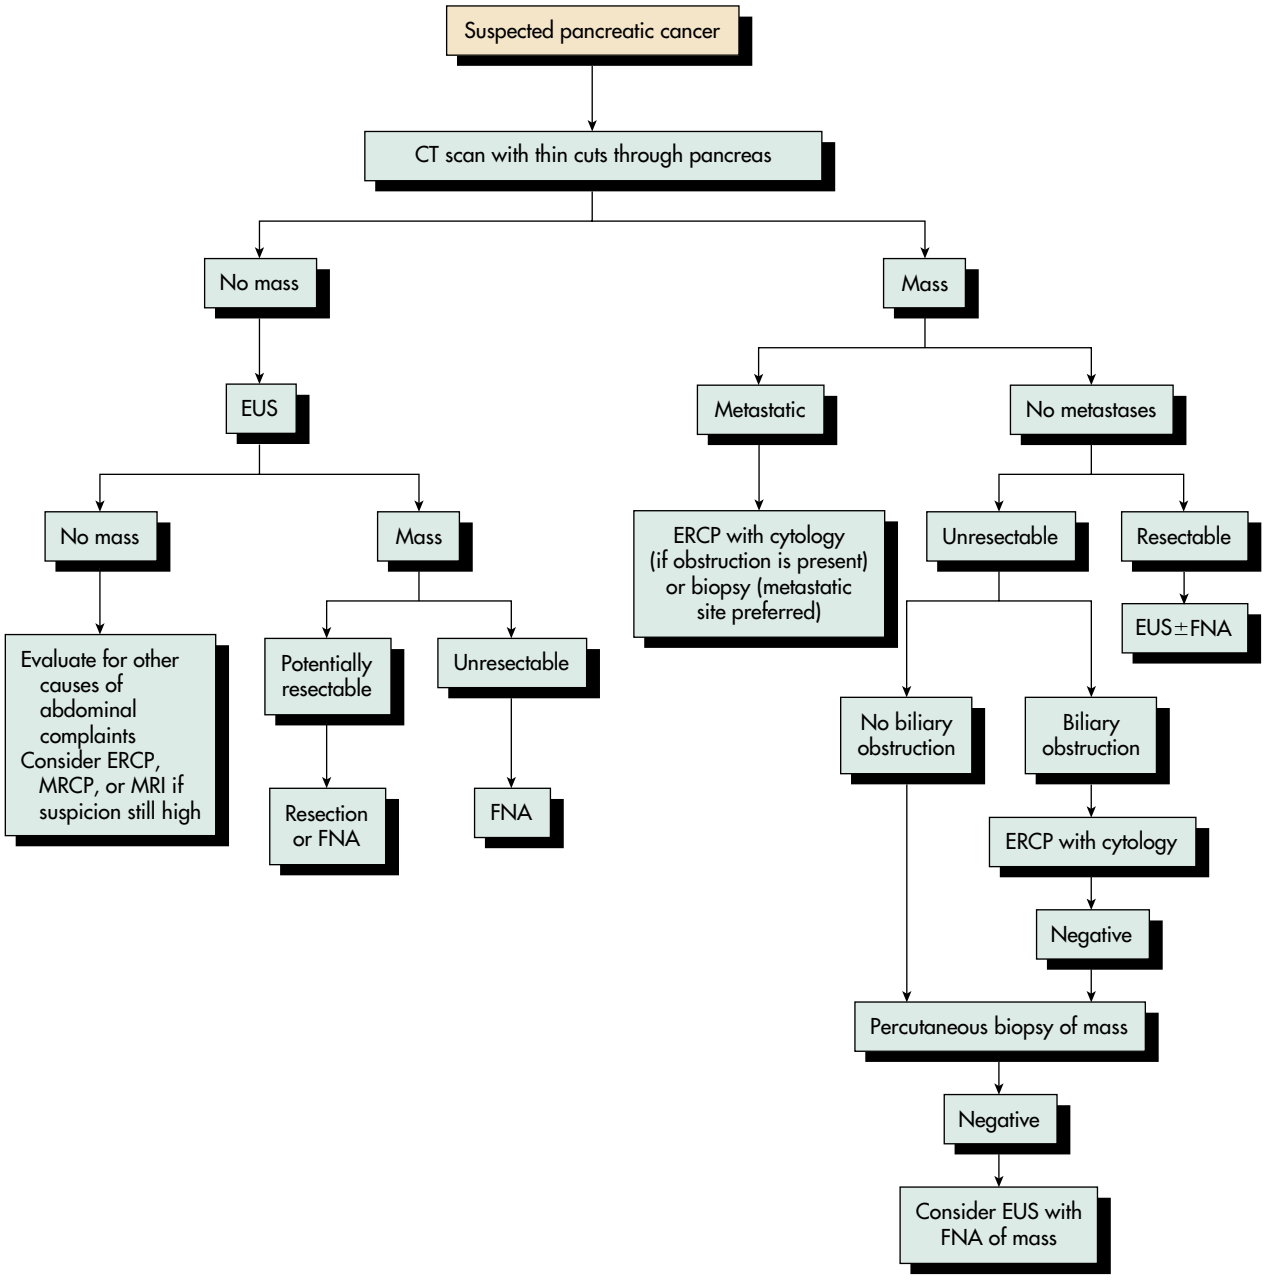

FIG. 116 Diagnostic algorithm for pancreatic cancer. Intraoperative fine-needle aspiration (FNA) if found inoperable during surgery. *CT,* Computed tomography; *ERCP,* endoscopic retrograde cholangiopancreatography; *EUS,* endoscopic ultrasonography; *MRCP*, magnetic resonance cholangiopancreatography; *MRI,* magnetic resonance imaging. (From Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

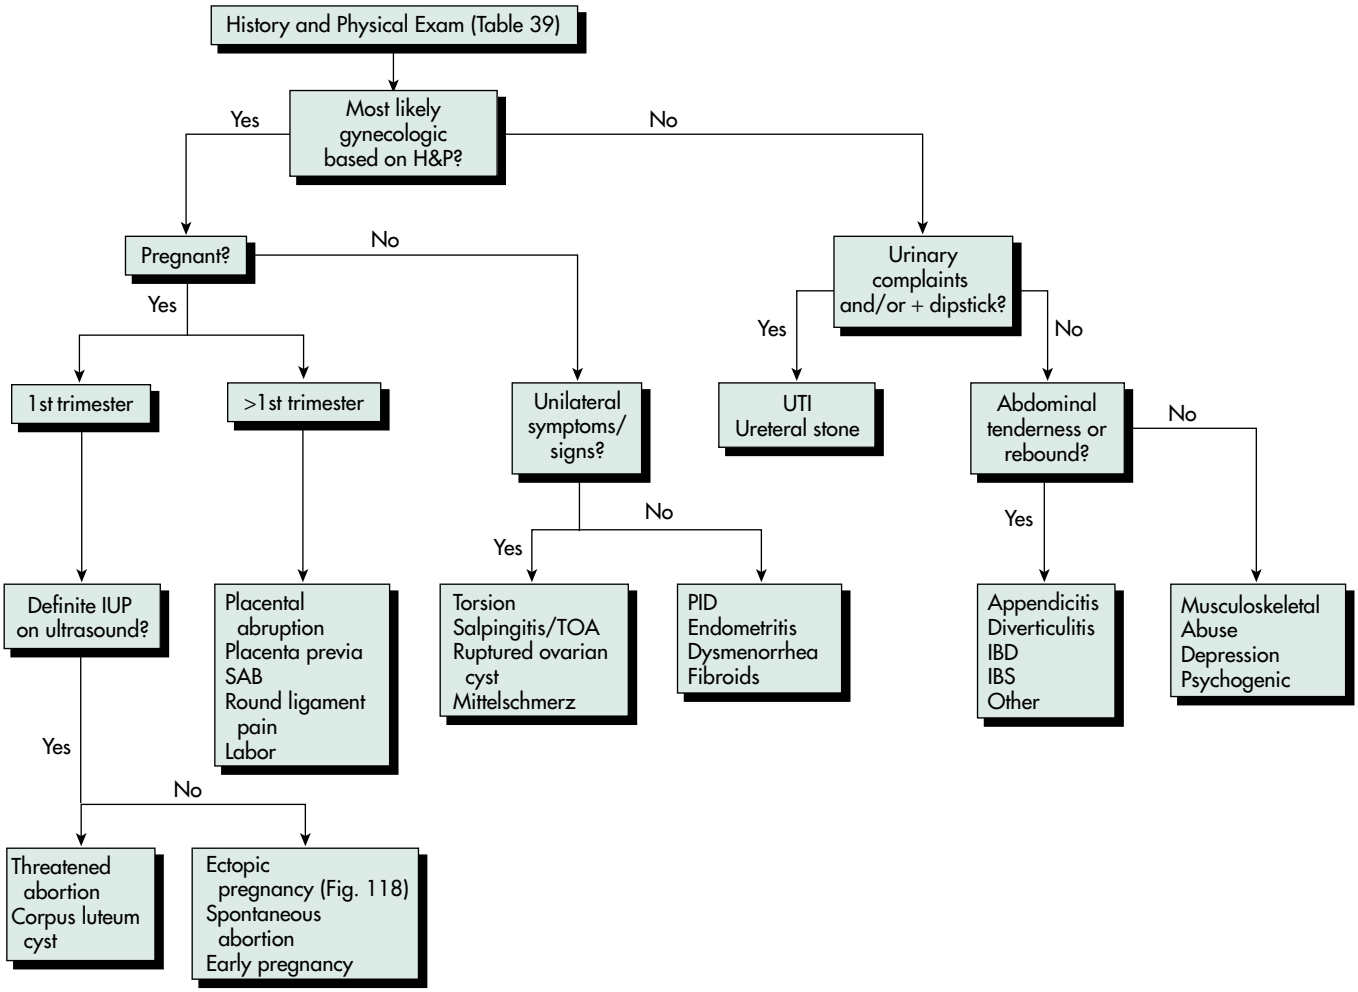

FIG. 117 Diagnostic algorithm for acute pelvic pain. *H&P,* History and physical; *IBD,* inflammatory bowel disease; *IBS,* irritable bowel syndrome; *IUP,* intrauterine pregnancy; *PID,* pelvic inflammatory disease; *SAB,* spontaneous abortion; *TOA,* tubo-ovarian abscess; *UTI,* urinary tract infection. (From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

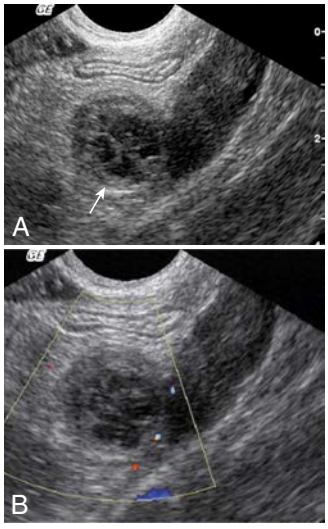

FIG. 118 Ectopic pregnancy seen as mixed-echogenicity mass. A 30-year-old woman presented with left lower quadrant pain at 7 weeks' gestation and β-hCG of 500 mIU/ml and falling over a 3-day period. **A,** In the left adnexa, medial to the left ovary, there was a 2-cm mass *(arrow)* with mixed echogenicity, and **B,** only minimal peripheral vascularity. A left ectopic pregnancy was confirmed and, based on a falling β-hCG, was treated expectantly and resolved without complication. (From Rumack CM et al: *Diagnostic ultrasound,* ed 4, Philadelphia, 2011, Elsevier.)

TABLE 39 Differentiation of Common or Potentially Catastrophic Causes of Pelvic Pain

Causative Disorder or Condition	Pain History	Associated Symptoms	Supporting History	Prevalence in ED	Physical Examination	Useful Tests	Atypical or Additional Aspects
Ectopic pregnancy (critical if ruptured)	Classically severe, sharp, lateral pelvic pain, but severity, location, and quality highly variable	Vaginal bleeding (often mild, can be absent)	Missed period; history of previous ectopic pregnancy, infertility, pelvic surgery, PID, or IUD use	Common	Classically unilateral adnexal tenderness, adnexal mass, and CMT	Pelvic US, quantitative β-hCG, T&C, laparoscopy	Cannot reliably exclude diagnosis based on history and physical examination. Severe pain, hypotension, or peritonitis suggests rupture
Ruptured ovarian cyst (emergent—critical with significant hemorrhage; otherwise, urgent)	Abrupt moderate to severe lateral pain	Light-headedness if bleeding is severe; rectal pain arises from fluid in cul-de-sac		Uncommon	Hypotension and tachycardia if blood loss is significant; possible peritonitis	Pelvic US, CBC, T&C	Physical examination findings often do not correlate with volume of blood in pelvis at US
Ovarian torsion (emergent)	Acute onset of moderate to severe lateral pain	Nausea and vomiting	History of ovarian mass or cyst	Uncommon	Adnexal mass and tenderness, possible peritonitis	US with Doppler flow studies, laparoscopy	Torsion can be intermittent
Appendicitis (emergent)	Duration often <48 hr, generalized followed by localized RLQ pain	Low-grade fever, nausea, anorexia	Migration of pain to RLQ from center, abdominal pain before vomiting	Common	RLQ tenderness, possible peritonitis	US or CT in unclear cases	Early in course, tenderness may be minimal or poorly localized
PID, TOA (TOA: emergent; PID: urgent-emergent)	Without TOA, pain usually bilateral. May manifest acutely within 48 hr or subacutely with up to 3 wk of pain	Fever, vaginal discharge	Vaginal discharge, history of PID, history of unprotected intercourse or multiple partners	PID: common TOA: uncommon	Pus from cervical os, CMT, adnexal tenderness. Peritonitis suggests severe PID or TOA	CBC, ESR, CRP, pelvic US, laparoscopy, cervical cultures, cervical smear for WBCs	History and physical examination may be inaccurate for diagnosis, particularly in patients with subacute presentation
UTI (urgent)	Pain with urination. Patient may have flank pain from associated pyelonephritis	Urinary urgency and frequency; fever and vomiting if patient has associated pyelonephritis	Recent urologic procedure, prior history of UTI	Common	Suprapubic tenderness, flank tenderness and fever with pyelonephritis	Urinalysis, urine culture (if recurrent or complicated)	WBCs can be present in urine with PID and appendicitis. RBCs present in urine with hemorrhagic cystitis
Ureteral colic (urgent)	Acute onset, manifests within hours. Pain is lateral, usually moderate to severe. Often radiates into the groin or costovertebral angle or flank	Nausea and vomiting	Prior history of stones	Common	Patient often appears uncomfortable, but physical examination can be otherwise unremarkable	Urinalysis: hematuria present in approximately 80% of cases. Renal ultrasound for hydronephrosis. Abdominal CT	If stone is at ureterovesicular junction, patient can have localized pain that can mimic appendicitis or other acute pelvic pathology
Unruptured ovarian cyst or tumor	Lateral ache, gradual onset	Often minimal	Prior history of similar pain	Common	Lateral pelvic tenderness, with or without a mass	Pelvic US	
Endometriosis	Unilateral or bilateral pelvic pain, often recurrent	Dysmenorrhea, dyspareunia	Prior history of same type of pain in association with menstrual cycle	Common	Unilateral or bilateral adnexal tenderness, occasionally pelvic mass present, peritoneal findings uncommon	Pelvic US, laparoscopy	Symptoms can mimic other types of pelvic pathology; laparoscopy often is needed for confirmation

β-hCG, β-Human chorionic gonadotropin; *CBC,* complete blood count; *CMT,* cervical motion tenderness; *CRP,* C-reactive protein; *CT,* computed tomography; *ED,* emergency department; *ESR,* erythrocyte sedimentation rate; *IUD,* intrauterine device; *PID,* pelvic inflammatory disease; *RBC,* red blood cell; *RLQ,* right lower quadrant; *T&C,* type and crossmatch; *TOA,* tubo-ovarian abscess; *US,* ultrasonography; *UTI,* urinary tract infection; *WBC,* white blood cell.

ICD-10CM # L56.0 Drug phototoxic response
L56.1 Drug photoallergic response
L56.2 Photocontact dermatitis [berloque dermatitis]

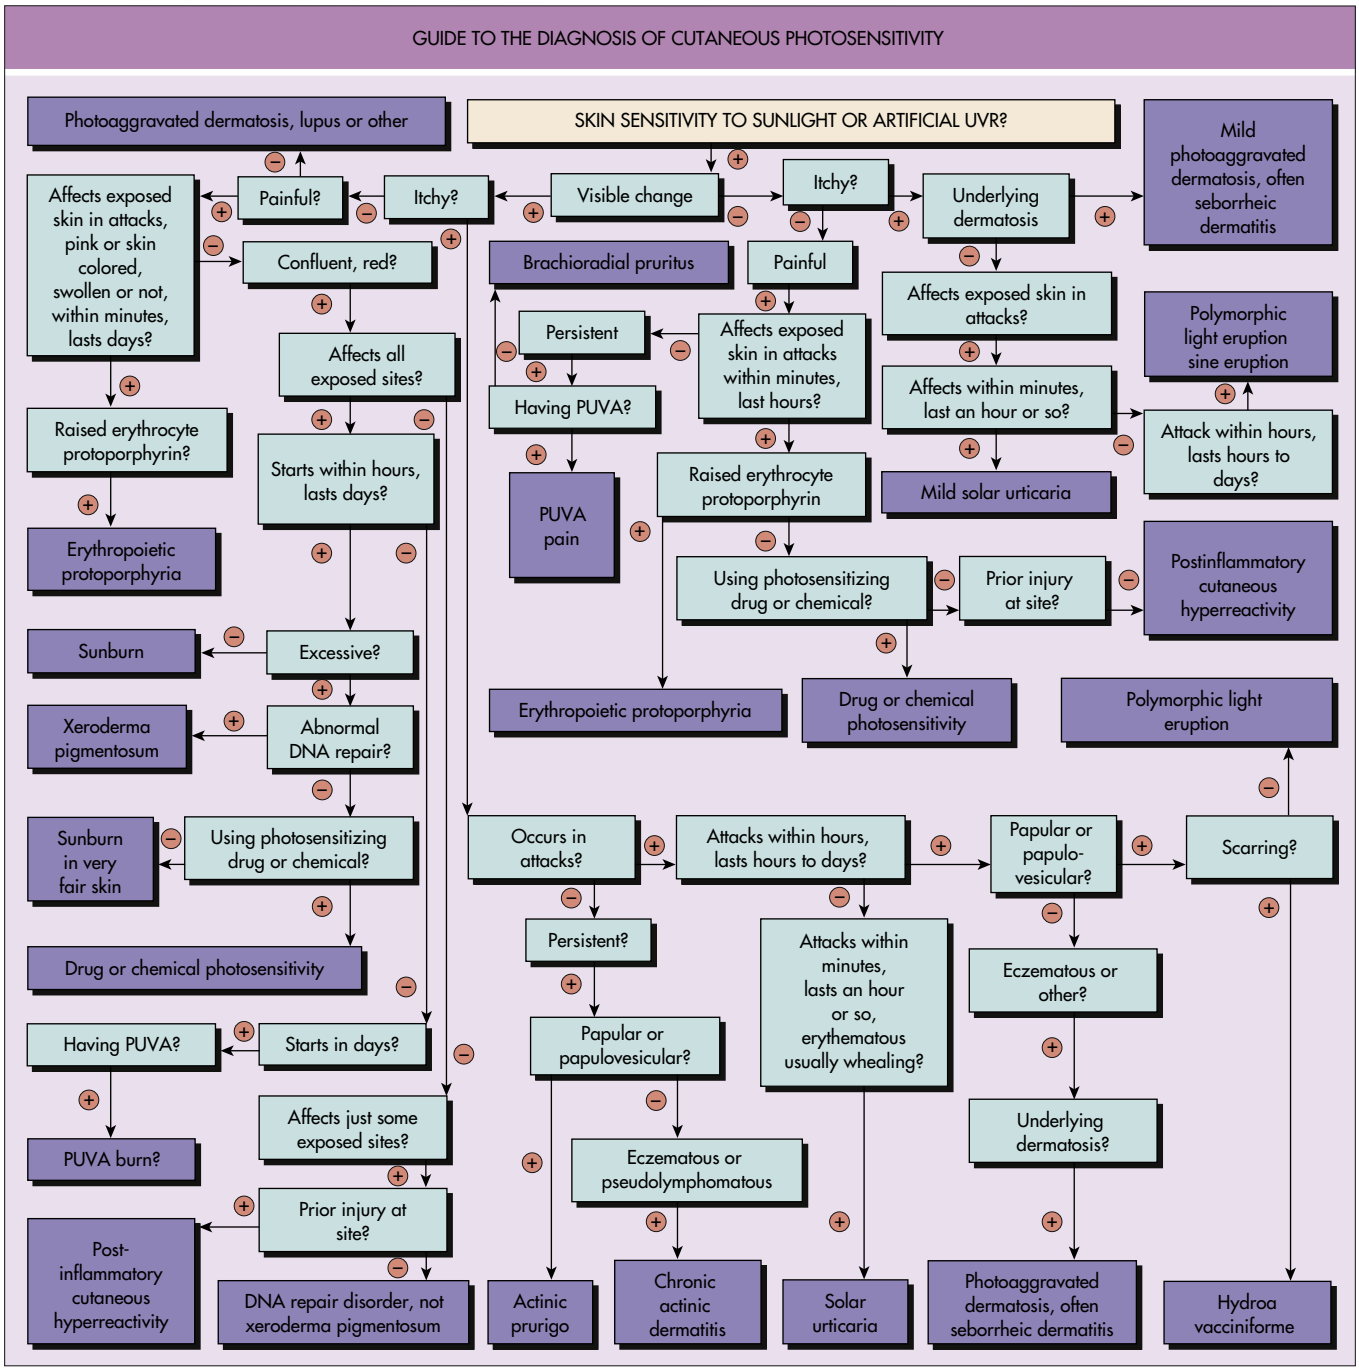

FIG. 121 Guide to the diagnosis of cutaneous photosensitivity. The diagnosis can generally be made from patient history and clinical findings, provided the titers of antinuclear antibodies and other LE-associated antibodies are normal. *PUVA,* Psoralen and ultraviolet A. (From Bolognia JL, Jorizzo JL, Schaffer JV: *Dermatology,* ed 3, St Louis, 2012, Elsevier.)

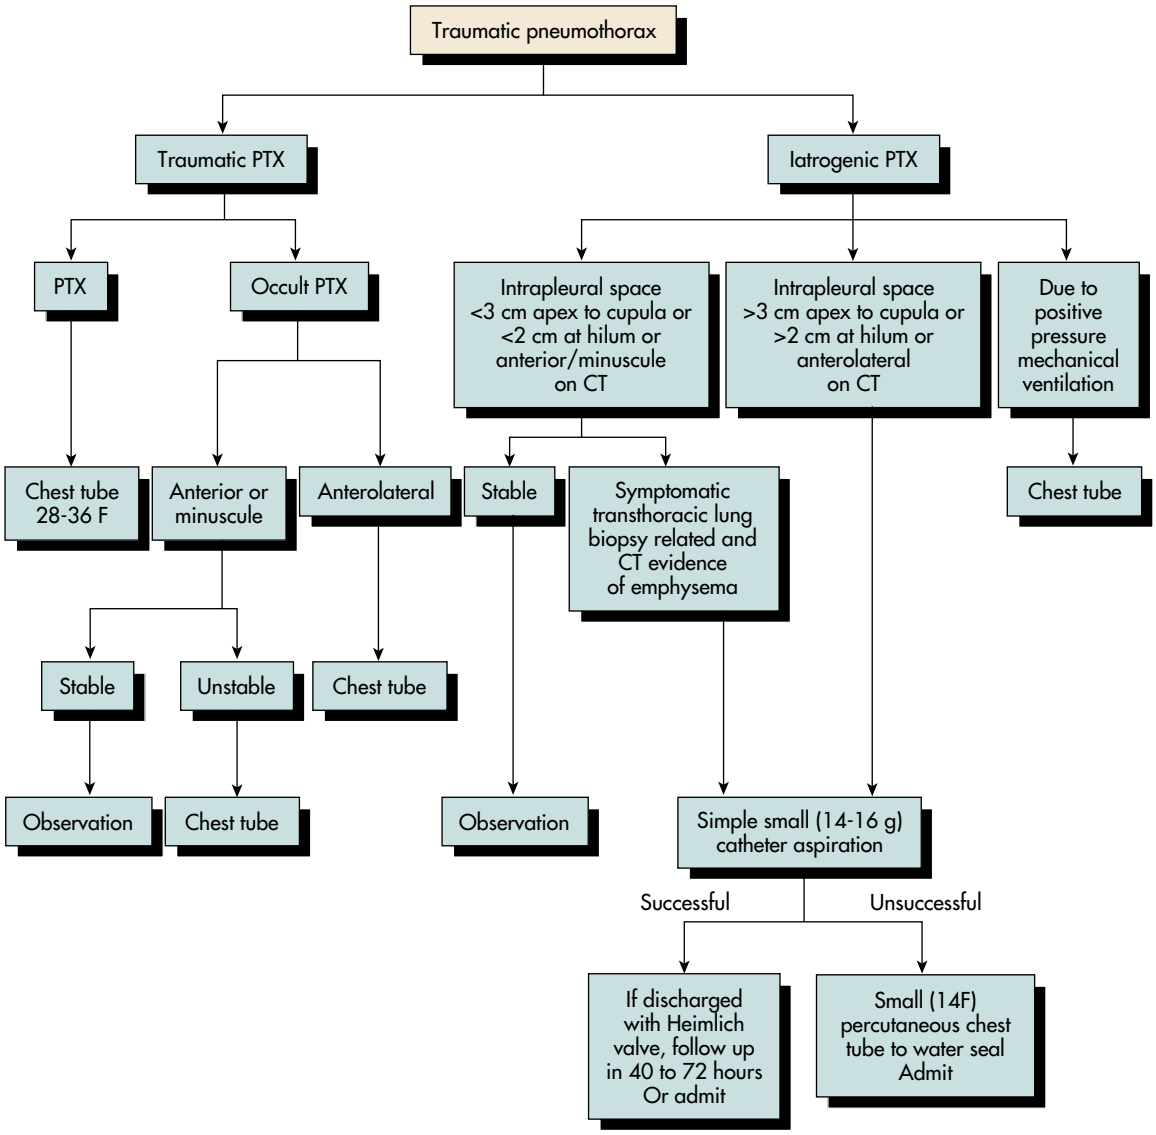

FIG. 122 Algorithmic approach to the treatment of traumatic pneumothorax. *CT,* Computed tomography; *PTX,* pneumothorax. (From Adams JG et al: *Emergency medicine: clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.)

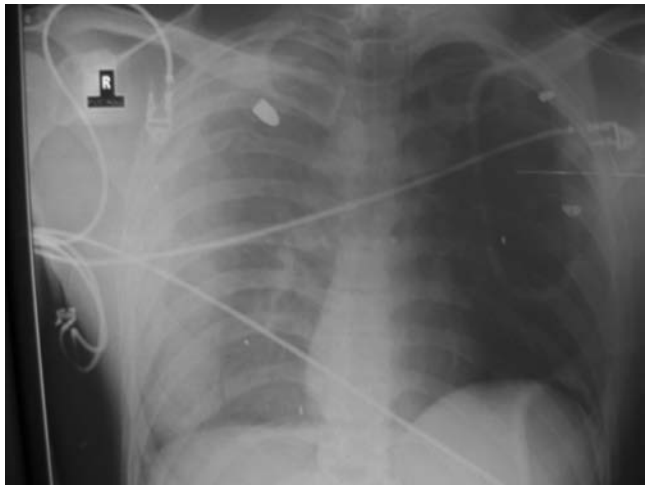

FIG. 123 Hemothorax secondary to gunshot wound. Note haziness over right hemithorax with bullet seen in right upper lobe. (From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

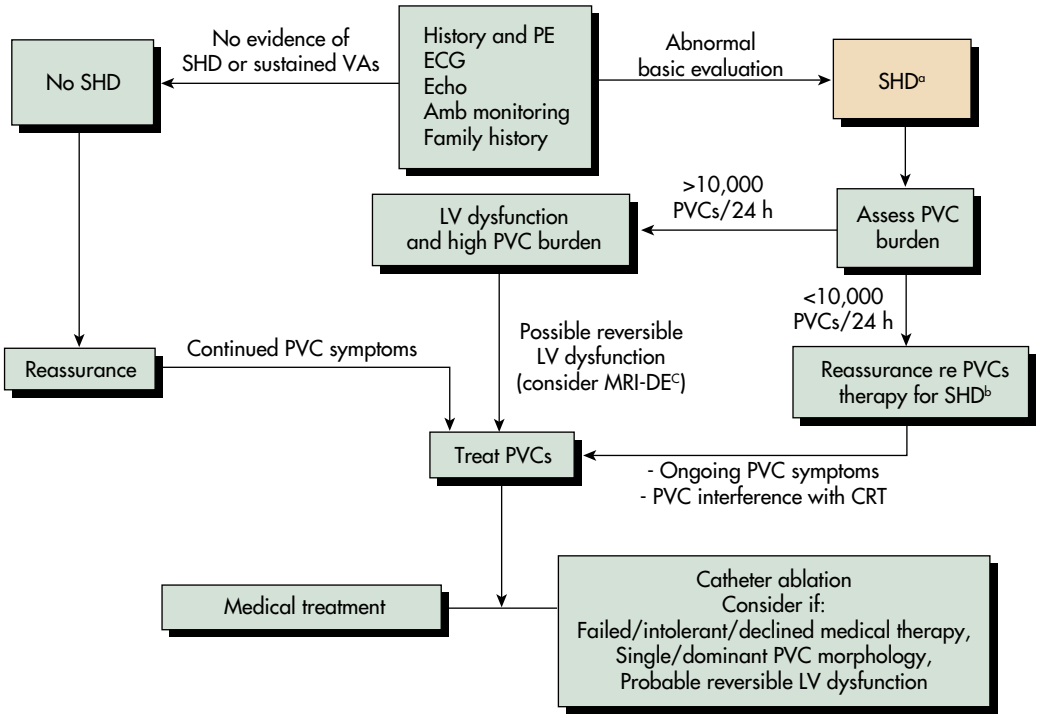

FIG. 124 Management of premature ventricular complexes (PVCs). *CRT,* Cardiac resynchronization therapy; *ECG,* electrocardiogram; *LV,* left ventricular; *MRI-DE,* magnetic resonance imaging with delayed enhancement; *PE,* physical examination; *PVC,* premature ventricular contraction; *SHD*, structural heart disease; *VAs,* ventricular arrhythmias. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.)

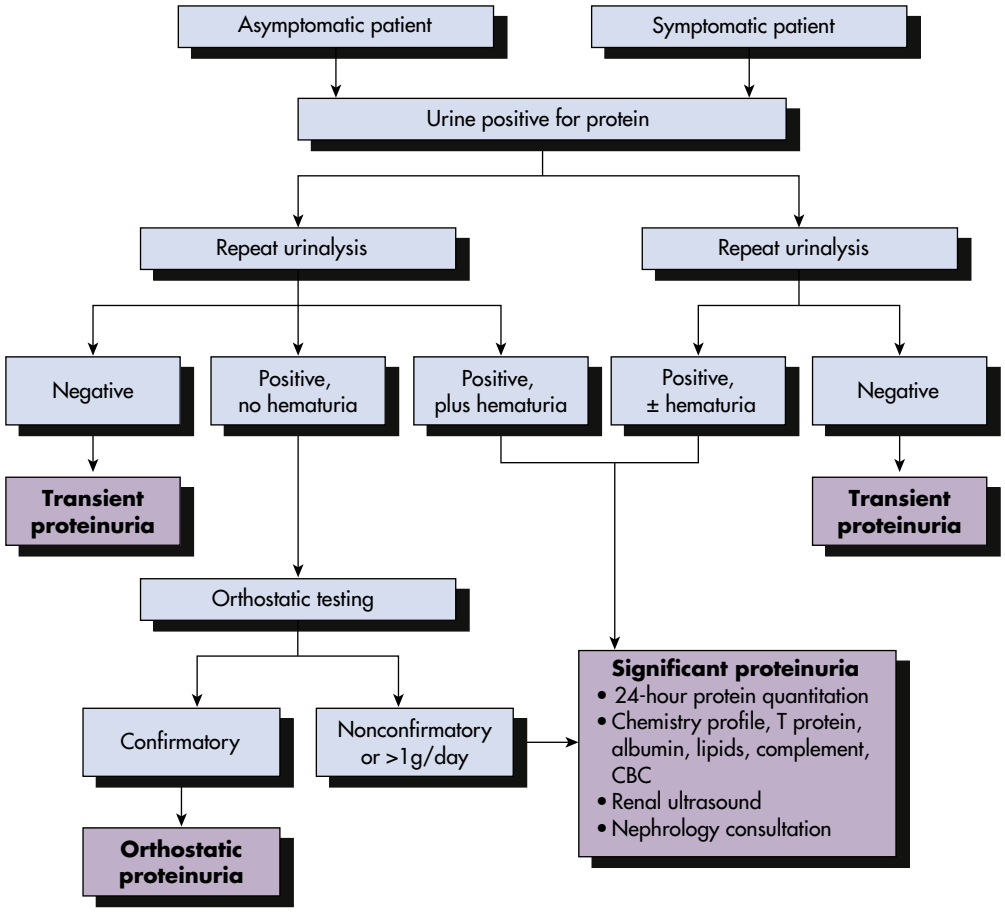

FIG. 125 Evaluation of children with proteinuria. *CBC*, Complete blood cell count. (From Wein AJ et al: *Campbell-Walsh urology*, ed 11, Philadelphia, 2016, Elsevier.)

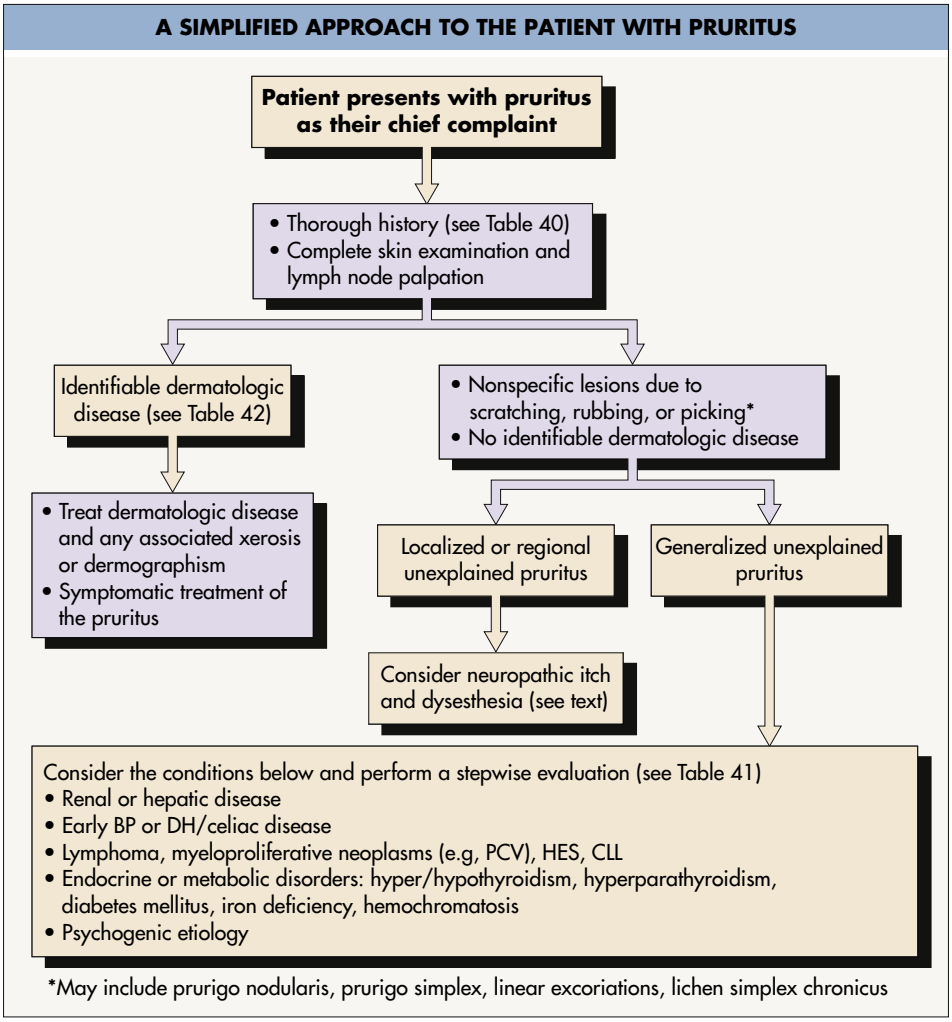

FIG. 126 A simplified approach to the patient with pruritus. *BP,* Bullous pemphigoid; *CLL,* chronic lymphocytic leukemia; *DH,* dermatitis herpetiformis; *HES,* hypereosinophilic syndromes; *PCV,* polycythemia vera. (From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.)

TABLE 40 Descriptive Features of the Pruritus and Additional Patient History

Questions to Ask Regarding the Pruritus

- WHEN did it start? *Duration:* days, weeks, months, years
- WHERE did it start? WHERE is it now? *Location*: localized or generalized, unilateral or bilateral
- HOW did it start? *Onset*: abrupt, gradual, prior history of pruritic episodes
- HOW does it feel? *Nature:* prickling, crawling, burning, stinging
- HOW intense is it? *Severity:* mild, moderate, severe; interference with normal activities or sleep
- HOW often do you feel it? *Time course:* intermittent, continuous, cyclical, nocturnal
- WHAT makes it worse? *Provoking/aggravating factors:* heat, cold, water, air, exercise, occupation, hobbies
- WHAT makes it better? *Itch relief:* cold, heat, scratching/rubbing/hurting, cool/hot showering
- WHAT do you think is the cause? *Patient's theory of pruritus etiology*

Additional patient history

- Skin care, bathing habits, exposure to irritants
- Medications (including topical agents): prescribed, over-the-counter; duration of use and relationship to onset of pruritus
- Use of nicotine, alcohol, and recreational/illicit drugs
- Allergies (known and suspected): drugs, airborne, food, contact
- Atopic history: atopic dermatitis, allergic rhinoconjunctivitis, asthma
- Past and present medical history: thyroid, liver, or renal dysfunction; other systemic diseases; psychological disease; surgeries or accidents
- Family history: atopy, skin disease, similar pruritic conditions
- Occupation, hobbies, personal stress
- Household and personal contacts; pets and their care
- Dietary habits
- Sexual history
- Travel history
- Prior diagnoses made by physician or patient

From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

TABLE 41 Laboratory and Radiographic Evaluation in Patients with Pruritus of Unknown Etiology

Basic Initial Evaluation

- Complete blood cell count (CBC) with differential and platelet count
- Erythrocyte sedimentation rate (ESR) and C-reactive protein (CRP)
- Creatinine, blood urea nitrogen, electrolytes
- Liver transaminases, alkaline phosphatase, bilirubin
- Lactate dehydrogenase (LDH)
- Fasting glucose
- Thyroid stimulating hormone (TSH) ± free thyroxine

Possible Additional Evaluation

Skin biopsy

- Routine histology (if skin lesions are present)
- Direct immunofluorescence studies*

Other laboratory tests

- Serum total and/or allergen-specific IgE
- Serum ferritin, iron, total iron binding capacity
- Hemoglobin A1c
- Parathyroid function (calcium, phosphate, and parathyroid hormone levels)
- Stool for ova/parasites and/or occult blood
- Viral hepatitis panel (including hepatitis B and C viruses)
- HIV testing
- Antitissue transglutaminase ± epidermal transglutaminase IgA antibodies**
- Anti-BP180 and anti-BP230 bullous pemphigoid IgG antibodies
- Antimitochondrial and antismooth muscle antibodies
- Serum tryptase, histamine, and/or chromogranin-A levels
- Urinalysis with sediment evaluation
- 24-Hour urine collection for 5-hydroxyindoleacetic acid (5-HIAA; a serotonin metabolite) and porphyrins
- Serum protein electrophoresis, serum immunofixation electrophoresis

Radiographic studies

- Chest x-ray or CT scan
- Abdominal and pelvic ultrasonography or CT scan
- Lymph node ultrasonography
- Spinal x-ray or MRI (for regional pruritus)

Other investigations

- Patch testing
- Prick testing for major atopy and relevant occupational allergens
- Age-appropriate cancer screening (in conjunction with primary care physician)
- If hydroxyethyl starch (HES)-induced pruritus is suspected, electron microscopy of a biopsy sample from normal-appearing skin

A1c, Glycated hemoglobin; *CT,* computed tomography; *IgA,* immunoglobin A; *IgE,* immunoglobin E, *IgG,* immunoglobin G; *MRI,* magnetic resonance imaging.

*Biopsy perilesional skin or normal-appearing skin (in vicinity of lesions if present) to assess for bullous pemphigoid and dermatitis herpetiformis, respectively.

**Often performed in conjunction with serum total IgA; in patients with IgA deficiency, anti-tissue transglutaminase IgG antibodies should be assessed.

From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

TABLE 42 Primary Dermatologic Conditions Associated with Pruritus

Cause	Dermatologic Disease
Inflammation	• Atopic dermatitis • Allergic or irritant contact dermatitis • Seborrheic dermatitis, especially of the scalp • Stasis dermatitis • Psoriasis • Parapsoriasis • Pityriasis rubra pilaris • Lichen planus • Urticaria, dermographism • Mastocytosis • Papular urticaria, urticarial dermatitis • Drug eruptions, e.g., morbilliform • Polymorphous light eruption, actinic prurigo, chronic actinic dermatitis • Bullous diseases, e.g., DH, BP • Polymorphic eruption of pregnancy (PEP) • Eosinophilic folliculitis • Dermatomyositis • Prurigo pigmentosa • Lichen sclerosus • Graft-versus-host disease
Infestation/bites & stings	• Scabies • Pediculosis • Arthropod bites
Infections	• Bacterial infections, e.g., folliculitis • Viral infections, e.g., varicella • Fungal infections, e.g., inflammatory tinea • Parasitic infections, e.g., schistosomal cercarial dermatitis
Neoplastic	• Cutaneous T-cell lymphoma, e.g., mycosis fungoides, Sézary syndrome
Genetic/nevoid	• Darier disease and Hailey-Hailey disease • Ichthyoses, e.g., Netherton, Sjögren-Larsson, and peeling skin syndromes • Pruriginosa subtype of dominant dystrophic EB • Porphyrias, e.g., porphyria cutanea tarda and erythropoietic protoporphyria • Inflammatory linear verrucous epidermal nevus (ILVEN) • Large/giant congenital melanocytic nevi, occasionally, especially in bulky lesions with neural differentiation
Other	• Xerosis, eczema craquelé • Primary cutaneous amyloidosis (macular, lichenoid) • Postburn pruritus • Scar-associated pruritus • Fiberglass dermatitis

BP, Bullous pemphigoid; *DH,* dermatitis herpetiformis; *EB,* epidermolysis bullosa.

From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

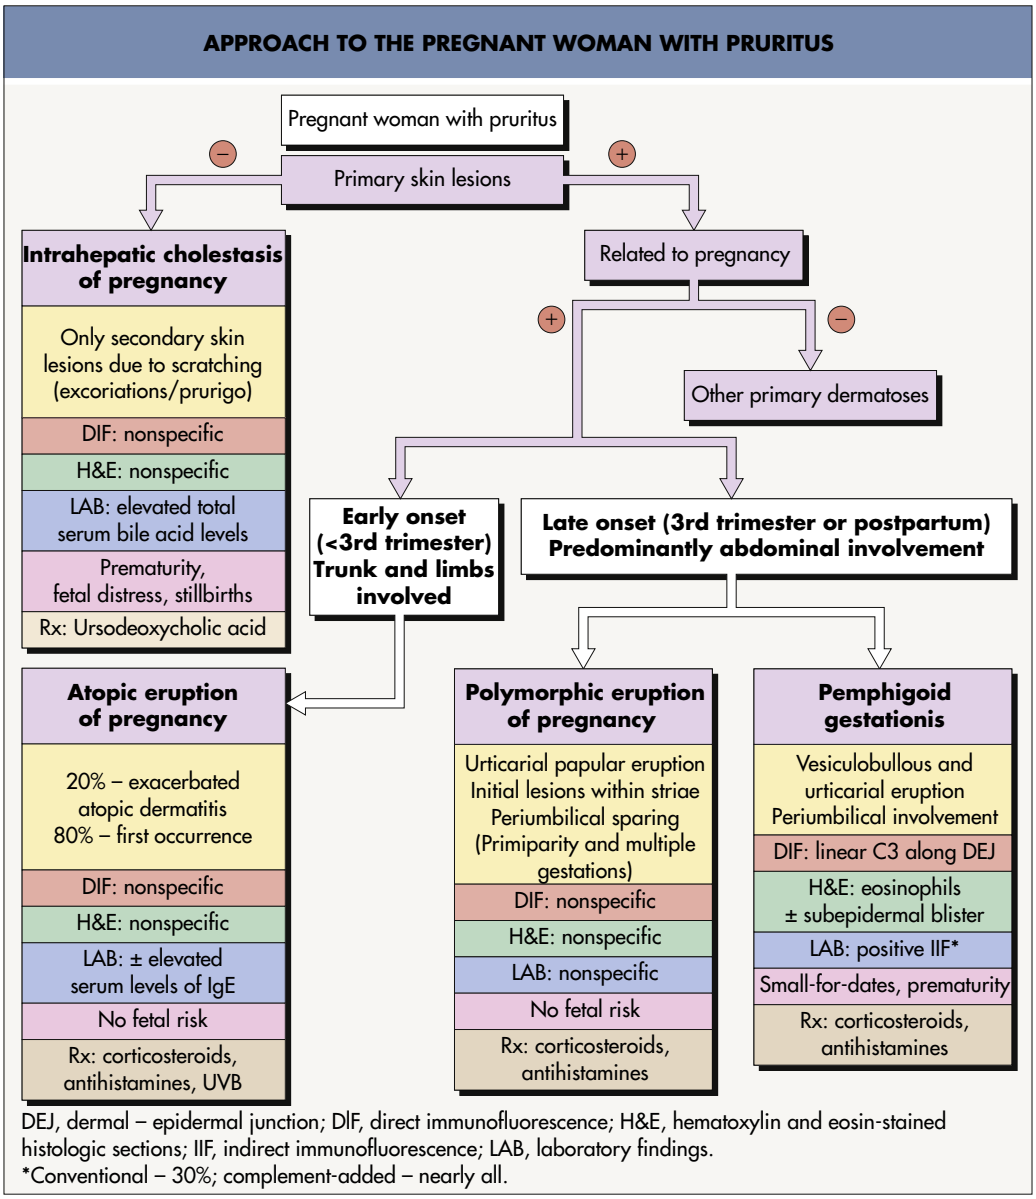

FIG. E127 Approach to the pregnant woman with pruritus. Patients with refractory pemphigoid gestationis may benefit from plasmapheresis during pregnancy. (From Bolognia J: *Dermatology*, ed 4, Philadelphia, 2018, Elsevier.)

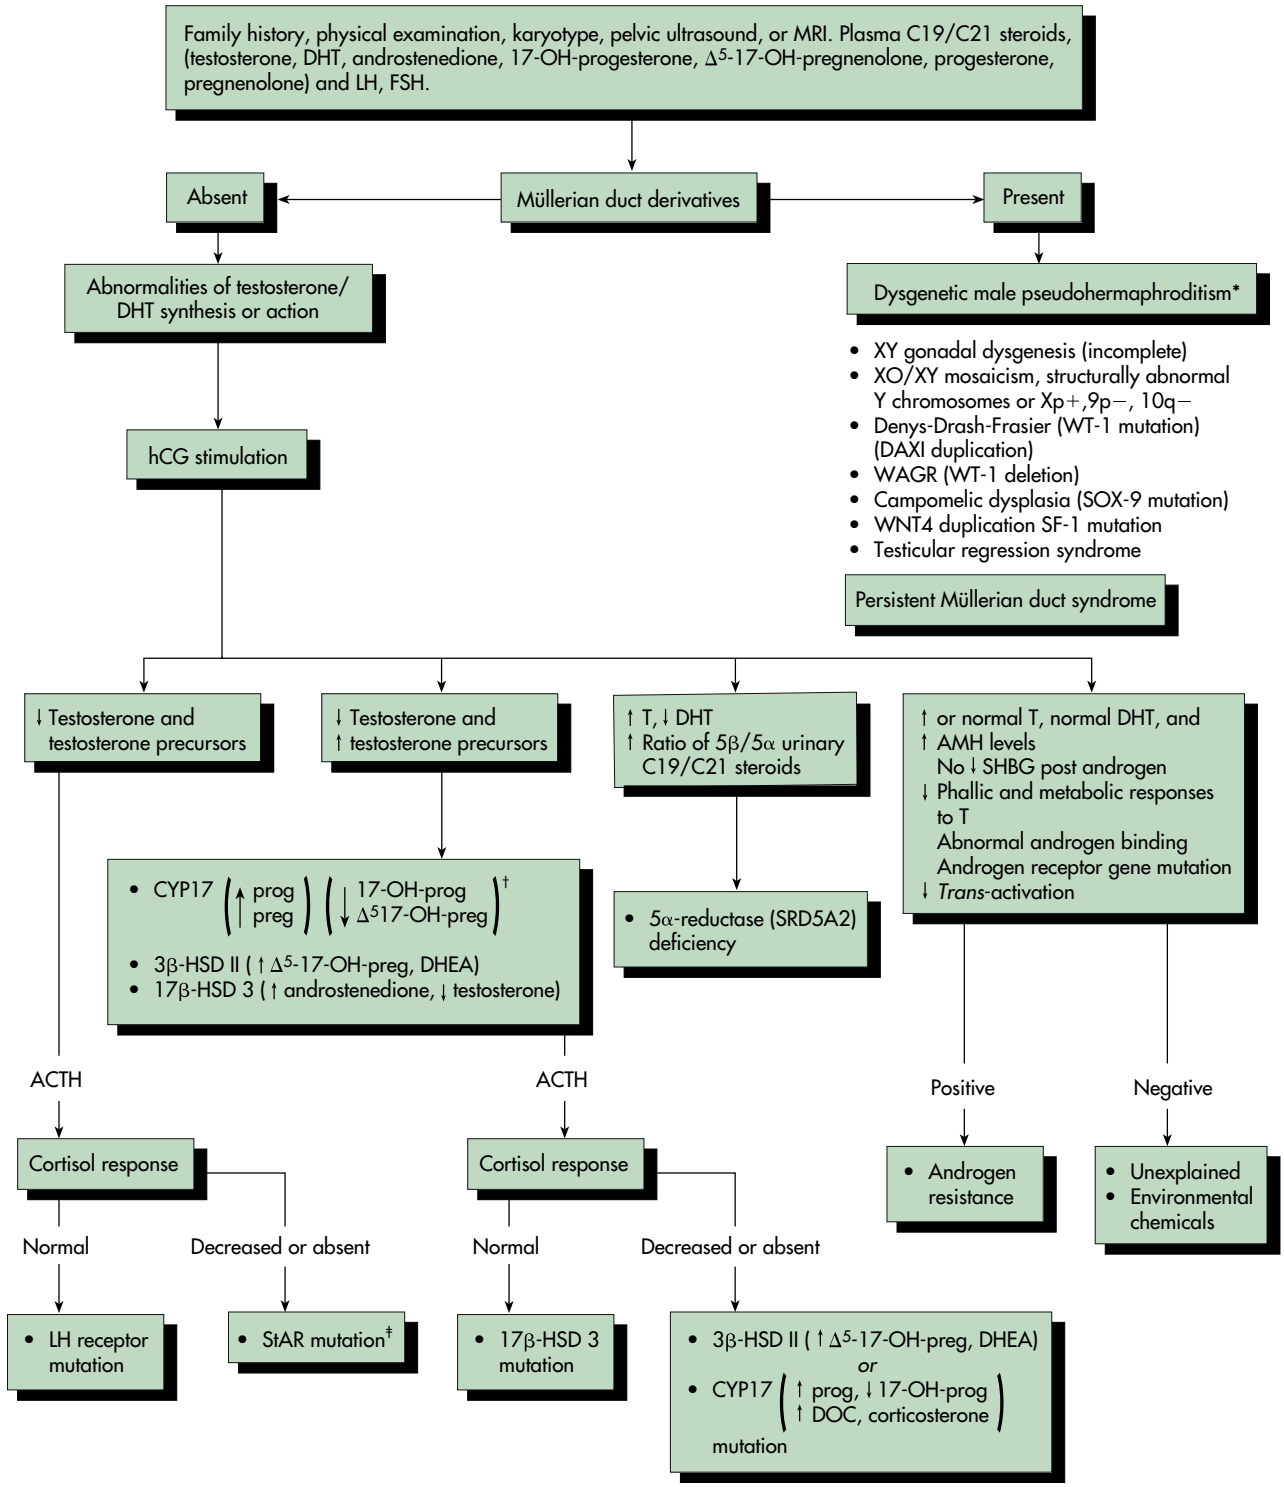

*Patients with dysgenetic male pseudohermaphroditism may manifest varying degrees of testicular dysgenesis with either complete or partial testosterone/DHT and/or AMH deficiency. Therefore, not all patients may manifest either ambiguous genitalia or the presence of Müllerian ducts. †CYP17 (P450??) catalyzes the 17-hydroxylation of progesterone and pregnenolone to 17-hydroxyprogesterone and Δ^5-17-hydroxypregnenolone as well as the scission (lyase) of 17-hydroxypregnenolone to DHEA. Patients with 17, 20- lyase deficiency have elevated levels of 17-hydroxyprogesterone and Δ^5-17-hydroxypregnenolone in relation to andro-stenedione and DHEA whether before or after hCG stimulation. ‡The StAR (steroidogenic acute regulatory) protein is involved in the transport of cholesterol from the outer to the inner mitochondrial membrane where the enzyme CYP11A1(P450??) resides. Patients with a mutation in the gene for this protein have a markedly diminished ability to convert cholesterol to Δ^5-pregnenolone, although their CYP11A1 enzymatic activity is intact. They manifest congenital lipoid adrenal hyperplasia.

FIG. E128 Steps in the differential diagnosis of male pseudohermaphroditism. *3β-HSD II,* 3β-Hydroxysteroid dehydrogenase/Δ^5-isomerase; *17β-HSD 3,* 17β-hydroxysteroid dehydrogenase (oxido-reductase) type 3; *ACTH,* adrenocorticotropic hormone; *AMH,* antimüllerian hormone; *CYP17,* 17α-hydroxylase/17,20-lyase; *DHEA,* dehydroepiandrosterone; *DHT,* dihydrotestosterone; *FSH,* follicle-stimulating hormone; *hCG,* human chorionic gonadotropin; *LH,* luteinizing hormone; *MRI,* magnetic resonance imaging; *SHBG,* sex hormone-binding globulin; *T,* testosterone; *WAGR,* Wilms tumor, aniridia, genital anomalies, and intellectual disability (formerly mental retardation). (From Larsen PR et al: *Williams textbook of endocrinology,* ed 11, Philadelphia, 2008, Saunders.)

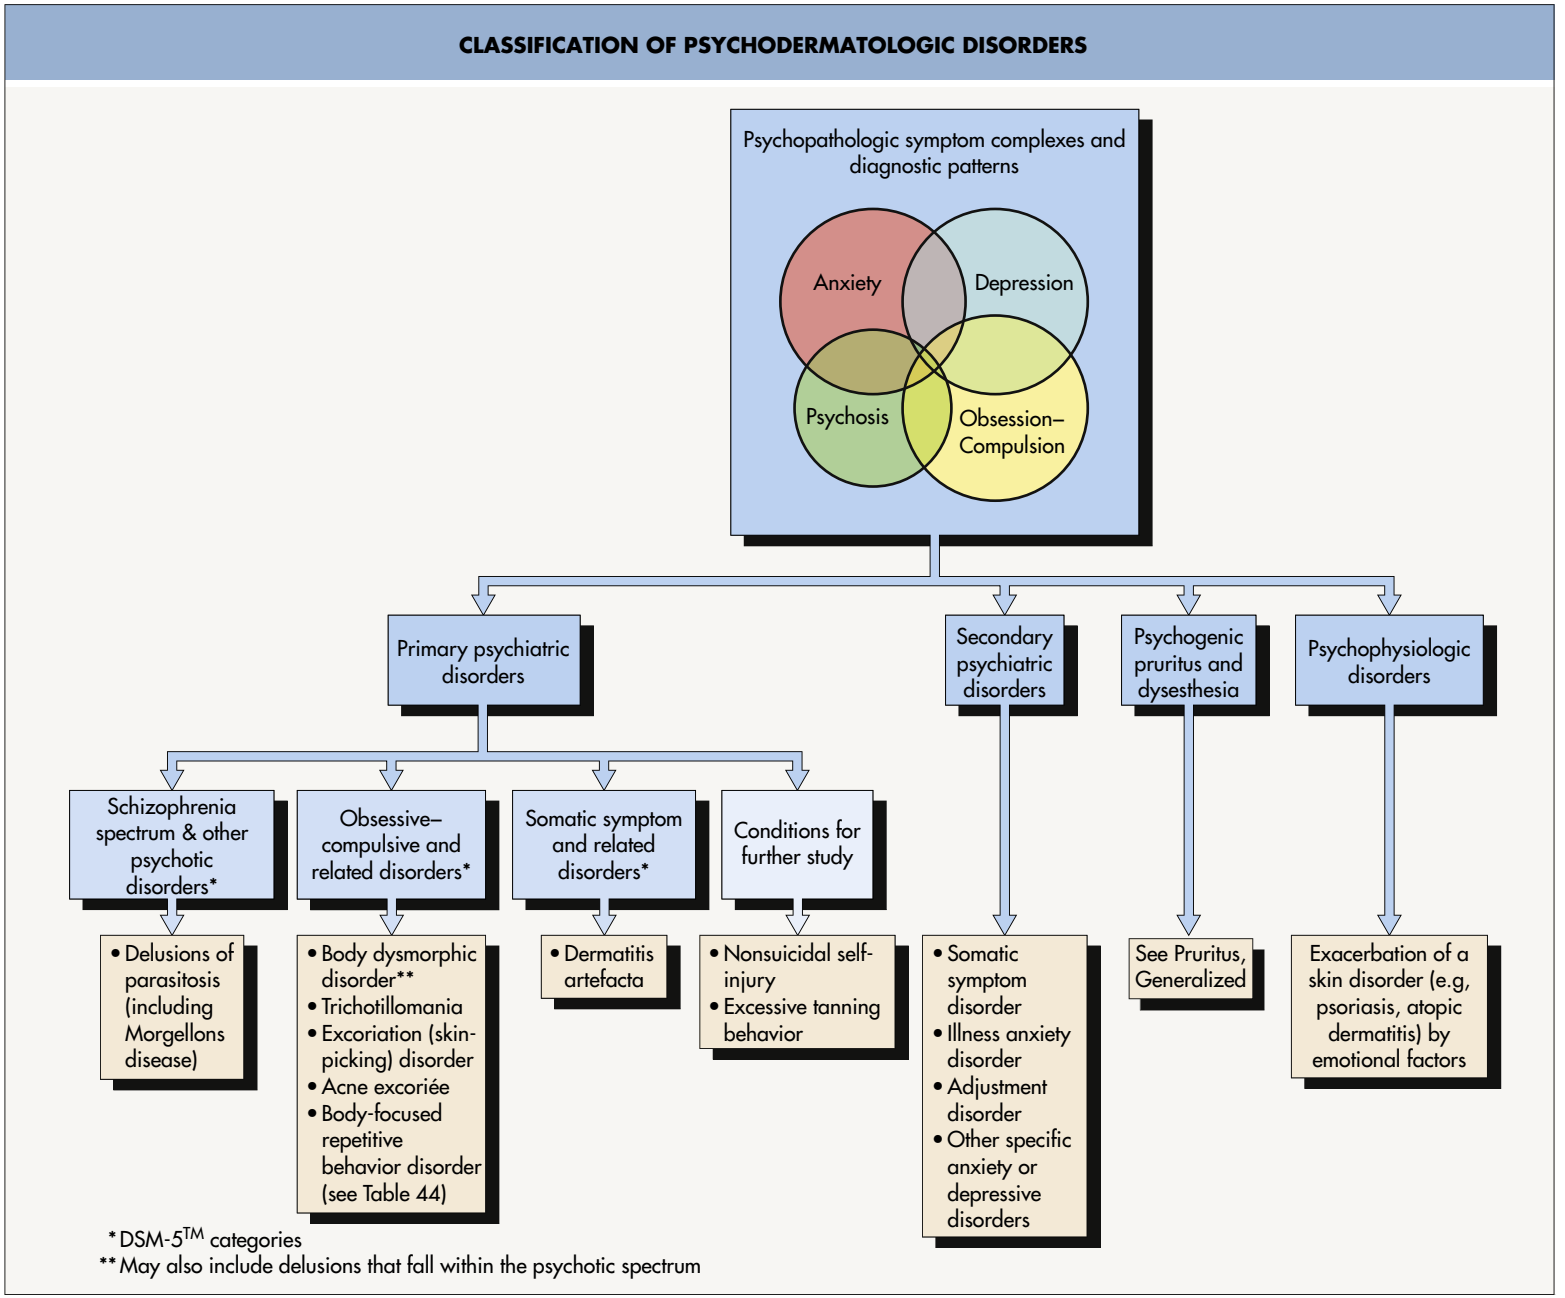

FIG. 129 Classification of psychodermatologic disorders. Psychocutaneous disorders can be conceptualized by (1) the specific psychodermatologic condition and its classification, and (2) the presenting symptom complex of the underlying psychopathology. Primary psychiatric disorders are those in which the patient has no primary skin disease and all of the cutaneous findings are self-induced. Secondary psychiatric disorders involve the development of psychological problems as a result of a skin disease. *Psychophysiologic disorders* are those in which a primary skin condition, such as psoriasis, is exacerbated by emotional factors. A particular patient with a psychodermatologic disorder can have a presenting symptom complex with features from one or more of the four major psychopathologic patterns of anxiety, depression, psychosis, and obsessions/compulsions. (From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.)

TABLE 43 Psychopathic Patterns and Psychotropic Medications Used in Dermatology

Underlying Psychopathology and Symptom Complex	Possible Pharmacologic Treatment	Comments and Precautions
Anxiety		
• Excessive anxiety and worry • Restlessness; feeling "keyed up" or "on edge" • Irritability • Fatigability • Difficulty concentrating or mind going blank • Muscle tension or feeling "shaky" • Sleep disturbance • Somatic symptoms, e.g., dizziness, sweating, palpitations, abdominal complaints	**Acute anxiety: Benzodiazepines** • Clonazepam (0.5-2 mg once or twice daily, as needed) • Lorazepam (0.5-2 mg every 6-8 hours, as needed) **Chronic anxiety: Nonbenzodiazepines**—start low and titrate slowly • *Azapirone anxiolytic* • Buspirone (15 mg/day, divided into 3 doses; increase daily dose by 5 mg every 2-3 days, up to a maximum of 60 mg/day if needed) • Selective serotonin reuptake inhibitors (*SSRIs*; see "Depression" below) • *Tricyclic antidepressants* (e.g., doxepin; see "Depression" below) • *Serotonin-norepinephrine reuptake inhibitor* • Venlafaxine, extended release (37.5-75 mg/day, up to 225 mg/day)	• Treatment not to exceed 4 weeks because of dependency/addiction risk • May cause sedation • Taper dosage to avoid withdrawal symptoms • Onset of action often delayed 2-4 weeks • Do not cause dependency/addiction
Depression		

• Depressed mood
• Anhedonia
• Unexplained weight loss/gain or appetite change
• Insomnia or hypersomnia
• Psychomotor agitation or retardation
• Fatigue, lack of energy
• Feelings of hopelessness, worthlessness
• Excessive guilt
• Difficulty with concentration, indecisiveness
• Suicidal ideation/plan
• Crying spells
• Preoccupation with physical concerns
	• *SSRIs*—start at minimal effective dose and increase every week or every other week as tolerated; if no response at 6-8 weeks, then change to a different class of antidepressants
	  • Fluoxetine (10-20 mg/day, up to 40 mg/day)
	  • Paroxetine (10-20 mg/day, up to 40 mg/day)
	  • Sertraline (25-50 mg/day, up to 200 mg/day)
	  • Escitalopram (5-10 mg/day, up to 30 mg/day)
	  • Citalopram (10-20 mg/day, up to 40 mg/day)
	• *Tricyclic antidepressants (TCAs)*
	  • Doxepin (dosage for pruritus is typically 10-25 mg at bedtime; for depression, typically start at 10-25 mg at bedtime and increase every 1-2 weeks to a therapeutic dose of 25-150 mg at bedtime or up to 300 mg in divided doses, depending on tolerance and disease severity)
		• SSRIs have a slow onset of action, with full therapeutic response not seen until 6-8 weeks
		• SSRIs may cause gastrointestinal disturbances, sexual dysfunction
		• Avoid abrupt discontinuation of SSRIs, as may cause dysphoria, dizziness, gastrointestinal distress
		• Citalopram and escitalopram can cause dose-dependent QT prolongation
		• TCAs can lead to weight gain, cardiac conduction abnormalities, orthostatic hypotension, and anticholinergic side effects
		• Doxepin often causes sedation, especially in the elderly and smaller individuals; should be started at low doses (e.g., 10 mg/day) in these individuals

Psychosis		
• Delusions are the most common feature that presents to dermatologists • Fixed false belief that the patient is convinced is true • Delusion is usually encapsulated (narrow focus)	• *Pimozide* (starting dose is 1 mg/day; increase by 1 mg every 1-2 weeks until optimal response is reached, typically at 4-6 mg/day)	• Must taper dosage of pimozide and not discontinue abruptly to avoid withdrawal symptoms such as dyskinetic movements • Pimozide is associated with QT prolongation, cardiac toxicity, extrapyramidal side effects (e.g., tardive dyskinesia), and drug interactions (avoid if taking macrolides, protease inhibitors, azole antifungals, grapefruit juice) • Baseline ECG often recommended when starting pimozide

	• *Atypical (second-generation) antipsychotics*
	  • Risperidone (1-2 mg/day, up to 4 mg/day)
	  • Olanzapine (5-10 mg/day, up to 20 mg/day)
	  • Aripiprazole (10-15 mg/day)
		• Weight gain, metabolic effects, and other side effects of atypical antipsychotics
		• Increasingly being used for delusions of parasitosis because of lower risk of tardive dyskinesia and QT prolongation compared to pimozide

Obsessive-compulsive disorder (OCD)		
• Presence of intrusive obsessions and/or compulsions (see text) • Varying degrees of insight	• *SSRIs* (start at low dose and increase every week or every other week until reach therapeutic range) • Fluoxetine (20 mg/day, up to 40-80 mg/day) • Paroxetine (20 mg/day, up to 40-60 mg/day) • Sertraline (50 mg/day, up to 200 mg/day) • Fluvoxamine (50 mg/day, up to 200-300 mg/day) • Escitalopram (10 mg/day, up to 20-40 mg/day) • Citalopram (20 mg/day, up to 40 mg/day)	• OCD often requires higher doses of SSRIs, and patients may take longer to respond (e.g., 10-12 weeks) • Once a therapeutic response is achieved, continue treatment for 1-2 yrs, followed by gradual tapering of the dosage
	• Tricyclic antidepressants • Clomipramine (50 mg/day, up to 100-250 mg/day)	• Clomipramine has a less tolerable side-effect profile than SSRIs, including cardiac toxicity and arrhythmias; check blood levels when the dose is ≥150 mg/day
	• Serotonin-norepinephrine reuptake inhibitor • Venlafaxine (75 mg/day, up to 225-350 mg/day)	• Venlafaxine may cause hypertension and an increased risk of gastrointestinal bleeding

Modified from Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

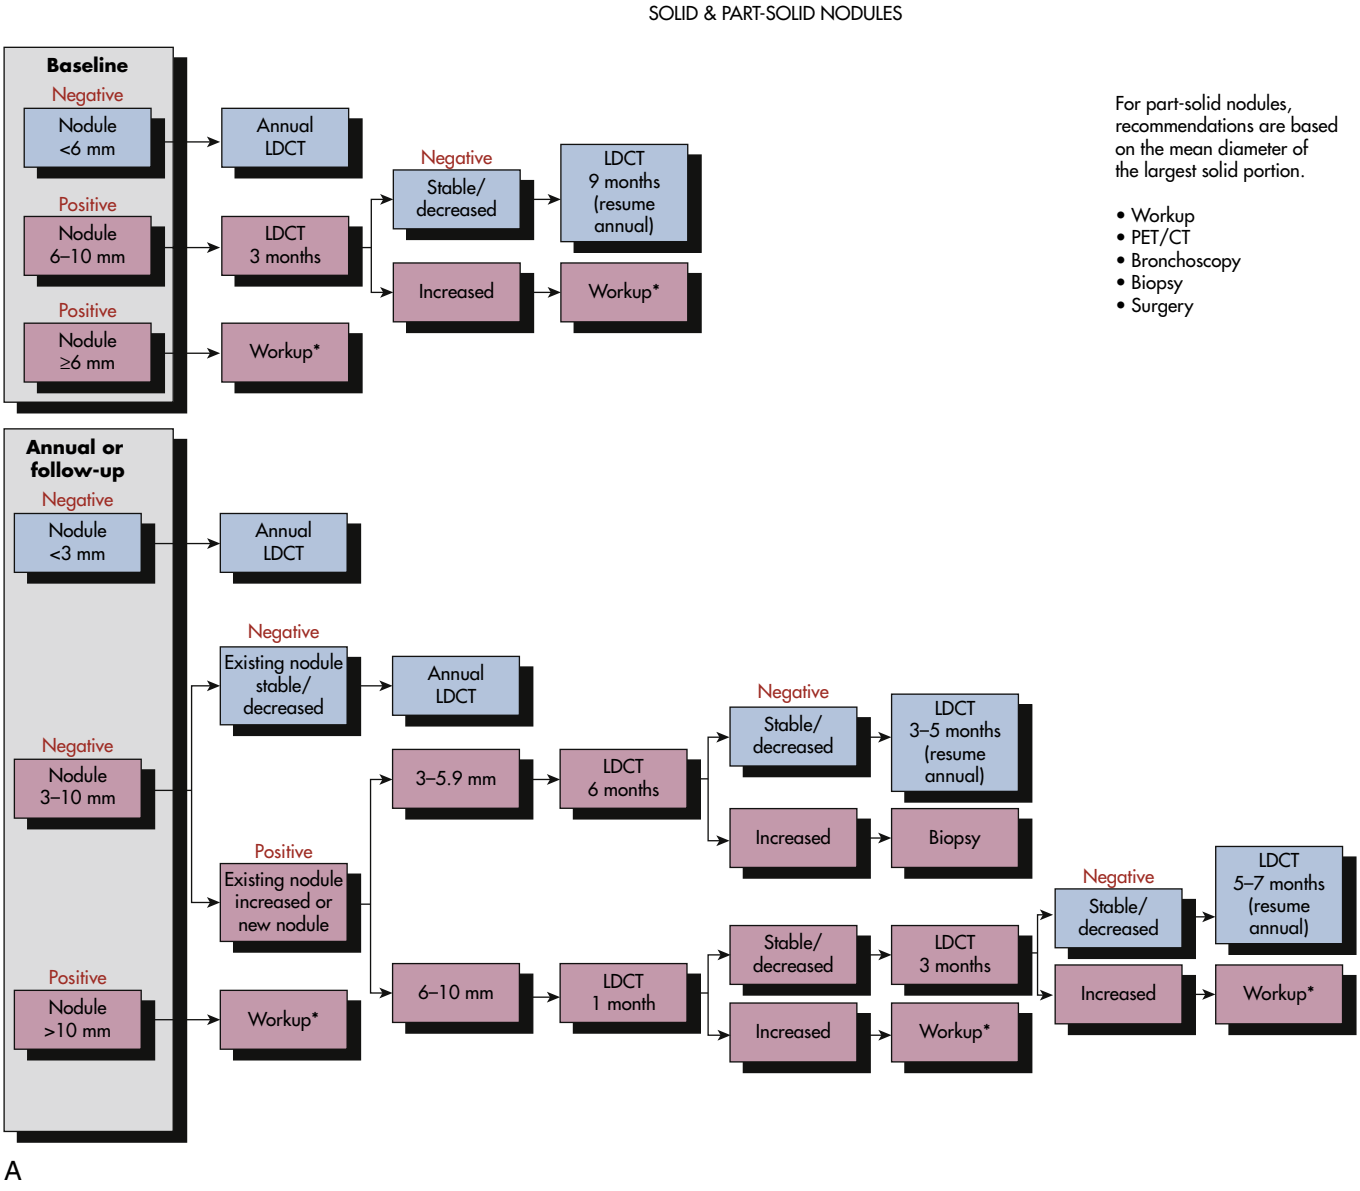
TABLE 44 Body-Focused Repetitive Behaviors and Associated Mucocutaneous Findings

Body-Focused Repetitive Behavior	Associated Mucocutaneous Findings
Lip licking	Irritant contact dermatitis, secondary bacterial or yeast infections
Lip picking or biting	Multiple erosions or ulcerations, recurrent HSV
Cheek chewing or biting	Bite fibroma, morsicatio buccarum
Cuticle pulling, picking, or biting	Paronychia, nail surface irregularities
Nail biting (onychophagia)	Paronychia, nail dystrophy, subungual hemorrhages
Nail picking or pulling (onychotillomania)	
Habit-tic deformity of the thumbnail	Multiple midline Beau's lines with prominent longitudinal central depression
Thumb or finger sucking	Skin maceration, dermatitis, secondary bacterial or yeast infections
Nose picking (rhinotillexomania)	Erosions, secondary bacterial infections
Trichotillomania	
Excoriation (skin-picking) disorder	

HSV, Herpes simplex virus.

Body-focused repetitive behaviors occur on a chronic basis and present with characteristic mucocutaneous findings, depending on the body site and behavior type. These behaviors exist along a spectrum, with habits at one end and body-focused repetitive behavioral disorders at the other end. The latter disorders continue despite repeated attempts to stop and lead to impaired functioning (e.g., social, occupational) or to distress manifesting as feelings of loss of control, embarrassment, or shame.

Modified from Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.



A

FIG. 130 The diagnostic algorithm for (A) solid or part-solid nodules and (B) nonsolid nodules. This algorithm was created through discussion by a multidisciplinary group composed of thoracic surgeons, radiologists, pulmonologists, oncologists, and pathologists. *Workup is at the discretion of the treating physicians but typically consists of a PET/CT and tissue diagnosis, either by bronchoscopy, CT-guided biopsy, or for highly suspicious nodules, minimally invasive surgery. *CT,* Computed tomography; *LDCT,* low-dose computed tomography; *PET,* positron emission tomography. (From Sellke FW, del Nido PJ, Swanson SJ: *Sabiston & Spencer surgery of the chest,* ed 9, Philadelphia, 2016, Elsevier. The Fleishner Society recommendations for computed tomography follow-up of pulmonary nodules are summarized in Tables 45-47).

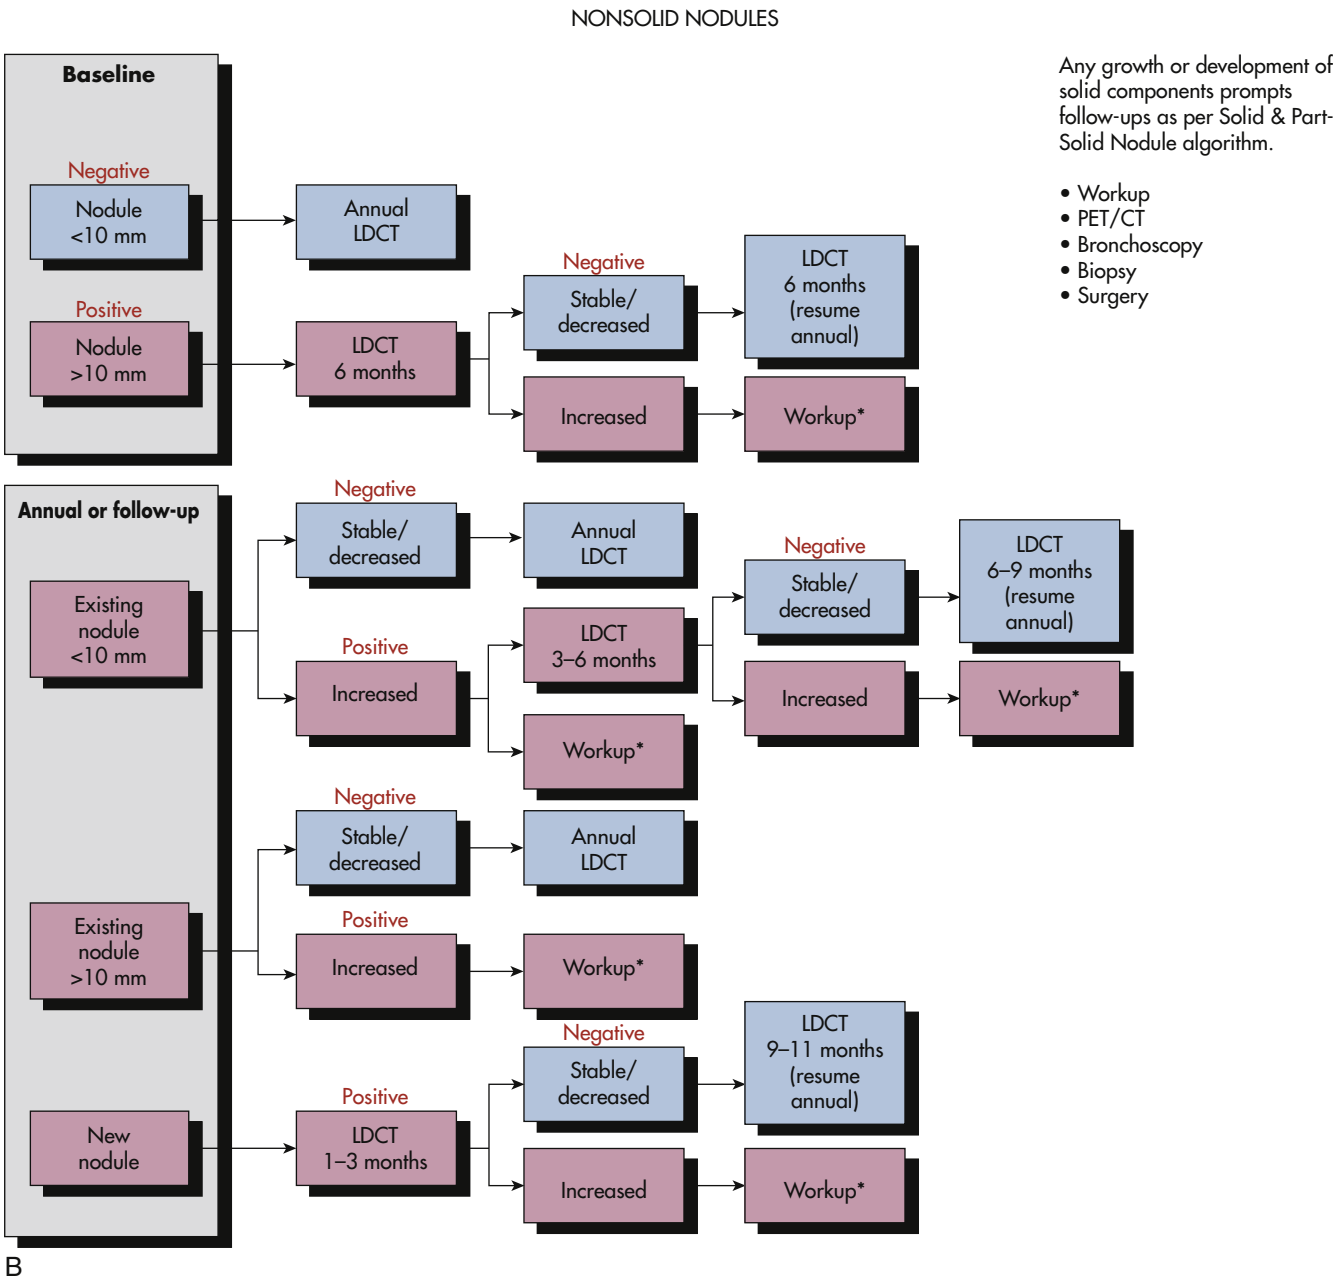


FIG. 130 (Continued)

TABLE 45 Fleischner Society Recommendations for Computed Tomography (CT) Follow-up (FU) of Solid Nodules*

Nodule Size	Low-Risk Patient	High-Risk Patient
≤4 mm	No FU CT needed (FU is optional)	FU CT at 12 months; if unchanged, no further FU
>4-6 mm	FU CT at 12 months; if unchanged, no further FU	FU CT at 6-12 months, then at 18-24 months if no change
>6-8 mm	FU CT at 6-12 months, then at 18-24 months if no change	FU CT at 3-6 months, then at 9-12 and 24 months if no change
>8 mm	Options: FU CT at 3, 9, and 24 months; positron emission tomography; biopsy; video-assisted thoracic surgery	

*Nodule size is average of length and width. Low-risk patient, minimal or absent history of smoking or other known risk factors; high-risk patient, history of smoking or other known risk factors.
From Webb WR, Brant WE, Major NM: *Fundamentals of body CT*, ed 4, Philadelphia, 2015, Saunders.

TABLE 46 Fleischner Society Recommendations for Computed Tomography (CT) Follow-up (FU) of Solitary Ground-Glass Opacity (GGO) or Part-GGO Nodules

Nodule Type	Recommendation	Additional Remarks
Solitary pure GGO ≤5 mm	No FU CT required	Use 1-mm slices to confirm nodule is pure GGO
Solitary pure GGO >5 mm	FU CT at 3 months; if persistent, yearly FU for at least 3 yrs	Positron emission tomography of limited value and not recommended
Solitary part-solid nodules	FU CT at 3 months; if persistent and solid component <5 mm, yearly FU for at least 3 yrs; if persistent and solid component ≥5 mm, then biopsy or resection	Consider positron emission tomography if nodule >1 cm

From Webb WR, Brant WE, Major NM: *Fundamentals of body CT*, ed 4, Philadelphia, 2015, Saunders.

TABLE 47 Fleischner Society Recommendations for Computed Tomography (CT) Follow-up (FU) of Multiple Ground-Glass Opacity (GGO) or Part-GGO Nodules

Nodule Type	Recommendation	Additional Remarks
Multiple pure GGO ≤5 mm	FU CT at 2 and 4 yrs	Consider alternate cause for GGO nodules
Multiple pure GGO >5 mm; no dominant lesion	FU CT at 3 months; if persistent, yearly FU for at least 3 yrs	Positron emission tomography of limited value and not recommended
Dominant part-solid nodule(s)	FU CT at 3 months; if persistent, then biopsy or resection, particularly if solid component ≥ 5 mm	Consider lung-sparing surgery in patients with a dominant lesion suspicious for lung cancer

From Webb WR, Brant WE, Major NM: *Fundamentals of body CT*, ed 4, Philadelphia, 2015, Saunders.

ICD-10CM #
D69.2 Other nonthrombocytopenic purpura
D69.0 Allergic purpura
D69.49 Other primary thrombocytopenia
M31.1 Thrombotic microangiopathy

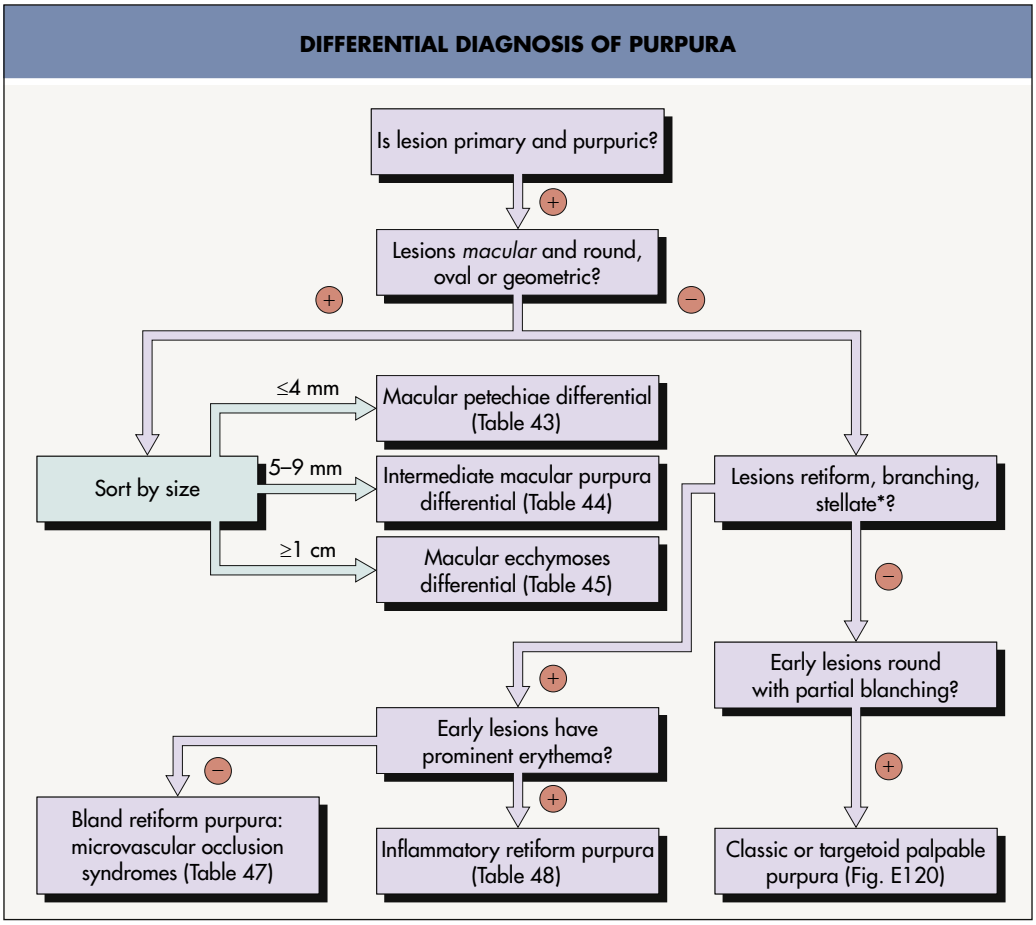

FIG. 131 Differential diagnosis of purpura. *Very few lesions are truly stellate, that is, characterized by a central area of necrosis or hemorrhage with radiating extensions, but some authors continue to use this term to describe these lesions. (From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.)

ICD-10CM #
D69.2 Other nonthrombocytopenic purpura
D69.0 Allergic purpura
D69.49 Other primary thrombocytopenia
M31.1 Thrombotic microangiopathy

TABLE 48 Differential Diagnosis of Macular Petechiae (≤4 mm in diameter)

Hemostatically Relevant Thrombocytopenia (<10, 000-20, 000/mm³)*

Major etiologies†

- Idiopathic thrombocytopenic purpura
- Thrombotic thrombocytopenic purpura
- Other acquired thrombocytopenias, including drug-related
  - Peripheral destruction (e.g., quinine, quinidine)
  - Drug-induced decreased production, idiosyncratic or dose-related (e.g., chemotherapy)
  - Bone marrow infiltration, fibrosis, or failure
- Disseminated intravascular coagulation (early sign)

Abnormal Platelet Function

Major etiologies†

- Congenital or hereditary platelet function defects
- Acquired platelet function defects
  - Aspirin, NSAIDs
  - Renal insufficiency
  - Monoclonal gammopathy (uncommon)
- Thrombocytosis secondary to myeloproliferative disorders (often >1,000,000/mm³)

Nonplatelet Etiologies

Major etiologies†

- Spiking elevations of intravascular venous pressure (Valsalva maneuver-like, e.g., repetitive vomiting, childbirth, paroxysmal coughing, seizure)
- Fixed increased pressure (e.g., stasis, ligatures) or intermittent pressure (e.g., blood pressure cuff [Rumpel-Leede sign])
- Trauma (often linear)
- Perifollicular (vitamin C deficiency)
- Mildly inflammatory conditions
  - Pigmented purpuric eruptions
  - Hypergammaglobulinemic purpura of Waldenström

*Platelets provide factors necessary for hemostasis of endothelial cell junctions. When counts fall below 10,000-20,000/mm³, inadequate platelet support leads to degradation of junction function, increased permeability, and hemorrhage.[3]
†Partial list.
From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

TABLE 49 Differential Diagnosis of Intermediate Macular Purpura (5-9 mm)

Major Etiologies*

- Hypergammaglobulinemic purpura of Waldenström
- Infection/inflammation in patients with thrombocytopenia
- Rarely, minimally inflamed cutaneous small vessel vasculitis (usually dependent distribution)

*Partial list.
From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

TABLE 50 Differential Diagnosis of Macular Ecchymoses (≥1 cm)

Procoagulant Defect Plus Minor Trauma

Major etiologies*

- Anticoagulant use
- Hepatic insufficiency with poor procoagulant synthesis
- Vitamin K deficiency
- Disseminated intravascular coagulation (some)

Poor dermal support of vessels plus minor trauma

Major etiologies*

- Solar (actinic, senile) purpura
- Corticosteroid therapy, topical or systemic
- Vitamin C deficiency (scurvy)
- Systemic amyloidosis (light chain-related, transthyretin-related
- Ehlers-Danlos syndrome

Platelet Disorders Plus Minor Trauma

Major etiologies*

- Platelet function defects, including von Willebrand disease and those induced by medications and metabolic diseases
- Acquired or congenital thrombocytopenia

Miscellaneous

- Papular purpuric gloves and socks syndrome

*Partial list.
From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

TABLE 51 Palpable Purpura: Inflammatory Purpura with Prominent Early Erythema

Leukocytoclastic Vasculitis due to Immune Complex Disease

Small vessels only

- Idiopathic, infection- or drug-associated IgG or IgM complexes
- Idiopathic IgA complexes (HSP), or IgA complexes associated with drugs or infection
- Hypergammaglobulinemic purpura of Waldenström
- Urticarial vasculitis: often minimally purpuric
- Pustular vasculitis (e.g., bowel bypass syndrome)

Small- and medium-sized (macroscopic) vessels may be involved

- Mixed cryoglobulinemia
- Rheumatic vasculitides (LE, RA, Sjögren syndrome)

Pauci-immune leukocytoclastic vasculitis

ANCA-associated

- Granulomatosis with polyangiitis
- Microscopic polyangiitis
- Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome)

Other

- Erythema elevatum diutinum
- Sweet syndrome (vasculitis unusual)

***Not* leukocytoclastic vasculitis**

Small vessels only

- Erythema multiforme
- Pityriasis lichenoides et varioliformis acuta (PLEVA)
- Pigmented purpuric eruptions
- Hypergammaglobulinemic purpura of Waldenström (although some lesions have histologic evidence of leukocytoclastic vasculitis)

Classic target lesion—usually erythema multiforme, but can be small vessel vasculitis, especially IgA-associated

AgG, Antigen G; *IgG,* immunoglobin G; *IgM,* immunoglobin M; *HSP,* Henoch-Schönlein purpura; *LE,* lupus erythematosus; *RA,* rheumatoid arthritis.
Modified from Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

ICD-10CM #
D69.2 Other nonthrombocytopenic purpura
D69.0 Allergic purpura
D69.49 Other primary thrombocytopenia
M31.1 Thrombotic microangiopathy

TABLE 52 Differential Diagnosis of Noninflammatory Retiform Purpura

Occlusion Primarily due to Platelet-Related Thrombopathy

Major etiologies*

- Heparin-induced thrombocytopenia syndrome (HITS)
- Thrombocytosis secondary to myeloproliferative disorders
- Paroxysmal nocturnal hemoglobinuria
- Thrombotic thrombocytopenic purpura (though platelet plugs form primarily in visceral vessels, and skin hemorrhage is due more often to thrombocytopenia)

Cold-related precipitation or agglutination

Major etiologies*

- Cryoglobulinemia, usually monoclonal (early lesions of mixed cryoglobulinemia are more often inflammatory and leukocytoclastic due to immune complex deposition)
- Cryofibrinogenemia (though most cryofibrinogens are incidental findings in hospitalized patients)
- Cold agglutinins (rarely cause occlusion; usually cause hemolysis or are asymptomatic)

Occlusion due to organisms growing in vessels

Major etiologies*

- Vessel-invasive fungi (e.g., *Mucor* spp., *Aspergillus* spp.; usually in immunocompromised patients)
- Ecthyma gangrenosum (often *Pseudomonas* spp. or other gram-negative bacilli proliferating in adventitia of subcutaneous arterioles)
- Disseminated strongyloidiasis
- Lucio phenomenon of Hansen disease
- Rocky Mountain spotted fever, other rickettsial spotted fevers

Systemic alteration in control of coagulation

Major etiologies*

- Protein C- and S-related
  - Homozygous protein C or protein S deficiency
  - Acquired protein C deficiency (some patients with sepsis-associated DIC)
  - Warfarin necrosis** (protein C dysfunction)
  - Postinfectious purpura fulminans (protein S dysfunction)
- Antiphospholipid antibody, lupus anticoagulant
- Levamisole-adulterated cocaine^

Vascular coagulopathy

- Livedoid vasculopathy/atrophie blanche (may also have a systemic prothrombotic component)
- Malignant atrophic papulosis/Degos disease (antiphospholipid antibody syndrome can mimic this disease)
- Sneddon syndrome (can be related to antiphospholipid antibody syndrome)
- Deficiency of adenosine deaminase 2 (ADA2)

Embolization or crystal deposition

Major etiologies*

- Cholesterol emboli
- Oxalate crystal deposition (rare)
- Marantic endocarditis, atrial myxoma, crystal globulins, hypereosinophilic syndrome (all rare)

Reticulocyte, red blood cell occlusion

- Sickle cell disease
- Severe malaria (usually *Plasmodium falciparum*)

Miscellaneous

- Cutaneous calciphylaxis
- Brown recluse (*Loxosceles*) spider bite reaction
- Intravascular B-cell lymphoma
- Hydroxyurea (rare)

DIC, Disseminated intravascular coagulation.
*Partial list.
**Also referred to as Coumadin® necrosis.
^Early lesions primarily thrombotic, but vasculitis can also occur.
From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

TABLE 53 Differential Diagnosis of Inflammatory Retiform Purpura

Vasculitis

Primarily dermal vessels

- IgA vasculitis

Dermal and Subcutaneous Vessels Usually Involved

- Mixed cryoglobulinemia
- Rheumatic vasculitides (LE, RA)
- Polyarteritis nodosa
- Microscopic polyangiitis
- Granulomatosis with polyangiitis
- Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome)

Dermal Vessel Inflammation/Occlusion/Constriction

- Livedoid vasculopathy
- Septic vasculitis
- Chilblains (pernio)
- Pyoderma gangrenosum

IgA, Immunoglobin A; *LE,* Lupus erythematosus; *RA,* rheumatoid arthritis.
From Bolognia J: *Dermatology,* ed 4, Philadelphia, 2018, Elsevier.

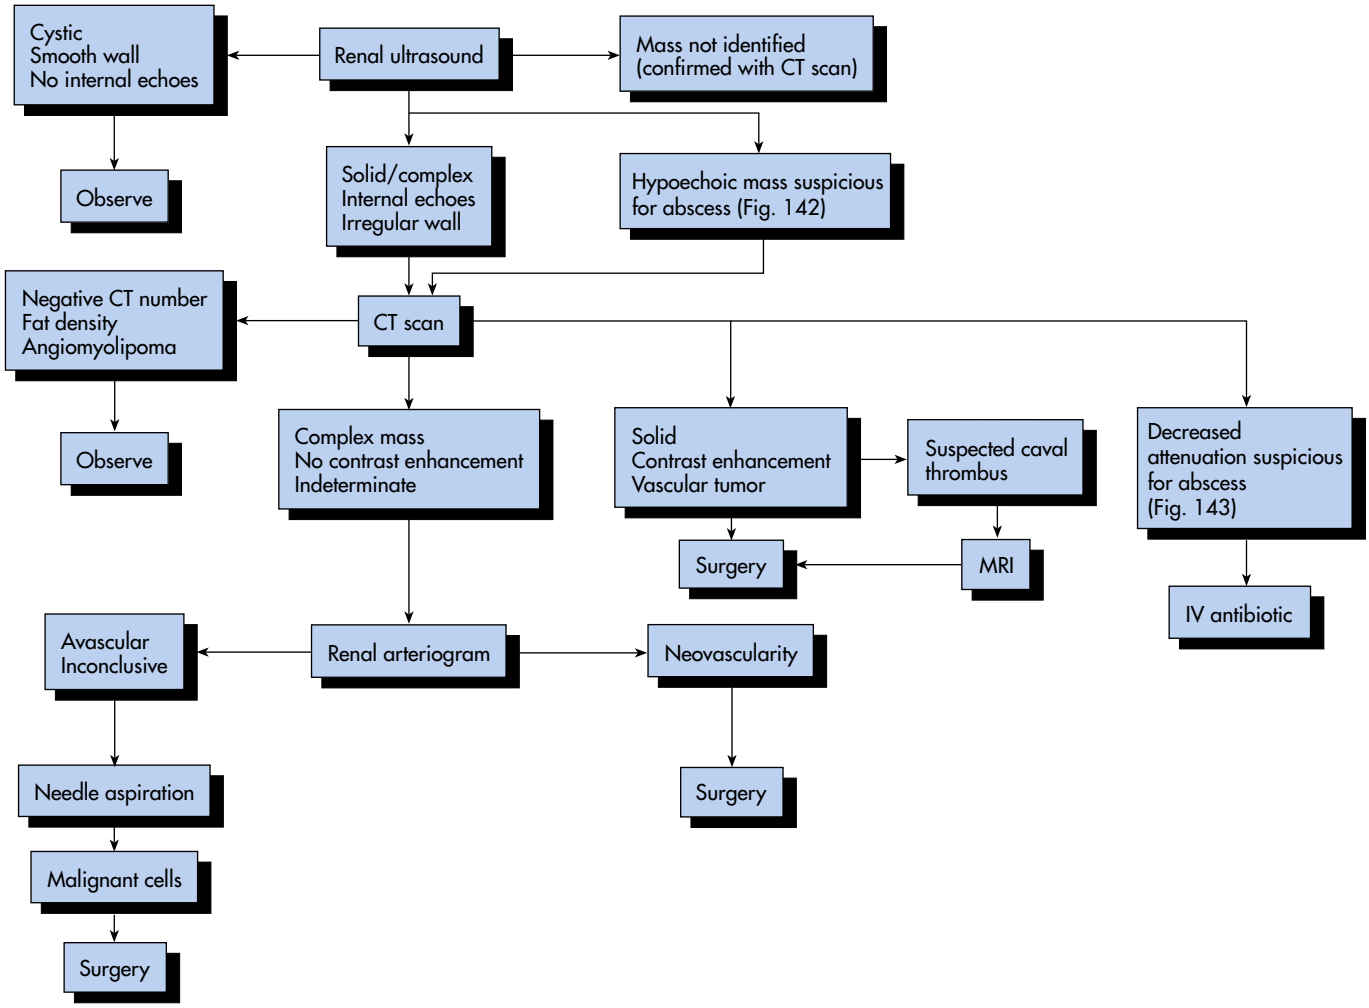

FIG. 141 Evaluation of a patient with a renal mass on renal ultrasound. *CT,* Computed tomography; *MRI,* magnetic resonance imaging. (Modified from Williams RD: Tumors of the kidney, ureter, and bladder. In Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 23, Philadelphia, 2008, Saunders.)

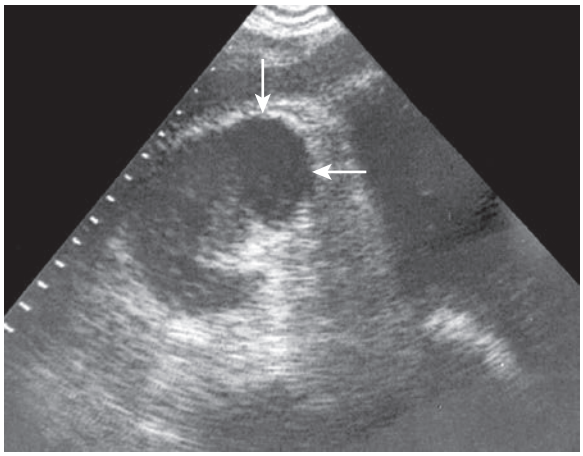

FIG. 142 Acute renal abscess. Transverse ultrasound image of the right kidney demonstrates a poorly marginated rounded focal hypoechoic mass *(arrows)* in the anterior portion of the kidney. *CT*, Computed tomography. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

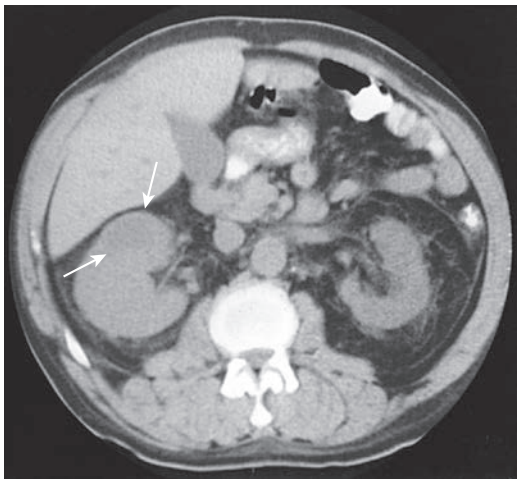

FIG. 143 Acute renal abscess. Nonenhanced computed tomography scan through the mid-pole of the right kidney demonstrates right renal enlargement and an area of decreased attenuation *(arrows).* After antimicrobial therapy, a follow-up scan showed complete regression of these findings. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

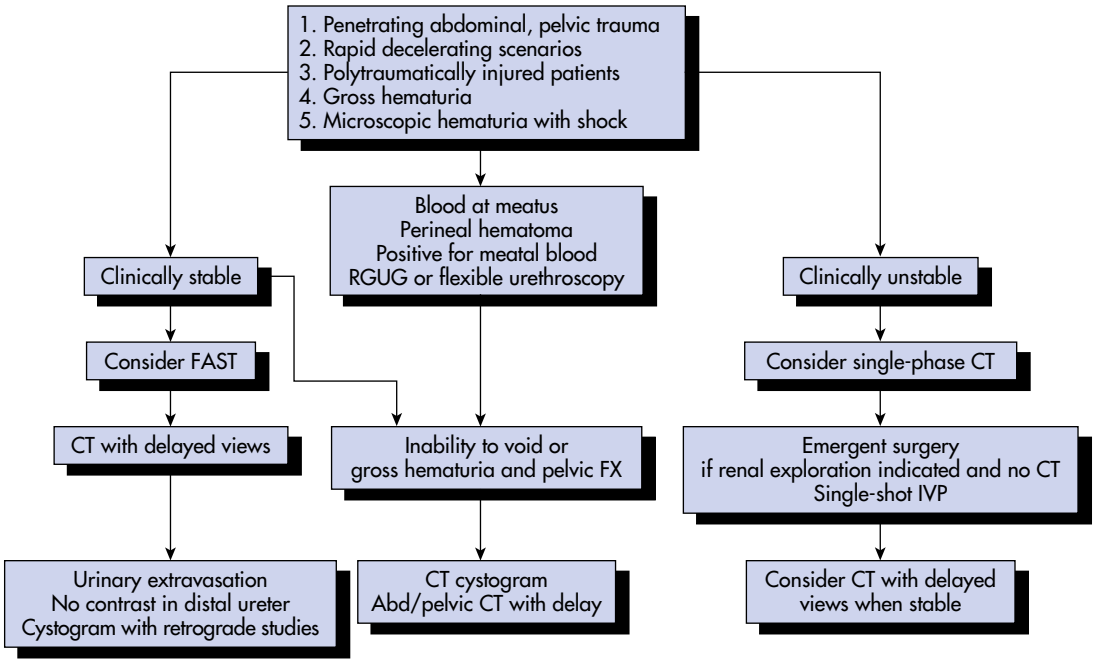

FIG. E144 Recommended evaluation protocol for patients with a medical history or physical findings consistent with possible genitourinary injury. *Abd,* Abdominal; *CT,* computed tomography; *FAST,* focused assessment with sonography for trauma; *FX,* fracture; *IVP,* intravenous pyelography; *RGUG,* retrograde urethrogram. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

TABLE E54 Consensus Recommendations for Management of Renal Trauma

Clinical Findings and/or Grade of Renal Injury	Recommended Treatment
Grade 1 or 2 renal injury irrespective of traumatic etiology*	Nonoperative
Isolated grade 3, grade 4, and hemodynamically stable grade 5 renal injuries	Nonoperative
Uncontrollable renal hemorrhage/vascular instability; occasionally grade 4 "shattered" kidneys and a high percentage of grade 5 injuries	Absolute requirement for surgical intervention
Persistent or delayed hemorrhage not responding to angiographic embolization	Absolute requirement for surgical intervention
Expanding pulsatile retroperitoneal mass found on surgical exploration for coexisting intraabdominal injuries	Absolute requirement for surgical intervention (verify contralateral renal function prior to exploration)
Penetrating trauma, inadequate preoperative radiographic staging because of vascular instability of patient, retroperitoneal hemorrhage found on exploration	Retroperitoneal (renal) exploration recommended (verify contralateral renal function prior to exploration)
Blunt trauma; inadequate preoperative radiographic staging because of vascular instability of patient; no duodenal, pancreatic, or colonic injuries with retroperitoneal hemorrhage found on exploration	Observation—if FAST with bilateral blood flow. If no FAST obtained, consider intraoperative single-shot IVP/US with renal blood flow assessment or CT immediately following stabilization of patient
Blunt trauma; inadequate preoperative radiographic staging because of vascular instability of patient; duodenal, pancreatic, or colonic injuries with retroperitoneal hemorrhage found on exploration	Surgical interventions with renorrhaphy an option (verify contralateral renal function prior to exploration) *or* Drain intra-abdominal injuries. Observation—if FAST with bilateral blood flow. If no FAST obtained, consider intraoperative single-shot IVP/US with renal blood flow assessment or CT immediately following stabilization of patient
Blunt/penetrating trauma; radiographic screening studies reveal grade 3 renal injury with devitalized renal fragments, grade 4 or 5 renal injury, coexisting intraabdominal injuries—especially duodenum, pancreas, and colon	Retroperitoneal (renal) exploration with renorrhaphy and repair recommended

CT, Computed tomography; *FAST,* focused assessment with sonography for trauma; *IVP,* intravenous pyelography; *US,* ultrasound.
*Blunt or penetrating trauma.
From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.

ICD-10CM #
N44.2 Benign cyst of testis
N44.8 Other noninflammatory disorders of the testis
N50.3 Cyst of epididymis
N50.8 Other specified disorders of male genital organs

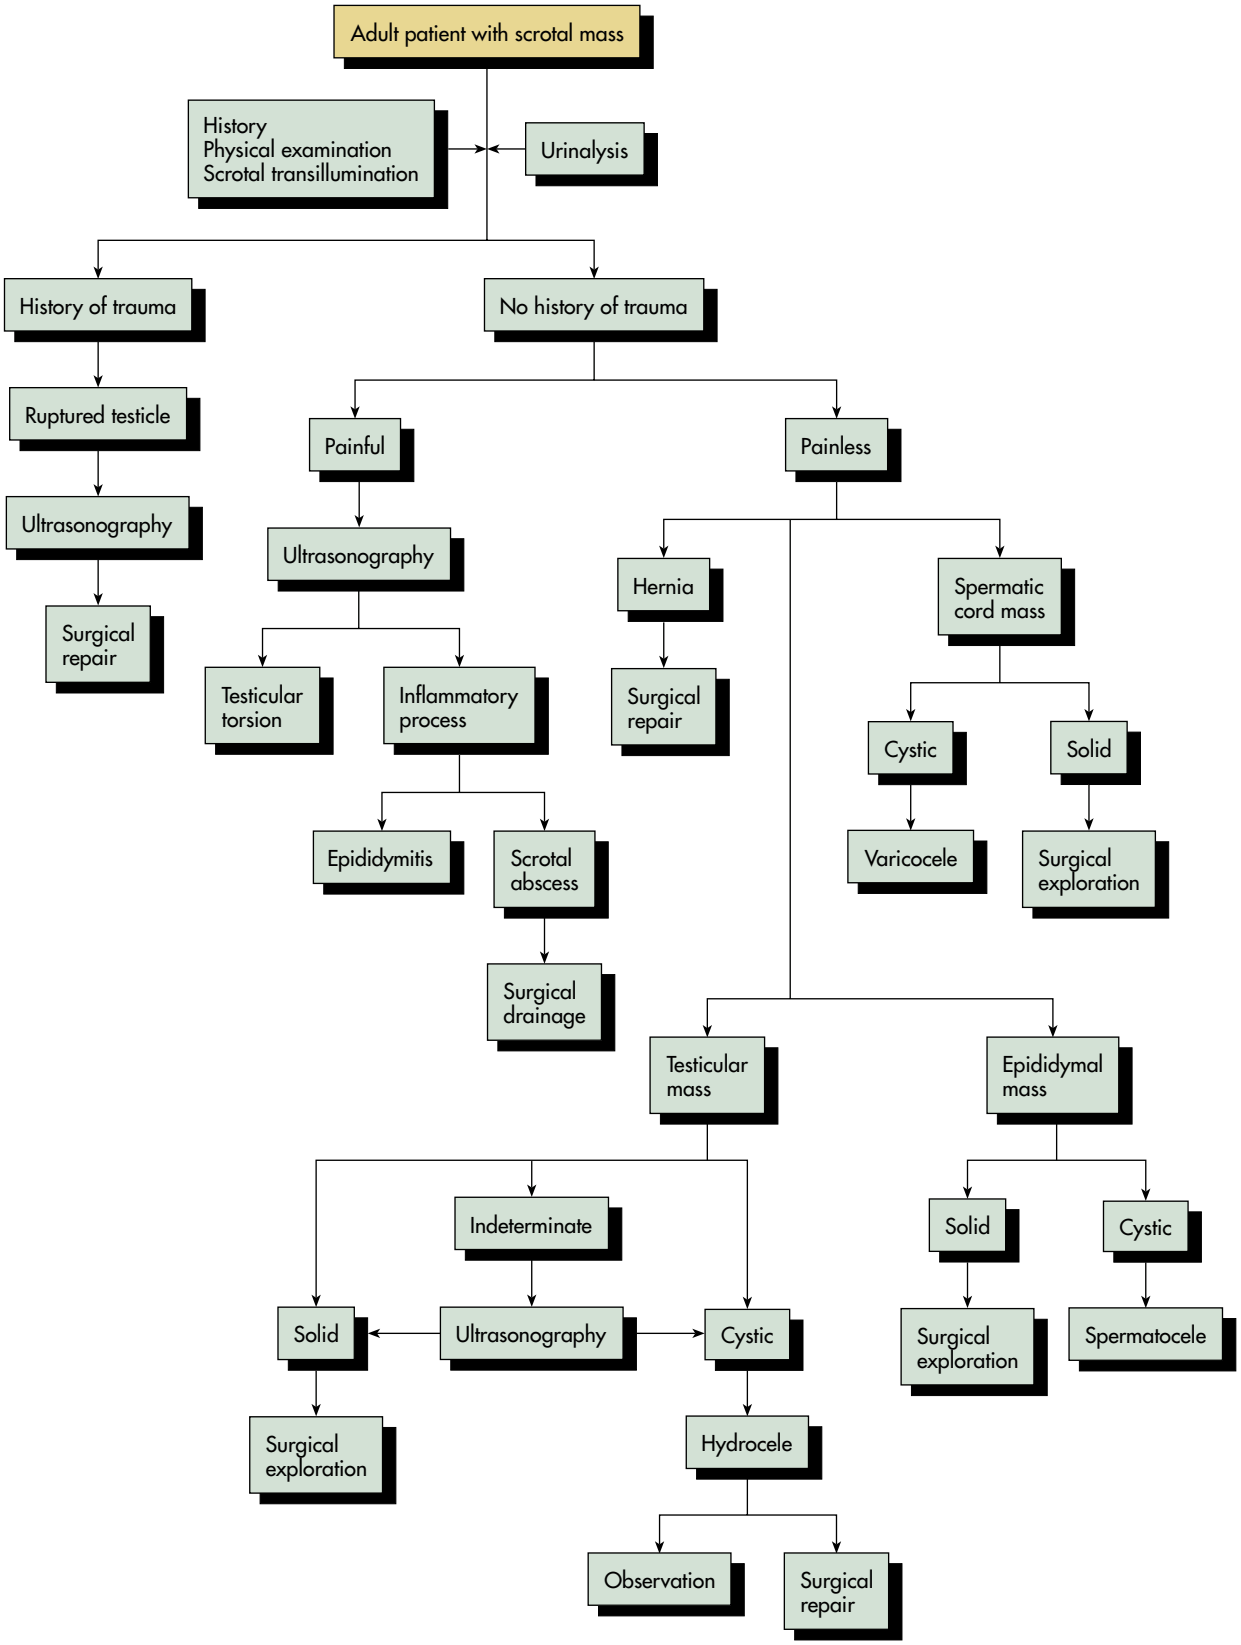

FIG. 145 Evaluation of scrotal mass. (Modified from Greene HL, Johnson WP, Lemcke DL [eds]: *Decision making in medicine*, ed 2, St Louis, 1998, Mosby.)

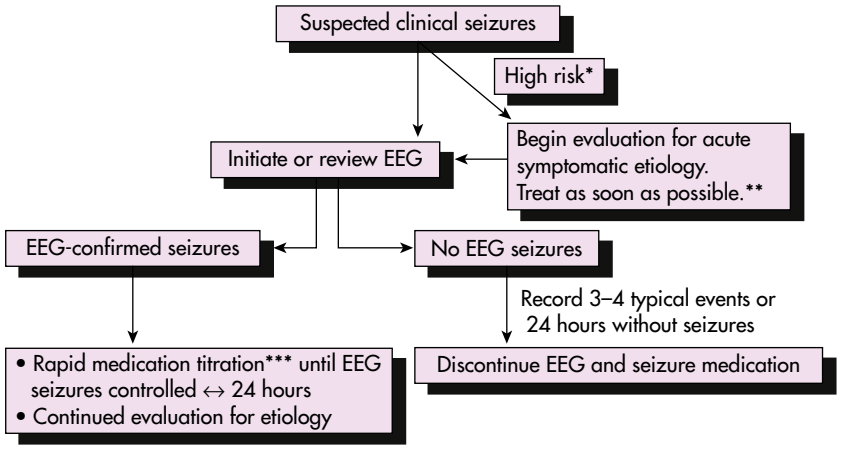
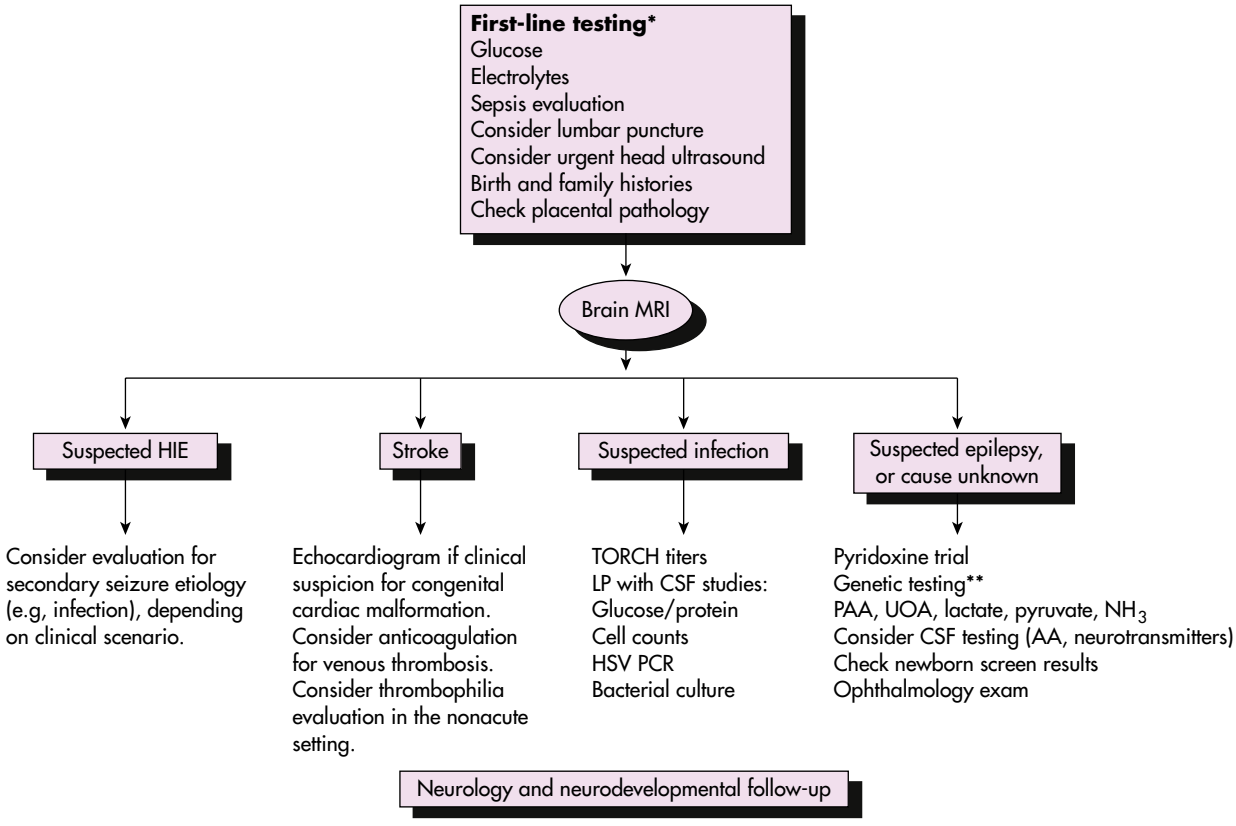


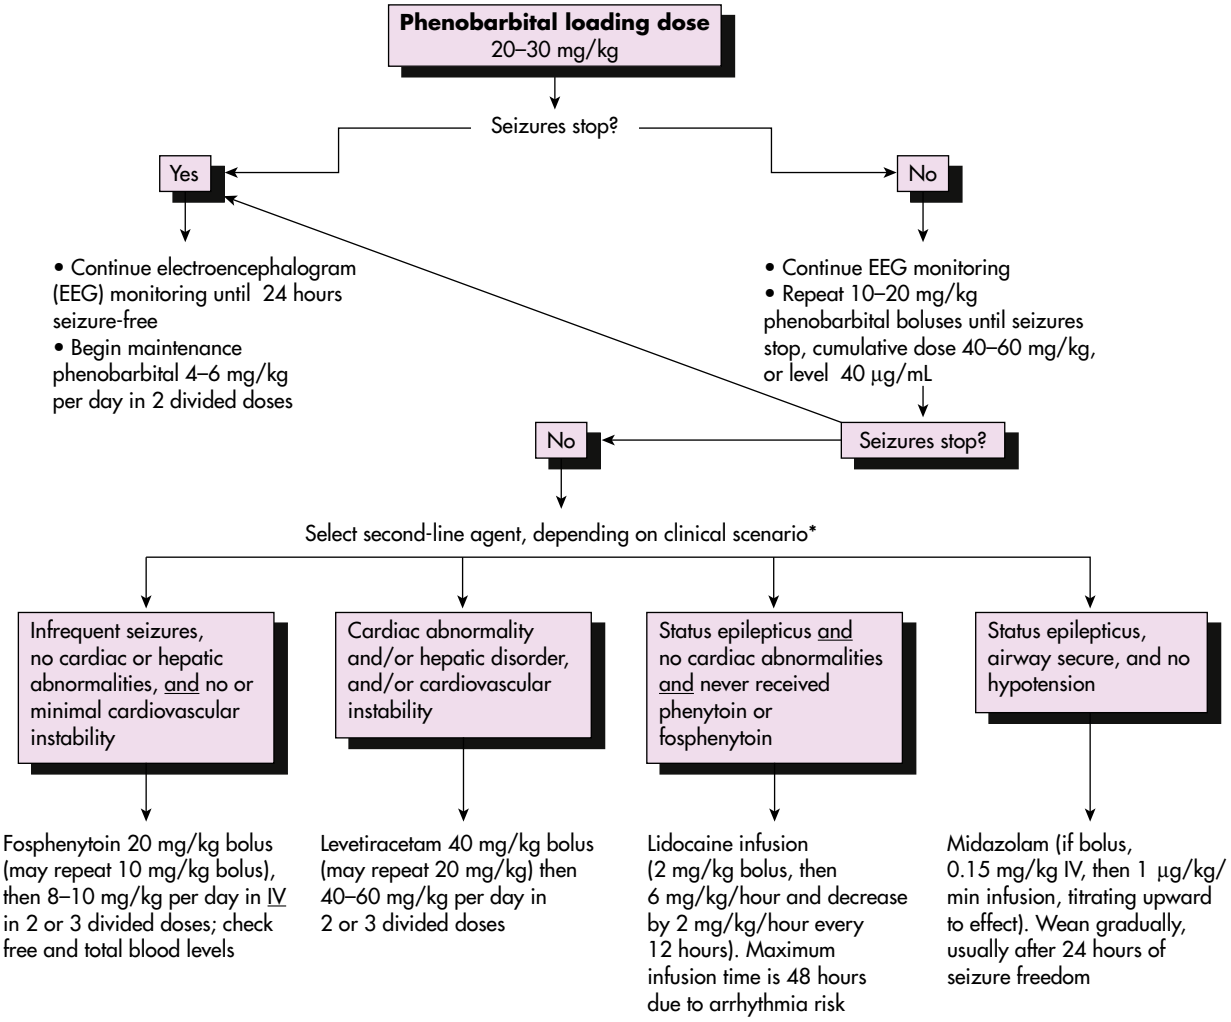
* High-risk scenarios: known or suspected acute brain injury, encephalopathy, previous EEG seizures, first 72 hours of life
** Reverse glucose or electrolyte abnormalities, and/or administer lorazepam 0.1 mg/kg IV, and/or administer phenobarbital loading dose.
*** Refer to Figure 148

FIG. 146 Assessment algorithm for newborns with suspected seizures. *EEG,* Electroencephalogram. (From Swaiman KF: *Swaiman's pediatric neurology, principles and practice,* ed 6, Philadelphia, 2017, Elsevier.)



**Genetic testing can include karyotype, chromosomal microarray, epilepsy gene panel, or single gene testing.

FIG. 147 Assessment algorithm for newborns with seizures. First-line testing should occur simultaneously with initiation of electroencephalography (and empiric seizure treatment in high-risk clinical scenarios). Most infants should receive neuroimaging, and brain magnetic resonance imaging *(MRI)* is the preferred neuroimaging modality. Second-line testing depends on the clinical scenario and MRI findings. Newborns with seizures are at high risk for long-term neurodevelopmental disability and epilepsy, and so they require careful follow-up by appropriate clinicians. *CSF,* Cerebrospinal fluid; *HIE,* hypoxic ischemic encephalopathy; *HSV,* herpes simplex virus; *LP,* lumbar puncture; *PCR,* polymerase chain reaction; *TORCH,* Toxoplasma gondii, other viruses, rubella, cytomegalovirus, and herpes simplex. (From Swaiman KF: *Swaiman's pediatric neurology: principles and practice,* ed 6, Philadelphia, 2017, Elsevier.)



*If the infant has acute symptomatic seizures, select from these options, based on comorbidities and seizure severity. If the newborn has epilepsy (e.g, lissencephaly, tuberous sclerosis), consider levetiracetam, topiramate, or oxcarbazepine as second- or third-line treatments.

FIG. 148 Suggested treatment algorithm for neonatal seizures. The rapidity of medication administration will depend on local guidelines and resources. Frequent assessment of treatment response is recommended. (From Swaiman KF: *Swaiman's pediatric neurology: principles and practice*, ed 6, Philadelphia, 2017, Elsevier.)

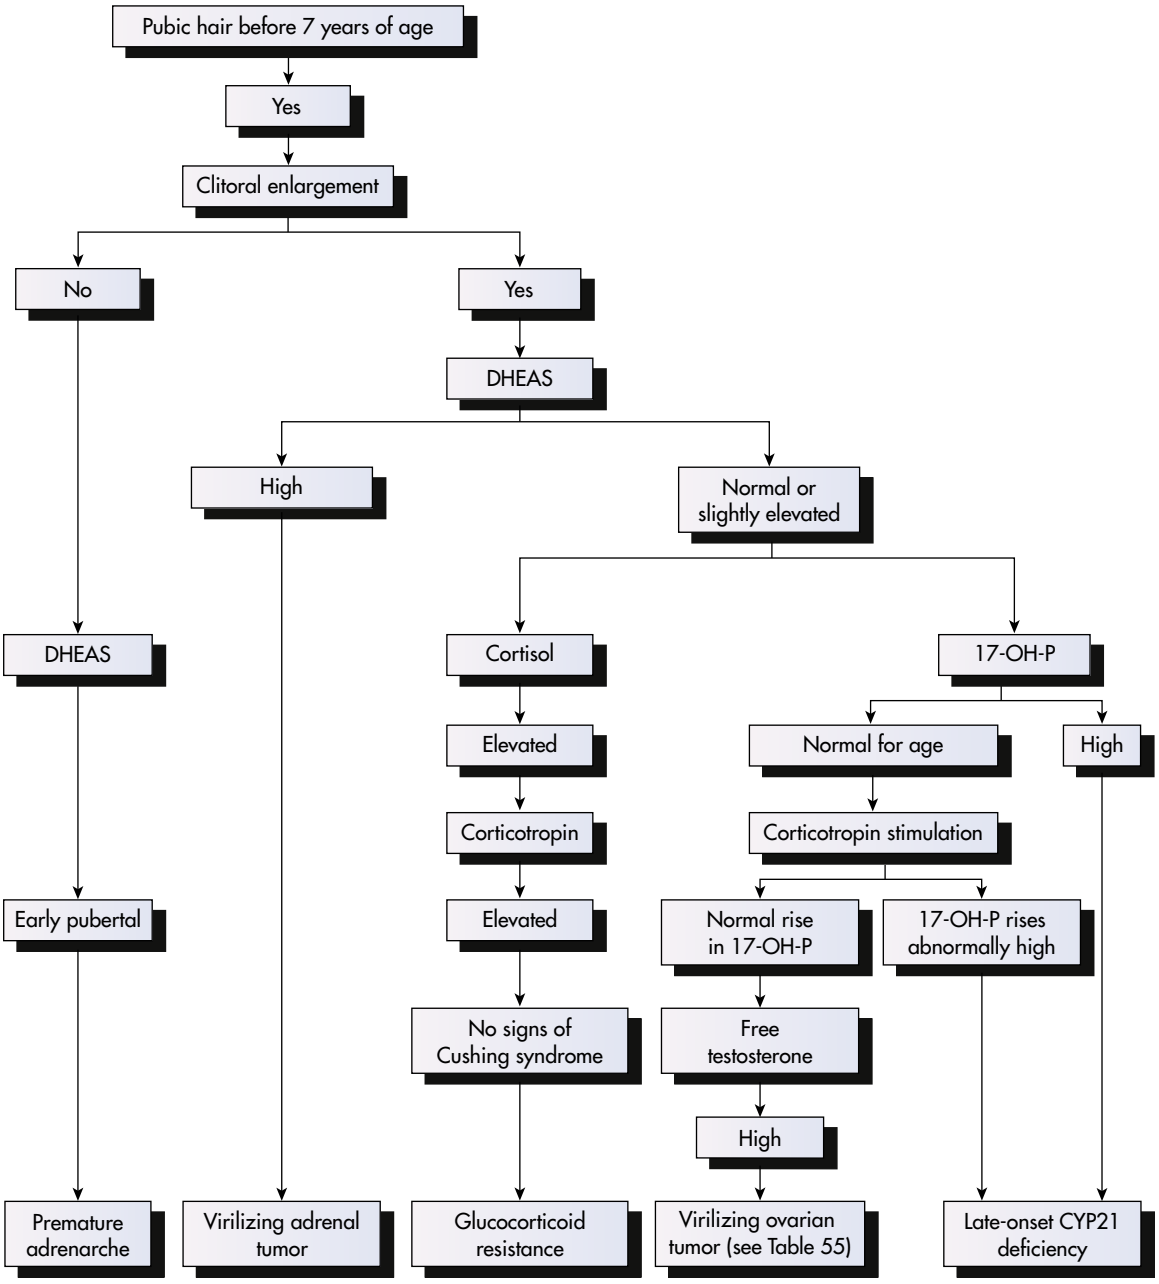
(From Melmed S et al: *Williams textbook of endocrinology,* ed 13, Philadelphia, 2016, Elsevier.)

ICD-10CM # E30.1 Precocious puberty
E30.8 Other disorders of puberty



Note: For more information on this topic, see Section I: Precocious Puberty.

FIG. 150 Flow chart for the evaluation of pubic hair in normal phenotypic girls before 7 years. *DHEAS,* Dehydroepiandrosterone sulfate; *17-OH-P,* 17-hydroxyprogesterone. (From Melmed S et al: *Williams textbook of endocrinology,* ed 13, Philadelphia, 2016, Elsevier.)

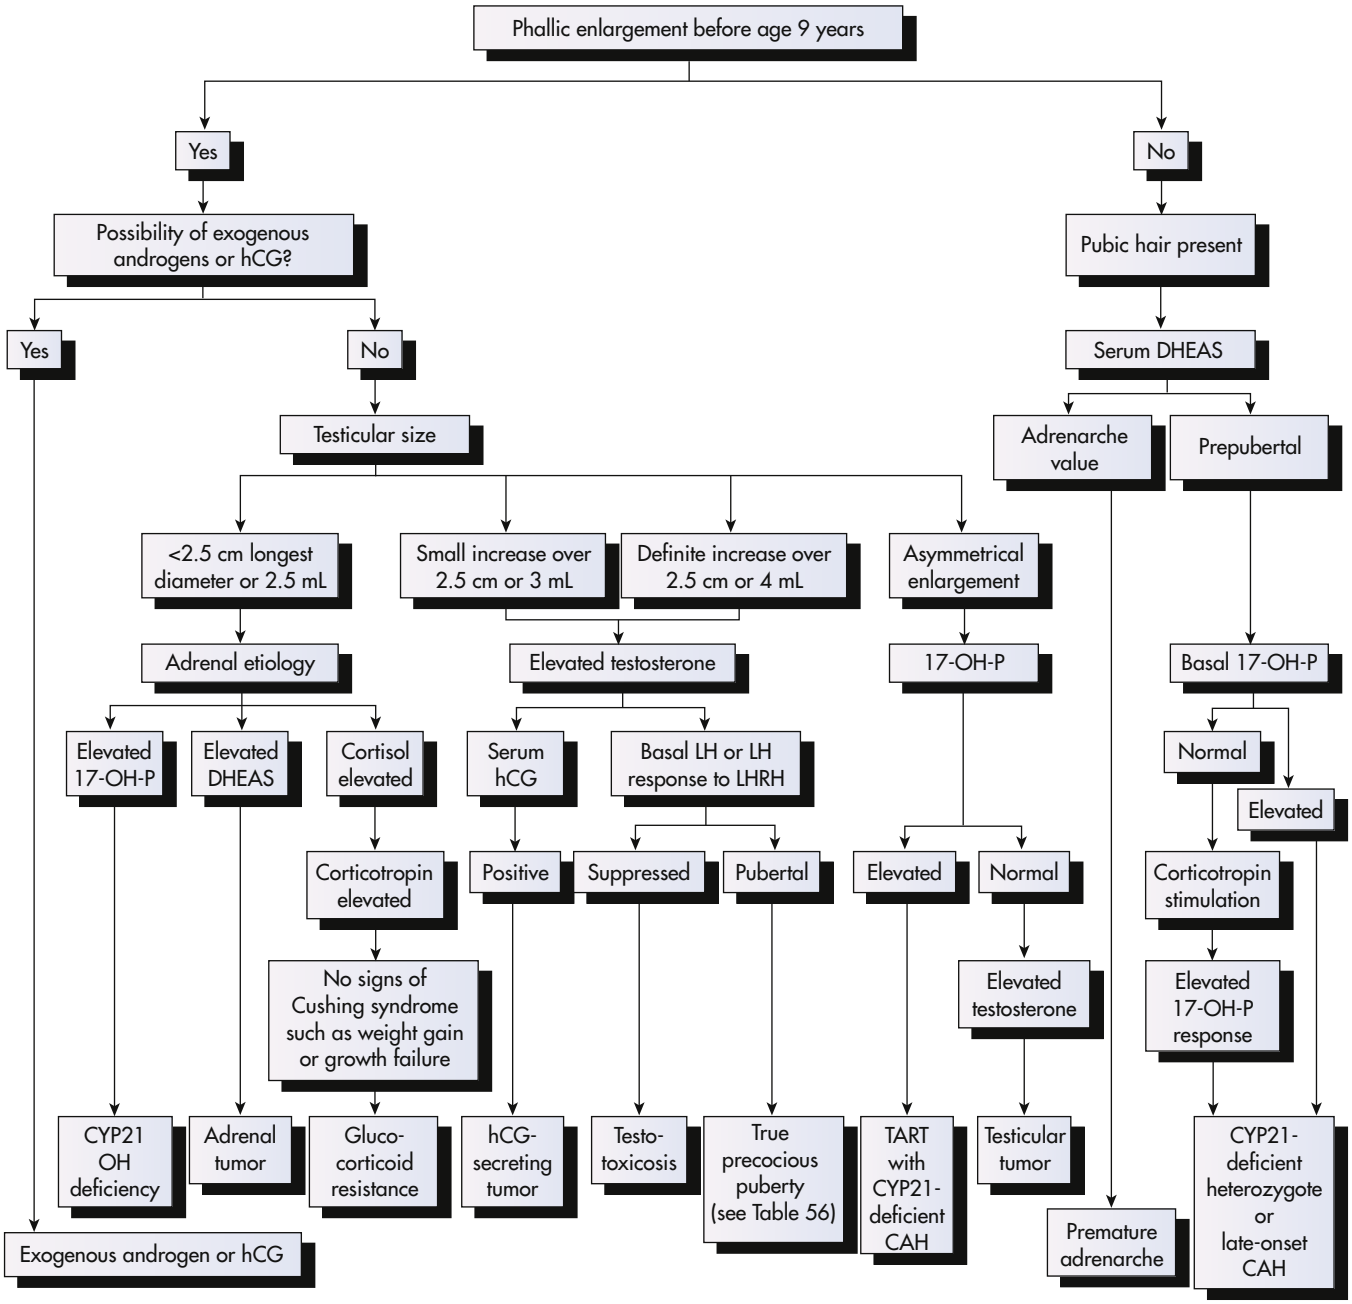
TABLE 55 Differential Diagnosis of Sexual Precocity

	Plasma Gonadotropins	LH Response to LHRH	Serum Sex Steroid Concentration	Gonadal Size	Miscellaneous
In Both Sexes					
McCune-Albright syndrome	Suppressed	Suppressed	Sex steroids pubertal or higher	Ovarian (on ultrasound); slight testicular enlargement	Skeletal survey for polyostotic fibrous dysplasia and skin examination for café-au-lait spots
Primary hypothyroidism	LH prepubertal; FSH may be slightly elevated	Prepubertal FSH may be increased	Estradiol may be pubertal	Testicular enlargement; ovaries cystic	TSH and prolactin elevated; T_4 low
Females					
Granulosa cell tumor (follicular cysts may present similarly)	Suppressed	Prepubertal LH response	Very high estradiol	Ovarian enlargement on physical examination, CT, or ultrasonography	Tumor often palpable on abdominal examination
Follicular cyst	Suppressed	Prepubertal LH response	Prepubertal to very high estradiol	Ovarian enlargement on physical examination, CT, or ultrasonography	Single or recurrent episodes of menses and/or breast development; exclude McCune-Albright syndrome
Feminizing adrenal tumor	Suppressed	Prepubertal LH response	High estradiol and DHEAS values	Ovaries prepubertal	Unilateral adrenal mass
Premature thelarche	Prepubertal	Prepubertal LH, pubertal estradiol response	Prepubertal or early	Ovaries prepubertal	Onset usually before 3 yrs of age
Premature adrenarche	Prepubertal	Prepubertal LH response	Prepubertal estradiol; DHEAS or urinary 17-ketosteroid values appropriate for pubic hair stage 2	Ovaries prepubertal	Onset usually after 6 yrs of age; more frequent in brain-injured children
Late-onset virilizing congenital adrenal hyperplasia	Prepubertal	Prepubertal LH response	Elevated 17-OHP in basal or corticotropin-stimulated state	Ovaries prepubertal	Autosomal recessive

CNS, Central nervous system; *CT,* computed tomography; *DHEAS,* dehydroepiandrosterone sulfate; *FSH,* follicle-stimulating hormone; *LH,* luteinizing hormone; *17-OHP,* 17-hydroxy progesterone; T_4, thyroxine; *TSH,* thyrotropin.

From Larsen PR et al [eds]: *Williams textbook of endocrinology,* ed 11, Philadelphia, 2008, Saunders.

ICD-10CM # E30.1 Precocious puberty
E30.8 Other disorders of puberty



Note: For more information on this topic, see Section I: Precocious Puberty.

FIG. 151 Flow chart for diagnosing sexual precocity in a phenotypic male. *CAH,* Congenital adrenal hyperplasia; *DHEAS,* dehydroepiandrosterone sulfate; *hCG,* human chorionic gonadotropin; *LH,* luteinizing hormone; *LHRH,* LH-releasing hormone; *17-OH-P,* 17-hydroxyprogesterone; *TART,* testicular adrenal rest tissue. (From Melmed S et al: *Williams textbook of endocrinology,* ed 13, Philadelphia, 2016, Elsevier.)

TABLE 56 Causes of Male Sexual Precocity

	Plasma Gonadotropins	LH Response to LHRH	Serum Sex Steroid Concentration	Gonadal Size	Miscellaneous
True Precocious Puberty (premature reactivation of LHRH pulse generator)	Prominent LH pulses, initially during sleep	Pubertal LH response	Pubertal values of testosterone or estradiol	Normal pubertal testicular enlargement or ovarian and uterine enlargement (by ultrasonography)	MRI of brain to rule out CNS tumor or other abnormality; skeletal survey for McCune-Albright syndrome
Incomplete Sexual Precocity (pituitary gonadotropin-independent)					
Males					
Chorionic gonadotropin-secreting tumor in males	High hCG, low LH	Prepubertal LH response	Pubertal value of testosterone	Slight to moderate uniform enlargement of testes	Hepatomegaly suggests hepatoblastoma; CT scan of brain if chorionic gonadotropin-secreting CNS tumor suspected
Leydig cell tumor in males	Suppressed	No LH response	Very high testosterone	Irregular asymmetrical enlargement of testes	
Familial testotoxicosis	Suppressed	No LH response	Pubertal values of testosterone	Testes symmetrical and larger than 2.5 cm but smaller than expected for pubertal development; spermatogenesis occurs	Familial; probably sex-limited, autosomal dominant trait
Virilizing congenital adrenal hyperplasia	Prepubertal	Prepubertal LH response	Elevated 17-OHP in CYP21 deficiency or elevated 11-deoxycortisol in CYP11B1 deficiency	Testes prepubertal	Autosomal recessive, may be congenital or late-onset form, may have salt loss in CYP21 deficiency or hypertension in CYP11B1 deficiency
Virilizing adrenal tumor	Prepubertal	Prepubertal LH response	High DHEAS and androstenedione values	Testes prepubertal	CT, MRI, or ultrasonography of abdomen
Premature adrenarche	Prepubertal	Prepubertal LH response	Prepubertal testosterone, DHEAS, or urinary 17-ketosteroid values appropriate for pubic hair stage 2	Testes prepubertal	Onset usually after 6 yrs of age; more frequent in CNS-injured children
In Both Sexes					
McCune-Albright syndrome	Suppressed	Suppressed	Sex steroids pubertal or higher	Ovarian (on ultrasound); slight testicular enlargement	Skeletal survey for polyostotic fibrous dysplasia and skin examination for café-au-lait spots
Primary hypothyroidism	LH prepubertal; FSH may be slightly elevated	Prepubertal FSH may be increased	Estradiol may be pubertal	Testicular enlargement; ovaries cystic	TSH and prolactin elevated; T_4 low

17-OHP, 17-Hydroxyprogesterone; *CNS,* central nervous system; *CT,* computed tomography; *DHEAS,* dehydroepiandrosterone sulfate; *hCG,* human chorionic gonadotropin; *LH,* luteinizing hormone; *LHRH,* luteinizing hormone-releasing hormone; *MRI,* magnetic resonance imaging; T_4, thyroxine; *TSH,* thyrotropin.

From Larsen PR et al [eds]: *Williams textbook of endocrinology,* ed 11, Philadelphia, 2008, Saunders.

ICD-10CM # R57.9 Shock, unspecified
R57.0 Cardiogenic shock
R57.1 Hypovolemic shock
R57.8 Other shock

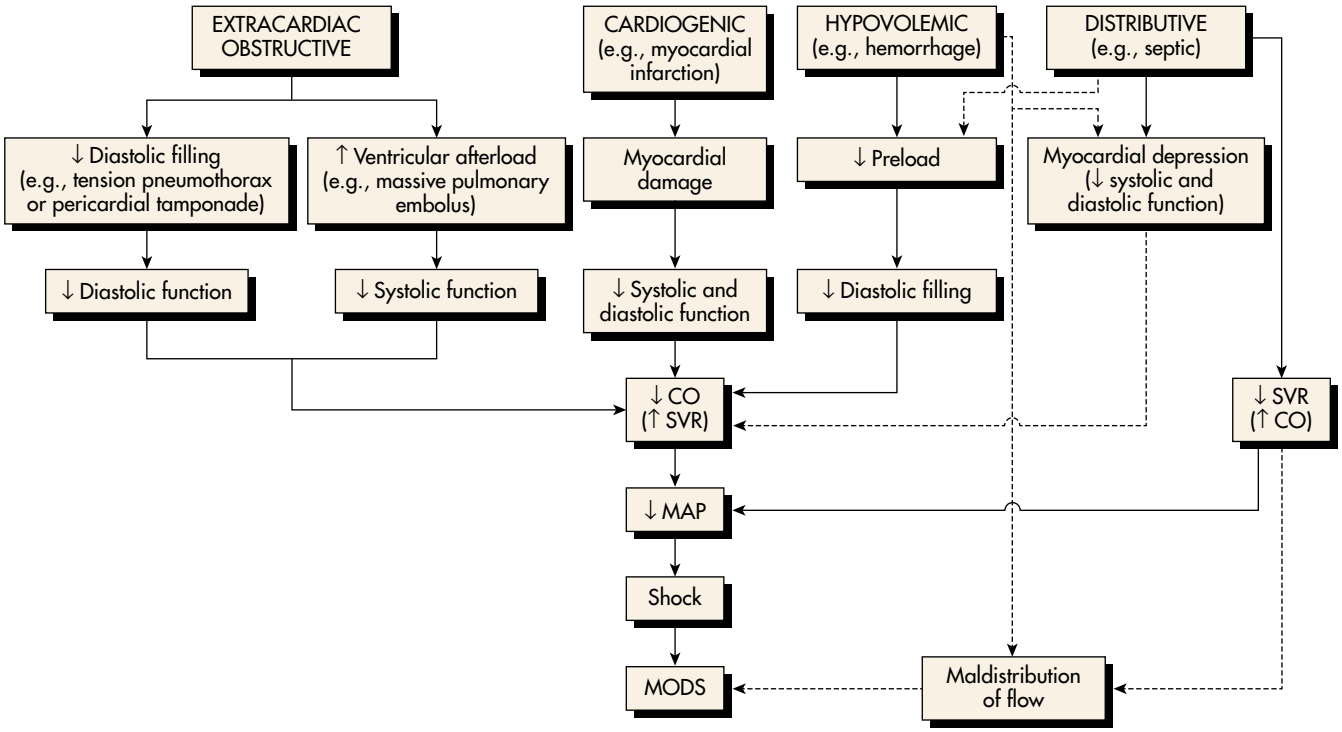


FIG. 152 The interrelationships between different forms of shock. For cardiogenic, hypovolemic, and obstructive shock, hypotension is primarily due to decreased cardiac output with systemic vascular resistance rising secondarily. With distributive (and particularly, septic) shock, hypotension is primarily due to a decrease in systemic vascular resistance with a secondary increase of cardiac output. In many forms of shock, the hemodynamic characteristics are influenced by elements of hypovolemia, myocardial depression (ischemic or otherwise), and vascular dysfunction (which may affect afterload). Dominant pathophysiologic pathways are denoted by *heavier lines. CO,* Cardiac output; *MAP,* mean arterial blood pressure; *MODS,* multiple organ dysfunction syndrome; *SVR,* systemic vascular resistance. (From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.)

BOX 17 Determinants of Effective Tissue Perfusion in Shock

1. Cardiovascular performance (total systemic perfusion/cardiac output)
   - Cardiac function
     - Preload
     - Afterload
     - Contractility
     - Heart rate
   - Venous return
     - Right atrial pressure (dependent on cardiac function)
     - Mean circulatory pressure
     - Stressed vascular volume
     - Mean vascular compliance
     - Venous vascular resistance
     - Distribution of blood flow
2. Distribution of cardiac output
   - Intrinsic regulatory systems (local tissue factors)
   - Extrinsic regulatory systems (sympathetic/adrenal activity)
   - Anatomic vascular disease
   - Exogenous vasoactive agents (inotropes, vasopressors, vasodilators)
3. Microvascular function
   - Precapillary and postcapillary sphincter function
   - Capillary endothelial integrity
   - Microvascular obstruction (fibrin, platelets, WBC, RBC)
4. Local oxygen unloading and diffusion
   - Oxyhemoglobin affinity
   - RBC 2,3-DPG
   - Blood pH
   - Temperature
5. Cellular energy generation/utilization capability
   - Citric acid (Kreb) cycle
   - Oxidative phosphorylation pathway
   - Other energy metabolism pathways (e.g., ATP utilization)

2,3-DPG, 2,3-Diphosphoglycerate; *ATP,* adenosine triphosphate; *RBC,* red blood cell; *WBC,* white blood cell.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.

BOX 18 Classification of Shock

1. Hypovolemic (Oligemic)
   - Hemorrhagic
     - Trauma
     - Gastrointestinal
     - Retroperitoneal
   - Intravascular fluid depletion (nonhemorrhagic)
     - External fluid loss
       - Dehydration
       - Vomiting
       - Diarrhea
       - Polyurea
     - Interstitial fluid redistribution
       - Thermal injury
       - Trauma
       - Anaphylaxis
     - Increased vascular capacitance (venodilation)
       - Sepsis
       - Anaphylaxis
       - Toxins/Drugs
2. Cardiogenic
   - Myopathic
     - Myocardial infarction
       - Left ventricle
       - Right ventricle
     - Myocardial contusion (trauma)
     - Myocarditis
     - Cardiomyopathy
     - Postischemic myocardial stunning
     - Septic myocardial depression
     - Drug toxicity
       - Anthracycline cardiotoxicity
       - Calcium channel blockers
     - Mechanical
       - Valvular failure (stenotic or regurgitant)
       - Hypertropic cardiomyopathy
       - Ventricular septal defect
     - Arrhythmic
       - Bradycardia
       - Sinus (e.g., vagal syncope)
       - Atrioventricular blocks
       - Tachycardia
       - Supraventricular
       - Ventricular
3. Extracardiac Obstructive
   - Impaired diastolic filling (decreased ventricular preload)
     - Direct venous obstruction (vena cava)
       - Intrathoracic obstructive tumors
     - Increased intrathoracic pressure (decreased transmural pressure gradient)
       - Tension pneumothorax
       - Mechanical ventilation (with positive end-expiratory pressure [PEEP] or volume depletion)
     - Decreased cardiac compliance
       - Constrictive pericarditis
       - Cardiac tamponade
         - Acute
           - Post MI free wall rupture
           - Traumatic
           - Hemorrhagic (anticoagulation)
         - Chronic
           - Malignant
           - Uremic
           - Idiopathic
     - Impaired systolic contraction (increased ventricular afterload)
       - Right ventricle
         - Pulmonary embolus (massive)
         - Acute pulmonary hypertension
       - Left ventricle
         - Saddle embolus
         - Aortic dissection
4. Distributive
   - Septic (bacterial, fungal, viral, rickettsial)
   - Toxic shock syndrome
   - Anaphylactic, anaphylactoid
   - Neurogenic (spinal shock)
   - Endocrinologic
     - Adrenal crisis
     - Thyroid storm
   - Toxic (e.g., nitroprusside, bretylium)

From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.

ICD-10CM # R57.9 Shock, unspecified
R57.0 Cardiogenic shock
R57.1 Hypovolemic shock
R57.8 Other shock

BOX 19 Cardiovascular/Metabolic Compensatory Responses to Shock

1. Maintain mean circulatory pressure (venous pressure)
   - Volume
     - Fluid redistribution to vascular space (increased total vascular volume) from interstitium (Starling effect) from intracellular space (osmotic)
     - Decreased renal fluid losses
     - Decreased glomerular filtration rate
     - Increased aldosterone
     - Increased vasopressin
   - Pressure
     - Decreased venous capacitance (increased stressed volume) increased sympathetic activity
     - Increased circulating (adrenal) epinephrine
     - Increased angiotensin
     - Increased vasopressin
2. Maximize cardiac performance
   - Increase contractility
   - Sympathetic stimulation
   - Adrenal stimulation
3. Redistribute perfusion
   - Extrinsic regulation of systemic arterial tone
   - Dominant autoregulation of vital organs (heart, brain)
4. Optimize oxygen unloading
   - Increased RBC 2,3-DPG
   - Tissue acidosis
   - Pyrexia
   - Decreased tissue Po_2

2,3-DPG, 2,3-Diphosphoglycerate; *Po_2,* partial pressure of oxygen.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.

BOX 20 General Approach to Shock: Immediate Goals

General
- Find cause of shock and apply specific treatment (examples: antibiotics for sepsis or pericardiocentesis for tamponade)

Hemodynamic
- MAP >65 mm Hg (higher in the presence of coronary artery disease or chronic hypertension)
- CVP = 8-12 mm Hg/PAOP = 12-15 mm Hg (may be higher for cardiogenic shock)[a]
- CI >2.1 L/min per m^2[a]

Optimization of oxygen delivery
- Hemoglobin >7-9 g/dl; >7 g/L after shock is sufficient
- Arterial saturation >92%
- Mvo_2 >60%, $scvO_2$ >70%
- Normalization of serum lactate (to <2.2 mM/L)

Reverse organ system dysfunction
- Reverse encephalopathy
- Maintain urine output >0.5 ml/kg per hour

CI, Cardiac index; *CVP,* central venous pressure; *MAP,* mean arterial pressure; *Mvo_2,* mixed venous oxygen saturation; *PAOP,* pulmonary artery occlusion pressure.
[a]Optional.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.

TABLE 57 Organ System Dysfunction in Shock

Central nervous system	Encephalopathy (ischemic or septic)
	Cortical necrosis
Heart	Tachycardia, bradycardia
	Supraventricular tachycardia
	Ventricular ectopy
	Myocardial ischemia
	Myocardial depression
Pulmonary system	Acute respiratory failure
	Acute respiratory distress syndrome
Kidney	Prerenal failure
	Acute tubular necrosis
Gastrointestinal system	Ileus
	Erosive gastritis
	Pancreatitis
	Acalculous cholecystitis
	Colonic submucosal hemorrhage
	Transluminal translocation of bacteria/antigens
Liver	Ischemic hepatitis
	"Shock" liver
	Intrahepatic cholestasis
Hematologic system	Disseminated intravascular coagulation
	Dilutional thrombocytopenia
Metabolic	Hyperglycemia
	Glycogenolysis
	Gluconeogenesis
	Hypoglycemia (late)
	Hypertriglyceridemia
Immune system	Gut barrier function depression
	Cellular immune depression
	Humoral immune depression

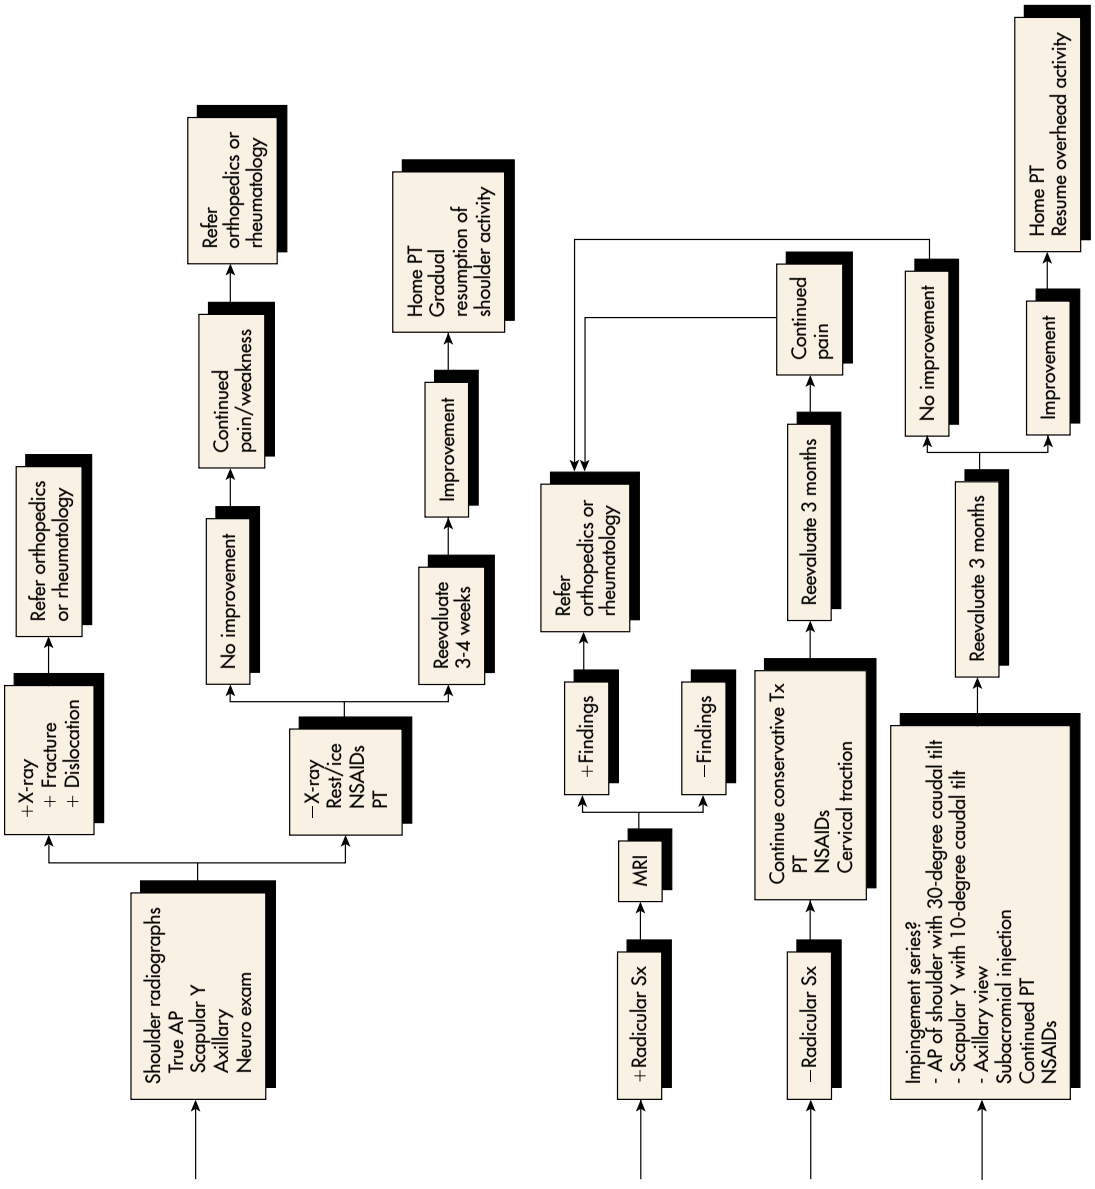

FIG. E154 (Continued)

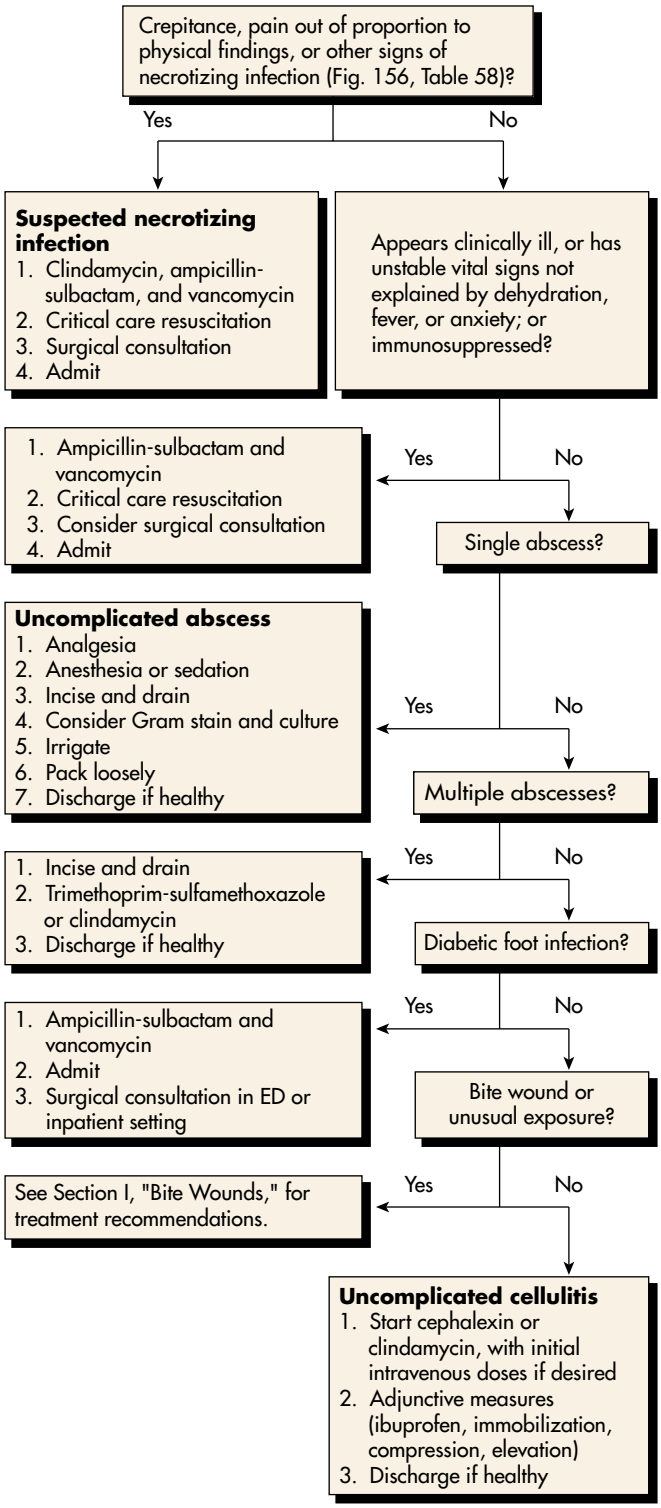

FIG. 155 Universal algorithm for skin and soft tissue infections (assuming no prior treatment).
(From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

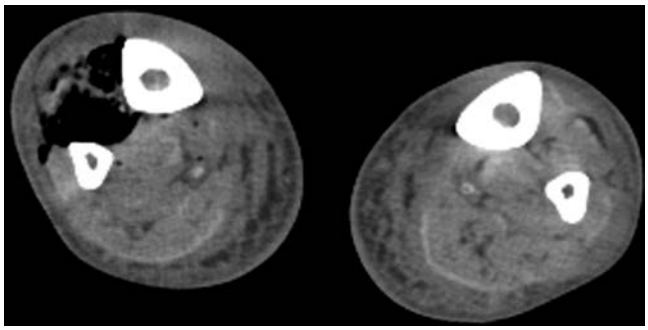

FIG. 156 Necrotizing fasciitis. Axial computed tomography through the lower extremities demonstrates gas in the anterior soft tissues. Necrotizing fasciitis is a clinical diagnosis. Imaging may lead to a delay in treatment. (From Webb WR, Brandt WE, Major NM: *Fundamentals of body CT,* ed 4, Philadelphia, 2015, Elsevier.)

TABLE 58 Differentiating Features of Necrotizing Skin and Soft Tissue Infections

Feature	Progressive Bacterial Synergistic Gangrene	Nonclostridial Anaerobic Cellulitis	Clostridial Myonecrosis (Gas Gangrene)	Necrotizing Fasciitis Type 1	Necrotizing Fasciitis Type 2
Risk factors	Surgery, ileostomy, colostomy, chronic ulceration	Diabetes mellitus	Trauma, surgery	Diabetes mellitus, surgery, perineal infection	Trauma, surgery, none
Microbiology	Microaerophilic streptococci plus *Staphylococcus aureus*	Non–spore-forming anaerobes ± coliforms, streptococci, *S. aureus*	*Clostridium* spp.	Polymicrobial (Enterobacteriaceae plus anaerobes)	Group A streptococci
Course	Slow	Slow or rapid	Very rapid	Rapid	Very rapid
Pain	++++	++/+++	++++	+++/++++	++++
Gas formation	–	++++	++	++	–
Appearance	Central necrotic ulcer, erythematous periphery	Erythematous skin necrosis	Bullae, necrosis	Bullae, skin	Bullae, necrotic skin and tissue
Drainage	Purulent if present	Purulent	Serosanguineous	"Dishwater," seropurulent	Serous if present
Depth of involvement	Skin, soft tissue	Skin, soft tissue	Muscle	Fascia	Fascia
Systemic toxicity	±	+++/++++	++++	+++/++++	++++

–, Absent; ±, occasionally present; +, minimal; ++, mild; +++, moderate; ++++, marked or severe.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 5, Philadelphia, 2019, Elsevier.

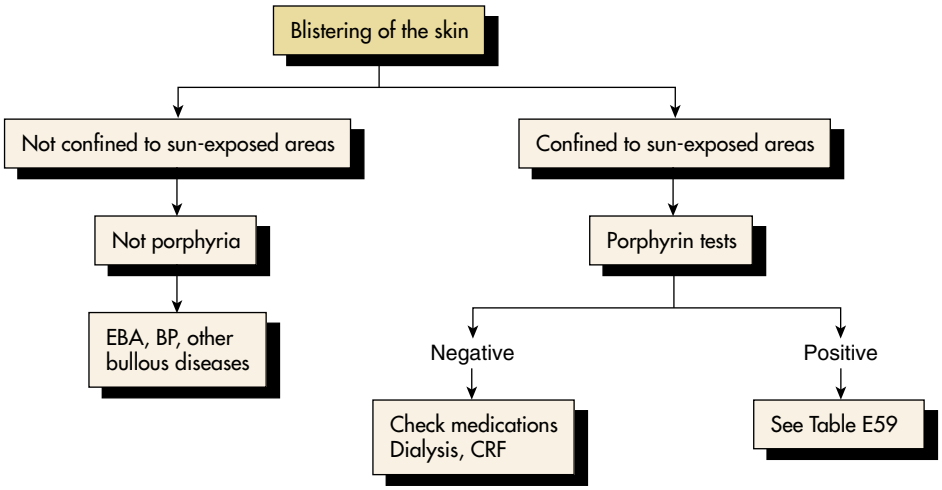

FIG. E157 An approach to the patient with blistering of the skin. *BP,* Bullous pemphigoid; *CRF,* chronic renal failure; *EBA,* epidermolysis bullosa acquisita. (From Bolognia JL et al [eds]: *Dermatology,* ed 2, St Louis, 2008, Mosby.)

TABLE E59 Investigative Tests Used in the Diagnosis of Porphyria

Porphyria	Enzyme	Urine	Stool	Plasma	RBC
Porphyria cutanea tarda	Uroporphyrinogen decarboxylase	URO+ + + COPRO+ 7COOH III>I	ISO-COPRO+ +7COOH	+	–
Erythropoietic protoporphyria	Ferrochelatase	Normal	PROTO+	+	free PROTO+ +
Congenital erythropoietic porphyria	Uroporphyrinogen III synthase	URO I+COPRO I++	COPRO I+	+	URO I+COPRO I+PROTO+
Acute intermittent porphyria	Porphobilinogen deaminase	*ALA+ + +*PBG+ + +	*ALA+*PBG+	–	–
Variegate porphyria	Protoporphyrinogen oxidase	*ALA+ +*PBG+ +URO+COPRO+ +	COPRO+PROTO+ +PORPH X+ + +	625-627 nm peak	–
Hereditary coproporphyria	Coproporphyrinogen oxidase	*ALA+ +*PBG+ +COPRO+ +URO+	COPRO+	+	–
Aminolevulinic acid (ALA) dehydratase-deficient porphyria	ALA dehydratase	ALA+ + +COPRO III	–	–	Zn PROTO+
Hepatoerythropoietic porphyria	Uroporphyrinogen decarboxylase	URO+ + +COPRO+7COOH III>I	ISO-COPRO+ +7COOH	+	Zn and free PROTO+ +
Tyrosinemia	ALA dehydratase	ALA	–	–	–
Iron deficiency	Ferrochelatase	–	–	–	Zn PROTO+ +
Lead poisoning	ALA dehydratase Coproporphyrinogen oxidase Ferrochelatase	ALA+ + +COPRO±	–	–	Zn PROTO+

COPRO, Coproporphyrin; *ISO-COPRO,* isocoproporphyrin; *PBG,* porphobilinogen; *PROTO,* protoporphyrin; *RBC,* red blood cells; *URO,* uroporphyrin; +, positive; –, negative; *, during acute attack. From Bolognia JL et al (eds): *Dermatology,* ed 2, St Louis, 2008, Mosby.

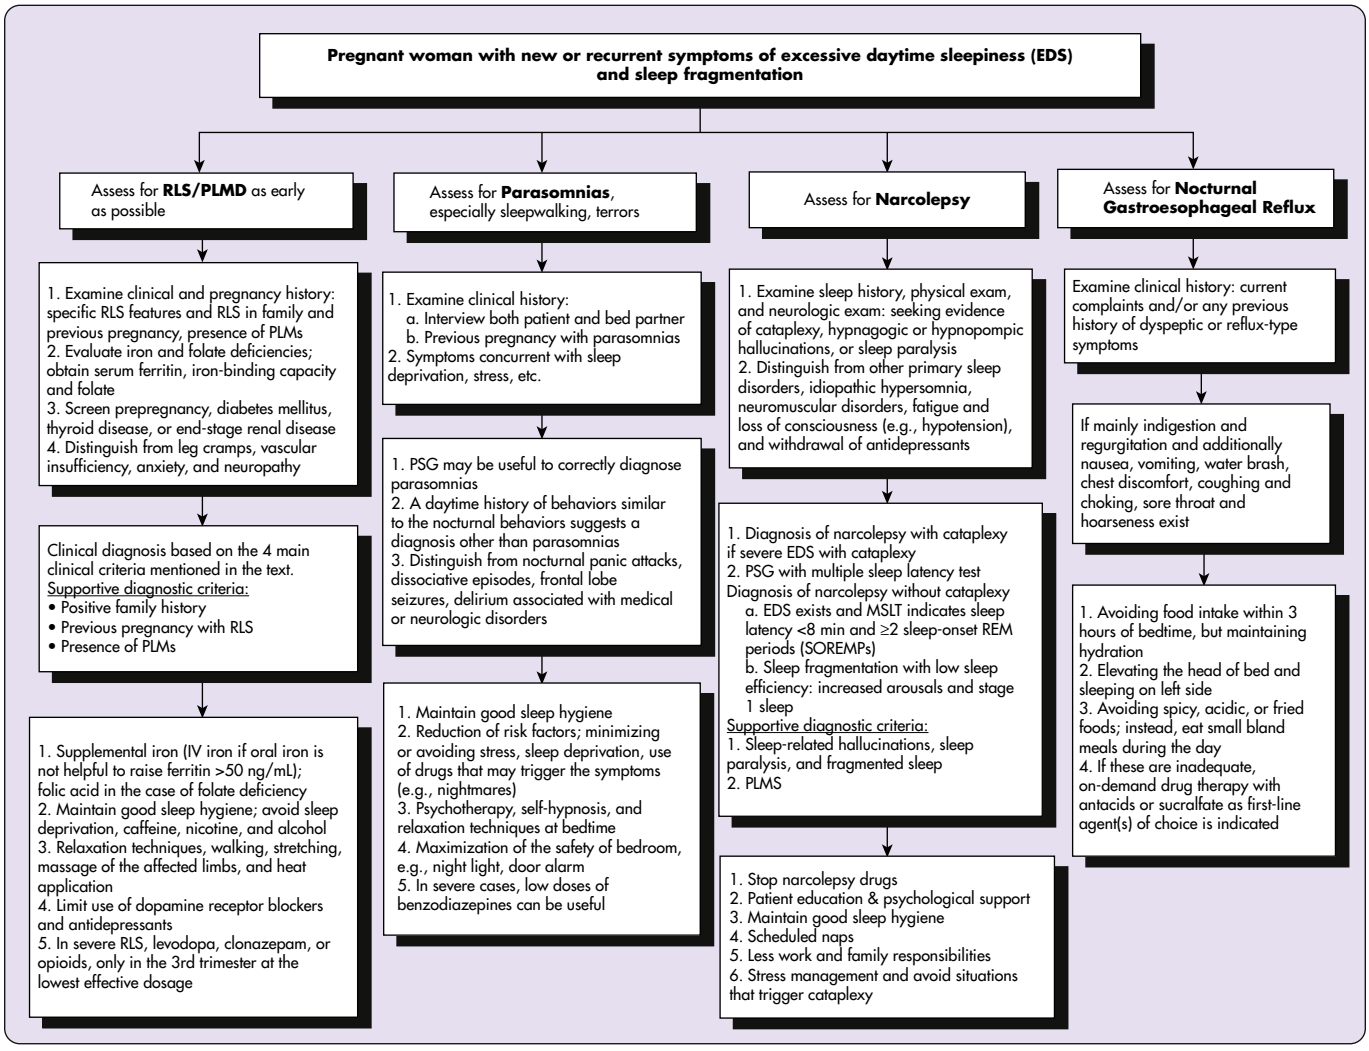

FIG. 158 Management and treatment of sleep-related disorders. *IV,* Intravenous; *MSLT,* Multiple Sleep Latency Test; *PLMs,* periodic leg movements; *PLMD,* periodic leg movement disorder; *PSG,* polysomnography; *REM,* rapid eye movement; *RLS,* restless legs syndrome; *SOREMP,* sleep-onset rapid eye movement sleep period. (From Kryger M, Roth T, Dement WC: *Principles and practice of sleep medicine,* ed 6, Philadelphia, 2017, Elsevier.)

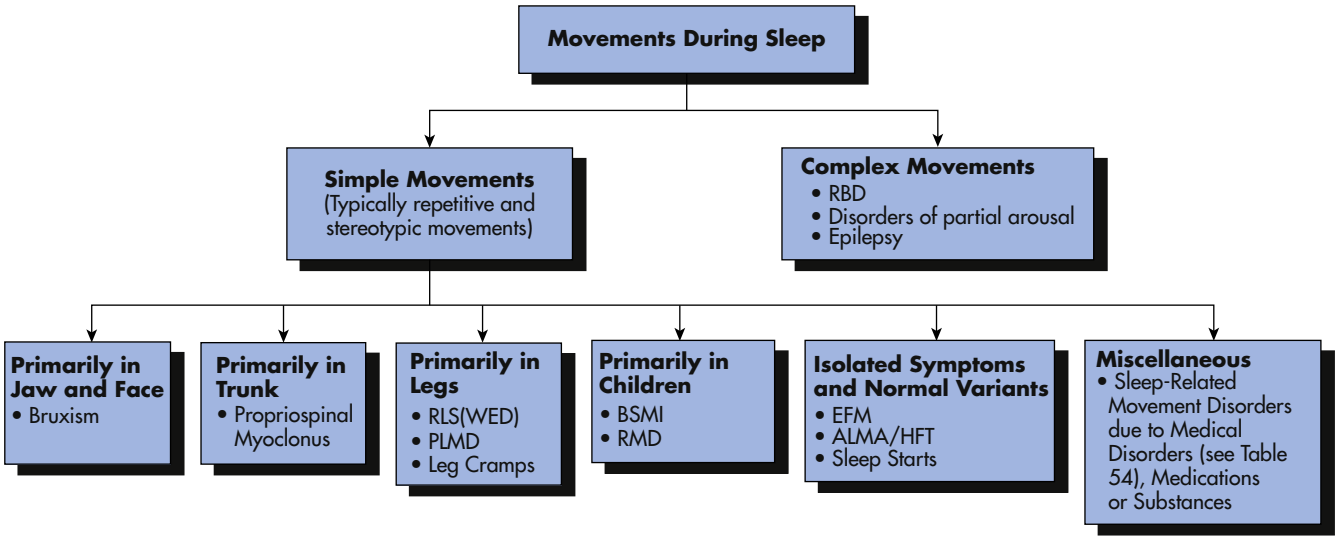

FIG. 159 Flow chart for the approach to the differential diagnosis of sleep-related movement disorders. *ALMA,* Alternating leg muscle activation; *BSMI,* benign sleep myoclonus of infancy; *EFM,* excessive fragmentary myoclonus; *HFT,* hypnagogic foot tremor; *PLMD,* periodic limb movement disorder; *RBD,* rapid eye movement (REM) sleep behavior disorder; *RLS (WED),* restless legs syndrome (Willis-Ekbom disease); *RMD,* rhythmic movement disorder. (From Kryger M, Roth T, Dement WC: *Principles and practice of sleep medicine,* ed 6, Philadelphia, 2017, Elsevier.)

TABLE 60 Distinguishing Features of Nocturnal Events

Feature	Disorders of Arousal	Sleep-Related Eating Disorder	REM Behavior Disorder	Recurrent Isolated Sleep Paralysis	Exploding Head Syndrome	Psychogenic Events	Nocturnal Seizures
Behavior	Confused; semi-purposeful movement with eyes open	Eating typically high-calorie foods; eyes open	Sometimes combative with eyes closed	Episodes of inability to move	Painless sensation of explosion inside the head	Variable	Dependent on the portion of brain involved
Age of onset	Childhood and adolescence	Variable	Older adult	Variable	Adult	Adolescence to adulthood	Variable
Time of occurrence	First third of night	First half of night	During REM	Typically on awakening	Usually near sleep onset but can be variable	Anytime	Anytime
Frequency of events	Less than one per night	Variable	Multiple per night	Variable less than weekly	Rare	Variable	Frontal seizures—multiple per night
Duration	Minutes	Minutes	Seconds to minute	Seconds to minutes	Seconds	Variable minutes or longer	Usually under 3 minutes
Memory of event	Usually none	Usually none or limited	Dream recall	Yes	Yes	None	Usually none
Stereotypical movements	No	No	No	No	Similar sensation	No	Yes
Polysomnogram findings	Arousals from slow wave sleep	Arousal from NREM sleep	Excessive electromyogram tone during REM sleep	Arousal from REM sleep	Usually occurs in light sleep	Occur from awake state	Potentially epileptiform activity

REM, Rapid eye movement; *NREM,* non-rapid eye movement.
From Kryger M, Roth T, Dement WC: *Principles and practice of sleep medicine,* ed 6, Philadelphia, 2017, Elsevier.

ICD-10CM # J02.9 Acute pharyngitis, unspecified
J31.2 Chronic pharyngitis
J02.0 Streptococcal pharyngitis

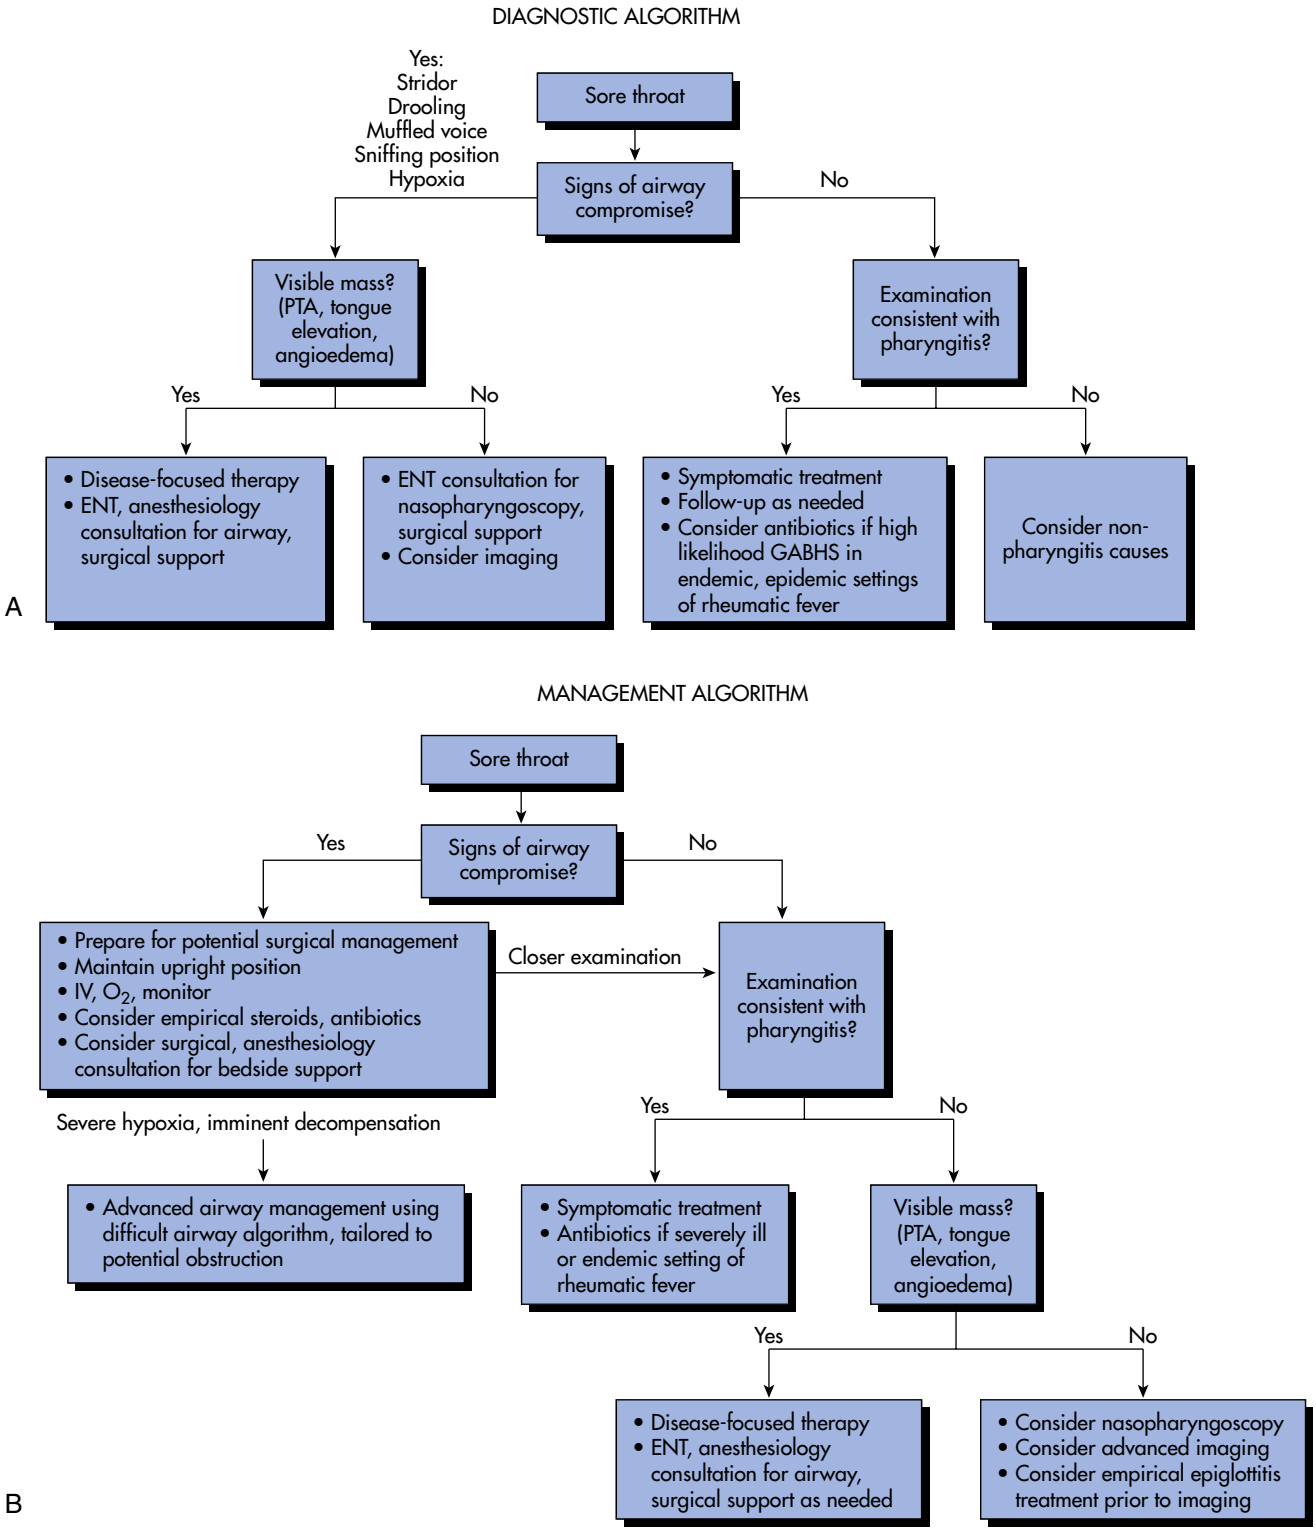

FIG. 160 Clinical approach to the patient with sore throat—diagnosis (A) and management (B). Refer to Section I topics Pharyngitis/Tonsillitis and Epiglottitis for additional information. *ENT,* Ear-nose-throat; *GABHS,* group A beta-hemolytic streptococcus; *IV,* intravenous; *PTA,* peritonsillar abscess. (From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

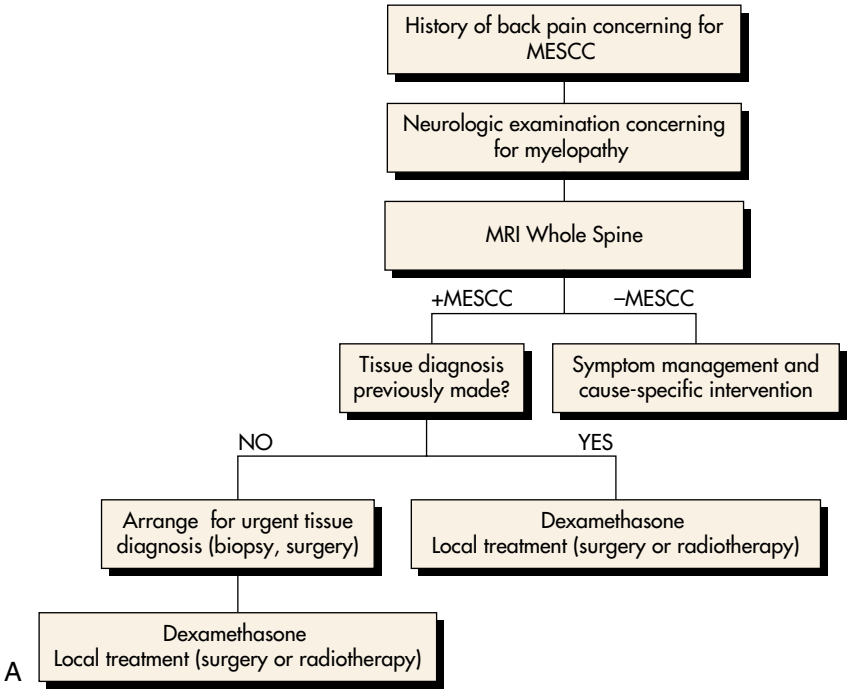
ICD-10CM # J02.9 Acute pharyngitis, unspecified
J31.2 Chronic pharyngitis
J02.0 Streptococcal pharyngitis

TABLE 61 Differential Diagnosis of Sore Throat

Type of Pharyngitis	Nature of Patient	Nature of Symptoms	Predisposing Factors	Physical Findings	Diagnostic Studies
Without Pharyngeal Ulcers					
Viral	All ages	Pain in throat Rapid onset Systemic symptoms	—	Exudate less likely than with streptococcal infections	—
Infectious mononucleosis	Adolescents and young adults Uncommon in elderly	Gradual onset	—	Low-grade temperature Occasional exudate Posterior cervical adenopathy Hepatosplenomegaly	Monospot test
Streptococcal pharyngitis	Patients younger than 25 yrs, especially age 6-12 yrs	Pain in throat Rapid onset Few systemic symptoms	Fall and winter Streptococcal infection in family Diabetes	Marked erythema and throat swelling Temperature >101°F Tender anterior cervical nodes Scarlatiniform rash Tonsillar exudate more likely than with viral infection	Culture Rapid streptococcal antigen screening Increased antistreptolysin O titer
Gonococcal pharyngitis	Most common in male homosexuals and people with anogenital gonorrhea	Often no symptoms	Orogenital sex	—	Culture
Sinusitis with postnasal drip	Adults	Mild throat soreness Symptoms often worse with recumbency	—	Evidence of sinusitis Postnasal drip	CT/flexible rhinoscopy (in recalcitrant cases)
Allergic pharyngitis	—	—	Seasonal allergies	No fever Intermittent postnasal drip Swollen pharynx with minimal injection	Allergy testing
With Pharyngeal Ulcers					
Herpangina	More common in children	Painful ulcers on tonsils, pillars, or uvula	Immunosuppression Summer and autumn	Vesicles 1-2-mm ulcers	Serologic tests
Fusospirochetal infection (Vincent angina)	Children and people with poor oral hygiene	Painful ulcers Bleeding gums Foul breath	—	No vesicles Ulcerative gingivitis Gray, necrotic ulcers 2-30-mm ulcers Pseudomembrane	Gram stain: spirochetes
Candidiasis	Children Immunosuppressed patients Those taking antibiotics	—	Immunosuppression Antibiotics Inhaled steroids	3-11-mm ulcers No vesicles	KOH smear: *Candida* culture
Herpes simplex	Most common in children	Not usually a cause of sore throat	Immunosuppression	1-2-mm painful ulcers Vesicles present on lips, gingivae, buccal mucosa, or tongue	Tzanck smear (not very sensitive) viral culture, PCR, herpes simplex virus antibody assay

CT, Computed tomography; *PCR*, polymerase chain reaction.
Modified from Seller RH, Symons AB: *Differential diagnosis of common complaints,* ed 7, Philadelphia, 2018, Elsevier.

Updated workup flowchart



Updated management flowchart

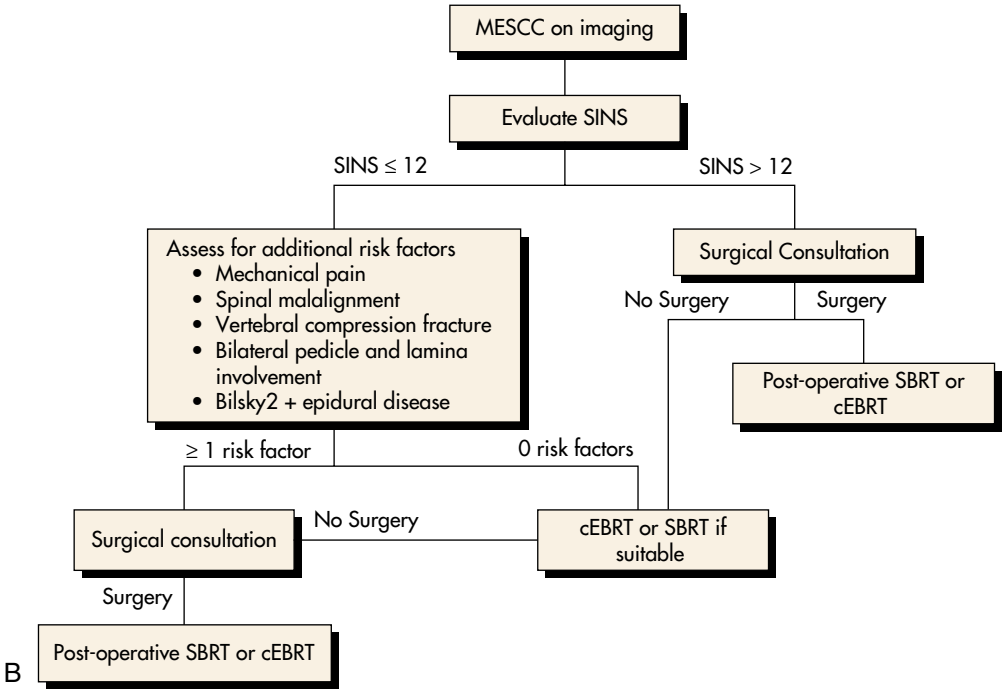


FIG. 161 (A) Flowchart for the initial workup of a patient with suspected spinal metastatic disease. **(B)** Flowchart for the management of metastatic epidural spinal cord compression *(MESCC). cEBRT,* Conventional external beam radiotherapy; *MRI,* magnetic resonance imaging; *SBRT,* stereotactic body radiation therapy; *SINS,* Spine Instability Neoplastic Score. (From Niederhuber JE: *Abeloff's clinical oncology*, ed 6, Philadelphia, 2020, Elsevier.)

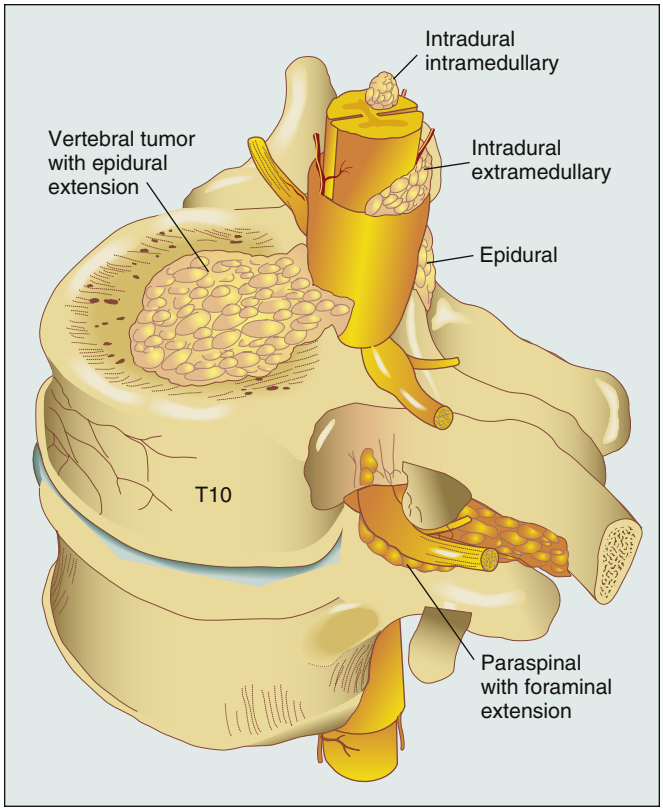

FIG. 162 Locations of metastatic lesions of the spine: vertebral body, epidural space, neural foramen, intradural space, and within the spinal cord itself. (From Niederhuber JE: *Abeloff's clinical oncology*, ed 6, Philadelphia, 2020, Elsevier.)

Element of SINS	Score
Location	
Junctional (occiput-C2, C7–T2, T11–L1, L5–S1)	3
Mobile spine (C3–C6, L2–L4)	2
Semi-rigid (T3–T10)	1
Rigid (S2–S5)	0
Pain relief with recumbency and/or pain with movement/loading of the spine	
Yes	3
No (occasional pain but not mechanical)	1
Pain free lesion	0
Bone lesion	
Lytic	2
Mixed (lytic/blastic)	1
Blastic	0
Radiographic spinal alignment	
Subluxation/translation present	4
De novo deformity (kyphosis/scoliosis)	2
Normal alignment	0
Vertebral body collapse	
>50% collapse	3
<50% collapse	2
No collapse with >50% body involved	1
None of the above	0
Posterolateral involvement of the spinal elements (facet, pedicle or CV joint fracture or replacement with tumor)	
Bilateral	3
Unilateral	1
None of the above	0

FIG. 163 Spinal Instability Neoplastic Score (SINS) elements with axial and sagittal computed tomography (CT) example of an L3 metastasis. In this case, the overall SINS was 11 (2 for location, 3 for pain, 1 for bone lesion, 0 for radiographic spinal alignment, 2 for vertebral body collapse, and 3 for posterolateral involvement of the spinal elements). (From Niederhuber JE: *Abeloff's clinical oncology*, ed 6, Philadelphia, 2020, Elsevier.)

ICD-10CM # S36.00XA Unspecified injury of spleen, initial encounter
S35.32 Injury of splenic vein
S35.3 Injury of portal or splenic vein and branches

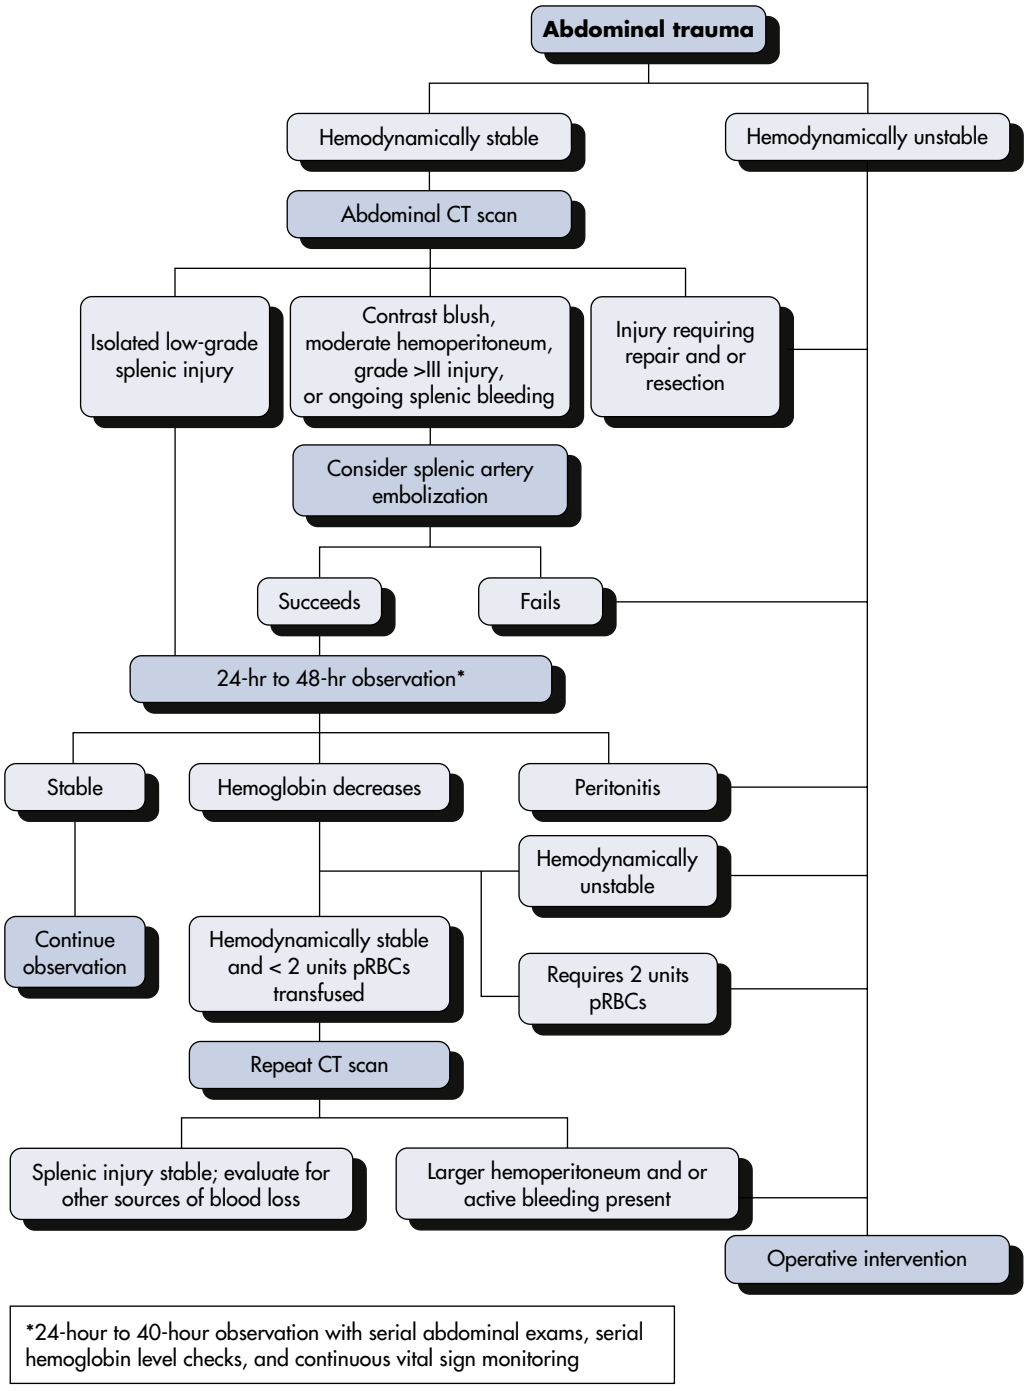

FIG. 164 Algorithmic approach to the management of traumatic splenic injury. *CT,* Computed tomography; *pRBC,* packed red blood cell. (From Cameron JL, Cameron AM: *Current surgical therapy,* ed 12, Philadelphia, 2017, Elsevier.)

ICD-10CM # S36.00XA Unspecified injury of spleen, initial encounter
S35.32 Injury of splenic vein
S35.3 Injury of portal or splenic vein and branches

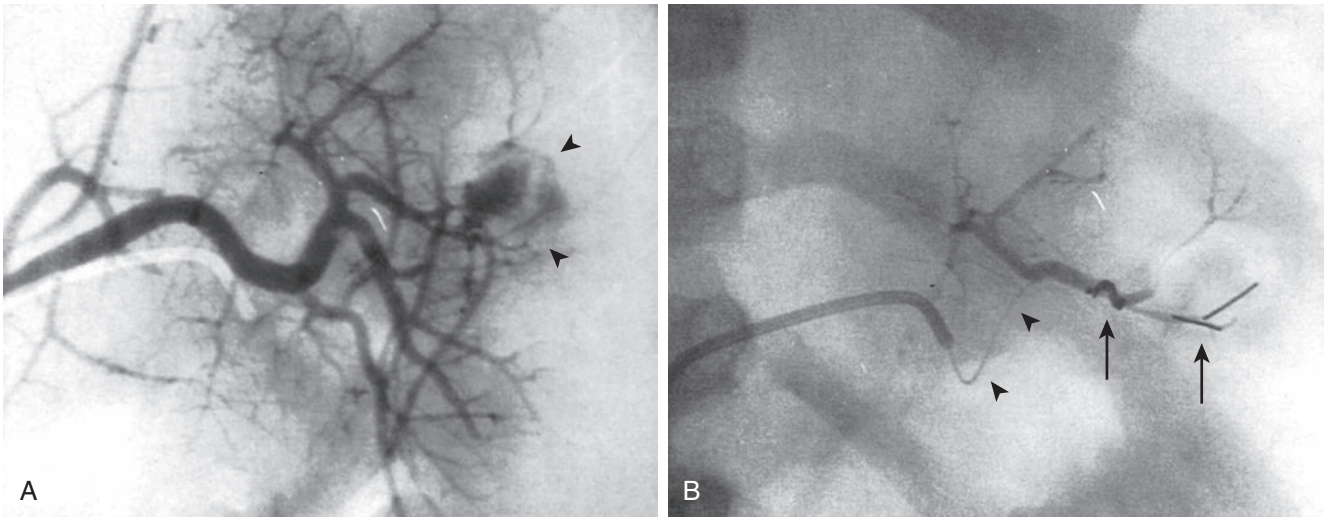

FIG. 165 A, Splenic pseudoaneurysm (*arrowheads* indicate contrast with the pseudoaneurysm) after nonoperative treatment of blunt splenic injury. **B,** Successful angiographic embolization (*arrows* show occlusion of ruptured vessels). (From Cameron JL, Cameron AM: *Current surgical therapy,* ed 12, Philadelphia, 2017, Elsevier.)

TABLE 62 Organ Injury Scale for the Spleen by the American Association for the Surgery of Trauma

Grade	Injury Type	Description of Injury
I	Hematoma	Subcapsular, nonexpanding, <10% surface area
	Laceration	Capsular tear, nonbleeding, <1 cm parenchymal depth
II	Hematoma	Subcapsular, nonexpanding, 10%-50% surface area; intraparenchymal, <5 cm in depth
	Laceration	Capsular tear, active bleeding, 1-3 cm parenchymal depth that does not involve a trabecular vessel
III	Hematoma	Subcapsular, >50% surface area or expanding; ruptured subcapsular or parenchymal hematoma with active bleeding; intraparenchymal hematoma ≥5 cm or expanding
	Laceration	>3 cm parenchymal depth or involving trabecular vessels
IV	Laceration	Laceration involving segmental or hilar vessels producing major devascularization (>25% of spleen)
V	Laceration	Completely shattered spleen
	Vascular	Hilar vascular injury with devascularized spleen

From Cameron JL, Cameron AM: *Current surgical therapy,* ed 12, Philadelphia, 2017, Elsevier.

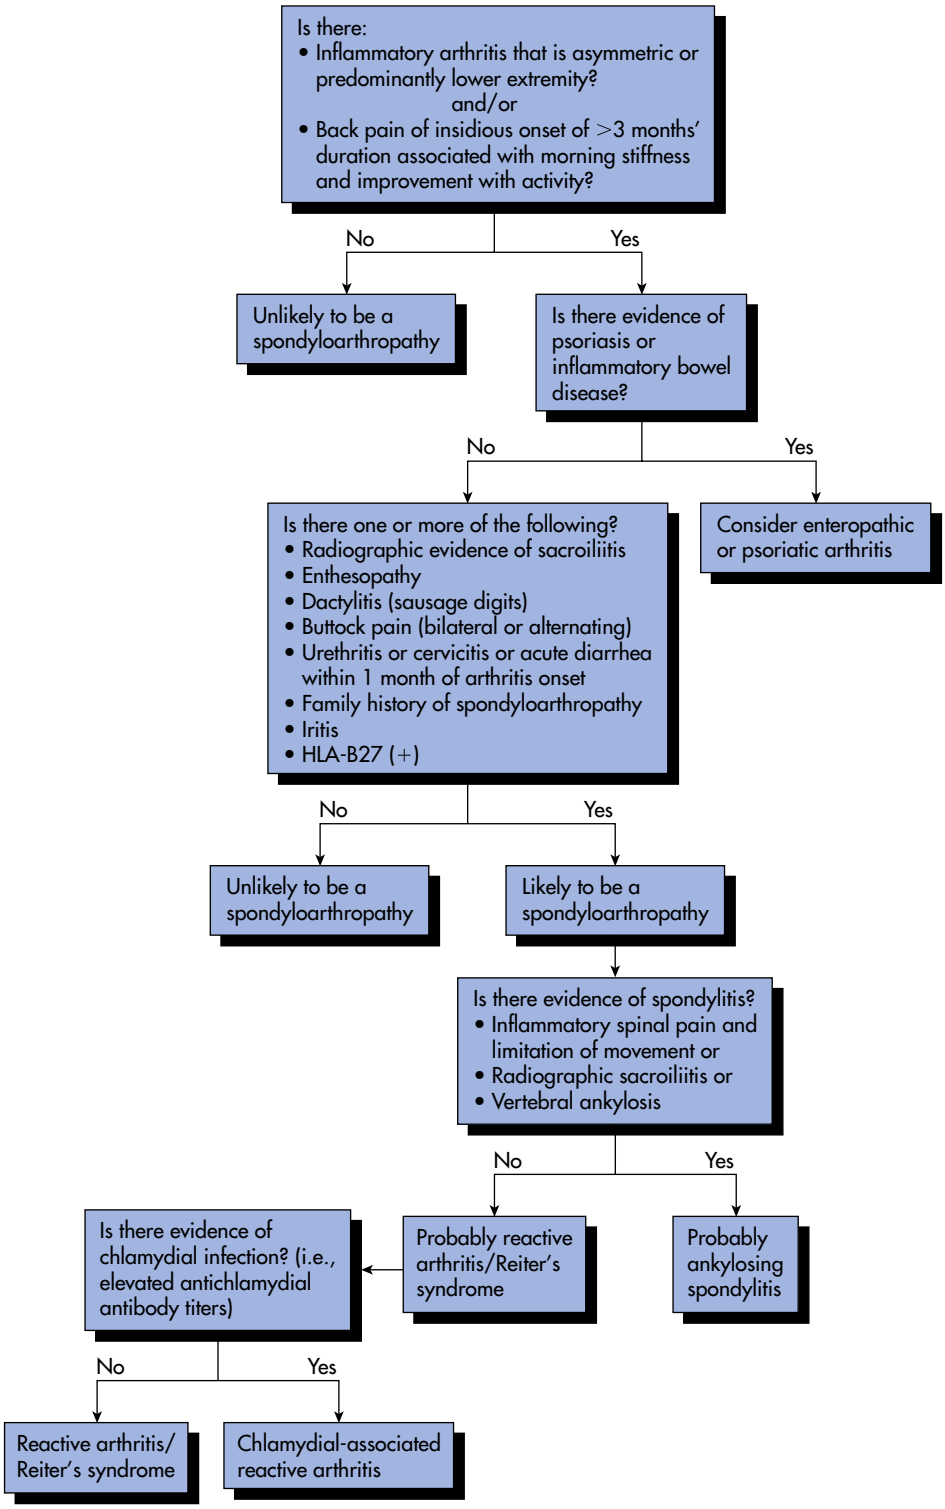

FIG. 166 Algorithm for diagnosis of the spondyloarthropathies. (From Goldman L, Schafer AL: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

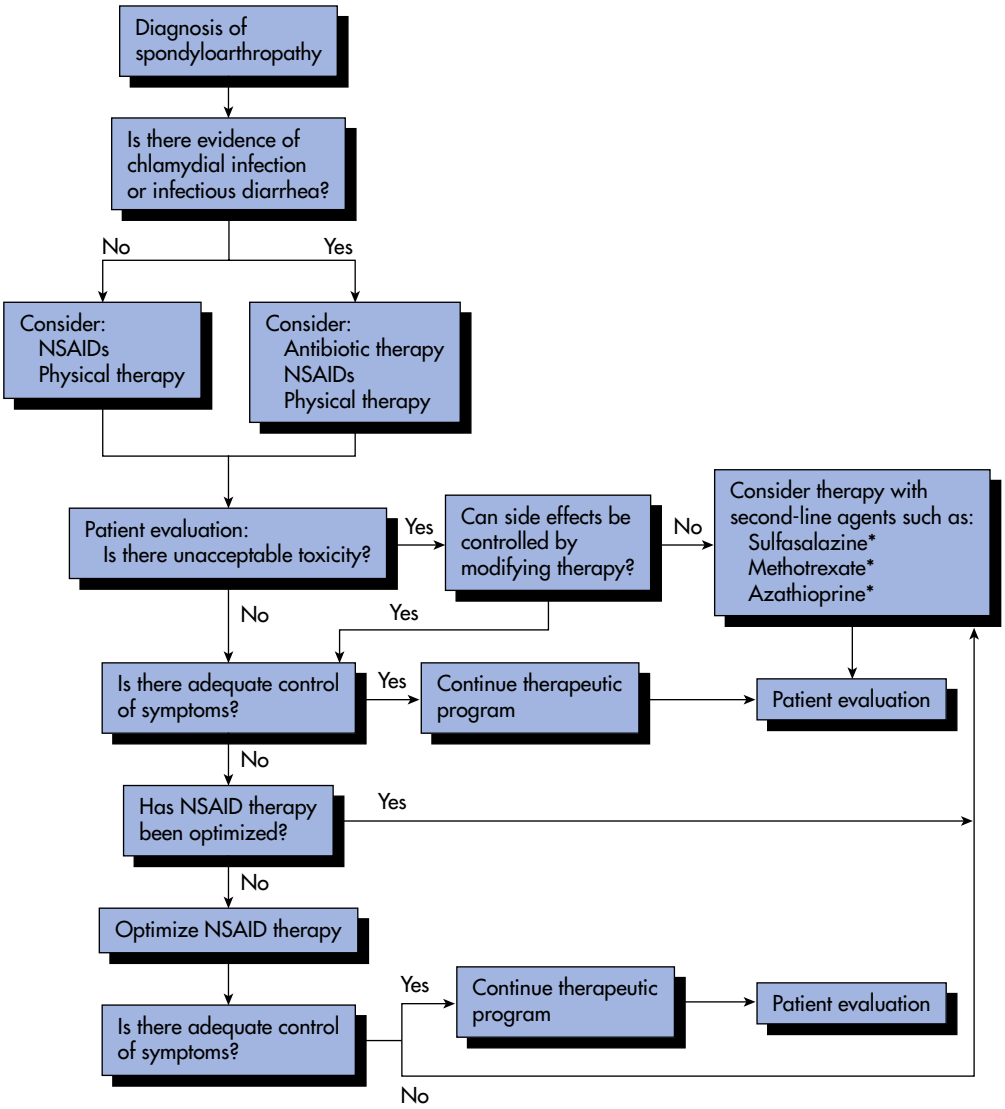
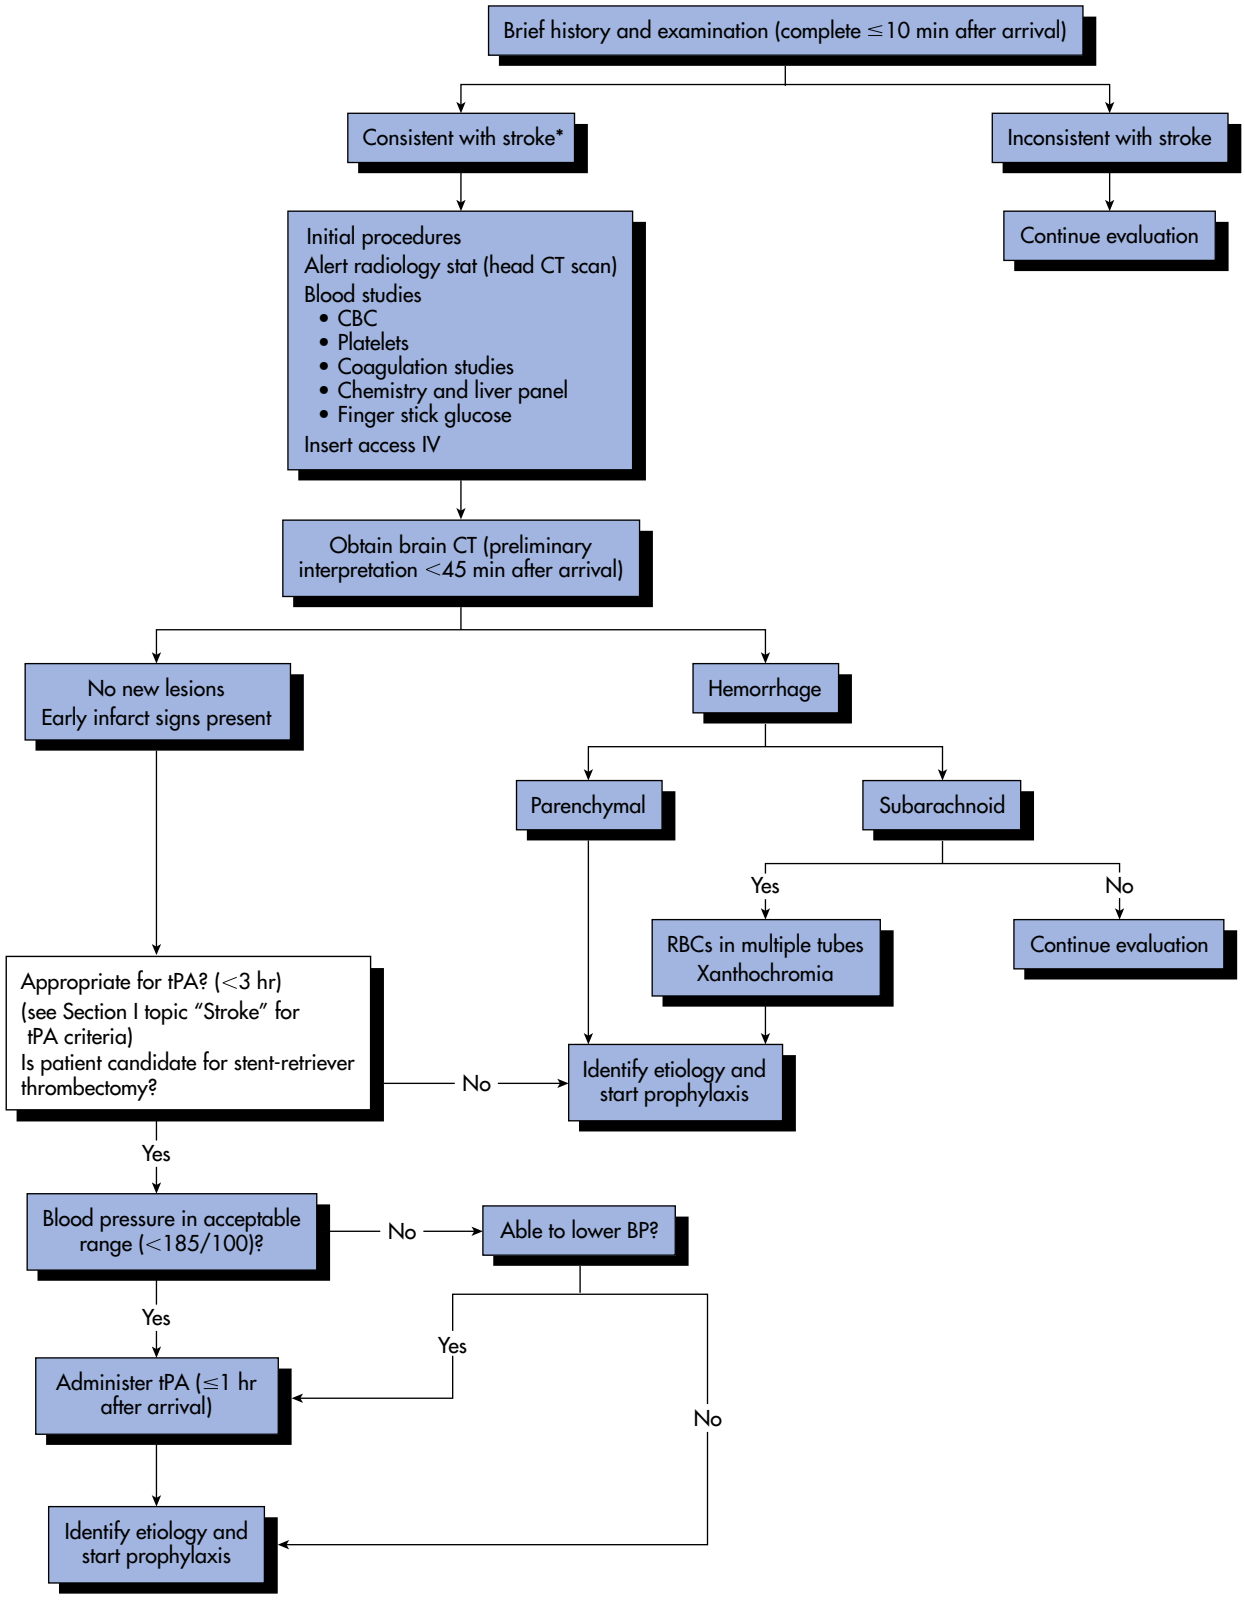


*Not approved by the FDA for treatment of spondyloarthropathies.

FIG. 167 Treatment algorithm for patients with a spondyloarthropathy. *FDA,* Food and Drug Administration; *NSAID,* nonsteroidal antiinflammatory drug. (From Goldman L, Schafer AL: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)



*Note: Refer to Section I for additional information on this topic.

FIG. 168 Algorithm for the emergency evaluation of a patient with suspected stroke. *BP,* Blood pressure; *CBC,* complete blood count; *CT,* computed tomography; *RBCs,* red blood cells; *tPA,* tissue plasminogen activator. (From Goldman L, Schafer AL [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, Saunders.)

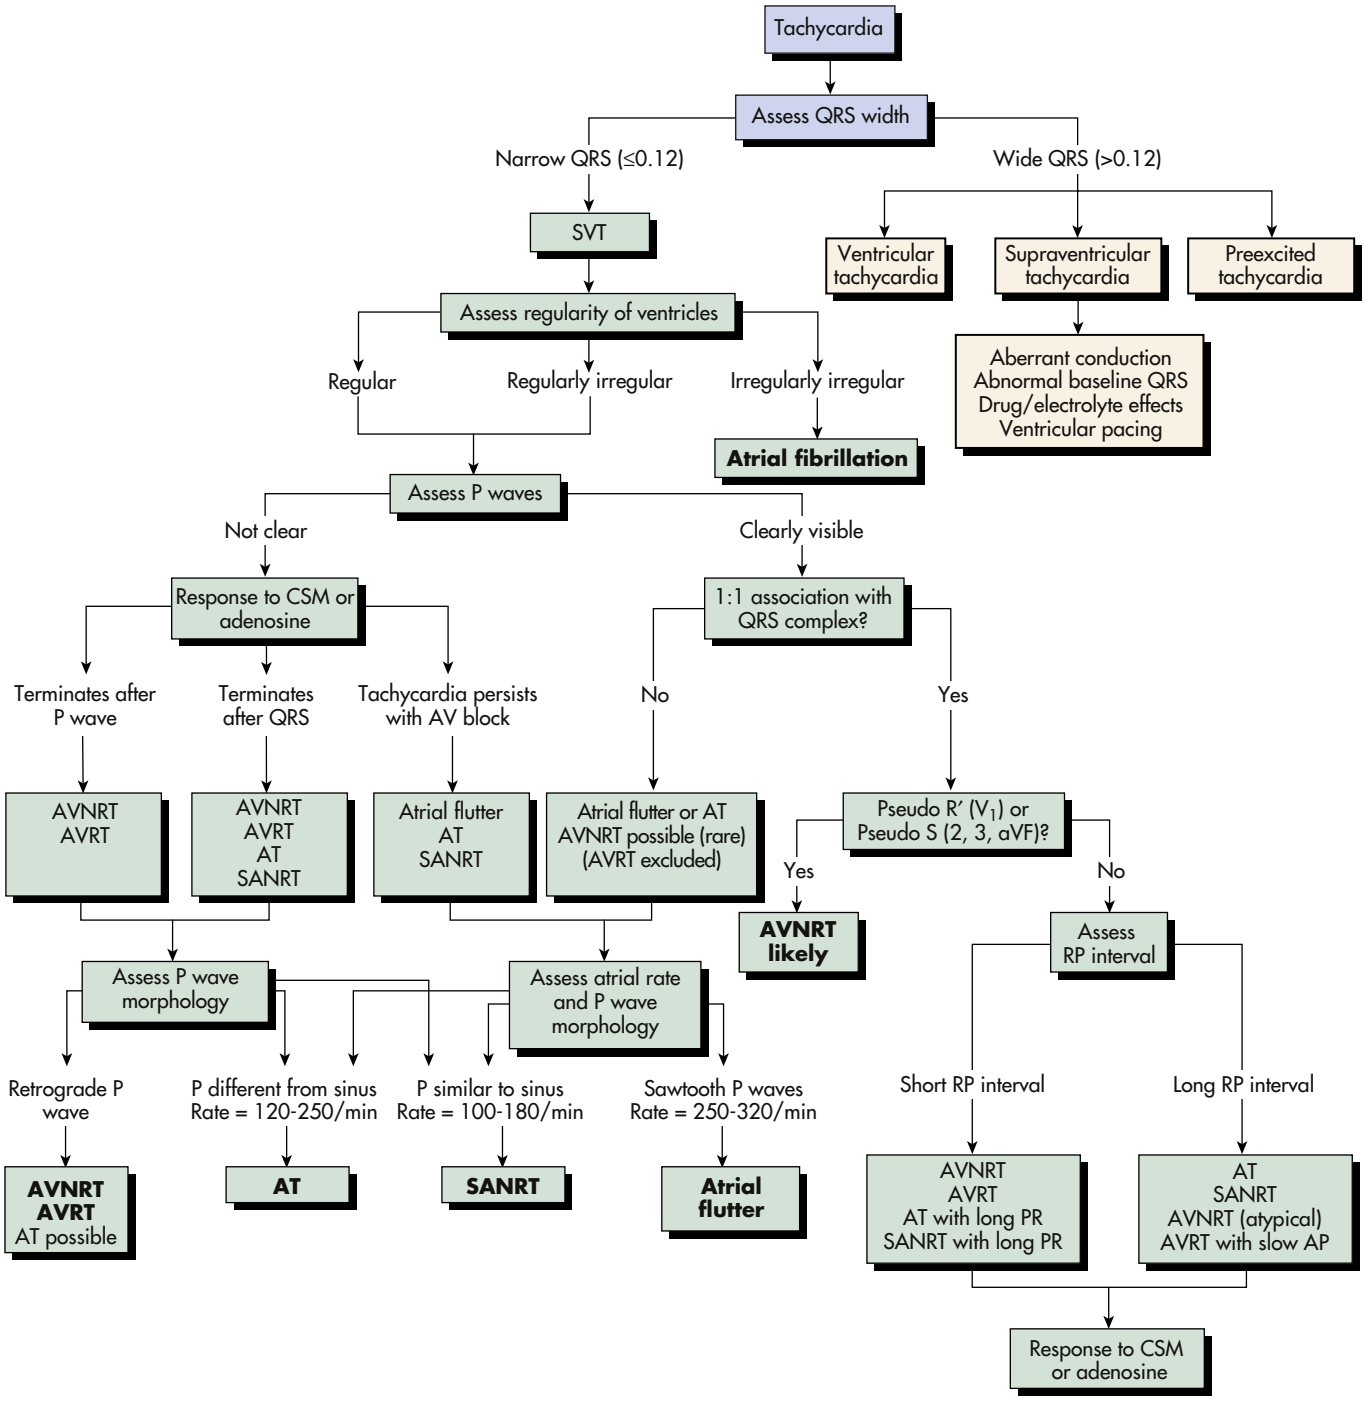


FIG. 169 Stepwise approach to diagnosis of the type of tachycardia based on a 12-lead electrocardiogram during the episode. The initial step is to determine whether the tachycardia has a wide or narrow QRS complex. For wide-complex tachycardia, see Table 63; the remainder of the algorithm is helpful in diagnosis of the type of narrow-complex tachycardia. *AP,* Accessory pathway; *AT,* atrial tachycardia; *AVNRT,* atrioventricular nodal reentrant tachycardia; *AVRT,* atrioventricular reciprocating tachycardia; *CSM,* carotid sinus massage; *SANRT,* sinoatrial nodal reentry tachycardia. (From Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.)

TABLE 63 Electrocardiographic Distinctions for Diagnosis of Wide-QRS Complex Tachycardia

Favor Supraventricular Tachycardia	Favor Ventricular Tachycardia
Initiation with a premature P wave	Initiation with a premature QRS complex
Tachycardia complexes identical to those in resting rhythm	Tachycardia beats identical to PVCs during sinus rhythm
"Long-short" sequence preceding initiation	"Short-long" sequence preceding initiation
Changes in the P-P interval preceding changes in the R-R interval	Changes in the R-R interval preceding changes in the P-P interval
QRS contours consistent with aberrant conduction (V_1, V_6)	QRS contours inconsistent with aberrant conduction (V_1, V_6)
Slowing or termination with vagal maneuvers	AV dissociation or other non-1:1 AV relationship
Onset of the QRS to its peak (positive or negative) <50 msec	Onset of the QRS to its peak (positive or negative) ≥50 msec
	Fusion beats, capture beats
QRS duration ≤0.14 sec	QRS duration >0.14 sec
Normal QRS axis (0 to +90 degrees)	Left axis deviation (especially −90 to 180 degrees)
	Concordant R wave progression pattern
	Contralateral bundle branch block pattern from the resting rhythm
	Initial R, q, or r >40 msec or notched Q in aVR
	Absence of an "rS" complex in any precordial lead

AV, Atrioventricular; *PVC,* premature ventricular complexes.
From Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine*, ed 11, Philadelphia, 2019, Elsevier.

ICD-10CM # I49.02 Ventricular flutter
I49.8 Other specified cardiac arrhythmias
R00.1 Bradycardia, unspecified

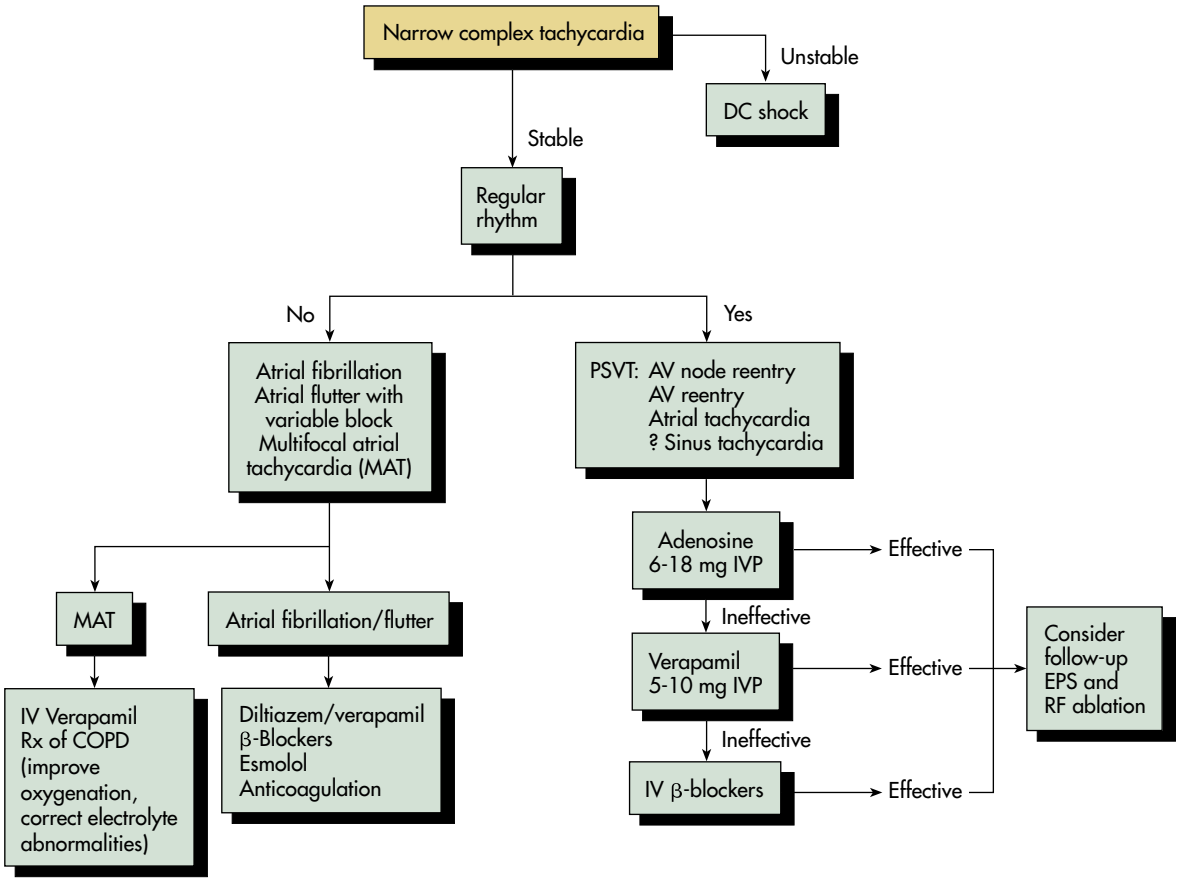

FIG. 170 Evaluation and management of narrow complex tachycardia. *AV,* Atrioventricular; *COPD,* chronic obstructive pulmonary disease; *DC,* direct current; *EPS,* electrophysiologic studies; *IV,* intravenous; *IVP,* intravenous push; *PSVT,* paroxysmal supraventricular tachycardia; *RF,* radiofrequency.

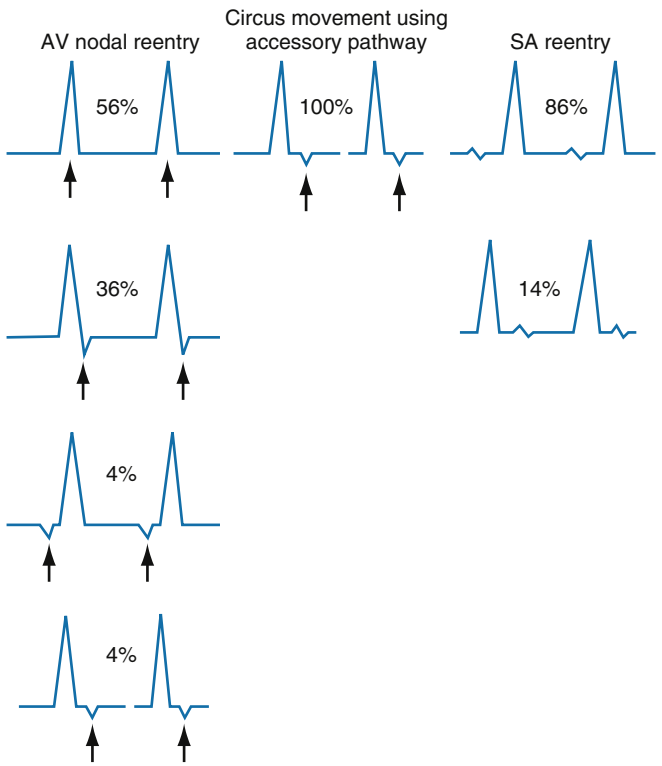

FIG. 171 Location of P waves in common causes of regular narrow-complex tachycardia. *AV,* Atrioventricular; *SA,* sinoatrial. (From Marriott HJL, Conover MB: *Advanced concepts in dysrhythmias,* 2nd ed. St Louis, Mosby, 1989. In Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

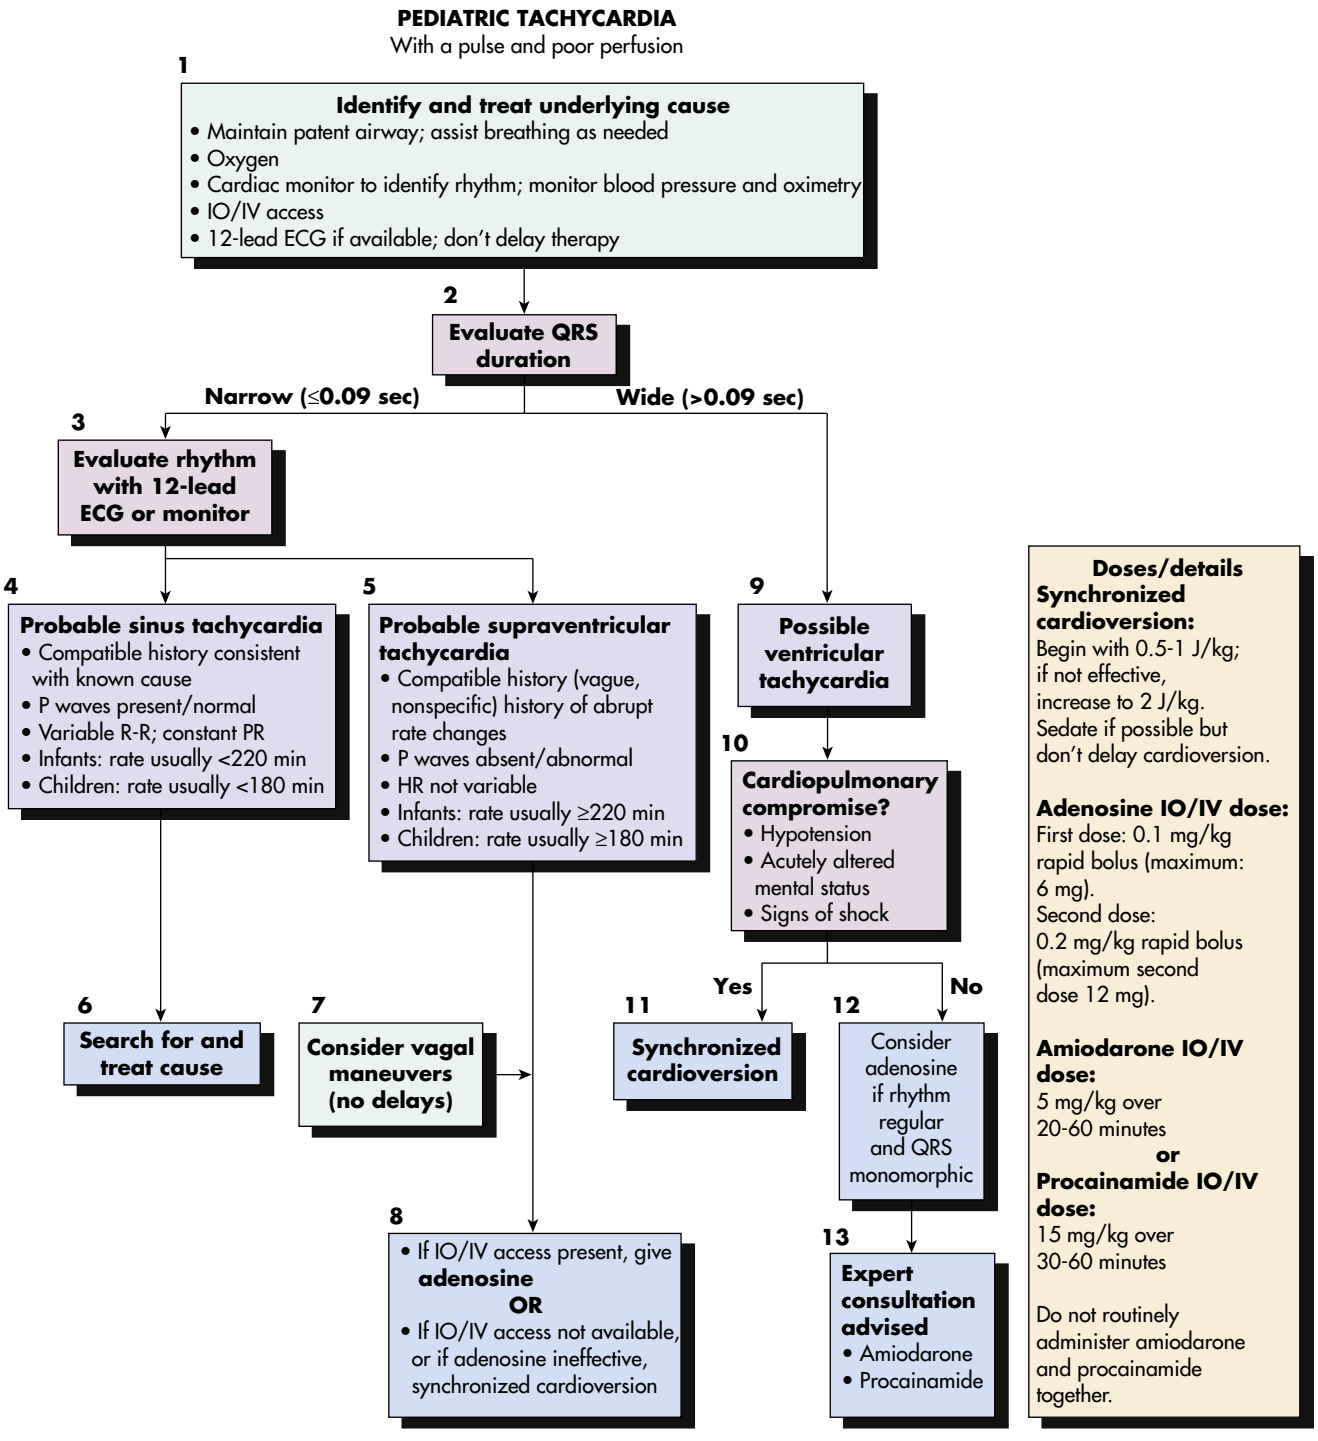

FIG. E172 American Heart Association guidelines for management of ventricular arrhythmias.
ECG, Electrocardiogram; *HR,* heart rate; *IO,* intraosseous; *IV,* intravenous. (From Fuhrman BP, Zimmermann JJ: *Fuhrman & Zimmerman's pediatric critical care,* ed 5, Philadelphia, 2017, Elsevier.)

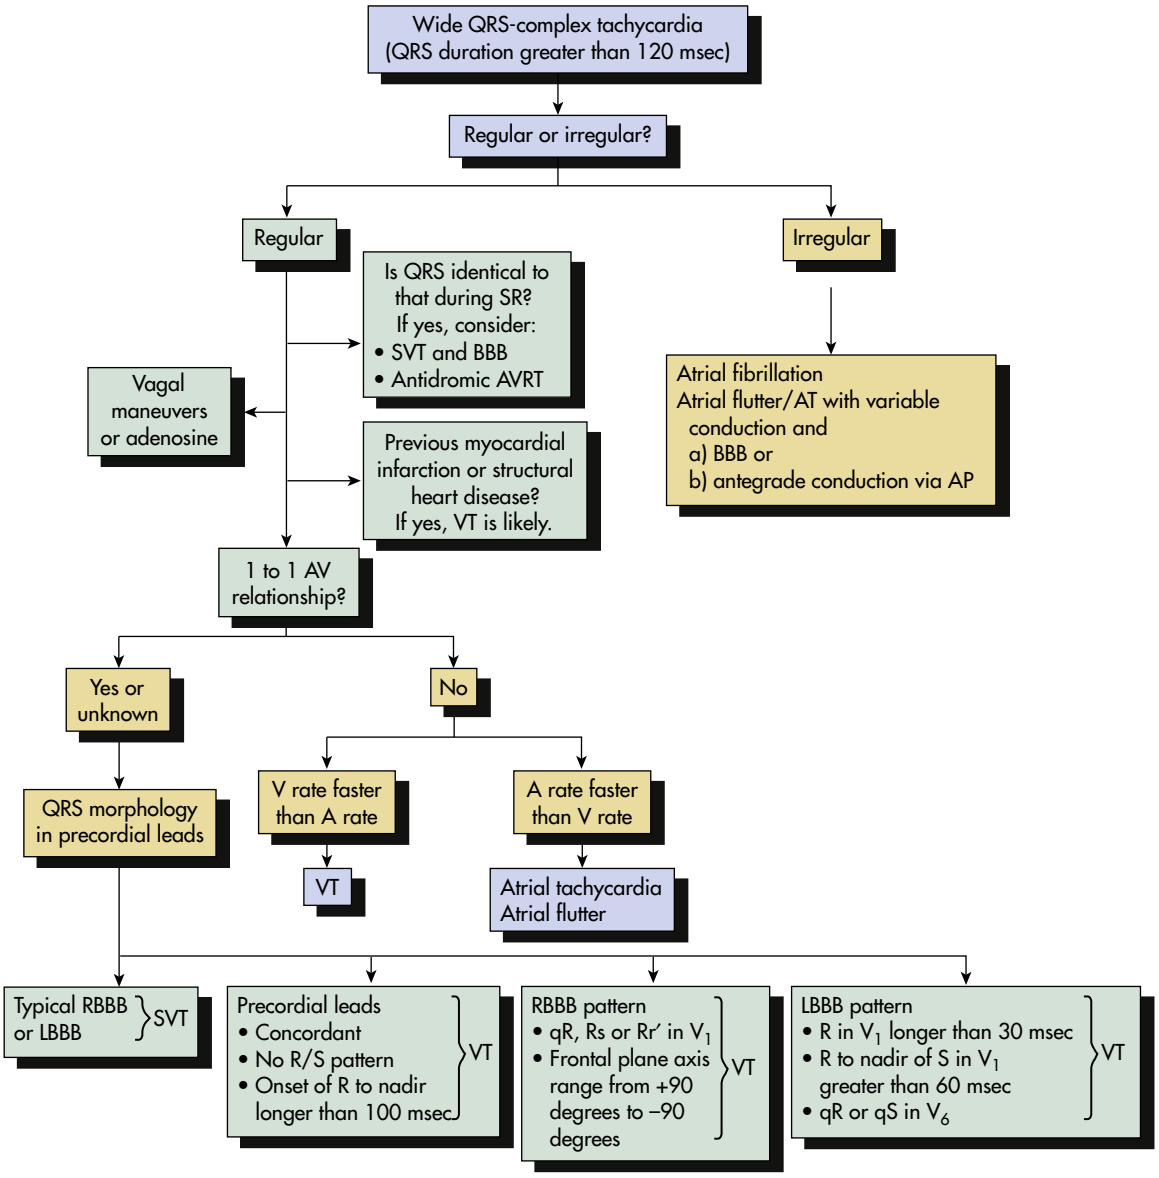

FIG. 173 Algorithm for diagnosis of wide-QRS tachycardia. *AP,* Accessory pathway; *AT,* atrial tachycardia; *AV,* atrioventricular; *AVRT,* AV reentrant tachycardia; *LBBB,* left bundle branch block; *RBBB,* right bundle branch block; *SVT,* supraventricular tachycardia; *VT,* ventricular tachycardia. (From Bloomstrom-Lundqvist C et al: ACC/AHA/ESC guidelines for the management of patients with supraventricular arrhythmias—executive summary: a report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines and the European Society of Cardiology Committee for Practice Guidelines [Writing Committee to Develop Guidelines for the Management of Patients with Supraventricular Arrhythmias]. *Circulation* 108:1871, 2003; Mann DL et al: *Braunwald's heart disease*, ed 10, Philadelphia, 2015, Elsevier.)

TABLE 66 Stepwise Criteria Favoring Ventricular Tachycardia Patients with Wide-Complex Tachycardias Using Different Algorithms

ACC/AHA/ESC Algorithm*	Kindwall Criteria†	Wellens Criteria‡	Brugada Criteria§	Miller criteria§
See Figure 173	R >30 ms in V_1 or V_2→ VT	AV dissociation → VT	Absence of RS complex in all precordial leads → VT	Initial R wave in aVR → VT
	Any Q in V_6→ VT	QRS width >140 ms →VT	Longest R/S interval >100 ms in any precordial lead → VT	aVR with initial r or q >40 sec in duration → VT
	>60 ms to S wave nadir in V_1 or V_2→ VT	Left axis deviation >–30° → VT	AV dissociation → VT	aVR with a notch on the descending limb of a negative-onset and predominantly negative QRS in aVR → VT
	Notched downstroke S wave in V_1 or V_2→ VT	If RBBB morphology, monophasic or biphasic QRS in V_1→ SVT or R-to-S ratio of <1 in V_6→ VT	If RBBB morphology, monophasic R or qR in V_1→ VT R taller than R′→ VT rS in V_6→ VT	In aVR, mV of initial 40 msec divided by terminal 40 msec ($v/v_t \leq 1$) → VT
		If LBBB morphology, S in V_1-V_2→ VT	If LBBB morphology, initial R >40 ms in duration →VT Slurred or notched S in V_1 or V_2→ VT Beginning Q or QS in V_6→ VT

ICD-10CM # C62.90 Malignant neoplasm of unspecified testis, unspecified whether descended or undescended

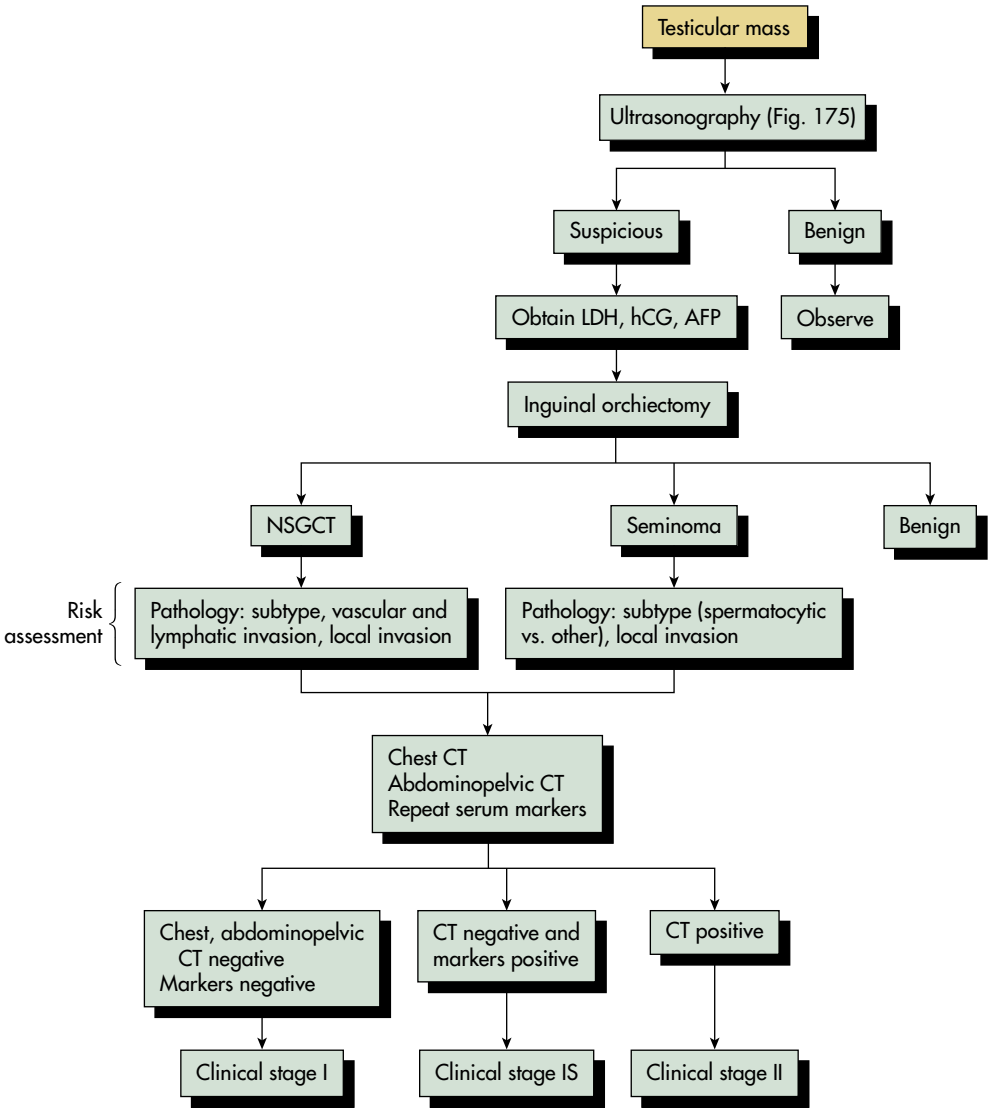

FIG. 174 Diagnosis, staging, and risk assessment of patients with testicular germ cell tumor. See Section I topic Testicular Cancer for additional information. *AFP,* α-Fetoprotein; *CT,* computed tomography; *hCG,* human chorionic gonadotropin; *LDH,* lactic dehydrogenase; *NSGCT,* nonseminoma germ cell tumor. (From Abeloff MD: *Clinical oncology,* ed 4, New York, 2007, Churchill Livingstone.)

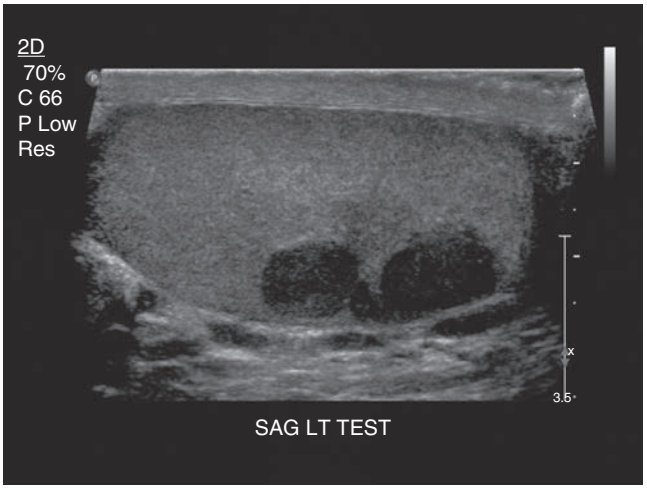

FIG. 175 Sagittal view of ultrasound of left testis showing multinodular hypoechoic intratesticular lesion confirmed to be pure seminoma at orchiectomy. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

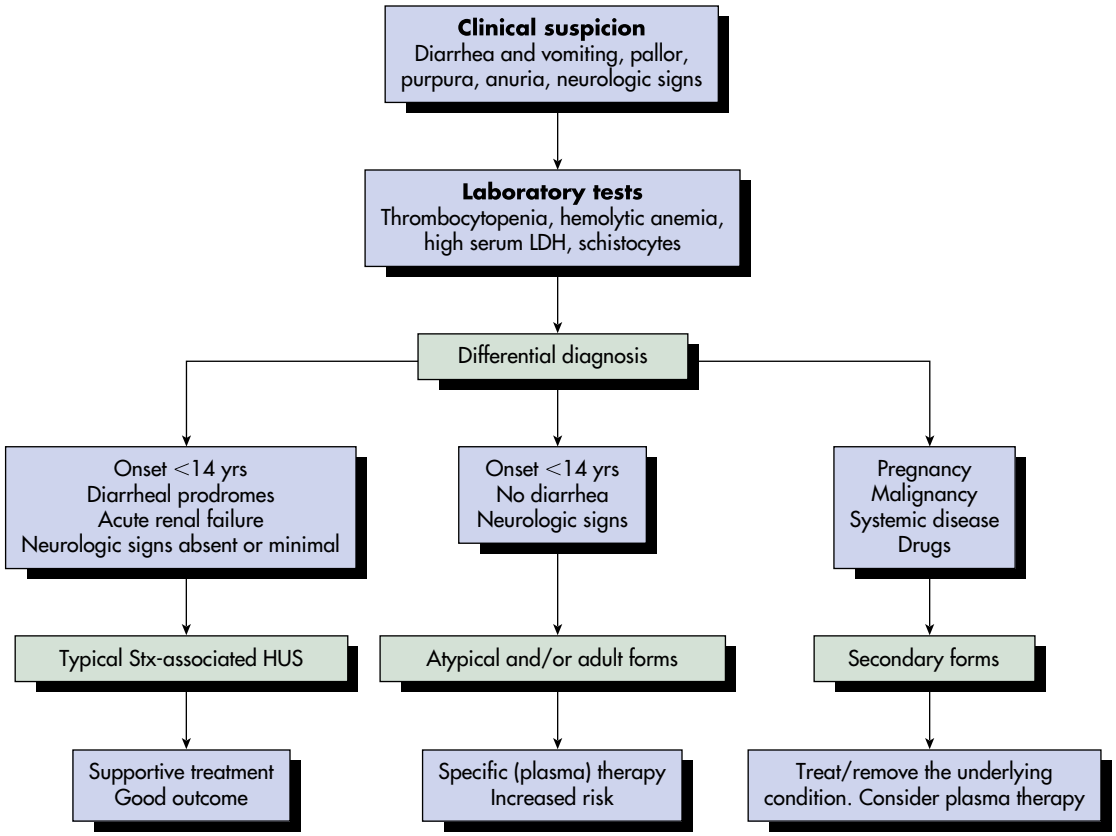

FIG. E176 Algorithm for the differential diagnosis of thrombotic microangiopathies. Patients with suggestive symptoms should be investigated for specific signs of microangiopathic hemolysis. In adults, secondary forms of the disease must be ruled out. Early diagnosis may help establish the most appropriate therapy. In children with Stx-associated hemolytic-uremic syndrome *(HUS)*, supportive treatment is mandatory. Specific therapies should be considered only in adults and in atypical forms. In secondary forms, treating and/or removing the underlying disease is fundamental. *LDH,* Lactate dehydrogenase; *Stx,* Shiga toxin. (From Feehally J, Floege J, Johnson RJ: *Comprehensive clinical nephrology,* ed 3, St Louis, 2007, Mosby.)

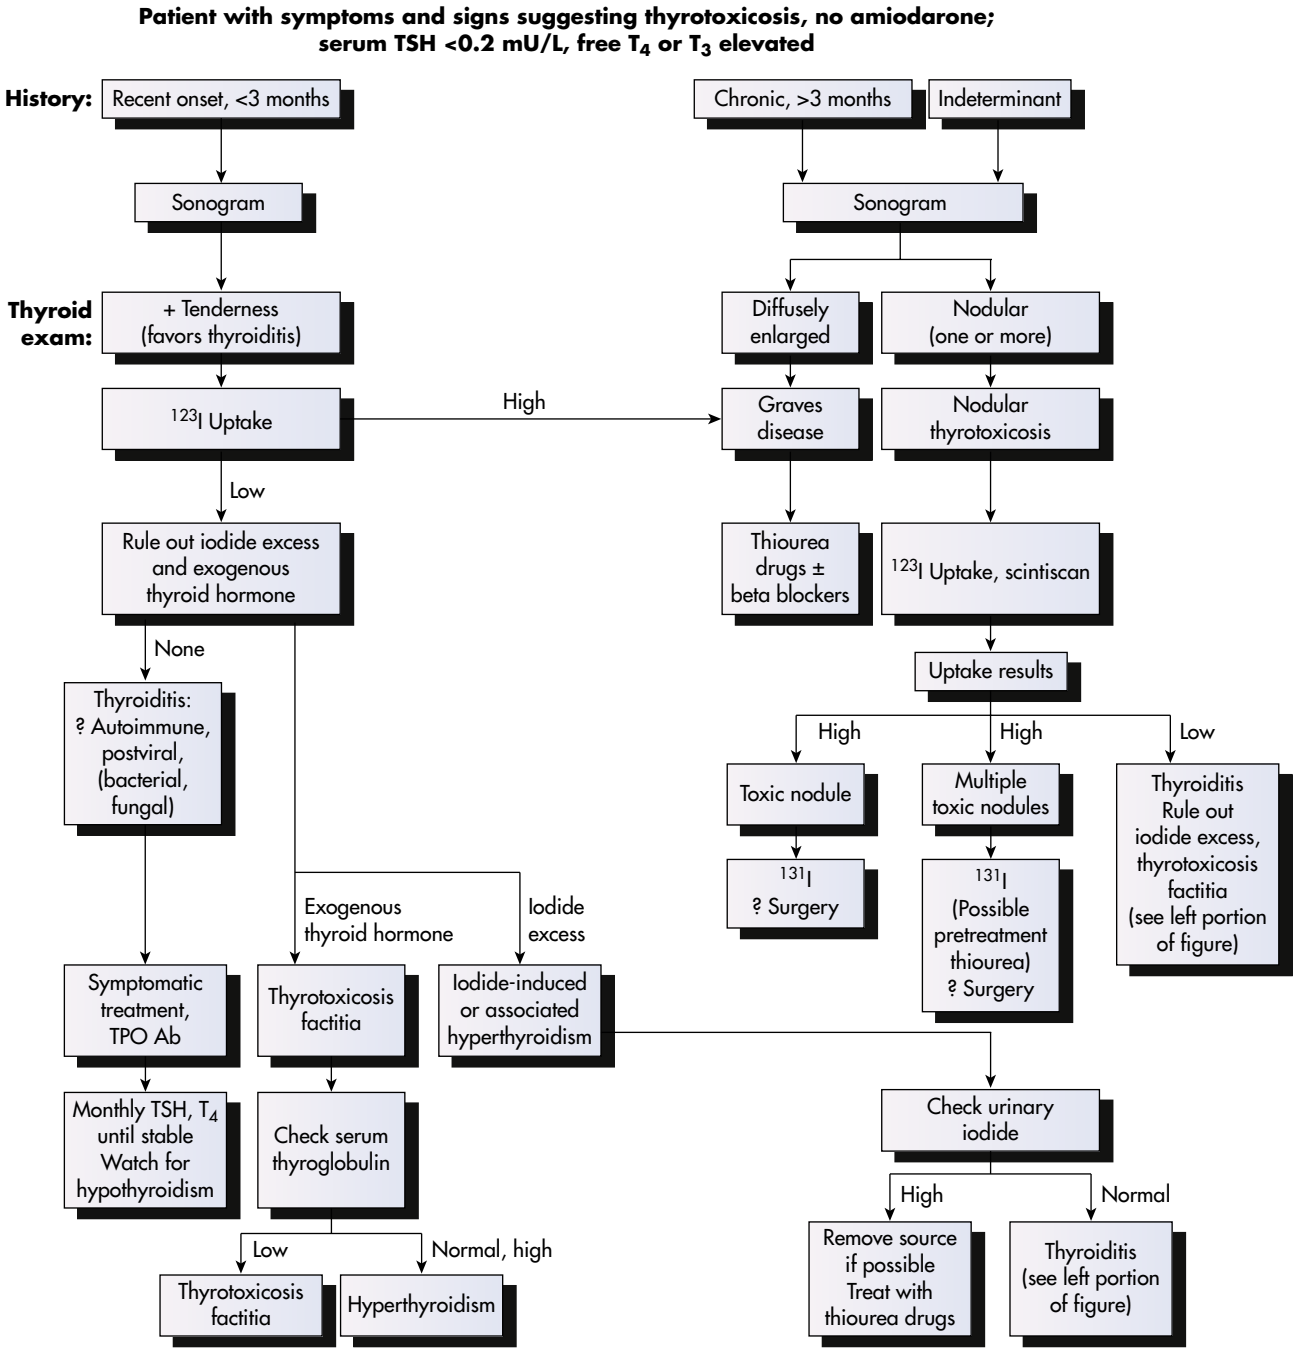

FIG. 177 Algorithm for determining the cause of thyrotropin-independent thyrotoxicosis. Additional information on thyrotoxicosis is available in Section I topics Hyperthyroidism, Thyroid Nodule, Thyroiditis, Thyroid Storm, and Graves Disease. *T_3*, Triiodothyronine; *T_4*, thyroxine; *TPO Ab*, thyroid peroxidase antibody; *TSH*, thyroid-stimulating hormone (thyrotropin). (From Melmed S et al: *Williams textbook of endocrinology,* ed 13, Philadelphia, 2016, Elsevier.)

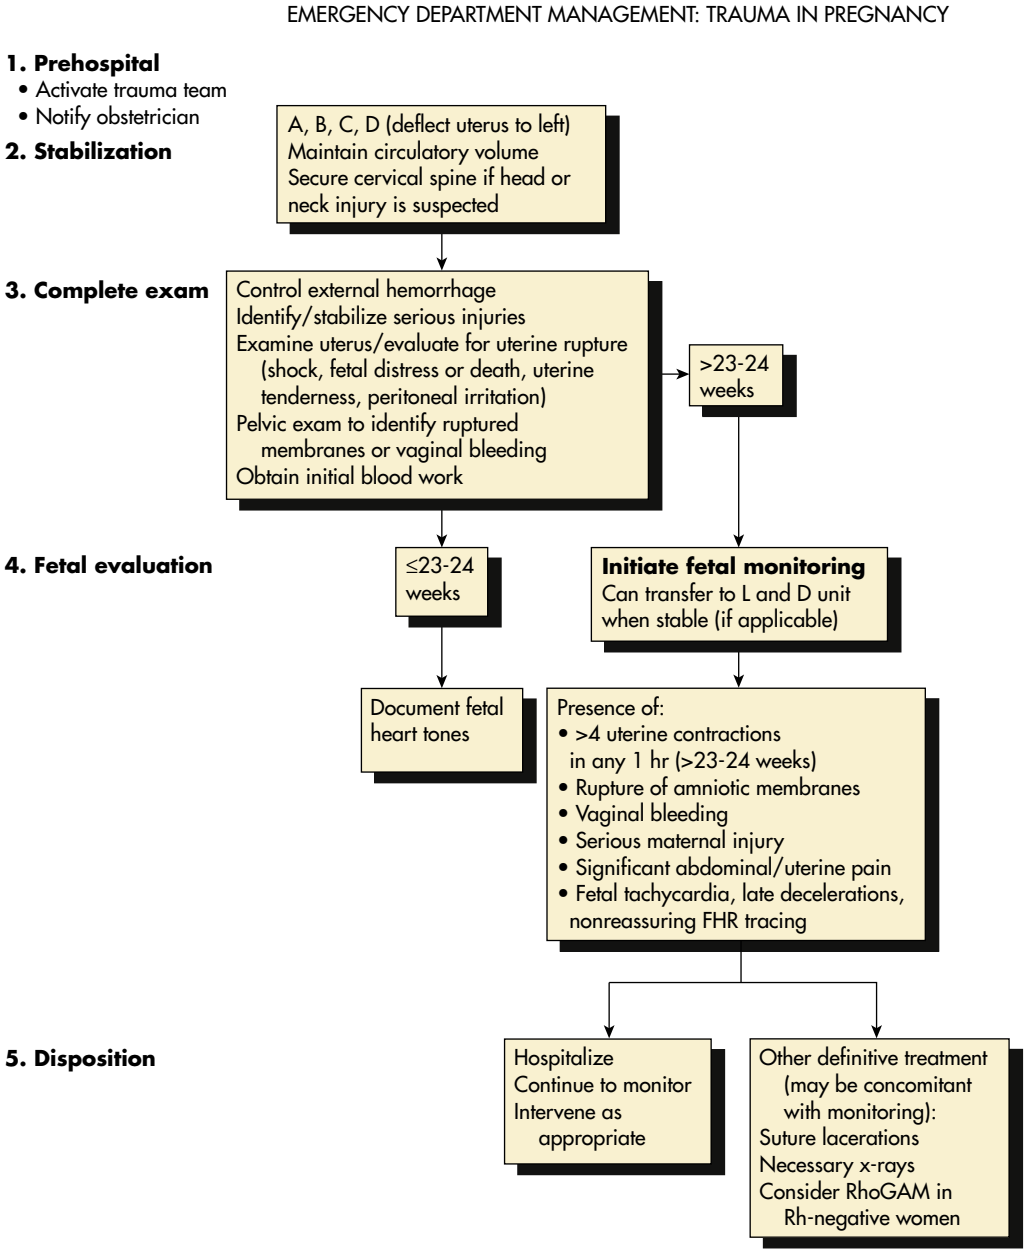

FIG. 178 Algorithm with suggested care plan for pregnant women who experience trauma. *FHR,* Fetal heart rate; *L and D,* labor and delivery. (From Gabbe SG et al: *Obstetrics,* ed 7, Philadelphia, 2017, Saunders.)

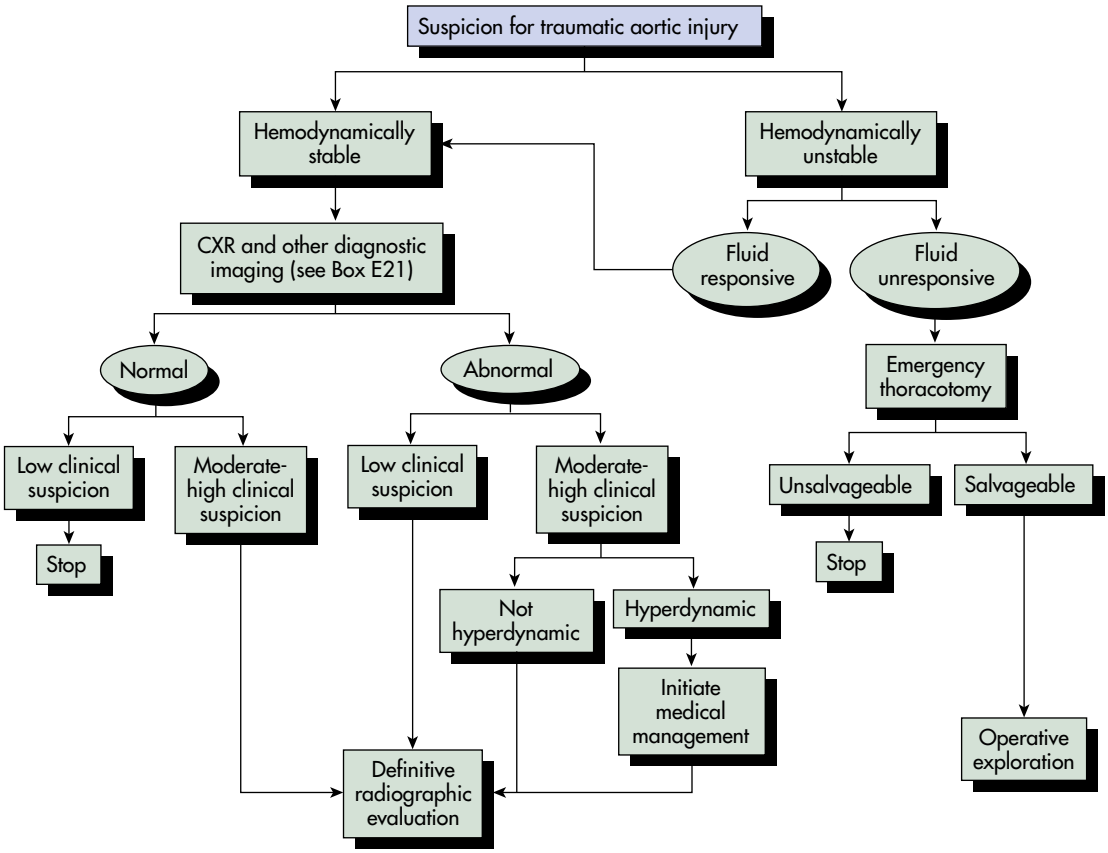

FIG. E179 Diagnostic management algorithm for suspected traumatic aortic injury. *CXR,* Chest radiograph. (Modified from Adams JG et al: *Emergency medicine: clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.)

BOX E21 Pros and Cons of Imaging Modalities for Great Vessel Injury

Chest Radiography

Pros
- Inexpensive
- Performed at the bedside
- Easy to interpret

Cons
- Nonspecific
- False-negative rate of 7% to 10% for traumatic aortic injury

Computed Tomographic Angiography

Pros
- Identifies mediastinal hematoma and differentiates its causes
- Identifies aortic injury, including intimal tears
- Sensitivity and specificity approaching 100% for traumatic aortic injury

Cons
- Poor delineation of nonaortic vascular injuries
- Requires relative hemodynamic stability to obtain

Aortography

Pros
- Traditional "gold standard"
- Beneficial in the diagnosis of branch vessel injuries
- Delineates equivocal computed tomographic angiographic findings

Cons
- Difficult to obtain on an emergency basis
- Requires relative hemodynamic stability

Transesophageal Echocardiography

Pros
- May be performed at the bedside
- Not limited by body habitus

Cons
- Poor availability on an emergency basis
- Contraindicated in patients with an unstable cervical spine or suspected esophageal trauma

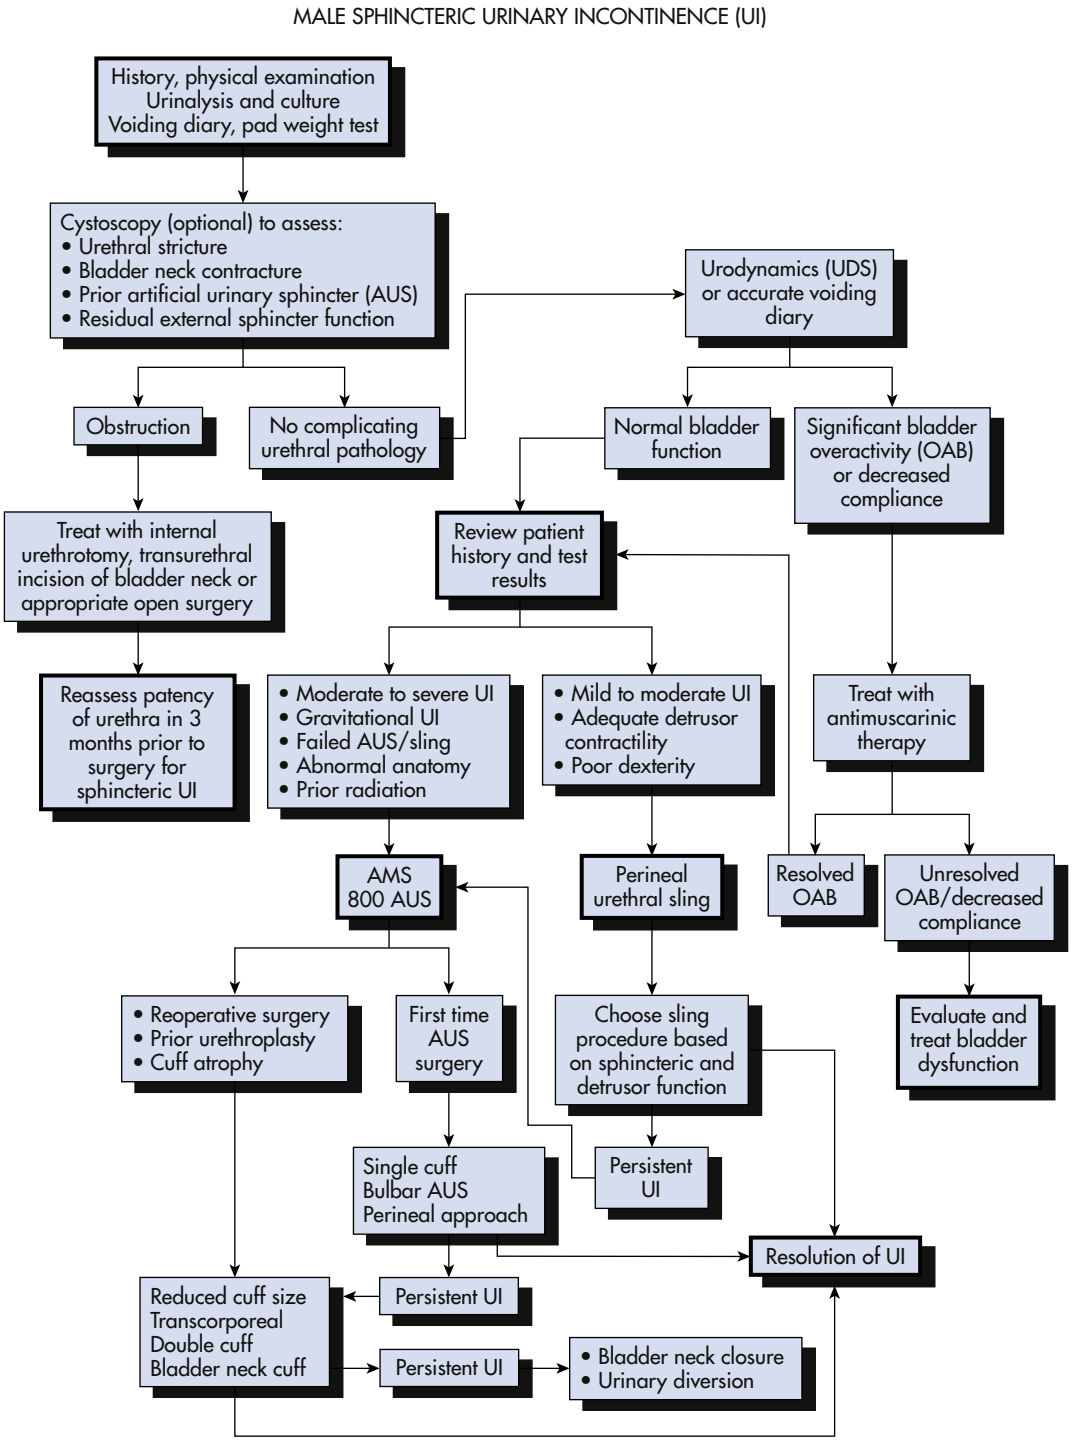

FIG. 180 Algorithm for the evaluation and management of sphincteric urinary incontinence. (From Wein AJ et al: *Campbell-Walsh urology,* ed 11, Philadelphia, 2016, Elsevier.)

ICD-10CM # R33.9 Retention of urine, unspecified
N21.8 Other lower urinary tract calculus
R32 Unspecified urinary incontinence

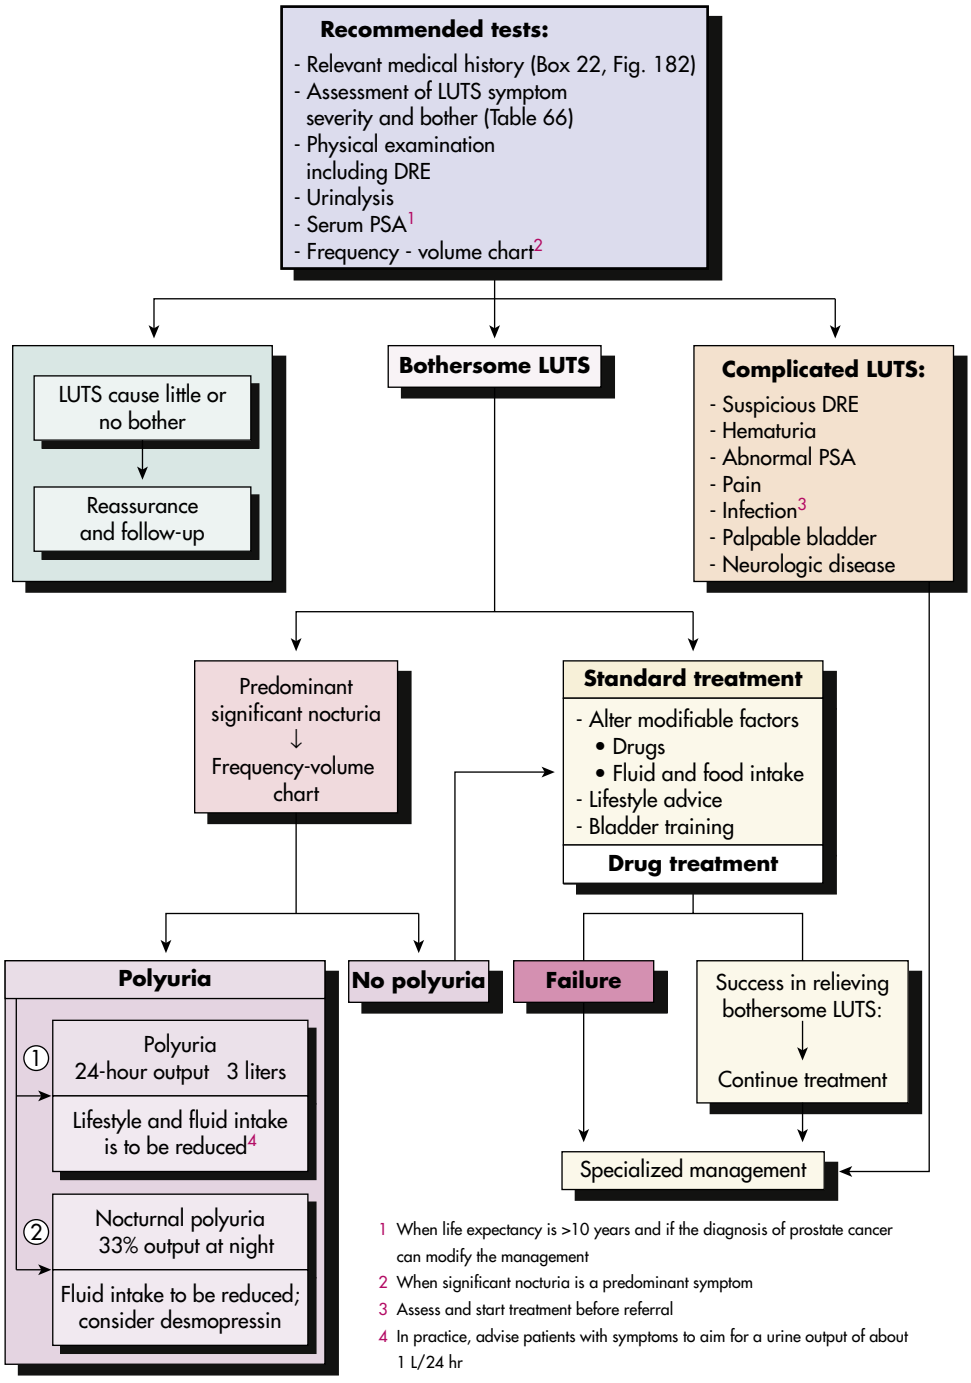

FIG. 181 Basic management of lower urinary tract symptoms *(LUTS)* in men. *DRE,* Digital rectal examination; *PSA,* prostate-specific antigen. (From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology,* ed 8, Philadelphia, 2017, Elsevier.)

BOX 22 Causes of Male Lower Urinary Tract Symptoms

Benign prostatic enlargement (secondary to benign prostatic hyperplasia)
Urinary tract infection
Prostatitis
Overactive bladder
Neurogenic bladder dysfunction
Urethral stricture
Bladder neck contracture
Phimosis
Urinary tract stones
Bladder tumor
Advanced prostate cancer
Foreign body in the bladder
Medications, illicit drugs, and dietary factors (including caffeine, alcohol, ketamine, and decongestants)
Diabetes mellitus

From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology,* ed 8, Philadelphia, 2017, Elsevier.

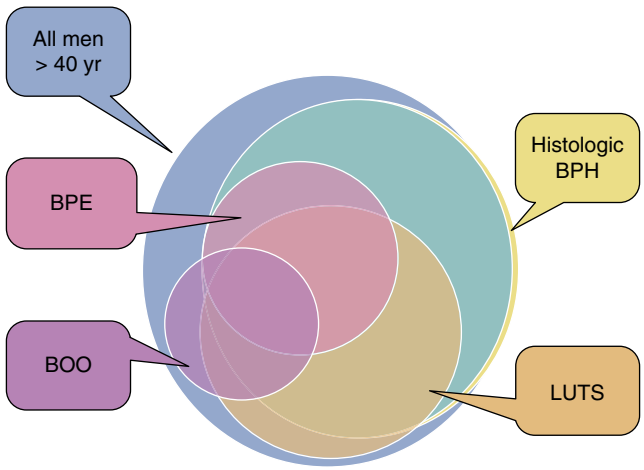

FIG. 182 Occurrence of LUTS with and without BOO, BPE, or BPH. *BOO,* Bladder outflow obstruction; *BPH,* benign prostate hyperplasia; *BPE,* benign prostate enlargement; *LUTS,* lower urinary tract symptoms. (From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology,* ed 8, Philadelphia, 2017, Elsevier.)

TABLE 67 International Continence Society Definitions of Lower Urinary Tract Symptoms

Voiding symptoms	*Hesitancy* is difficulty in initiating micturition, resulting in a delay in the onset of voiding after being ready to pass urine.
	Slow stream is the perception of reduced urine flow, usually compared to previous performance or in comparison to others.
	Splitting or spraying of the urine stream.
	Intermittent stream (intermittency) is the term used to describe urine flow that stops and starts, on one or more occasions, during micturition.
	Straining to void describes the muscular effort used to initiate, maintain, or improve the urinary stream.
	Terminal dribble is the term used to describe a prolonged final part of micturition, when the flow has slowed to a trickle or dribble.
Storage symptoms	*Increased daytime frequency* is the complaint by the patient who considers that he voids too often during the day.
	Nocturia is the complaint that the man has to wake at night one or more times to void.
	Urgency is the complaint of a sudden compelling desire to pass urine that is difficult to defer.
	Urinary incontinence is the complaint of any involuntary leakage of urine.
Postmicturition symptoms	*Feeling of incomplete emptying* is a self-explanatory term for a feeling experienced by the individual after passing urine.
	Postmicturition dribble is the term used to describe the involuntary loss of urine immediately after finishing passing urine, usually after leaving the toilet.

From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology,* ed 8, Philadelphia, 2017, Elsevier.

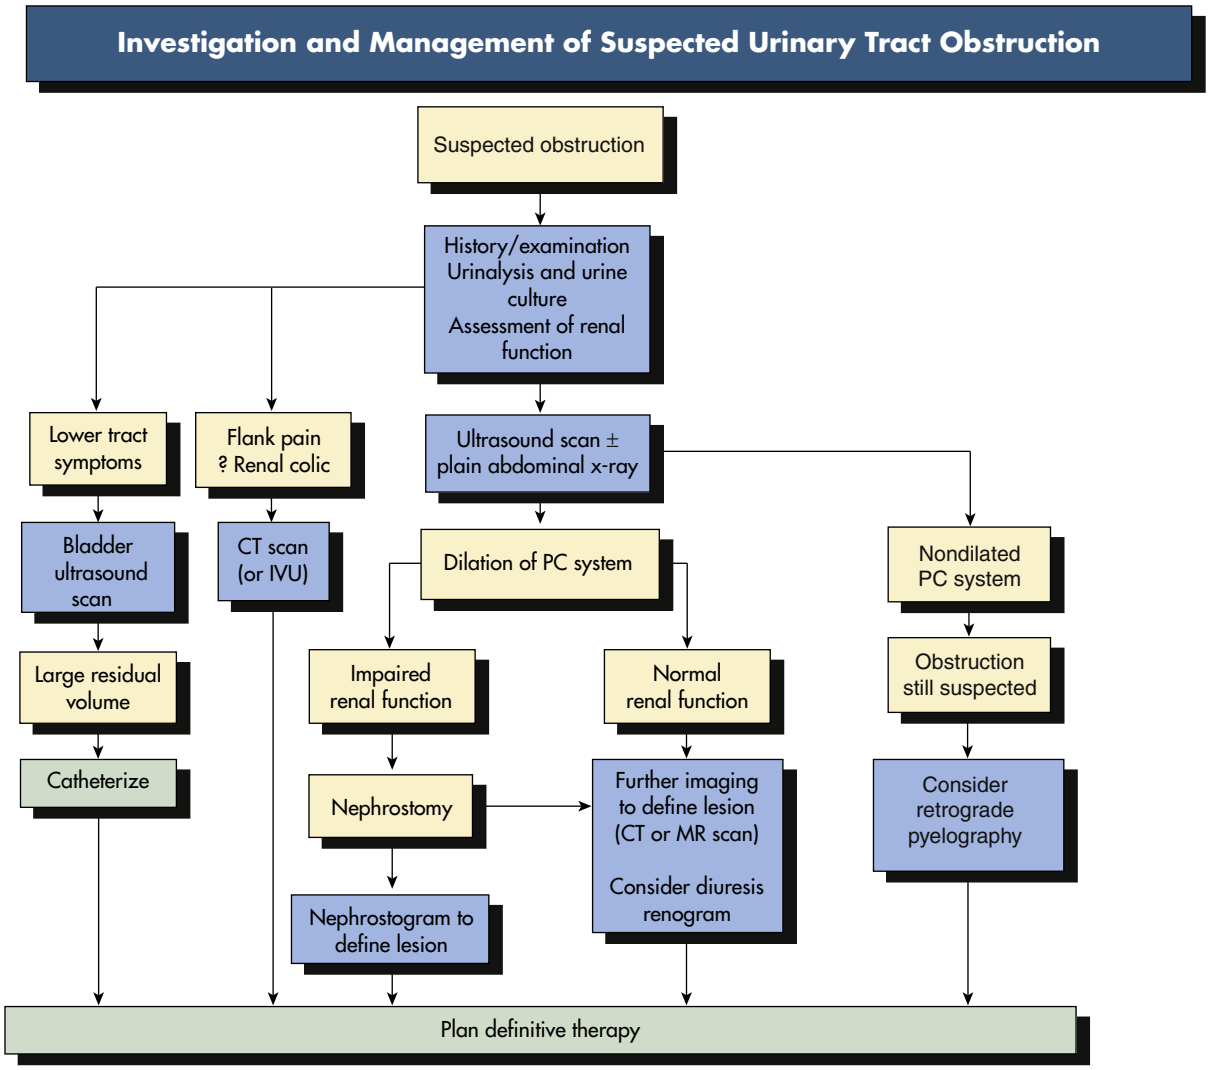

FIG. 183 Investigation and management of suspected urinary tract obstruction. A full history should be taken and a thorough examination performed, together with urinalysis, urine microscopy and culture, and measurement of renal function and serum electrolytes. Ultrasound is a useful first-line investigation for any patient with suspected urinary tract obstruction. Computed tomography *(CT)* is now the preferred imaging technique when renal calculi are suspected. Either CT or magnetic resonance *(MR)* urography can accurately diagnose both the site and cause of obstruction in most cases. If there is renal impairment, a nephrostomy allows the effective relief of the obstruction and time for renal function to recover while definitive therapy is planned. *IVU,* Intravenous urography; *PC,* pelvicalyceal. (From Johnson R, Feehally J, Floege J: *Comprehensive clinical nephrology*, ed 5, Philadelphia, 2015, Saunders.)

BOX 23 Diagnostic Tests Used in Obstructive Uropathy

Upper Urinary Tract Obstruction
- Sonography (ultrasound)
- Plain films of the abdomen (KUB)
- Excretory or intravenous pyelography (very rarely needed)
- Retrograde pyelography
- Isotopic renography
- Computed tomography (helical CT)
- Magnetic resonance imaging
- Pressure flow studies (the Whitaker test)

Lower Urinary Tract Obstruction
- Some of the tests listed at left
- Cystoscopy
- Voiding cystourethrogram
- Retrograde urethrography
- Urodynamic tests
- Debimetry
- Cystometrography
- Electromyography
- Urethral pressure profile

KUB, Kidneys, ureter, bladder.

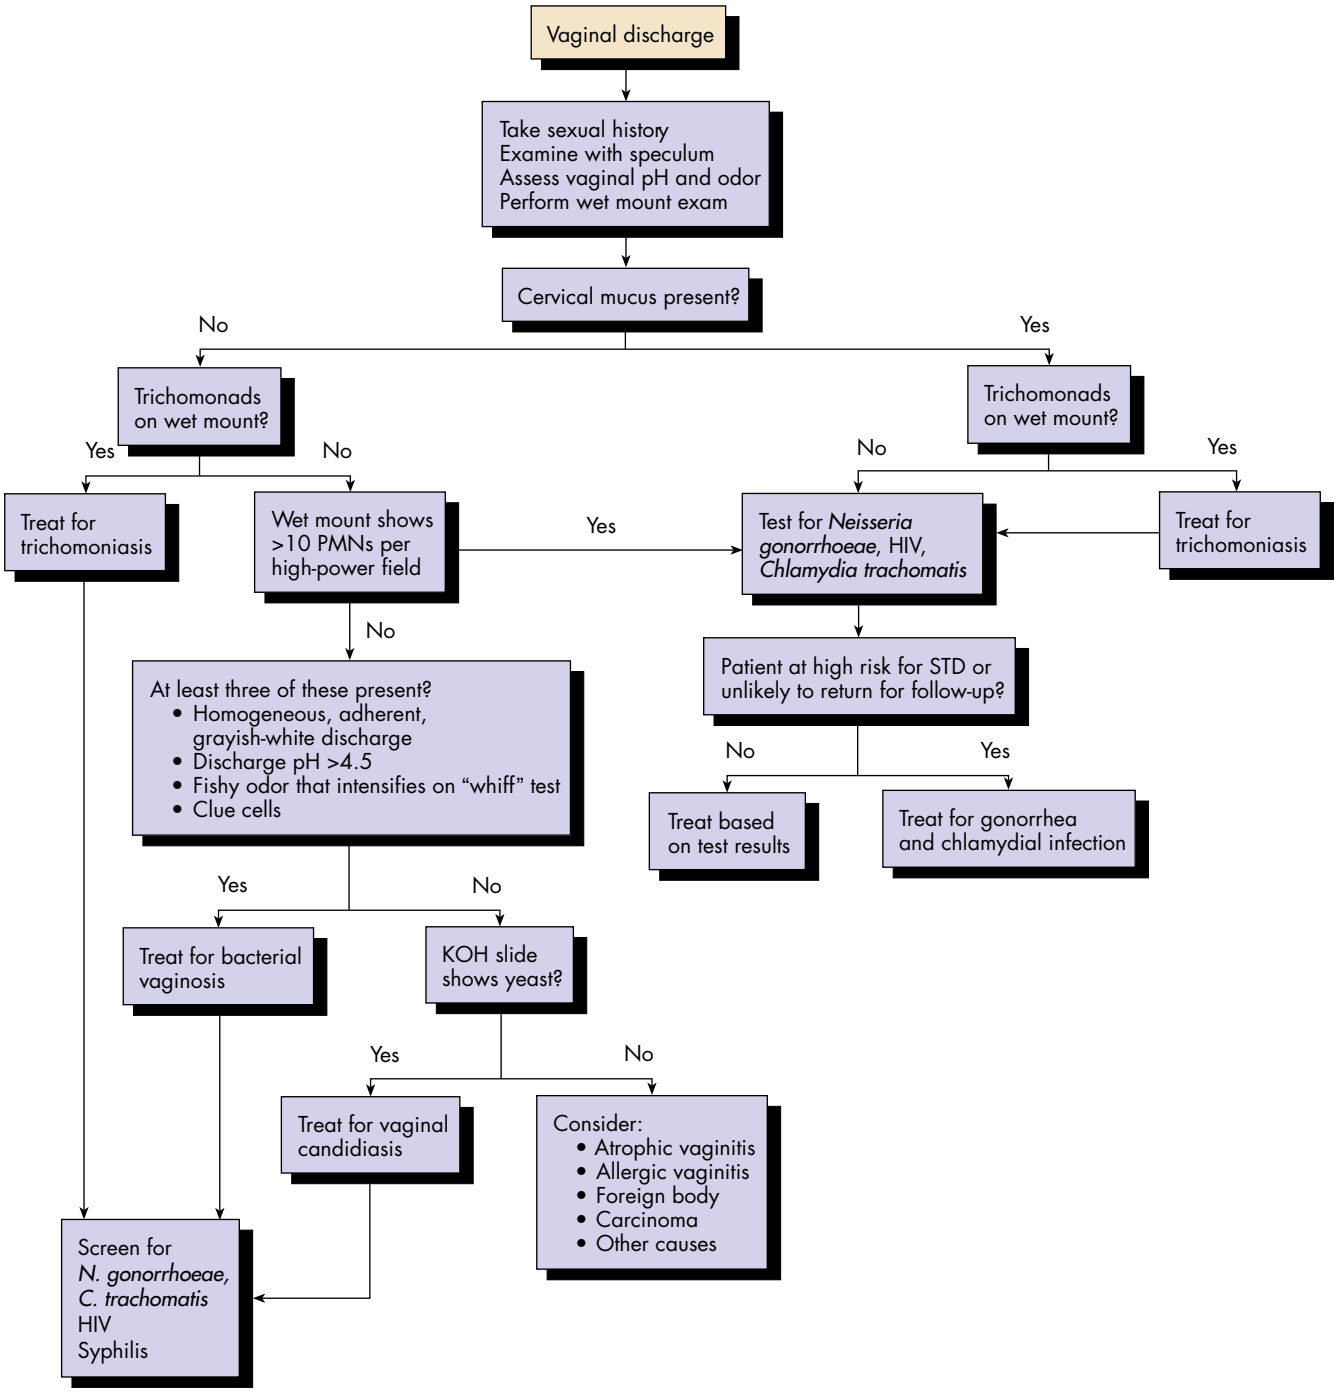

FIG. 184 Evaluation of vaginal discharge. See Section I topics Vaginitis, Fungal and Vaginitis, Trichomonas for additional information. *HIV,* Human immunodeficiency virus; *KOH,* potassium hydroxide; *PMN,* polymorphonuclear leukocyte; *STD,* sexually transmitted disease.

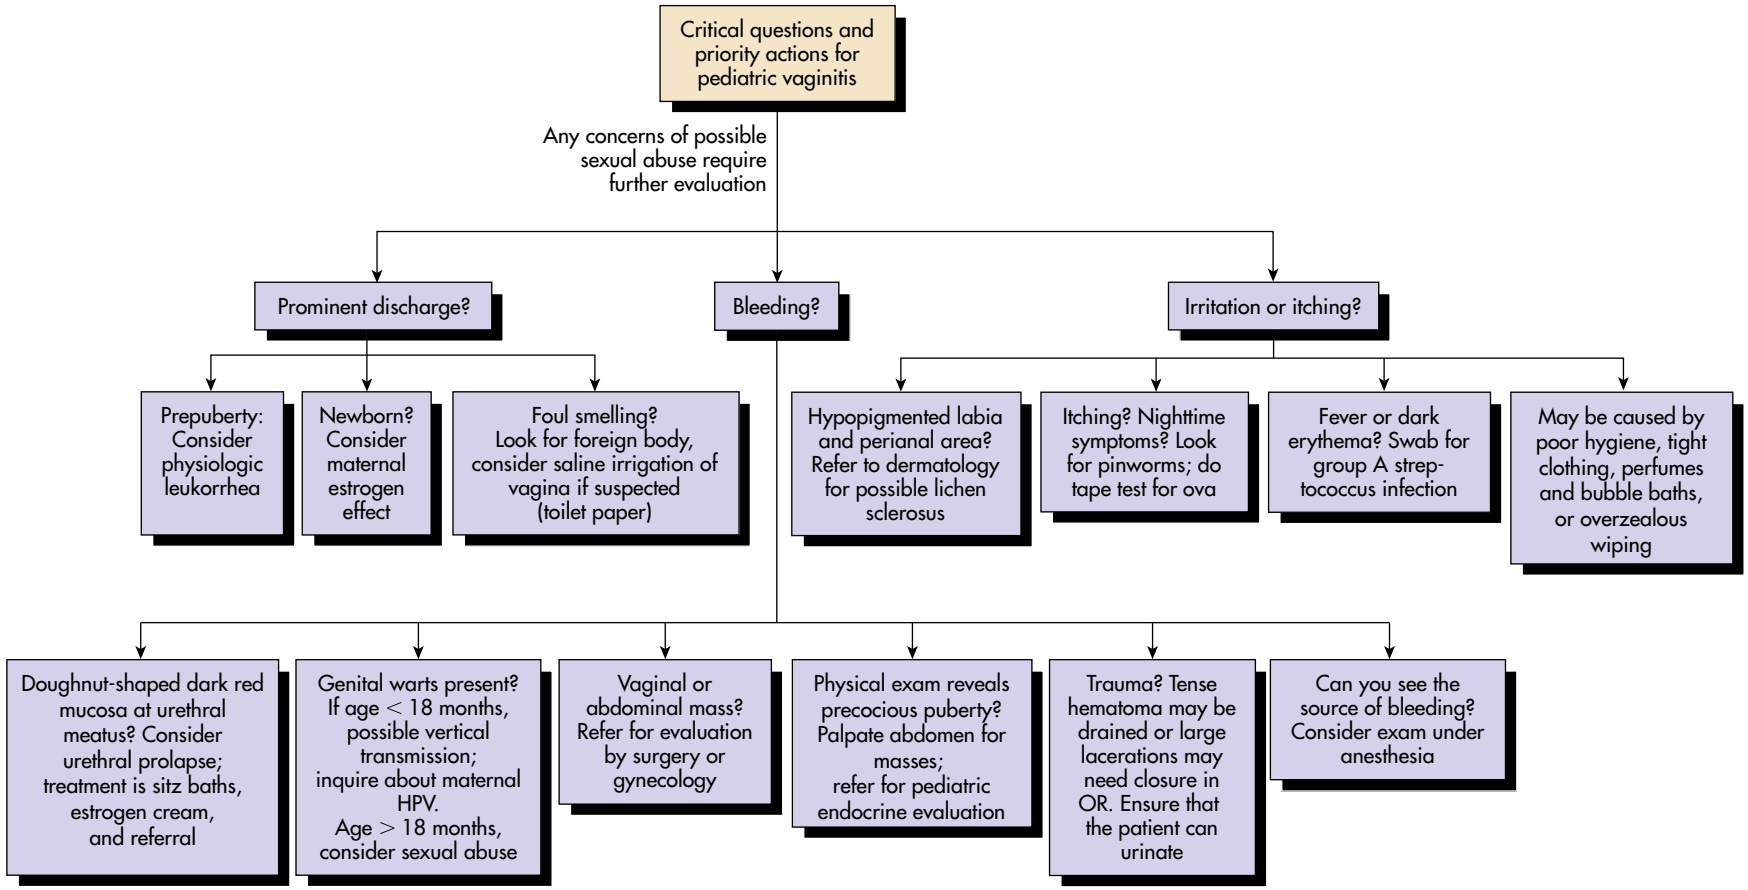

FIG. 185 Algorithm showing critical questions and priority actions for pediatric vaginitis. Additional information available in Section I topic Vaginitis, Prepubescent. *HPV,* Human papillomavirus; *OR,* operating room. (From Adams JG et al: *Emergency medicine: clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.)

J15.6	Pneumonia due to other aerobic gram-negative bacteria
J15.212	Pneumonia due to methicillin-resistant *Staphylococcus aureus*

Patient has a baseline period of stability or improvement on the ventilator, defined by ≥2 calendar days of stable or decreasing daily minimum* FiO_2 or PEEP values. The baseline period is defined as the 2 calendar days immediately preceding the first day of increased daily minimum PEEP or FiO_2.
*Daily minimum defined by lowest value of FiO_2 or PEEP during a calendar day that is maintained for at least 1 hour.

↓

After a period of stability or improvement on the ventilator, the patient has at least one of the following indicators of worsening oxygenation:
1) Increase in daily minimum* FiO_2 of ≥0.20 (20 points) over the daily minimum FiO_2 in the baseline period, sustained for ≥2 calendar days.
2) Increase in daily minimum* PEEP values of ≥3 cm H_2O over the daily minimum PEEP in the baseline period,† sustained for ≥2 calendar days.
*Daily minimum defined by lowest value of FiO_2 or PEEP during a calendar day that is maintained for at least 1 hour.
†Daily minimum PEEP values of 0–5 cm H_2O are considered equivalent for the purposes of VAE surveillance.

↓

Ventilator-Associated Condition (VAC)

↓

On or after calendar day 3 of mechanical ventilation and within 2 calendar days before or after the onset of worsening oxygenation, the patient meets *both* of the following criteria:

1) Temperature >38° C or <36° C, **OR** white blood cell count ≥12,000 cells/mm^3 or ≤4,000 cells/mm^3.
AND
2) A new antimicrobial agent(s) is started, and is continued for ≥4 calendar days.

↓

Infection-related Ventilator-Associated Complication (IVAC)

↓

On or after calendar day 3 of mechanical ventilation and within 2 calendar days before or after the onset of worsening oxygenation, ONE of the following criteria is met (**taking into account organism exclusions specified in the protocol**):

1) Criterion 1: Positive culture of one of the following specimens, meeting quantitative or semiquantitative thresholds as outlined in protocol, *without* requirement for purulent respiratory secretions:
   - Endotracheal aspirate, ≥10^5 CFU/mL or corresponding semiquantitative result
   - Bronchoalveolar lavage, ≥10^4 CFU/mL or corresponding semiquantitative result
   - Lung tissue, ≥10^4 CFU/g or corresponding semiquantitative result
   - Protected specimen brush, ≥10^3 CFU/mL or corresponding semiquantitative result
2) Criterion 2: Purulent respiratory secretions (defined as secretions from the lungs, bronchi, or trachea that contain ≥25 neutrophils and ≤10 squamous epithelial cells per low power field [lpf, 100])† *plus* a positive culture of one of the following specimens (qualitative culture, or quantitative/semiquantitative culture without sufficient growth to meet criterion #1):
   - Sputum
   - Endotracheal aspirate
   - Bronchoalveolar lavage
   - Lung tissue
   - Protected specimen brush

   † If the laboratory reports semiquantitative results, those results must correspond to the above quantitative thresholds. See additional instructions for using the purulent respiratory secretions criterion in the VAE Protocol.
3) Criterion 3: One of the following positive tests:
   - Pleural fluid culture (where specimen was obtained during thoracentesis or initial placement of chest tube and NOT from an indwelling chest tube)
   - Lung histopathology, defined as: 1) abscess formation or foci of consolidation with intense neutrophil accumulation in bronchioles and alveoli; 2) evidence of lung parenchyma invasion by fungi (hyphae, pseudohyphae, or yeast forms); 3) evidence of infection with the viral pathogens listed below based on results of immunohistochemical assays, cytology, or microscopy performed on lung tissue
   - Diagnostic test for *Legionella* species
   - Diagnostic test on respiratory secretions for influenza virus, respiratory syncytial virus, adenovirus, parainfluenza virus, rhinovirus human metapneumovirus coronavirus

R42	Dizziness and giddiness
H81.13	Benign paroxysmal vertigo, bilateral
H81.49	Vertigo of central origin, unspecified ear
H81.399	Other peripheral vertigo, unspecified ear
H81.23	Vestibular neuronitis, bilateral

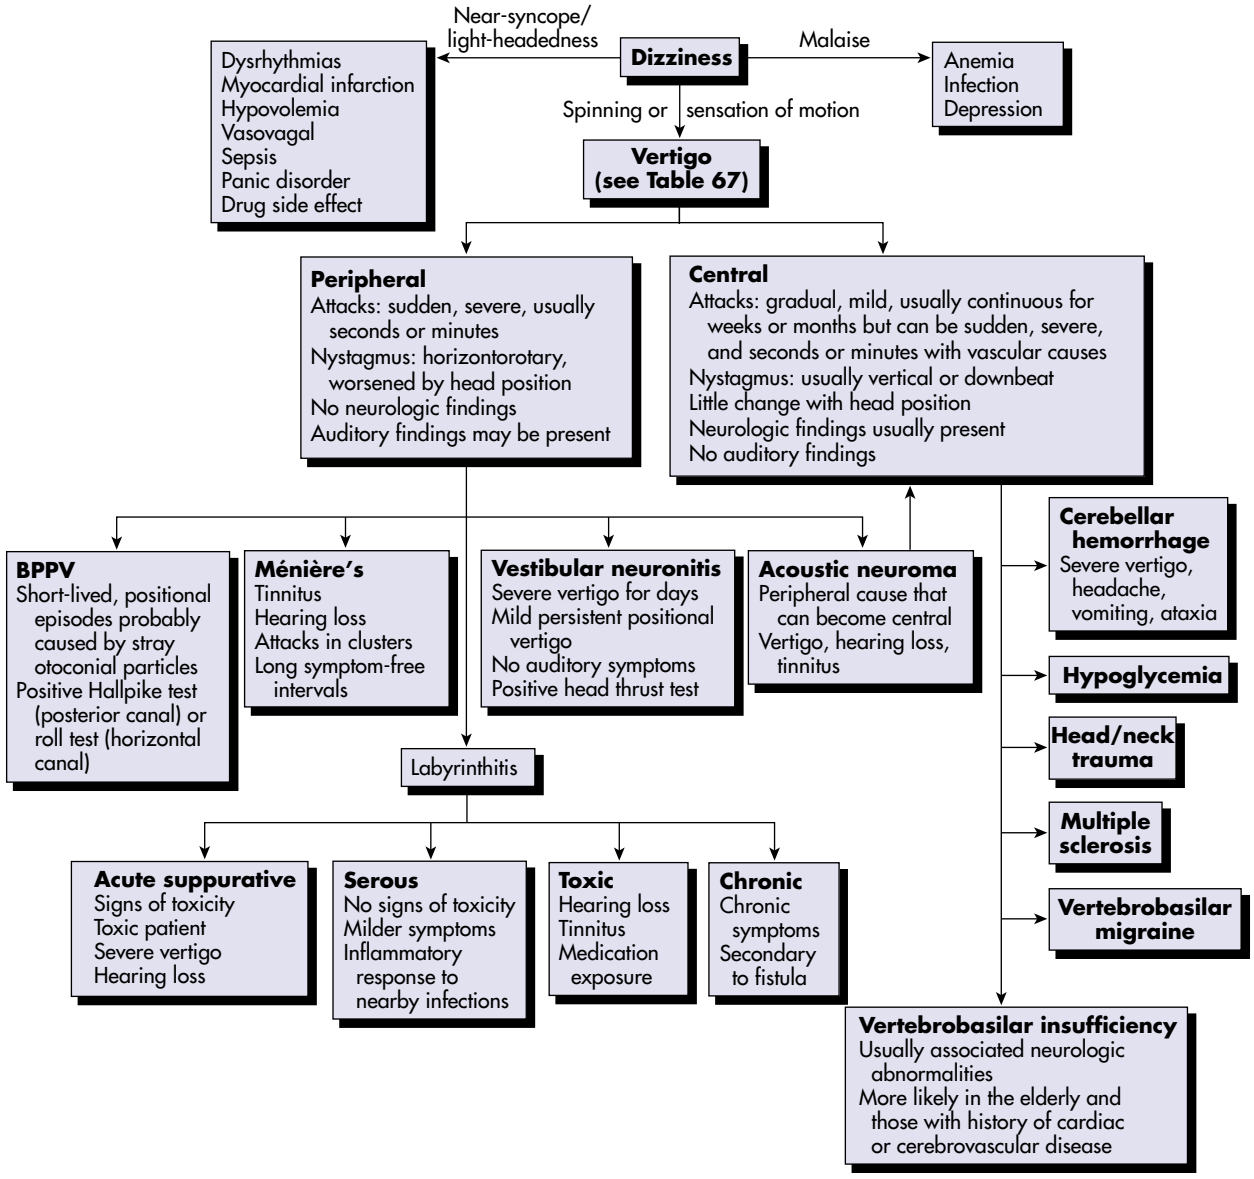

FIG. 188 Diagnostic algorithm for dizziness and vertigo. Also see Section I topics Vestibular Neuronitis, Acoustic Neuroma, Labyrinthitis, Ménière Disease, and Benign Paroxysmal Positional Vertigo. *BPPV,* Benign paroxysmal positional vertigo. (From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

ICD-10CM #

R42	Dizziness and giddiness
H81.13	Benign paroxysmal vertigo, bilateral
H81.49	Vertigo of central origin, unspecified ear
H81.399	Other peripheral vertigo, unspecified ear
H81.23	Vestibular neuronitis, bilateral

TABLE 68 Differential Diagnosis of Patients with True Vertigo

Cause	History	Associated Symptoms	Physical
Peripheral			
1. Benign paroxysmal positional vertigo	Short-lived, positional, fatigable episodes	Nausea, vomiting	Single position can precipitate vertigo. Positive result on Hallpike test (posterior semicircular canal) or Roll test (horizontal canal).
2. Labyrinthitis			
A. Serous	Mild to severe positional symptoms. Usually coexisting or antecedent infection of ear, nose, throat, or meninges.	Mild to severe hearing loss can occur	Usually nontoxic patient with minimal fever elevation
B. Acute suppurative	Coexisting acute exudative infection of the inner ear. Severe symptoms.	Usually severe hearing loss, nausea, vomiting	Febrile patient showing signs of toxicity. Acute otitis media.
C. Toxic	Gradually progressive symptoms: Patients on medication causing toxicity.	Hearing loss that may become rapid and severe, nausea and vomiting	Hearing loss. Ataxia common feature in chronic phase.
3. Ménière disease	Recurrent episodes of severe rotational vertigo usually lasting hours. Onset usually abrupt. Attacks may occur in clusters. Long symptom-free remissions.	Nausea, vomiting, tinnitus, hearing loss	Positional nystagmus not present
4. Vestibular neuritis	Sudden onset of severe vertigo, increasing in intensity for hours, then gradually subsiding over several days but can last weeks to months. Can be worsened with positional change. Sometimes history of infection or toxic exposure that precedes initial attack. Highest incidence is found in third and fifth decades.	Nausea, vomiting. Auditory symptoms do not occur.	Spontaneous nystagmus toward the involved ear may be present.
5. Acoustic neuroma	Gradual onset and increase in symptoms. Neurologic signs in later stages. Most occur in women aged 30 to 60.	Hearing loss, tinnitus. True ataxia and neurologic signs as tumor enlarges.	Unilateral decreased hearing. True truncal ataxia and other neurologic signs when tumor enlarges. May have diminution or absence of corneal reflex. Eighth cranial nerve deficit may be present.
Central			
1. Vascular disorders			
A. Vertebrobasilar insufficiency	Should be considered in any patient of advanced age with isolated new-onset vertigo without an obvious cause. More likely with history of atherosclerosis. Can occur with neck trauma. Initial episode usually lasts seconds to minutes.	Often headache. Usually neurologic symptoms including dysarthria, ataxia, weakness, numbness, double vision. Tinnitus and deafness uncommon.	Neurologic deficits usually present, but initially neurologic examination can be normal
B. Cerebellar hemorrhage	Sudden onset of severe symptoms	Headache, vomiting, ataxia	Signs of toxicity. Dysmetria, true ataxia. Ipsilateral sixth cranial nerve palsy may be present.
C. Occlusion of posterior inferior cerebellar artery (Wallenberg syndrome)	Vertigo associated with significant neurologic complaints	Nausea, vomiting, loss of pain and temperature sensation, ataxia, hoarseness	Loss of pain and temperature sensation on the side of the face ipsilateral to the lesion and on the opposite side of the body, paralysis of the palate, pharynx, and larynx. Horner syndrome (ipsilateral ptosis, miosis, and decreased facial sweating).
2. Head trauma	Symptoms begin with or shortly after head trauma. Positional symptoms most common type after trauma. Self-limited symptoms that can persist weeks to months.	Usually mild nausea	Occasionally, basilar skull fracture
3. Vertebrobasilar migraine	Vertigo almost always followed by headache. Patient has usually had similar episodes in past. Most patients have a family history of migraine. Syndrome usually begins in adolescence.	Dysarthria, ataxia, visual disturbances, or paresthesias usually precede headache	No residual neurologic or otologic signs are present after attack
4. Multiple sclerosis	Vertigo presenting symptom in 7%-10% and appears in the course of the disease in a third. Onset may be severe and suggest labyrinth disease. Disease onset usually between ages 20 and 40. Often history of other attacks with varying neurologic signs or symptoms.	Nausea and vomiting, which may be severe	May have horizontal, rotary, or vertical nystagmus. Nystagmus may persist after the vertiginous symptoms have subsided. Bilateral internuclear ophthalmoplegia and ataxic eye movements suggest multiple sclerosis.
5. Temporal lobe epilepsy	Can be initial or prominent symptom in some patients with the disorder	Memory impairment, hallucinations, trancelike states, seizures	May have aphasia or convulsions
6. Hypoglycemia	Should be considered in diabetics and any other patient with unexplained symptoms	Sweating, anxiety	Tachycardia, mental status change may be present

From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.

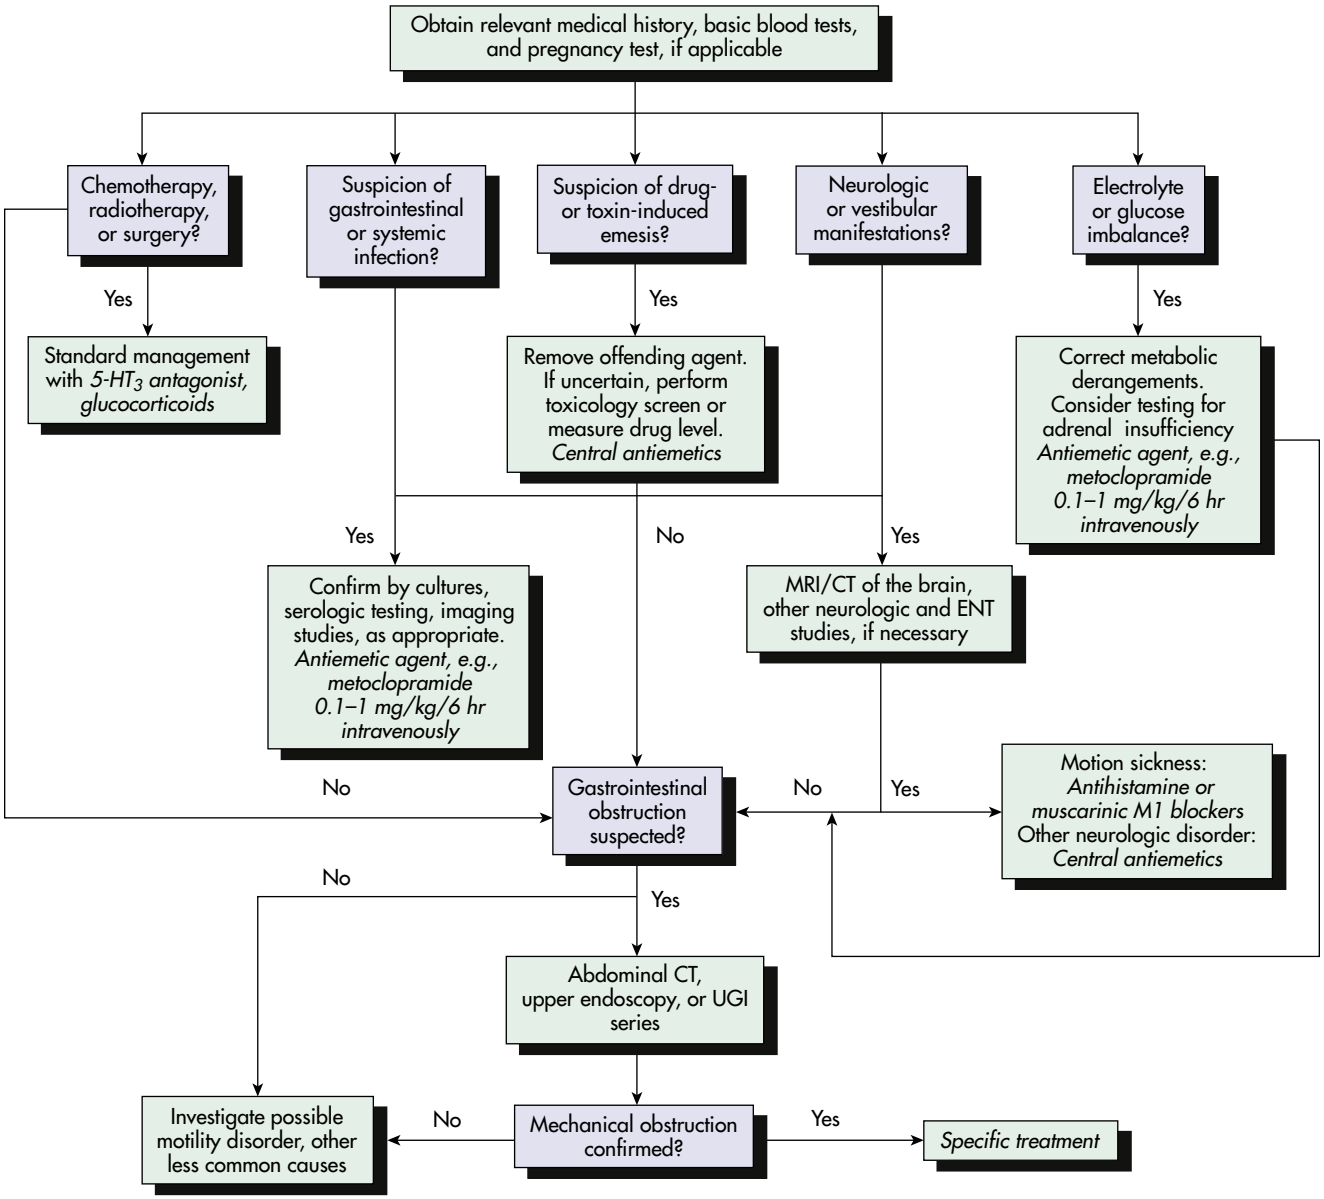

FIG. 189 Algorithm for management of a patient with acute vomiting. Possible treatments are italicized. *ENT,* ear, nose, and throat; *5-HT,* 5-hydroxytryptamine; *UGI,* upper GI. Potential treatments are shown in italics. (From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease,* ed 10, Philadelphia, 2016, Elsevier.)

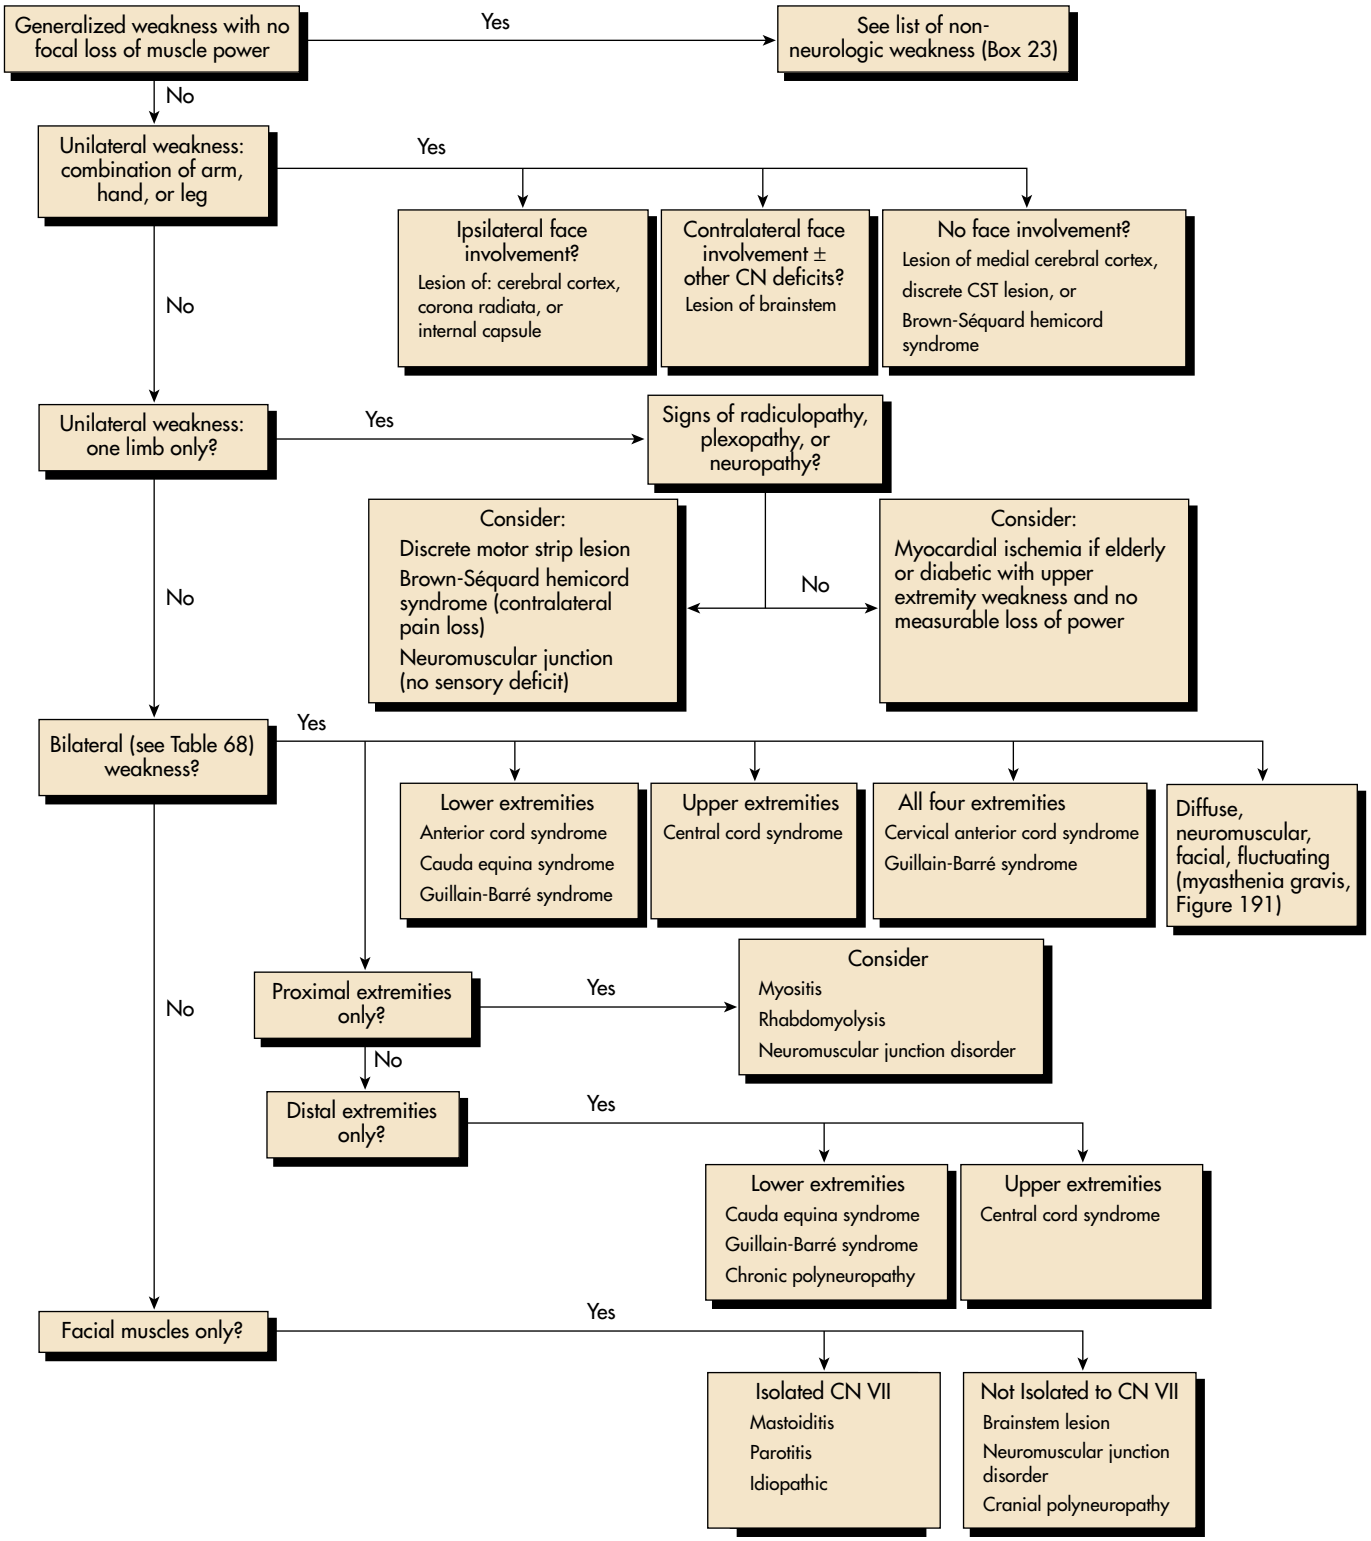

FIG. 190 Common clinical patterns of weakness, classified and assessed. *CN,* Cranial nerve; *CST,* corticospinal tract. (Modified from Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.)

FIG. 191 Myopathic facies in myasthenia gravis. (From Bowling B: *Kanski's clinical ophthalmology, a systemic approach,* ed 8, 2106, Elsevier.)

TABLE 69 Critical and Emergent Causes of Neuromuscular Weakness

Critical Diagnoses	
Cerebral cortex or subcortical	Ischemic or hemorrhagic cerebrovascular accident (CVA)
Brainstem	Ischemic or hemorrhagic CVA
Spinal cord	Ischemia, compression (disk, abscess, or hematoma)
Peripheral nerve	Acute demyelination (Guillain-Barré syndrome)
Neuromuscular junction	Myasthenic or cholinergic crisis Botulism Tick paralysis Organophosphate poisoning
Muscle	Rhabdomyolysis
Emergent Diagnoses	
Cerebral cortex or subcortical	Tumor, abscess, demyelination
Brainstem	Demyelination
Spinal cord	Demyelination (transverse myelitis) Compression (disk, spondylosis)
Peripheral nerve	Compressive plexopathy (hematoma, aneurysm) Paraneoplastic vasculitis uremia
Muscle	Inflammatory myositis

From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Saunders.

BOX 23 Nonneurologic Weakness

- Alterations in plasma volume (dehydration)
- Alterations in plasma composition (glucose, electrolytes)
- Derangement in circulating red blood cells (anemia or polycythemia)
- Decrement in cardiac pump function (myocardial ischemia)
- Drop in systemic vascular resistance (vasodilatory shock from any cause)
- Increased metabolic demand (local or systemic infection, endocrinopathy, toxin)
- Mitochondrial dysfunction (severe sepsis or toxin-mediated)
- Global depression of the central nervous system (sedatives, stimulant withdrawal)

From Marx JA et al: *Rosen's emergency medicine*, ed 8, Philadelphia, 2014, Elsevier.

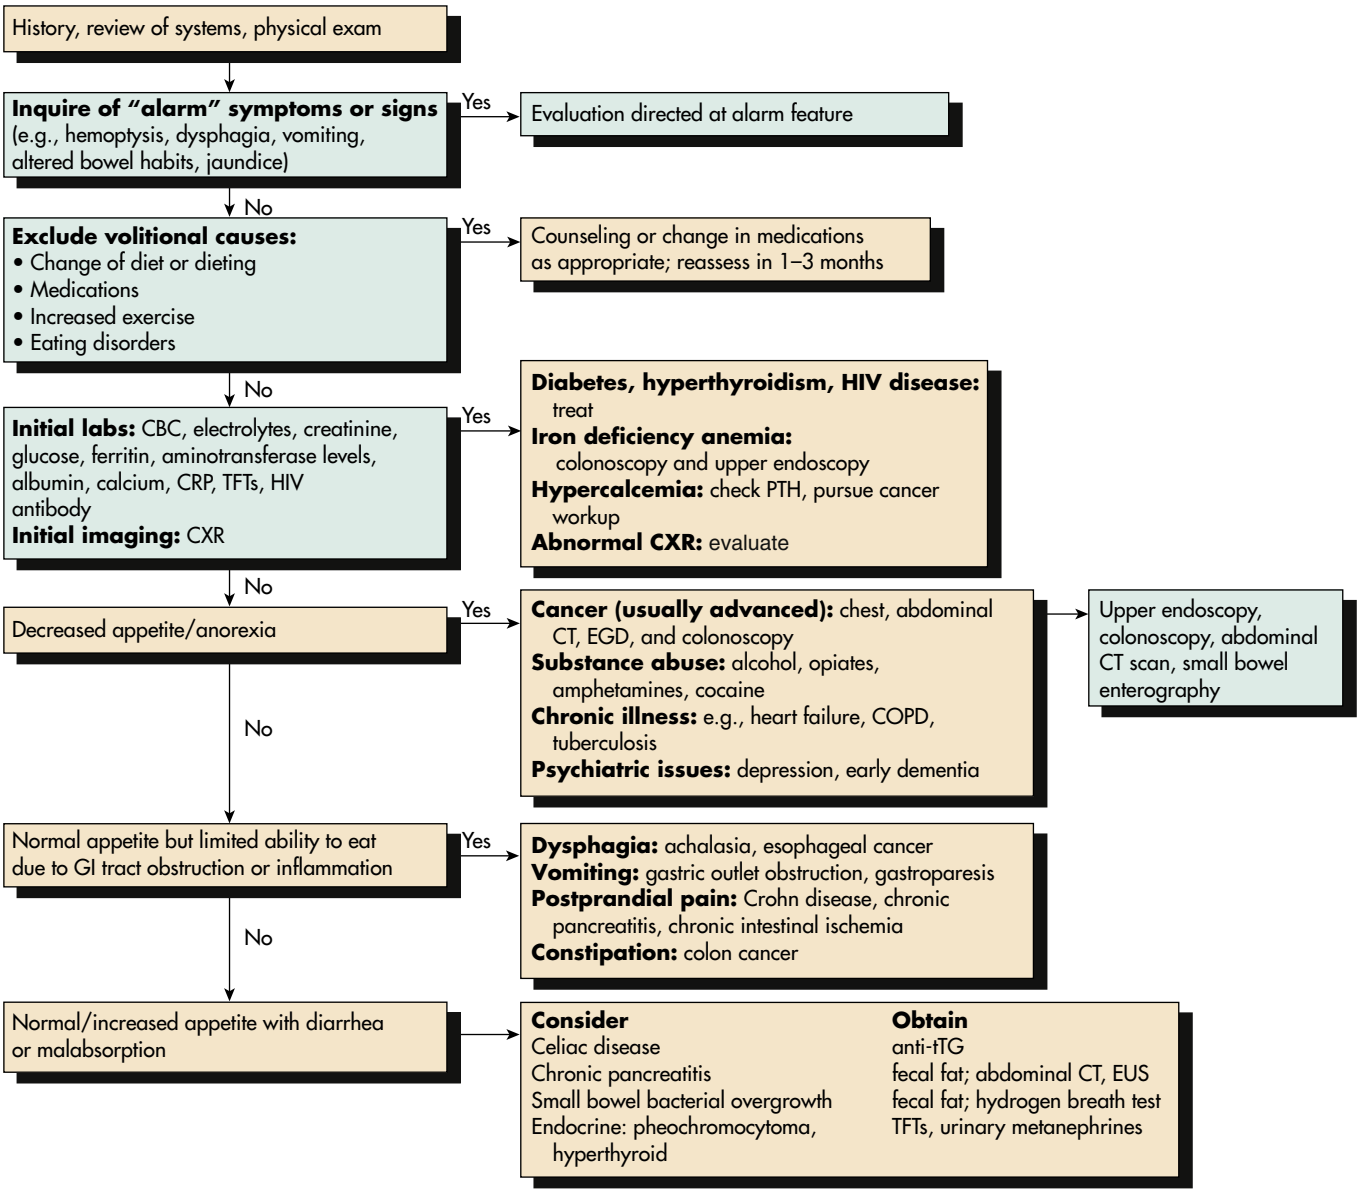

FIG. 192 Approach to the patient with unintentional weight loss of more than 5%. *CBC,* Complete blood count; *COPD*, chronic obstructive pulmonary disease; *CRP*, C-reactive protein; *CT*, computed tomography; *CXR*, chest radiograph; *EGD*, esophagogastroduodenoscopy; *EUS*, endoscopic ultrasound; *GI*, gastrointestinal; *HIV*, human immunodeficiency virus; *PTH*, parathyroid hormone; *TFTs*, thyroid function tests; *tTG*, tissue transglutaminase. (From Goldman L, Schafer AI: *Goldman Cecil medicine*, ed 25, Philadelphia, 2016, Saunders.)

ACE LEVEL
See ANGIOTENSIN-CONVERTING ENZYME

ACETONE (serum or plasma)
Normal: Negative
Elevated in: diabetic ketoacidosis (DKA), starvation, isopropanol ingestion

ACETYLCHOLINE RECEPTOR (AChR) ANTIBODY
Normal: <0.03 nmol/L
Elevated in: Myasthenia gravis. Changes in AChR concentration correlate with the clinical severity of myasthenia gravis following therapy and during therapy with prednisone and immunosuppressants. False-positive AChR antibody results may be found in patients with Eaton-Lambert syndrome.

ACID-BASE REFERENCE VALUES
See Tables 1, 2, and 3.

ACID PHOSPHATASE (serum)
Normal range: 0 to 5.5 U/L (0 to 90 nkat/L [CF: 16.67; SMI: 2 nkat/L])
Elevated in: Carcinoma of prostate, other neoplasms (breast, bone), Paget disease, osteogenesis imperfecta, malignant invasion of bone, Gaucher disease, multiple myeloma, myeloproliferative disorders, benign prostatic hypertrophy, prostatic palpation or surgery, hyperparathyroidism, liver disease, chronic renal failure, idiopathic thrombocytopenic purpura, bronchitis

ACID SERUM TEST
See HAM TEST

ACTIVATED CLOTTING TIME (ACT)
Normal: This test is used to determine the dose of protamine sulfate to reverse the effect of heparin as an anticoagulant during angioplasty, cardiac surgery, and hemodialysis. The accepted goal during cardiopulmonary bypass surgery is usually 400-500 sec.

ACTIVATED PARTIAL THROMBOPLASTIN TIME (APTT, aPTT)
See PARTIAL THROMBOPLASTIN TIME

ADRENOCORTICOTROPIC HORMONE (ACTH)
Normal: 9 to 52 pg/ml. Table 4 describes patterns of serum levels of ACTH and cortisol in different adrenal gland disorders.
Elevated in: Addison disease, ectopic ACTH-producing tumors, congenital adrenal hyperplasia, Nelson syndrome, pituitary-dependent Cushing disease
Decreased in: Secondary adrenocortical insufficiency, hypopituitarism, adrenal adenoma or adrenal carcinoma

ALANINE AMINOPEPTIDASE
Normal:
Male: 1.11 to 1.71 mcg/ml
Female: 0.96 to 1.52 mcg/ml
Elevated in: Liver or pancreatic disease, ethanol use, oral contraceptives use, malignancy, tobacco use, pregnancy
Decreased in: Abortion

ALANINE AMINOTRANSFERASE (ALT, SGPT)
See Fig. 1, an algorithm for evaluation of elevated ALT. Table 5 describes patterns of liver function tests in liver disorders.
Normal range: 0 to 35 U/L (0.058 μkat/L [CF: 0.02 μkat/L])
Elevated in: Liver disease (hepatitis, cirrhosis, Reye syndrome), hepatic congestion, infectious mononucleosis, myocardial infarction, myocarditis, severe muscle trauma, dermatomyositis/polymyositis, muscular dystrophy, drugs (antibiotics, narcotics, antihypertensive agents, heparin, labetalol, statins, NSAIDs, amiodarone, chlorpromazine, phenytoin), malignancy, renal and pulmonary infarction, seizures, eclampsia, shock liver

TABLE 1 Commonly Used Acid-Base Reference Values for Arterial and Venous Plasma or Serum (Averaged from Various Sources)

	ARTERIAL		VENOUS	
	Conventional Units	SI Units*	Conventional Units	SI Units*
pH	7.40 (7.35-7.45)	7.40 (7.35-7.45)	7.37 (7.32-7.42)	7.37 (7.32-7.42)
Pco_2	40 mm Hg (35-45)	5.33 kPa (4.67-6.10)	45 mm Hg (45-50)	6.10 kPa (5.33-6.67)
Po_2	80-100 mm Hg	10.66-13.33 kPa	40 mm Hg (37-43)	5.33 kPa (4.93-5.73)
HCO_3 (CO_2 combining power)	24 mEq/L (20-28)	24 mmol/L (20-28)	26 mEq/L (22-30)	26 mmol/L (22-30)
CO_2 content	25 mEq/L (22-28)	25 mmol/L (22-28)	27 mEq/L (24-30)	27 mmol/L(24-30)

*International system.
From Ravel R: *Clinical laboratory medicine*, ed 6, St Louis, 1995, Mosby.

TABLE 2 Summary of Laboratory Findings in Primary Uncomplicated Respiratory and Metabolic Acid-Base Disorders*

Disorder	Pco_2	pH	Base Excess
Acute primary respiratory hypoactivity (respiratory acidosis)	Increase	Decrease	Normal/positive
Acute primary respiratory hyperactivity (respiratory alkalosis)	Decrease	Increase	Normal/negative
Uncompensated metabolic acidosis	Normal	Decrease	Negative
Uncompensated metabolic alkalosis	Normal	Increase	Positive
Partially compensated metabolic acidosis	Decrease	Decrease	Negative
Partially compensated metabolic alkalosis	Increase	Increase	Positive
Chronic primary respiratory hypoactivity (compensated respiratory acidosis)	Increase	Normal	Positive
Fully compensated metabolic alkalosis	Increase	Normal	Positive
Chronic primary respiratory hyperactivity (compensated respiratory alkalosis)	Decrease	Normal	Negative
Fully compensated metabolic acidosis	Decrease	Normal	Negative

*Base excess results refer to negative (–) values more than 22 and positive (+) values more than 12.
From Ravel R: *Clinical laboratory medicine*, ed 6, St Louis, 1995, Mosby.

TABLE 3 Acid-Base Abnormalities and Appropriate Compensatory Responses for Simple Disorders

Primary Acid-Base Disorders	Primary Defect	Effect on pH	Compensatory Response	Expected Range of Compensation	Limits of Compensation
Respiratory acidosis	Alveolar hypoventilation (↑ P_{CO_2})	↓	↑ Renal HCO_3^- reabsorption (HCO_3^-↑)	Acute: Δ[HCO_3^-] = +1 mEq/L for each ↑ΔP_{CO_2} of 10 mm Hg	[HCO_3^-] = 38 mEq/L
				Chronic: Δ[HCO_3^-] = +4 mEq/L for each ↑ΔP_{CO_2} of 10 mm Hg	[HCO_3^-] = 45 mEq/L
Respiratory alkalosis	Alveolar hyperventilation (↓ P_{CO_2})	↑	↓ Renal HCO_3^- reabsorption (HCO_3^-↓)	Acute: Δ[HCO_3^-] = −2 mEq/L for each ↓ΔP_{CO_2} of 10 mm Hg	[HCO_3^-] = 18 mEq/L
				Chronic: Δ[HCO_3^-] = −5 mEq/L for each ↓ΔP_{CO_2} of 10 mm Hg	[HCO_3^-] = 15 mEq/L
Metabolic acidosis	Loss of HCO_3^- or gain of H^+ (↓ HCO_3^-)	↓	Alveolar hyperventilation to ↑ pulmonary CO_2 excretion (↓P_{CO_2})	P_{CO_2} = 1.5[HCO_3^-] + 8 ± 2 P_{CO_2} = last 2 digits of pH × 100 P_{CO_2} = 15 + [HCO_3^-]	P_{CO_2} = 15 mm Hg
Metabolic alkalosis	Gain of HCO_3^- or loss of H^+ (↑ HCO_3^-)	↑	Alveolar hypoventilation to ↓ pulmonary CO_2 excretion (↑ P_{CO_2})	P_{CO_2} = +0.6 mm Hg for Δ[HCO_3^-] of 1 mEq/L. P_{CO_2} = 15 + [HCO_3^-]	P_{CO_2} = 55 mm Hg

From Vincent JL et al: *Textbook of critical care*, ed 7, Philadelphia, 2017, Elsevier. Adapted and updated from Bidani A, Tauzon DM, Heming TA. Regulation of whole body acid-base balance. In DuBose TD, Hamm LL (eds): *Acid base and electrolytes disorders: a companion to Brenner and Rector's the kidney,* Philadelphia, 2002, WB Saunders, p. 1-21.

TABLE 4 Patterns of Serum Levels of Adrenocorticotropic Hormone (ACTH) and Cortisol in Different Adrenal Gland Conditions

Condition	Cortisol	ACTH	Dexamethasone Suppression, Low Dose	Dexamethasone Suppression, High Dose	Site of Disease
Normal adrenal	Normal	Normal	N/A	N/A	None
Primary hypoadrenalism	Low	High	N/A	N/A	Adrenal gland
Secondary hypoadrenalism	Low	Low	N/A	N/A	Pituitary
Primary hyperadrenalism—high cortisol, low ACTH	High	Low	N/A	N/A	Adrenal
Primary hyperadrenalism—high cortisol, borderline low ACTH	High	Borderline low	Positive	N/A	Adrenal
Primary hyperadrenalism due to adrenal hyperplasia—high cortisol, borderline low ACTH	High	Borderline low	Negative	Positive	Adrenal
Primary hyperadrenalism due to adrenal adenoma/carcinoma—high cortisol, borderline low ACTH	High	Borderline low	Negative	Negative	Adrenal
Secondary hyperadrenalism	High	High	N/A	N/A	Pituitary

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

ALBUMIN (serum)

Normal range: 4 to 6 g/dl (40 to 60 g/L [CF:10; SMI: 1 g/L])
Elevated in: Dehydration (relative increase)
Decreased in: Liver disease, nephrotic syndrome, poor nutritional status, rapid IV hydration, protein-losing enteropathies (e.g., inflammatory bowel disease), severe burns, neoplasia, chronic inflammatory diseases, pregnancy, oral contraceptives, prolonged immobilization, lymphomas, hypervitaminosis A, chronic glomerulonephritis

ALCOHOL DEHYDROGENASE

Normal: 0 to 7 U/L
Elevated in: Drug-induced hepatocellular damage, obstructive jaundice, malignancy, inflammation, infection

ALDOLASE (serum)

Normal range: 0 to 6 U/L (0 to 100 nkat/L [CF: 16.67; SMI: 20 nkat/L])
Elevated in: Muscular dystrophy, rhabdomyolysis, dermatomyositis/polymyositis, trichinosis, acute hepatitis and other liver diseases, myocardial infarction, prostatic carcinoma, hemorrhagic pancreatitis, gangrene, delirium tremens, burns
Decreased in: Loss of muscle mass, late stages of muscular dystrophy

ALDOSTERONE

Normal range:
Recumbent: 50 to 150 ng/L
Upright: 150 to 300 ng/L
(Highest levels in neonates, decreasing over time to adult levels). The normal renin-angiotensin-aldosterone axis is illustrated in Fig. 2.
Elevated in: Primary aldosteronism, secondary aldosteronism, pseudoprimary aldosteronism. Table 6 differentiates the various causes of hyperaldosteronism.
Decreased in: Patient with hypertension: Diabetes mellitus, Turner syndrome, acute alcohol intoxication, excess secretion of deoxycorticosterone, corticosterone, and 18-hydroxycorticosterone

Patient without hypertension: Addison disease, hypoaldosteronism resulting from renin deficiency, isolated aldosterone deficiency. Table 7 differentiates the various causes of hypoaldosteronism.

ALKALINE PHOSPHATASE (ALP) (serum)

See Fig. 3 for investigating a raised ALP in general practice.
See Fig. E4 for approach to elevated ALP.

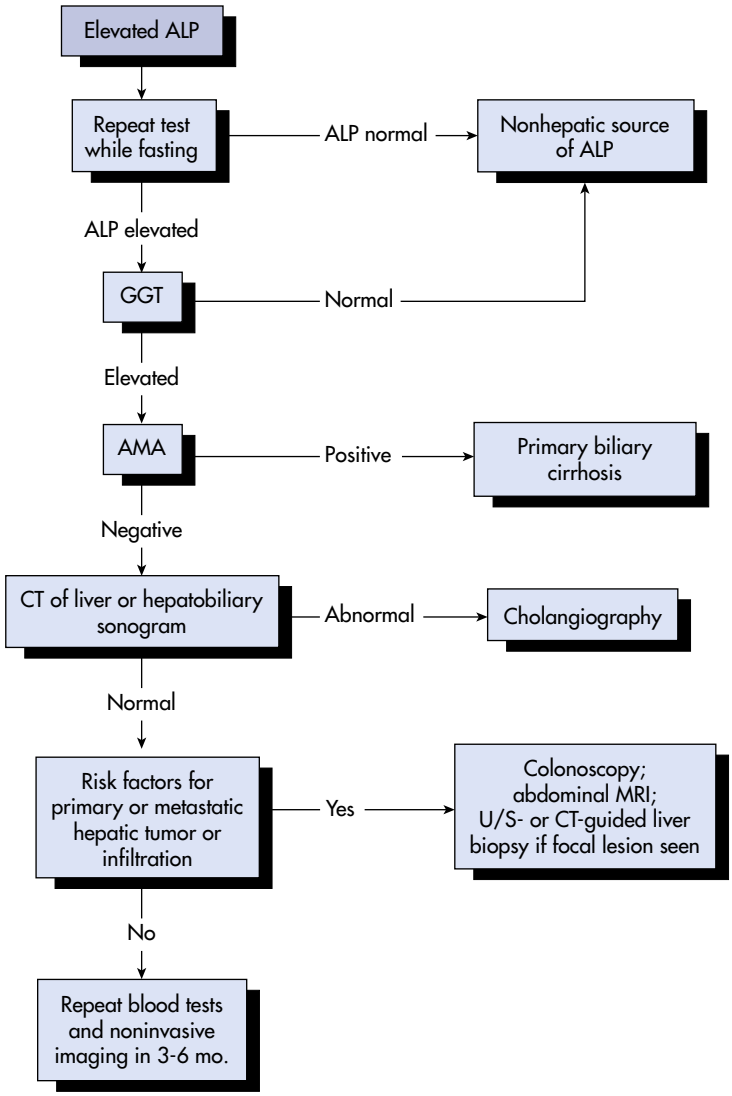

FIG. E4 Approach to the asymptomatic patient with isolated elevated levels of serum alkaline phosphatase *(ALP)*. *AMA,* Antimitochondrial antibody; *CT,* computed tomography; *GGT,* g-glutamyl transpeptidase; *MRI,* magnetic resonance imaging; *U/S,* ultrasonography. (Modified from Goldman L, Ausiello D [eds]: *Cecil textbook of medicine*, ed 24, Philadelphia, 2012, WB Saunders.)

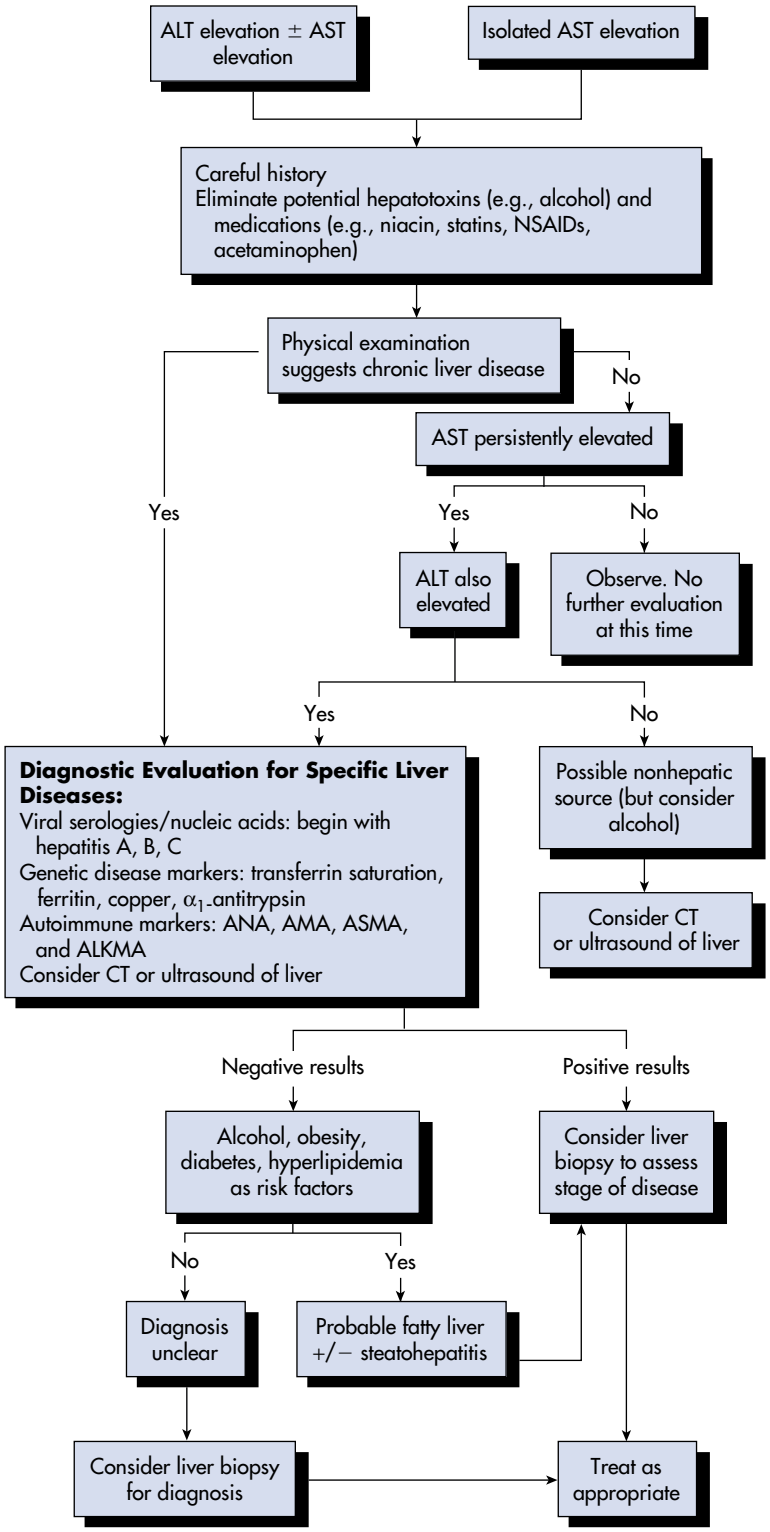

FIG. 1 Approach to the evaluation of isolated elevated levels of serum alanine aminotransferase *(ALT)* and/or aspartate aminotransferase *(AST)* in the asymptomatic patient. *ALKMA,* Anti-liver/kidney microsomal antibody; *AMA*, antimitochondrial antibody; *ANA,* antinuclear antibody; *ASMA,* anti-smooth muscle antibody; *CT,* computed tomography; *NSAIDs,* nonsteroidal antiinflammatory drugs. (Modified from Goldman L, Ausiello D [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, WB Saunders.)

TABLE 5 Six Fundamental Patterns of Liver Function Tests

Condition	AST	ALT	LD	AP	TP	Albumin	Bilirubin	Ammonia
1. Hepatitis	H	H	H	H	N	N	H	N
2. Cirrhosis	N	N	N	N-sl H	L	L	H	H
3. Biliary obstruction	N	N	N	H	N	N	H	N
4. Space-occupying lesion	N or H	N or H	H	H	N	N	N-H	N
5. Passive congestion	Sl H	sl H	sl H	N-sl H	N	N	N-sl H	N
6. Fulminant failure	Very H	H	H	H	L	L	H	H

ALT, Alanine aminotransferase; *AP,* alkaline phosphatase; *AST,* aspartate aminotransferase; *H,* high; *L,* low; *LD,* lactate dehydrogenase; *N,* normal; *sl,* slightly; *TP,* total protein.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.

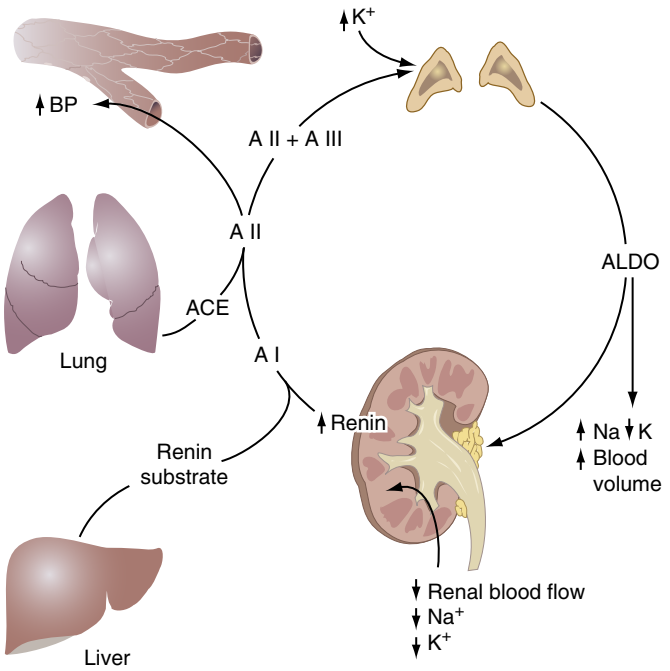

FIG. 2 The normal renin-angiotensin-aldosterone axis. Renin, secreted by the kidney, cleaves angiotensin I from renin substrate (angiotensinogen) produced by the liver. Angiotensin I is converted to angiotensin II by angiotensin-converting enzyme *(ACE)* mainly in the lung. Angiotensin II increases peripheral vascular resistance and, together with angiotensin III, stimulates aldosterone *(ALDO)* secretion, which results in sodium retention and increased plasma volume. (Adapted from Stewart PM: The adrenal cortex. In Larsen PR et al [eds]: *Williams textbook of endocrinology,* ed 10, Philadelphia, 2003, WB Saunders, p 499. McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.)

TABLE 6 Differentiating the Various Causes of Hyperaldosteronism

Disorder	Aldosterone	Renin	Serum K^+
Primary hyperaldosteronism	↑	↓	↓
Renin-secreting tumor	↑	↑	↓—N
Dexamethasone-suppressible hyperaldosteronism	↑	↓	↓
Renovascular hypertension	N—↑	N—↑	↓—N
Bartter syndrome	↑	↑	↓
Diuretics, congestive heart failure, cirrhosis, nephrotic syndrome	↑	↑	N—↓

N, Normal.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 7 Differentiating the Various Causes of Hypoaldosteronism

Disorder	Aldosterone	Renin	Serum K^+
Addison disease	↓	↑	↑
Cushing syndrome	↓	↓	N or ↓
Liddle syndrome	↓	↓	↓
Hyporeninemic hypoaldosteronism	↓	↓	↑
Apparent mineralocorticoid excess	↓	↓	↓
Isolated hypoaldosteronism	↓	↑	↑

N, Normal.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Normal range: 30 to 120 U/L (0.5 to 2 μkat/L [CF:0.01667; SMI: 0.1 μkat/L])

Elevated in

LIVER AND BILIARY TRACT ORIGIN.
Extrahepatic bile duct obstruction
Intrahepatic biliary obstruction
Liver cell acute injury
Liver passive congestion
Drug-induced liver cell dysfunction
Space-occupying lesions
Primary biliary cirrhosis
Sepsis
BONE ORIGIN (OSTEOBLAST HYPERACTIVITY).
Physiologic (rapid) bone growth (childhood and adolescence)
Metastatic tumor with osteoblastic reaction
Fracture healing
Paget disease of bone
CAPILLARY ENDOTHELIAL ORIGIN.
Granulation tissue formation (active)
PLACENTAL ORIGIN.
Pregnancy
Some parenteral albumin preparations

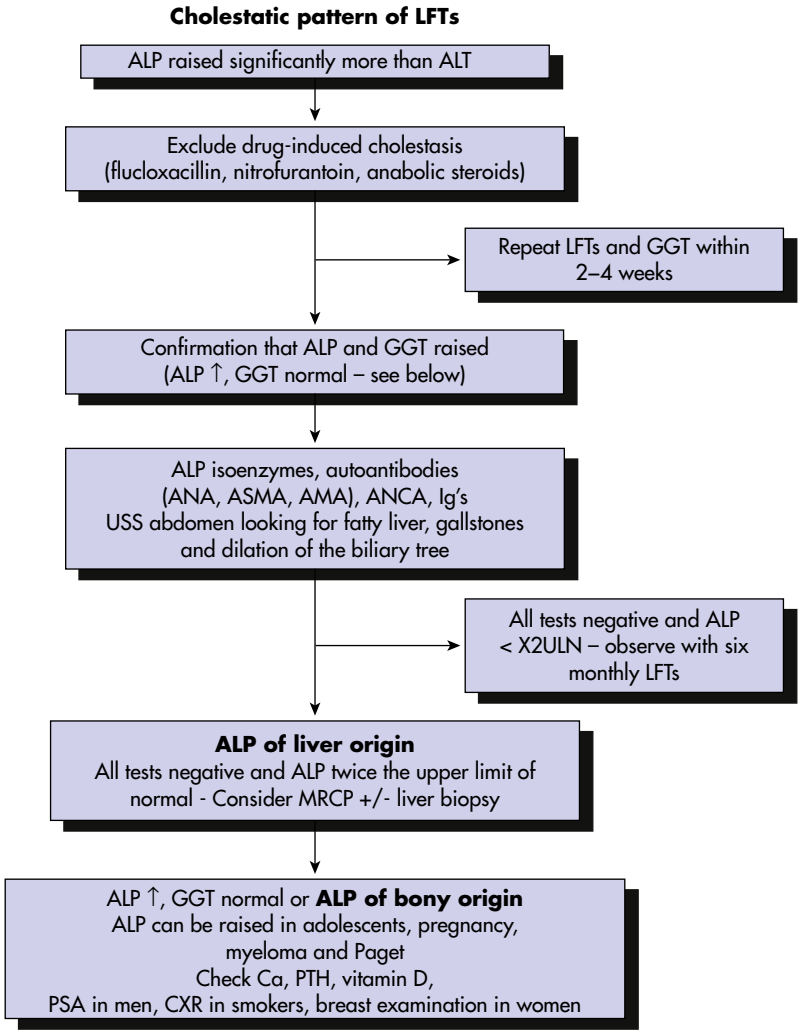

FIG. 3 Investigating a raised ALP in general practice. *ALP,* Alkaline phosphatase; *ALT,* alanine transaminase; *AMA,* antimitochondrial antibody; *ANA,* antinuclear antibody; *ANCA,* antineutrophil cytoplasmic antibody; *ASMA,* anti-smooth muscle antibody; *CXR,* chest x-ray; *GGT,* γ-glutamyl transpeptidase; *Ig,* immunoglobulin; *LFT,* liver function test; *MRCP,* magnetic resonance cholangiopancreatography; *PSA,* prostate-specific antigen; *PTH,* parathyroid hormone; *USS,* ultrasound scan. (From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology,* ed 8, Philadelphia, 2017, Elsevier.)

OTHER
Thyrotoxicosis
Benign transient hyperphosphatasemia
Primary hyperparathyroidism
Decreased in: Hypothyroidism, pernicious anemia, hypophosphatemia, hypervitaminosis D, malnutrition

ALPHA-1-ANTITRYPSIN (serum)
Normal range: 110 to 140 mg/dl
Decreased in: Homozygous or heterozygous deficiency

ALPHA-1-FETOPROTEIN (serum)
See α-1 FETOPROTEIN

ALT
See ALANINE AMINOTRANSFERASE

ALUMINUM (serum)
Normal range: 0 to 6 ng/ml
Elevated in: Chronic renal failure on dialysis, parenteral nutrition, industrial exposure

AMA
See ANTIMITOCHONDRIAL ANTIBODY

AMEBIASIS SEROLOGIC TEST
Test description: Test is used to support diagnosis of amebiasis caused by *Entamoeba histolytica*. Serum acute and convalescent titers are drawn 1 to 3 wk apart. A fourfold increase in titer is the most indicative result.

AMINOLEVULINIC ACID (δ-ALA) (24-hr urine collection)
Normal: 1.5 to 7.5 mg/day
Elevated in: Acute porphyrias, lead poisoning, DKA, pregnancy, anticonvulsant drugs, hereditary tyrosinemia
Decreased in: Alcoholic liver disease

AMMONIA (serum)
See Box 1 for differential diagnosis of hyperammonemia.

BOX 1 Differential Diagnosis of Hyperammonemia

- Acute liver failure
- Chronic kidney disease
- Cigarette smoking
- Cirrhosis
- GI bleeding
- Inborn errors of metabolism
  - Proline metabolism disorders
  - Urea cycle defects (e.g., carbamoyl phosphate synthetase I deficiency, ornithine transcarbamylase deficiency, arginino-succinate lyase deficiency, *N*-acetylglutamate synthetase deficiency)
- Medications/toxins
  - Alcohol
  - Diuretics (e.g., acetazolamide)
  - Narcotics
  - Valproic acid
- Muscle exertion and ischemia

GI, Gastrointestinal.
From Feldman M et al: *Sleisenger and Fordtran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.

See Fig. E5 for approach to hyperammonemia in pediatric patients.
Normal range: 10 to 80 μg/dl (5 to 50 μmol/L [CF: 0.5872; SMI: 5 μmol/L])
Elevated in: Hepatic failure, hepatic encephalopathy, Reye syndrome, portacaval shunt, drugs (diuretics, polymyxin B, methicillin)
Decreased in: Drugs (neomycin, lactulose, tetracycline), renal failure

AMYLASE (serum)

Normal range: 0 to 130 U/L (0 to 2.17 μkat/L [CF: 0.01667; SMI: 0.01 μkat/L])
Elevated in: Acute pancreatitis, pancreatic neoplasm, abscess, pseudocyst, ascites, macroamylasemia, perforated peptic ulcer, intestinal obstruction, intestinal infarction, acute cholecystitis, appendicitis, ruptured ectopic pregnancy, salivary gland inflammation, peritonitis, burns, diabetic ketoacidosis, renal insufficiency, drugs (morphine), carcinomatosis (of lung, esophagus, ovary), acute ethanol ingestion, mumps, prostate tumors, post-endoscopic retrograde cholangiopancreatography, bulimia, anorexia nervosa (Table 8)
Decreased in: Advanced chronic pancreatitis, hepatic necrosis, cystic fibrosis

AMYLASE, URINE

See URINE AMYLASE

AMYLOID A PROTEIN (serum)

Normal: <10 mcg/ml
Elevated in: Inflammatory disorders (acute phase-reacting protein), infections, acute coronary syndrome, malignancies

ANA

See ANTINUCLEAR ANTIBODY

ANCA

See ANTINEUTROPHIL CYTOPLASMIC ANTIBODY

ANDROSTENEDIONE (serum)

Normal:
Male: 75 to 205 ng/dl
Female: 85 to 275 ng/dl
Elevated in: Congenital adrenal hyperplasia, polycystic ovary syndrome, ectopic ACTH-producing tumor, Cushing syndrome, hirsutism, hyperplasia of ovarian stroma, ovarian neoplasm
Decreased in: Ovarian failure, adrenal failure, sickle cell anemia

ANGIOTENSIN II

Normal: 10 to 60 pg/ml

TABLE 8 Differential Diagnosis of Hyperamylasemia

Pancreatic Pathology
- Acute or chronic pancreatitis
- Complications of pancreatitis (pseudocyst, ascites, abscess)
- Factitious pancreatitis

Salivary Gland Pathology
- Parotitis (mumps, *Staphylococcus aureus*, cytomegalovirus, HIV, Epstein-Barr virus)
- Sialadenitis (calculus, radiation)
- Eating disorders (anorexia nervosa, bulimia)

Intraabdominal Pathology
- Biliary tract disease (cholelithiasis)
- Peptic ulcer perforation
- Peritonitis
- Intestinal obstruction
- Appendicitis

Systemic Diseases
- Metabolic acidosis (diabetes mellitus, shock)
- Renal insufficiency, transplantation
- Burns
- Pregnancy
- Drugs (morphine)
- Head injury
- Cardiopulmonary bypass

HIV, Human immunodeficiency virus.
From Kliegman RM: *Nelson textbook of pediatrics*, ed 21, Philadelphia, 2020, Elsevier.

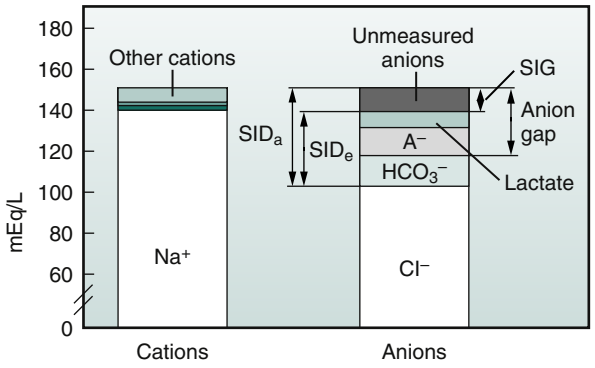

FIG. 6 Charge balance in blood plasma. "Other cations" include Ca2+ and Mg2+. The strong ion difference (SID) is always positive (in plasma) and SID minus effective SID (SIDe) must equal 0. Any difference between SID apparent (SIDa) and SIDe is the strong ion gap (SIG) and must represent unmeasured anions. *A–,* Concentration of dissociated weak acids; *HCO_3–,* bicarbonate. (From Ronco C: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.)

Elevated in: Hypertension, congestive heart failure (CHF), cirrhosis, renin-secreting renal tumor, volume depletion
Decreased in: ACE inhibitor drugs, angiotensin-converting enzyme inhibitor (ARB) drugs, primary aldosteronism, Cushing syndrome

ANGIOTENSIN-CONVERTING ENZYME (ACE level)

Normal range: <40 nmol/ml/min (<670 nkat/L [CF: 16.67; SMI: 10 nkat/L])
Elevated in: Sarcoidosis, primary biliary cirrhosis, alcoholic liver disease, hyperthyroidism, hyperparathyroidism, diabetes mellitus, amyloidosis, multiple myeloma, lung disease (asbestosis, silicosis, berylliosis, allergic alveolitis, coccidioidomycosis), Gaucher disease, leprosy

ANH

See ATRIAL NATRIURETIC HORMONE

ANION GAP (AG)

The AG is the net change difference between the cations Na^+, K^+, and the anions Cl^- and HCO_3–
See Fig. 6 for charge balance in blood plasma.
See Tables 9, 10, 11.

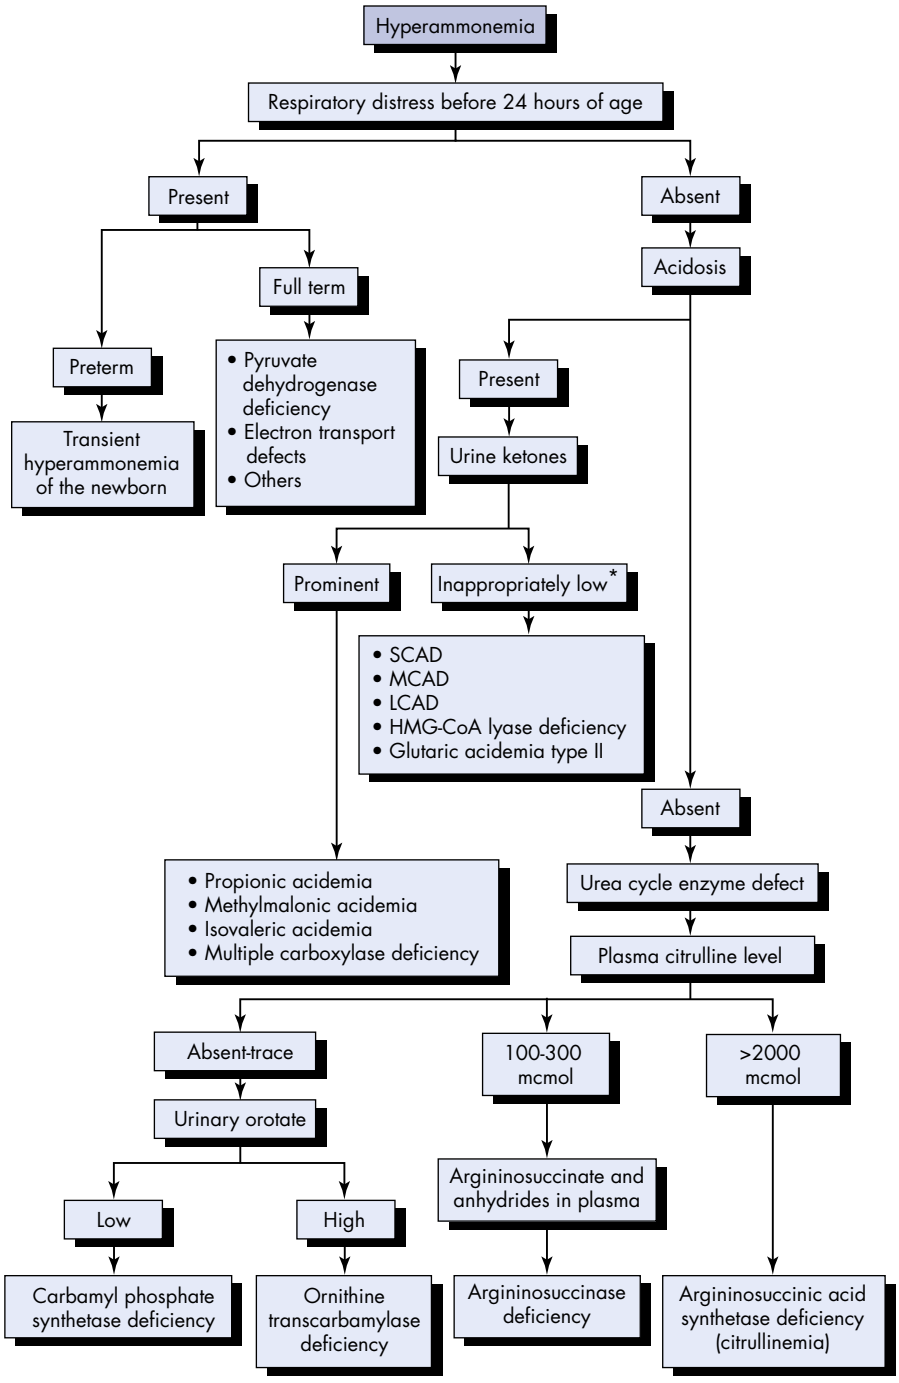

FIG. E5 Differential diagnosis of hyperammonemia. *Indicates inappropriately low urinary ketones in settling of symptomatic hypoglycemia. *HMG-CoA,* Hydroxymethylglutaryl-CoA; *LCAD,* long-chain acyl-CoA dehydrogenase; *MCAD,* medium-chain acyl-CoA dehydrogenase; *SCAD,* short-chain acyl-CoA dehydrogenase. (From Custer JW, Rau RE: *The Harriet Lane handbook,* ed 18, St Louis, 2009, Mosby.)

TABLE 9 Equations Used to Estimate the Quantity of Unmeasured Ions

Anion gap (AG)	$(Na^+ + K^+) - (Cl^- + HCO_3^-)$	Normal values: 12 ± mEq/L (with K^+) 8 ± 4 mEq/L (without K^+)
Connected anion gap (cAG)	$(Na^+ + K^+) - (Cl^- + HCO_3^- + 2[albumin\ g/dl] + 0.5[phosphate\ mg/dl] + lactate)$ SI (all units mEq/L): $(Na^+ + K^+) - (Cl^- + HCO_3^- + 0.2[albumin\ g/L] + 1.5[phosphate\ mmol/L] + lactate)$	Normal values: 0 ± 5 mEq/L
Apparent strong ion difference (SID_a)	$(Na^+ + K^+ + Ca^{2+} + Mg^{2+}) - (Cl^- + lactate)$	The difference between measured strong cations and anions. Concentrations should be expressed in mEq/L (Ca^{2+} and Mg^{2+} multiplied by 2 from mmol/L).
Effective strong ion difference (SID_e)	$(HCO_3^- + [\text{albumin g/dl}] \times (0.123 \times pH - 0.631) + [PO^2{-}_4] \times (0.39 \times pH - 0.469)$	
Strong ion gap (SIG)	$SID_a - SID_e$	Should theoretically approach 0, but is normally 5 (±5) in critically ill patients
$\Delta AG/\Delta HCO_3^-$ (delta ratio)	$(cAG - cAG_{normal})/(24 - HCO_3^-)$	Normal values 0.8 to 1.6
Osmolar gap	$Measured\ osmolality - ([1.86 \times Na^+] + glucose\ mg/dl/18 + BUN\ mg/dl/2.8 + ethanol\ mg/dl/4.6)$ SI (all units mmol/L): $measured\ osmolality - ([1.86 \times Na^+] + glucose + urea + 1.25 \times ethanol)$	Normally ≤ 19 mmol/L

BUN, Blood urea nitrogen; *SI,* strong ion.
From Ronco C et al: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.

Normal range: 9 to 14 mEq/L
Elevated in: Lactic acidosis, ketoacidosis (diabetes, alcoholic starvation), uremia (chronic renal failure), ingestion of toxins (paraldehyde, methanol, salicylates, ethylene glycol), hyperosmolar nonketotic coma, antibiotics (carbenicillin)
Decreased in: Hypoalbuminemia, severe hypermagnesemia, IgG myeloma, lithium toxicity, laboratory error (falsely decreased sodium or overestimation of bicarbonate or chloride), hypercalcemia of parathyroid origin, antibiotics (e.g., polymyxin)

ANTICARDIOLIPIN ANTIBODY (ACA)

Normal range: Negative. Test includes detection of IgG, IgM, and IgA antibodies to phospholipid, cardiolipin
Present in: Antiphospholipid antibody syndrome, chronic hepatitis C

ANTICOAGULANT

See CIRCULATING ANTICOAGULANT

ANTIDIURETIC HORMONE

Normal range: mOsm/kg 295 to 300 (4 to 12 pg/ml)
Elevated in: SIADH, antipsychotic medications, ectopic ADH from systemic neoplasm, Guillain-Barré syndrome, CNS infections, brain tumors, nephrogenic diabetes insipidus

TABLE 10 Causes of Increased Anion Gap or Strong Ion Gap

Common causes	Lactic acidosis*
	L-lactate (hypoxic and nonhypoxic)
	D-lactate (in short bowel syndrome)
	Renal failure
	Ketoacidosis
	Diabetic
	Alcoholic
	Starvation
	Metabolic errors
	Toxins
	Methanol
	Ethylene and propylene glycol
	Salicylates
	5-oxoproline (pyroglutamic acid)
	Sepsis
Rare causes	Severe liver disease
	Sodium salts
	Sodium lactate
	Sodium citrate
	Sodium acetate
	Sodium penicillin (>50 million units/day)
	Carbenicillin (>30 g/day)
	Decreased unmeasured cations
	Hypomagnesemia
	Hypocalcemia
	Massive rhabdomyolysis
	Alkalemia

*Lactate, Mg^{2+}, and Ca^{2+} are accounted for in the strong ion gap.
From Ronco C: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.

TABLE 11 Causes of Normal Anion Gap or Strong Ion Gap Acidosis

Nonrenal causes: Urine SID (Na + K − Cl) < 0	Low SID infusions (e.g., normal saline)
	Strong cation (or HCO_3^-) losses though diarrhea
	Ureteral diversions
	Biliary or pancreatic fistulas
Renal causes: Urine SID (Na + K − Cl) >0	Type 1 (distal) RTA
	Type 2 (proximal) RTA
	Type 4 (hypoaldosteronism) RTA

RTA, Renal tubular acidosis; *SID,* strong ion difference.
From Ronco C: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.

Decreased in: Central diabetes insipidus, nephritic syndrome, psychogenic polydipsias, demeclocycline, lithium, phenytoin, alcohol. Table 12 describes the water deprivation test used for diagnosing and classifying diabetes insipidus. Table 13 summarizes tests in the differential diagnosis of water homeostasis. Causes of polyuria due to water diuresis are described in Box 2.

ANTI-DNA

Normal range: Absent
Present in: Systemic lupus erythematosus, chronic active hepatitis, infectious mononucleosis, biliary cirrhosis

ANTI-DS DNA

Normal: <25 U
Elevated in: Systemic lupus erythematosus

ANTIGLOBULIN TEST

See DIRECT ANTIGLOBULIN (COOMBS DIRECT)
See INDIRECT ANTIGLOBULIN (COOMBS INDIRECT)

ANTIGLOMERULAR BASEMENT ANTIBODY

See GLOMERULAR BASEMENT MEMBRANE ANTIBODY

ANTIHISTONE

Normal: <1 U

TABLE 12 Water Deprivation Test for Diagnosing and Classifying Diabetes Insipidus

Patients with mild polyuria may be instructed to withhold all fluid intake from 10 P.M. onward. For those with more severe polyuria (8 to 10 L/day), water deprivation should be started early in the morning under close observation.

1. During testing, the patient is forbidden to take in anything by mouth.
2. Obtain the following baseline parameters: urine volume (Uvol) and urinary osmolality (Uosm), plasma osmolality (Posm), and plasma sodium (PNa). Also record the weight and blood pressure (BP)/pulse (P) seated and standing.
3. Urine and plasma are collected hourly for Uvol, Uosm, and Posm. Weight, BP, and P are also recorded. Record requests for fluid.
4. When the Uosm has plateaued (e.g., hourly increase <30 mOsm/kg for 3 consecutive hours), or when body weight has decreased by 3%-5%, or the patient develops a >20-mm Hg drop in systolic BP, obtain samples for Uvol, Uosm, Posm, PNa, and AVP (plasma).
5. Administer 1 mcg of desmopressin IV or IM, or 5 mcg of AVP SC Uosm; urine output and Posm are recorded at 30, 60, and 120 min after the injection. The highest Uosm value is used to evaluate the patient's response to AVP.

Precautions

When possible, discontinue any medications that can influence ADH secretion. Observe for hypotension and nausea, which may stimulate ADH secretion. The patient should not be permitted to smoke during the test.

Interpretation

Normal	Final Uosm before AVP challenge is higher than Posm. Following AVP challenge, the Uosm is less than 10% higher than the maximal Uosm achieved with water restriction alone.
Neurogenic DI	Final Uosm before AVP challenge is less than Posm. Following AVP administration, there is a greater than 50% increase in Uosm.
Nephrogenic DI	Final Uosm before AVP challenge is less than Posm. Following AVP administration, there is a less than 10% increase in Uosm.
Partial central DI	Uosm may be higher than Posm following dehydration; however, there is only a 10%-50% increase in Uosm following administration of AVP.
Partial nephrogenic DI	Uosm may be higher than Posm following dehydration; however, there is a greater than 10% increase in Uosm following administration of AVP.

Plotting basal and postdehydration Uosm and plasma ADH on the nomograms from Zerbe and Robertson will permit further distinction between partial nephrogenic DI, partial central DI, and primary polydipsia

ADH, Antidiuretic hormone; *AVP,* arginine vasopressin; *DI,* diabetes insipidus; *IM,* intramuscular; *IV,* intravenous; *SC,* subcutaneous.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 13 Tests in the Differential Diagnosis of Disorders of Water Homeostasis

	BASELINE			AFTER 12-HOUR FLUID RESTRICTION			
Disorder	**Serum Na+ and Osmolality**	**Urine Na+ and Osmolality**	**Serum ADH**	**Serum Na+ and Osmolality**	**Urine Na+ and Osmolality**	**Serum ADH**	**Urine Osmolality Post-AVP Challenge**
Normal control	N	N	N	N	High	High	Same
SIADH	Low	N-High	High	Low-N	High	High	—
Neurogenic DI	N-High	Low	Low	High	Low-N	Low	Increased
Nephrogenic DI	N-High	Low	N-High	High	Low-N	High	Same
Psychogenic polydipsia	Low-N	Low	Low	N	N-High	N-High	Same

ADH, Antidiuretic hormone; *AVP,* arginine vasopressin; *DI,* diabetes insipidus; *N,* normal; *SIADH,* syndrome of inappropriate secretion of ADH.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.

Elevated in: Drug-induced lupus erythematosus

ANTIMITOCHONDRIAL ANTIBODY (AMA, Mitochondrial antibody)

Normal range: <1:20 titer
Elevated in: Primary biliary cirrhosis (85% to 95%), chronic active hepatitis (25% to 30%), cryptogenic cirrhosis (25% to 30%)

ANTINEUTROPHIL CYTOPLASMIC ANTIBODY (ANCA)

Positive test: Cytoplasmic pattern (c-ANCA): Positive in granulomatosis with polyangiitis (see Fig. E7 and Table E14 for approach to patient with positive c-ANCA)

Perinuclear pattern (p-ANCA): Positive in inflammatory bowel disease, primary biliary cirrhosis, primary sclerosing cholangitis, autoimmune chronic active hepatitis, crescentic glomerulonephritis (see Table E14 for approach to patient with positive p-ANCA)

BOX 2 Causes of Polyuria Due to Water Diuresis

Lack of ADH
Central diabetes insipidus (DI): Congenital or acquired (idiopathic cell degeneration, tumors and granulomas, surgery, trauma, infarction, and infection of the pituitary gland or hypothalamus)
Dipsogenic: Psychogenic, organic brain disease, iatrogenic
Gestational DI: Excess vasopressinase

Failure of the Kidney to Respond to ADH (Nephrogenic DI)
Congenital nephrogenic DI: A defect in ADH receptor, a defect in aquaporin expression.
Chronic renal failure.
Acquired nephrogenic DI: Lithium toxicity, demeclocycline toxicity, methoxyflurane toxicity, amyloidosis, light chain nephropathy, hypercalcemia, hypokalemia, obstructive uropathy

ADH, Antidiuretic hormone.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

* Some patients also have gastrointestinal, cardiac, and/or neurologic involvement
† Granulomatous inflammation
‡ Of skin, mucosa, respiratory tract (upper/lower), or kidney

FIG. E7 Approach to the patient with perinuclear antineutrophil cytoplasmic antibodies *(P-ANCA).* (Courtesy of Julie V Schaffer, MD. From Bolognia JL, Jorizzo JL, Rapini RP: *Dermatology*, St Louis, 2003, Mosby.)

TABLE E14 Other Disorders Associated with Antineutrophil Cytoplasmic Antibodies (ANCA)

	Type of ANCA*	Major Antigen(s)**	Evaluation
Inflammatory bowel disease: Ulcerative colitis (50%-70%) >Crohn disease (20%-40%)	P >C	Catalase, BPI, α-enolase, LF, CG, HMG1/2>MPO, PR3	Colonoscopy
Autoimmune liver disease: Autoimmune hepatitis (type 1; 80%), primary sclerosing cholangitis (70%) >primary biliary cirrhosis (30%)	P >C	Actin, HMG1/2	LFTs; ANA; antismooth muscle Ab; antimitochondrial Ab
Connective tissue disease: Systemic lupus erythematosus (20%-30%), rheumatoid arthritis (20%-30%) >Sjögren syndrome, dermatomyositis, reactive arthritis, relapsing polychondritis, antiphospholipid syndrome	P >C	MPO, PR3, BPI, CG, LF, lysozyme, HMG1/2	ANA panel; RF; anticardiolipin Ab
Drug-induced vasculitis/lupus/hepatitis: Propylthiouracil (20%), minocycline >levamisole, sulfasalazine Hydralazine, penicillamine >allopurinol† High-dose intravenous immunoglobulin	P >C P C	MPO>PR3, elastase MPO, elastase	Skin biopsy, ANA panel; LFTs; discontinue drug
Other cutaneous and/or systemic vasculitides:‡ Mixed cryoglobulinemia, Behçet disease, paraneoplastic Henoch-Schönlein purpura, Buerger disease	P >C P	Variable	Skin biopsy; cryoglobulins; hepatitis B, C panels; exclude malignancy
Other glomerulonephritides: Anti-GBM Ab-associated (30%) >immune complex (15%) >poststreptococcal	P	MPO	UA; BUN/creatinine; ASO; renal biopsy
Infections: Respiratory tract infections (bacterial/mycobacterial/fungal), enteritis, periodontitis, HIV, parvovirus B19, malaria, leprosy Onchocerciasis: Subacute bacterial endocarditis, chromomycosis, invasive amebiasis	P, C P C	MPO, others Defensin PR3	Cultures; serologies; echocardiogram
Cystic fibrosis (80%)	C >P	BPI	Sweat test
Hypergammaglobulinemia	P, C	—	Serum protein electrophoresis

Ab, Antibodies; *ANA,* antinuclear antibodies; *ASO,* antistreptolysin O; *BUN,* blood urea nitrogen; *C,* cytoplasmic [c-ANCA or c-ANCA (atypical)]; *HIV,* human immunodeficiency virus; *GBM,* glomerular basement membrane; *LFTs,* liver function tests; *P,* perinuclear [P-ANCA]; *RF,* rheumatoid factor; *UA,* urinalysis.

*C-ANCA are often atypical; in addition, immunofluorescence testing in some laboratories may not distinguish c-ANCA (atypical) from atypical ANCA.

**P-ANCA often have antigen specificity other than myeloperoxidase (MPO), e.g., lactoferrin (LF), elastase, cathepsin G (CG), lysozyme, bactericidal/permeability-increasing protein (BPI), high mobility group non-histone chromosomal proteins (HMG1/2), α-enolase, catalase, actin, defensin; c-ANCA (atypical) have antigen specificity other than proteinase 3 (PR3), e.g., BPI, lysozyme, or multiple antigens.

†Other drugs associated with P-ANCA in single case reports include cimetidine, cefotaxime, phenytoin, and isotretinoin.

‡Although primarily associated with c-ANCA, 5% to 15% of patients with granulomatosis with polyangiitis have P-ANCA; likewise, although primarily associated with P-ANCA, 5% to 15% of patients with Churg-Strauss syndrome and >40% of those with microscopic polyangiitis have c-ANCA; ANCA have also been reported in leukocytoclastic vasculitis of unknown etiology and unclassified vasculitis.

(Courtesy of Julie V Schaffer, MD).

TABLE 15 Frequency of Antinuclear Antibodies in Autoimmune and Nonrheumatic Diseases

	Sensitivity (%)
Autoimmune disease	
Systemic lupus erythematosus	95-100
Systemic sclerosis	60-80
Mixed connective tissue disease	100
Polymyositis or dermatomyositis	60
Rheumatoid arthritis	50
Rheumatoid vasculitis	30-50
Sjögren syndrome	40-70
Drug-induced lupus	90
Discoid lupus	15
Pauciarticular juvenile chronic arthritis	70
Nonrheumatic diseases	
Hashimoto thyroiditis	45
Graves disease	50
Autoimmune hepatitis	50
Primary pulmonary hypertension	40

From Hochberg MC: *Rheumatology*, ed 7, Philadelphia, 2019, Elsevier.

ANTINUCLEAR ANTIBODY (ANA)

Fig. E8 describes an algorithm for the use of antinuclear antibodies in the diagnosis of connective tissue disorders. See Fig. E9 for approach to positive ANA pattern. Table 15 shows the frequency of antinuclear antibodies in autoimmune and nonrheumatic diseases.

Normal range: <1:20 titer

Positive test: Systemic lupus erythematosus (more significant if titer >1:160), drugs (phenytoin, ethosuximide, primidone, methyldopa, hydralazine, carbamazepine, penicillin, procainamide, chlorpromazine, griseofulvin, thiazides), chronic active hepatitis, autoimmune thyroid disease (positive ANA is found in up to 45% of patients), idiopathic thrombocytopenic purpura, multiple sclerosis, rheumatoid arthritis, scleroderma, mixed connective tissue disease, necrotizing vasculitis, Sjögren syndrome, tuberculosis, pulmonary interstitial fibrosis. Positive ANA results are nonspecific and can be found in healthy individuals (13.8% of the adult general population). Table 16 describes diseases associated with ANA subtypes. Fig. 10 illustrates various fluorescent ANA test patterns.

ANTI-RNP ANTIBODY

See EXTRACTABLE NUCLEAR ANTIGEN

ANTI-SCL-70

Normal: Absent

Elevated in: Scleroderma

ANTI-SM (anti-Smith) ANTIBODY

See EXTRACTABLE NUCLEAR ANTIGEN

ANTI-SMOOTH MUSCLE ANTIBODY

See SMOOTH MUSCLE ANTIBODY

ANTISTREPTOLYSIN O TITER (Streptozyme, ASLO titer)

Normal range for adults: <160 Todd units

Elevated in: Streptococcal upper airway infection, acute rheumatic fever, acute glomerulonephritis, increased levels of β-lipoprotein

NOTE: A fourfold increase in titer between acute and convalescent specimens is diagnostic of streptococcal upper airway infection regardless of the initial titer.

ANTITHROMBIN III

See Table 17.

Normal range: 81% to 120% of normal activity; 17 to 30 mg/dl

Decreased in: Hereditary deficiency of antithrombin III, disseminated intravascular coagulation, pulmonary embolism, cirrhosis, thrombolytic therapy, chronic liver failure, postsurgery, third trimester of pregnancy, oral contraceptives, nephrotic syndrome, IV heparin >3 days, sepsis, acute leukemia, carcinoma, thrombophlebitis

Elevated in: Warfarin drugs, postmyocardial infarction

TABLE 16 Disease-Associated Antinuclear Antibody Subtypes

Nuclear Location	Disease(s)
"Native" DNA (dsDNA, or dsDNA/ssDNA complex)	SLE (60%-70%; range, 35%-75%) Also PSS (5%-55%), MCTD (11%-25%), RA (5%-40%), DM (5%-25%), SS (5%)
sNP	SLE (50%) Also other collagen diseases
DNP (DNA-histone complex)	SLE (52%) Also MCTD (8%), RA (3%)
Histones	Drug-induced SLE (95%) Also SLE (30%), RA (15%-24%)
ENA Sm	SLE (30%-40%; range, 28%-40%) Also MCTD (0%-8%); RNP (U1-RNP) MCTD (in high titer without any other ANA subtype present: 95%-100%) Also SLE (26%-50%), PSS (11%-22%), RA (10%), SS (3%)
SS-A (Ro)*	SS without RA (60%-70%) Also SLE (26%-50%), neonatal SLE (over 95%), PSS (30%), MCTD (50%), SS with RA (9%), PBC (15%-19%)
SS-B (La)	SS without RA (40%-60%) Also SLE (5%-15%), SS with RA (5%)
Scl-70*	PSS (15%-43%)
Centromere*	CREST syndrome (70%-90%; range, 57%-96%) Also PSS (4%-20%), PBC (12%)
Nucleolar	PSS (scleroderma) (54%-90%) Also SLE (25%-26%), RA (9%)
RAP (RANA)	SS with RA (60%-76%) Also SS without RA (5%)
Jo-1	Polymyositis (30%)
PM-1	Polymyositis or PMS/PSS overlap syndrome (60%-90%) Also DM (17%)
ssDNA	SLE (60%-70%) Also CAH, infectious mononucleosis, RA, chronic GN, chronic infections, PBC
Cytoplasmic Location	Disease(s)
Mitochondrial	PBC (90%-100%) Also CAH (7%-30%), cryptogenic cirrhosis (30%), acute hepatitis, viral hepatitis (3%), other liver diseases (0%-20%), SLE (5%), SS and PSS (8%)
Microsomal†	Chronic active hepatitis (60%-80%), Hashimoto thyroiditis (97%)
Ribosomal	SLE (5%-12%)
Smooth muscle‡	Chronic active hepatitis (60%-91%)

ANA, Antinuclear antibody; *CAH,* chronic active hepatitis; *CREST,* calcinosis, Raynaud phenomenon, esophageal dysfunction, sclerodactyly, and telangiectasia; *DM,* dermatomyositis; *GN,* glomerulonephritis; *MCTD,* mixed connective tissue disease; *MS,* multiple sclerosis; *PBC,* primary biliary cirrhosis; *PMS,* premenstrual syndrome; *PSS,* progressive systemic sclerosis; *RA,* rheumatoid arthritis; *RNP,* ribonucleoprotein; *SLE,* systemic lupus erythematosus; *SS,* Sjögren syndrome; *ssDNA,* single-stranded DNA.

*Not detected using rat or mouse liver or kidney tissue method.

†Not detected by cultured cell method.

‡Detected by cultured cells but better with rat or mouse tissue.

From Ravel R: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

APOLIPOPROTEIN A-1 (Apo A-1)

Normal: Desirable >120 mg/dl

Elevated in: Familial hyperalphalipoproteinemia, statins, niacin, estrogens, weight loss, familial cholesteryl ester transfer protein (CETP) deficiency

Decreased in: Familial hypoalphalipoproteinemia, Tangier disease, diuretics, androgens, cigarette smoking, hepatocellular disorders, chronic renal failure, nephritic syndrome, coronary heart disease, cholestasis

APOLIPOPROTEIN B (Apo B)

Normal: Desirable <100 mg/dl; high risk >120 mg/dl

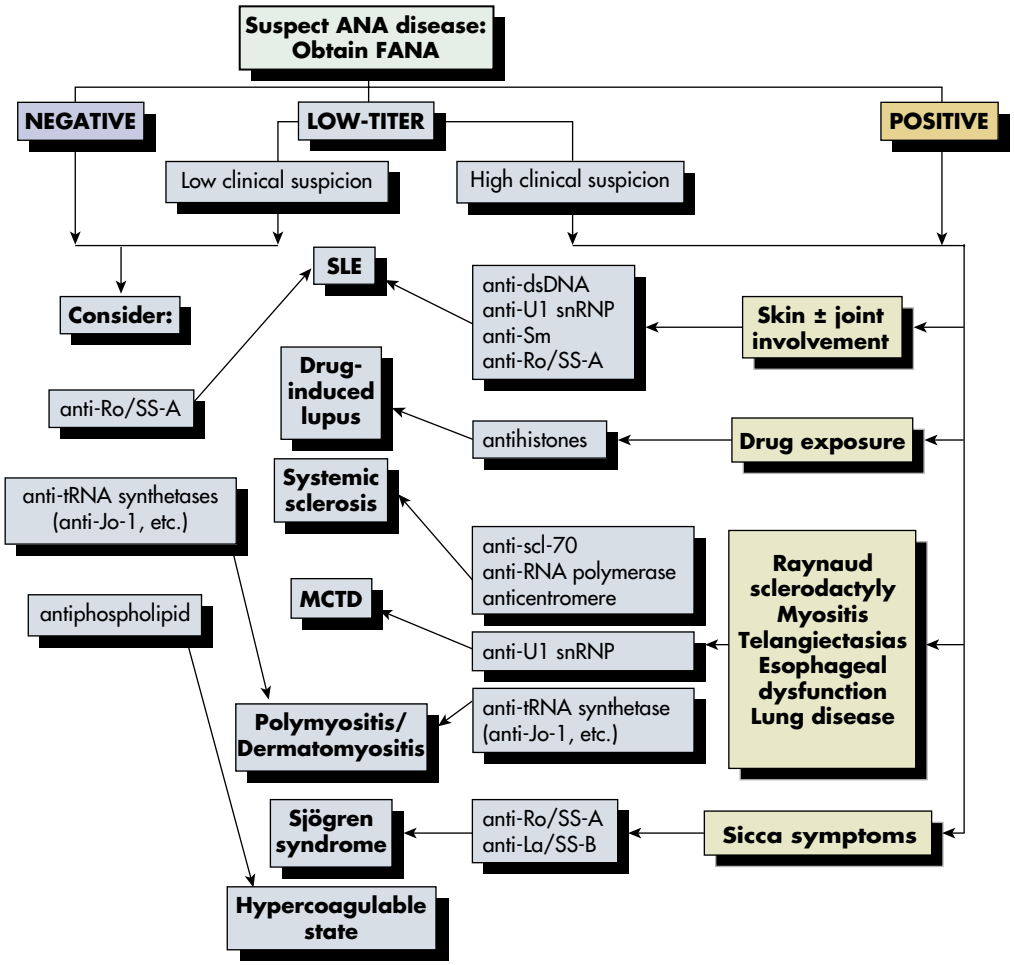

FIG. E8 Algorithm for the use of antinuclear antibodies in the diagnosis of connective tissue disorder. *ANA,* Antinuclear antibody; *FANA,* fluorescent antinuclear antibody; *MCTD,* mixed connective tissue disease; *SLE,* systemic lupus erythematosus. (From Firestein GS et al: *Kelly's textbook of rheumatology*, ed 9, Philadelphia, 2013, WB Saunders.)

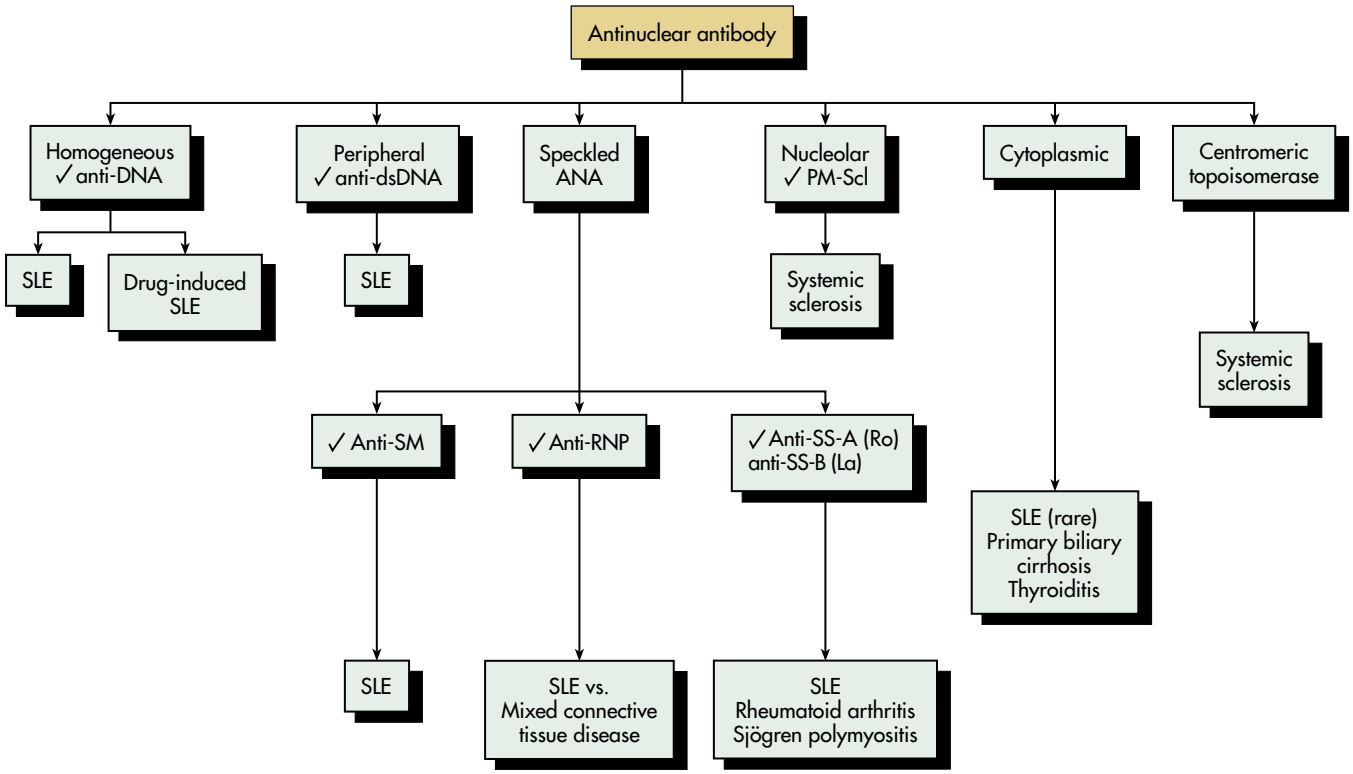

FIG. E9 Diagnostic tests and diagnoses to consider from antinuclear antibody pattern. *ANA,* Antinuclear antibody; *PM-Scl,* polymyositis/scleromyositis; *SLE,* systemic lupus erythematosus. (From Carlson KJ et al: *Primary care of women*, ed 2, St Louis, 2002, Mosby.)

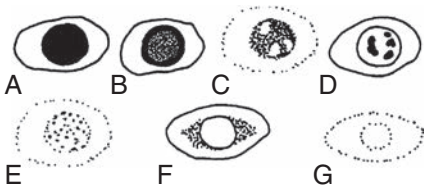

FIG. 10 Fluorescent antinuclear antibody test patterns (HEP-2 cells). A, Solid (homogeneous). **B,** Peripheral (rim). **C,** Speckled. **D,** Nucleolar. **E,** Anticentromere. **F,** Antimitochondrial. **G,** Normal (nonreactive). (From Ravel R [ed]: *Clinical laboratory medicine*, ed 6, St Louis, 1995, Mosby.)

TABLE 17 Assay Measurements in Heterozygous Antithrombin (ATIII) Deficiency for Diagnosis

	ACTIVITY		
Type	**Antigen**	**Heparin Cofactor**	**Progressive ATIII**
I	Low	Low	Low
II			
Active site defect	Normal	Low	Low
Heparin-binding site defect	Normal	Low	Normal

From Hoffman R et al: *Hematology: Basic principles and practice,* ed 5, Philadelphia, 2009, Churchill Livingstone.

Elevated in: High saturated fat diet, high-cholesterol diet, hyperapobetalipoproteinemia, familial combined hyperlipidemia, anabolic steroids, diuretics, beta-blockers, corticosteroids, progestins, diabetes, hypothyroidism, chronic renal failure, liver disease, Cushing syndrome, coronary heart disease
Decreased in: Statins, niacin, low-cholesterol diet, malnutrition, abetalipoproteinemia, hypobetalipoproteinemia, hyperthyroidism

ARTERIAL BLOOD GASES

Normal range:
Po_2: 75 to 100 mm Hg
Pco_2: 35 to 45 mm Hg
HCO_3: 24 to 28 mEq/L
pH: 7.35 to 7.45
Abnormal values: Acid-base disturbances (see the following)
METABOLIC ACIDOSIS
Causes of metabolic acidosis by net acid excretion are summarized in Box 3.
Metabolic acidosis with increased AG (AG acidosis)
Lactic acidosis (see Box 4)
Ketoacidosis (diabetes mellitus, alcoholic ketoacidosis)
Uremia (chronic renal failure)
Ingestion of toxins (paraldehyde, methanol, salicylate, ethylene glycol)
High-fat diet (mild acidosis)

EXTRARENAL ACIDOSIS: INCREASE IN NET ACID EXCRETION

Gastrointestinal loss of bicarbonate
Ingestion of acids or acid precursors: Ammonium chloride, sulfur-containing compounds
Acid precursors or toxins: Salicylate, ethylene glycol, methanol, toluene, acetaminophen, paraldehyde
Organic acidosis:
- L-lactic acidosis
- D-lactic acidosis
- Ketoacidosis
- Pyroglutamic acidosis

BOX 3 Causes of Metabolic Acidosis by Net Acid Excretion

Renal Acidosis: Absolute or Relative Reduction in Net Acid Excretion
Uremic acidosis
Renal tubular acidosis
- Distal renal tubular acidosis (type I)
- Proximal renal tubular acidosis (type II)
- Aldosterone deficiency or unresponsiveness (type IV)

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

BOX 4 Causes of L-Lactic Acidosis

Type A Lactic Acidosis Due to Tissue Hypoxia
Circulatory shock
Severe hypoxemia
Heart failure
Severe anemia
Grand mal seizure

Type B Lactic Acidosis, No Tissue Hypoxia
Acute alcoholism
Drugs and toxins (e.g., metformin, antiretroviral drugs, salicylate intoxication)
Diabetes mellitus
Leukemia
Deficiency of thiamin or riboflavin
Idiopathic

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.

Metabolic acidosis with normal AG (hyperchloremic acidosis)
Renal tubular acidosis (including acidosis of aldosterone deficiency)
Intestinal loss of HCO_3^- (diarrhea, pancreatic fistula)
Carbonic anhydrase inhibitors (e.g., acetazolamide)
Dilutional acidosis (as a result of rapid infusion of bicarbonate-free isotonic saline)
Ingestion of exogenous acids (ammonium chloride, methionine, cystine, calcium chloride)
Ileostomy
Ureterosigmoidostomy
Drugs: Amiloride, triamterene, spironolactone, β-blockers
RESPIRATORY ACIDOSIS
Pulmonary disease (chronic obstructive pulmonary disease (COPD), severe pneumonia, pulmonary edema, interstitial fibrosis)
Airway obstruction (foreign body, severe bronchospasm, laryngospasm)
Thoracic cage disorders (pneumothorax, flail chest, kyphoscoliosis)
Defects in muscles of respiration (myasthenia gravis, hypokalemia, muscular dystrophy)
Defects in peripheral nervous system (amyotrophic lateral sclerosis, poliomyelitis, Guillain-Barré syndrome, botulism, tetanus, organophosphate poisoning, spinal cord injury)
Depression of respiratory center (anesthesia, narcotics, sedatives, vertebral artery embolism or thrombosis, increased intracranial pressure)
Failure of mechanical ventilator
METABOLIC ALKALOSIS
Divided into chloride-responsive (urinary chloride <15 mEq/l) and chloride-resistant forms (urinary chloride level >15 mEq/l)

Chloride-responsive
Vomiting
Nasogastric (NG) suction
Diuretics
Posthypercapnic alkalosis
Stool losses (laxative abuse, cystic fibrosis, villous adenoma)

Massive blood transfusion
Exogenous alkali administration
Chloride-resistant
Hyperadrenocorticoid states (Cushing syndrome, primary hyperaldosteronism, secondary mineralocorticoidism [licorice, chewing tobacco])
Hypomagnesemia
Hypokalemia
Bartter syndrome
RESPIRATORY ALKALOSIS
Hypoxemia (pneumonia, pulmonary embolism, atelectasis, high-altitude living)
Drugs (salicylates, xanthines, progesterone, epinephrine, thyroxine, nicotine)
Central nervous system (CNS) disorders (tumor, cerebrovascular accident [CVA], trauma, infections)
Psychogenic hyperventilation (anxiety, hysteria)
Hepatic encephalopathy
Gram-negative sepsis
Hyponatremia
Sudden recovery from metabolic acidosis
Assisted ventilation

TABLE 18 Reference Intervals for Synovial Fluid Constituents

Constituent	Synovial Fluid	Plasma
Total protein	1-3 g/dl	6-8 g/dl
Albumin	55%-70%	50%-65%
α1-Globulin	6%-8%	3%-5%
α2-Globulin	5%-7%	7%-13%
β-Globulin	8%-10%	8%-14%
γ-Globulin	10%-14%	12%-22%
Hyaluronic acid	0.3-0.4 g/dl	
Glucose	70-110 mg/dl	70-110 mg/dl
Uric acid	2-8 mg/dl	2-8 mg/dl
Lactate	9-29 mg/dl	9-29 mg/dl

Modified from Kjeldsberg CR, Knight JA: *Body fluids: laboratory examination of amniotic, cerebrospinal, seminal, serous and synovial fluids,* ed 3, Chicago, 1993, American Society for Clinical Pathology, with permission.
McPherson RA, Pincus MR: Henry's clinical diagnosis and management by laboratory methods, ed 23, 2017, Elsevier

ARTHROCENTESIS FLUID

Reference intervals for synovial fluid constituents are described in Table 18. Also see Fig. 11.

Interpretation of results:

1. **Color:** Normally it is clear or pale yellow; cloudiness indicates inflammatory process or presence of crystals, cell debris, fibrin, or triglycerides.
2. **Viscosity:** Normally it has a high viscosity because of hyaluronate; when fluid is placed on a slide, it can be stretched to a string >2 cm in length before separating (low viscosity indicates breakdown of hyaluronate [lysosomal enzymes from leukocytes] or the presence of edema fluid).
3. **Mucin clot:** Add 1 ml of fluid to 5 ml of a 5% acetic acid solution and allow 1 minute for the clot to form; a firm clot (does not fragment on shaking) is normal and indicates the presence of large molecules of hyaluronic acid (this test is nonspecific and infrequently done).
4. **Glucose:** Normally it approximately equals serum glucose level; a difference of more than 40 mg/dl is suggestive of infection.
5. **Protein:** Total protein concentration is <2.5 g/dl in the normal synovial fluid; it is elevated in inflammatory and septic arthritis.
6. Microscopic examination for crystals
   a. **Gout:** Monosodium urate crystals
   b. **Pseudogout:** Calcium pyrophosphate dihydrate crystals

ASLO TITER

See ANTISTREPTOLYSIN O TITER

ASPARTATE AMINOTRANSFERASE (AST, SGOT)

Normal range: 0 to 35 U/L (0 to 0.58 μkat/L [CF: 0.01667, SMI: 0.01μkat/L])

Elevated in:

HEART
Acute myocardial infarction
Pericarditis (active—some cases)
LIVER
Hepatitis virus, Epstein-Barr, or cytomegalovirus infection
Active cirrhosis
Liver passive congestion or hypoxia
Alcohol- or drug-induced liver dysfunction
Space-occupying lesions (active)
Fatty liver (severe)
Extrahepatic biliary obstruction (early)
Drug-induced
SKELETAL MUSCLE
Acute skeletal muscle injury
Muscle inflammation (infectious or noninfectious)

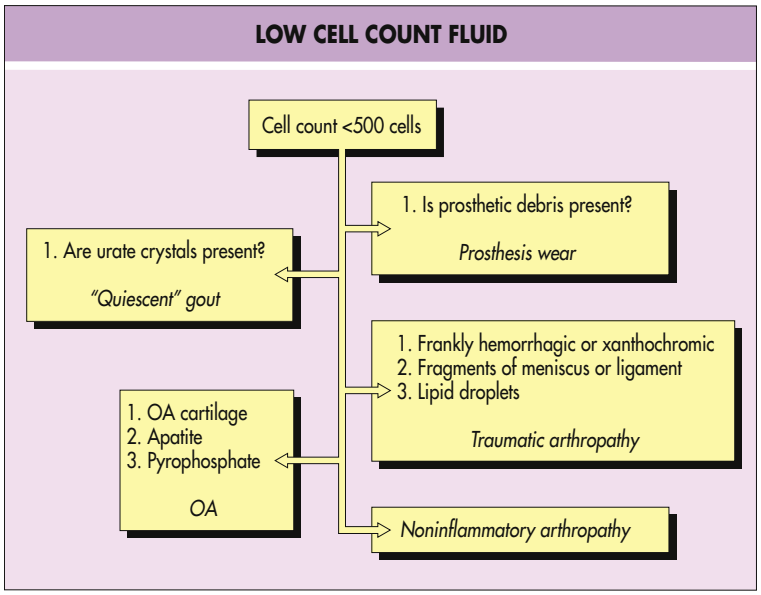

FIG. 11 Low cell count fluid. *OA,* Osteoarthritis. (From Hochberg MC: *Rheumatology*, ed 7, Philadelphia, 2019, Elsevier.)

Muscular dystrophy (active)
Recent surgery
Delirium tremens
KIDNEY
Acute injury or damage
Renal infarct
OTHER
Intestinal infarction
Shock
Cholecystitis
Acute pancreatitis
Hypothyroidism
Heparin therapy (60% to 80% of cases)
Fig. 1 describes an approach to the evaluation of AST elevation.
Box 5 describes causes of elevated serum aminotransferase levels.

ATRIAL NATRIURETIC HORMONE (ANH)

Normal: 20 to 77 pg/ml
Elevated in: CHF, volume overload, cardiovascular disease with high filling pressure
Decreased with: Prazosin and other alpha blockers

BOX 5 Causes of Elevated Serum Aminotransferase Levels*

Chronic, Mild Elevations, ALT > AST (<150 U/L or 5 × normal)

Hepatic Causes
α_1-Antitrypsin deficiency
Autoimmune hepatitis
Chronic viral hepatitis (B, C, and D)
Hemochromatosis
Medications and toxins
Steatosis and steatohepatitis
Wilson disease

Nonhepatic Causes
Celiac disease
Hyperthyroidism

Severe, Acute Elevations, ALT > AST (>1000 U/L or >20 to 25 × normal)

Hepatic Causes
Acute bile duct obstruction
Acute Budd-Chiari syndrome
Acute viral hepatitis
Autoimmune hepatitis
Drugs and toxins
Hepatic artery ligation
Ischemic hepatitis
Wilson disease

Severe, Acute Elevations, AST > ALT (>1000 U/L or >20 to 25 × normal)

Hepatic Cause
Medications or toxins in a patient with underlying alcoholic liver injury

Nonhepatic Cause
Acute rhabdomyolysis

Chronic, Mild Elevations, AST > ALT (<150 U/L, <5 × normal)

Hepatic Causes
Alcohol-related liver injury (AST/ALT > 2:1, AST nearly always <300 U/L)
Cirrhosis

Nonhepatic Causes
Hypothyroidism
Macro-AST
Myopathy
Strenuous exercise

*Virtually any liver disease can cause moderate aminotransferase elevations (5-15 × normal).
ALT, alanine aminotransferase; *AST,* aspartate aminotransferase.
From Feldman M, Friedman LS, Brandt LJ: *Sleisenger and Fortran's gastrointestinal and liver disease*, ed 10, Philadelphia, 2016, Elsevier.

B-TYPE NATRIURETIC PEPTIDE (BNP)

Normal range: up to 100 mcg/L. Natriuretic peptides are secreted to regulate fluid volume, blood pressure, and electrolyte balance. They have activity in both the central and peripheral nervous systems. In humans the main source of circulatory BNP is the heart ventricles.
Elevated in: Heart failure. This test is useful to differentiate heart failure patients from those with chronic obstructive pulmonary disease presenting with dyspnea. Levels are also increased in asymptomatic left ventricular dysfunction, arterial and pulmonary hypertension, cardiac hypertrophy, valvular heart disease, arrhythmia, and acute coronary syndrome. See Fig. 12.

BASOPHIL COUNT

Normal range
a. 0.4% to 1% of total white blood cells (WBCs); 40-100/mm^3
Elevated in: Leukemia, inflammatory processes, polycythemia vera, Hodgkin lymphoma, hemolytic anemia, after splenectomy, myeloid metaplasia, myxedema
Decreased in: Stress, hypersensitivity reaction, steroids, pregnancy, hyperthyroidism, postirradiation

BICARBONATE

Normal
- Arterial: 21 to 28 mEq/L
- Venous: 22 to 29 mEq/L

Elevated in: Metabolic alkalosis, compensated respiratory acidosis, diuretics, corticosteroids, laxative abuse
Decreased in: Metabolic acidosis, compensated respiratory alkalosis, acetazolamide, cyclosporine, cholestyramine, methanol or ethylene glycol poisoning

BILE, URINE

See URINE BILE

BILIRUBIN, DIRECT (CONJUGATED BILIRUBIN)

Normal range: 0 to 0.2 mg/dl (0 to 4 μmol/L [CF: 17.10; SMI: 2 μmol/L])
Elevated in: Hepatocellular disease, biliary obstruction, drug-induced cholestasis, hereditary disorders (Dubin-Johnson syndrome, Rotor syndrome)

BILIRUBIN, INDIRECT (UNCONJUGATED BILIRUBIN)

Normal range: 0 to 1.0 mg/dl (2 to 18 μmol/L [CF: 17.10; SMI: 2 μmol/L])
Elevated in: Increased bilirubin production (if normal liver, serum unconjugated bilirubin is usually less than 4 mg/100 ml)
Hemolytic anemia
Acquired
Congenital
Resorption from extravascular sources
Hematomas
Pulmonary infarcts
Excessive ineffective erythropoiesis
Congenital (congenital dyserythropoietic anemias)
Acquired (pernicious anemia, severe lead poisoning; if present, bilirubinemia is usually mild)
Defective hepatic unconjugated bilirubin clearance (defective uptake or conjugation)
Severe liver disease
Gilbert syndrome
Crigler-Najjar type I or II
Drug-induced inhibition
Portacaval shunt
Congestive heart failure
Hyperthyroidism (uncommon)

BILIRUBIN, TOTAL

See Fig. 13, Table 19, and Table 20 for evaluation of hyperbilirubinemia and liver disease.
Normal range: 0 to 1.0 mg/dl (2 to 18 μmol/L [CF: 17.10, SMI: 2 μmol/L])

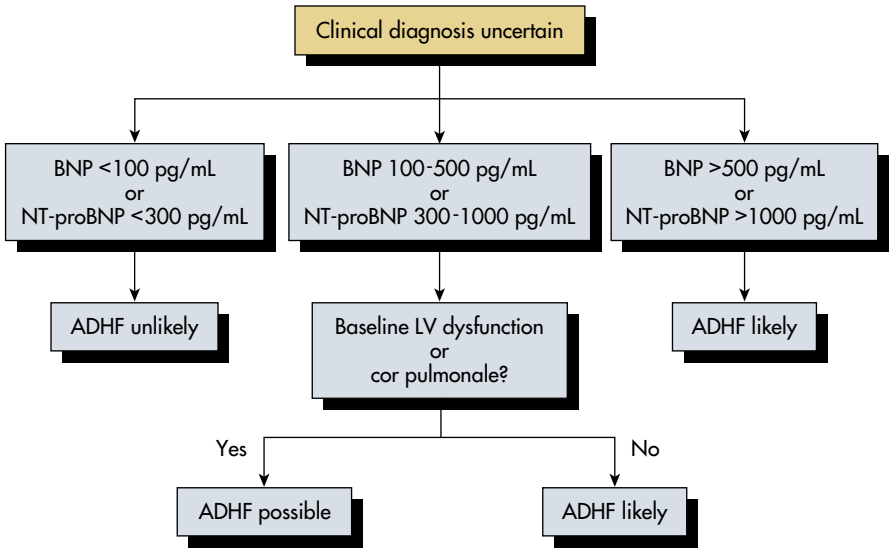

FIG. 12 Interpretation of natriuretic peptide levels. *ADHF,* Acute decompensated heart failure; *BNP,* B-type natriuretic peptide; *LV,* left ventricle; *NT-proBNP,* inactive N-terminal fragment of BNP. (From Adams JG et al: *Emergency medicine, clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.)

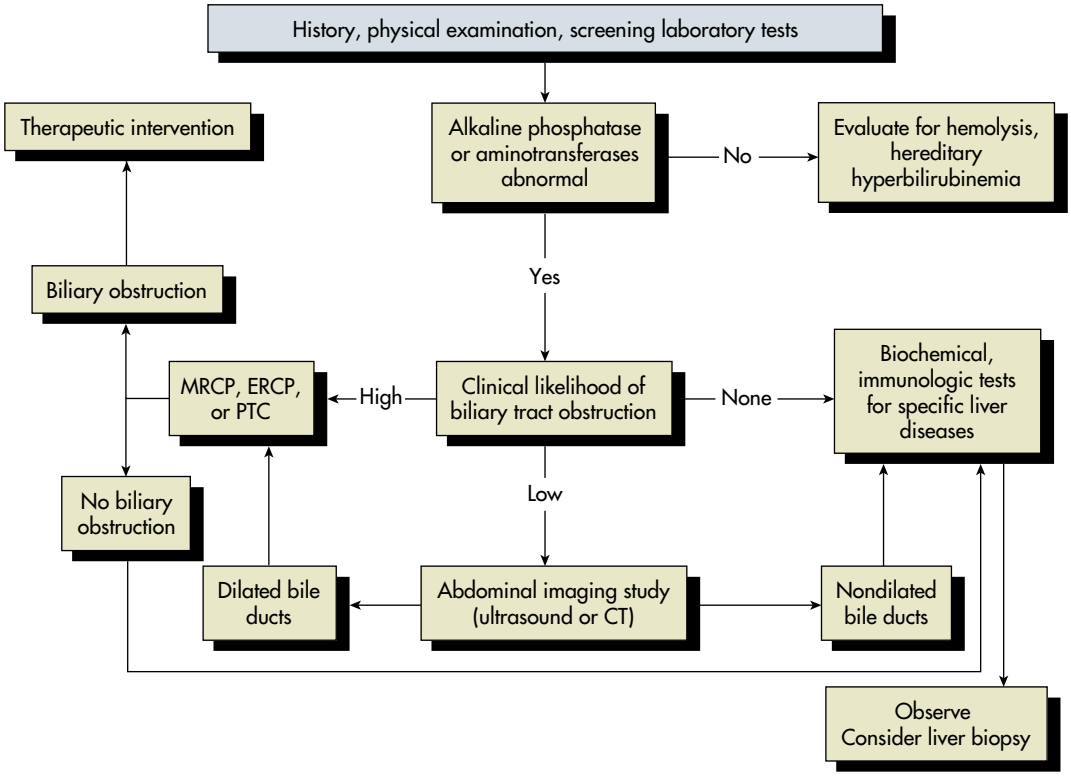

FIG. 13 Diagnosis algorithm for the evaluation of hyperbilirubinemia and other liver test abnormalities and/or signs and symptoms suggestive of liver disease. *CT,* Computed tomography; *ERCP,* endoscopic retrograde cholangiopancreatography; *MRCP,* magnetic resonance cholangiopancreatography; *PTC,* percutaneous cholangiogram. (From Goldman L, Ausiello D [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, WB Saunders. Modified and updated from Lidofsky SD, Scharschmidt BF: Jaundice. In Feldman M et al [eds]: *Gastrointestinal and liver disease,* ed 6, Philadelphia, 1998, WB Saunders.)

Elevated in: Liver disease (hepatitis, cirrhosis, cholangitis, neoplasm, biliary obstruction, infectious mononucleosis), hereditary disorders (Gilbert disease, Dubin-Johnson syndrome), drugs (steroids, statins, niacin, acetaminophen, diphenylhydantoin, phenothiazines, penicillin, erythromycin, clindamycin, captopril, amphotericin B, sulfonamides, azathioprine, isoniazid, 5-aminosalicylic acid, allopurinol, methyldopa, indomethacin, halothane, oral contraceptives, procainamide, tolbutamide, labetalol), hemolysis, pulmonary embolism or infarct, hepatic congestion secondary to congestive heart failure

TABLE 19 Obstructive Jaundice vs. Cholestatic Liver Disease

Feature	Suggests Obstructive Jaundice	Suggests Parenchymal Liver Disease
History	Abdominal pain; fever, rigors; prior biliary surgery; older age; acholic stools	Anorexia, malaise, myalgias, suggestive of viral prodrome; known infectious exposure; receipt of blood products, use of intravenous drugs; exposure to known hepatotoxin; family history of jaundice
Physical examination	High fever; abdominal tenderness; palpable abdominal mass; abdominal scar	Ascites; other stigmata of liver disease (e.g., prominent abdominal veins, gynecomastia, spider angiomata, asterixis, encephalopathy, Kayser-Fleischer rings)
Laboratory studies	Predominant elevation of serum bilirubin and alkaline phosphatase; prothrombin time that is normal or normalizes with vitamin K administration; elevated serum amylase	Predominant elevation of serum aminotransferases; prolonged prothrombin time that does not correct with vitamin K administration; blood tests indicative of specific liver disease

From Goldman L, Ausiello D (eds): *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, WB Saunders.

TABLE 20 Causes and Mechanisms of Isolated Hyperbilirubinemia in Adults

Cause	Mechanism
Indirect Hyperbilirubinemia	
Hemolytic Disorders	Overproduction of bilirubin
Inherited	
Red cell enzyme defects (e.g., glucose-6-phosphate dehydrogenase deficiency)	
Sickle cell disease	
Spherocytosis and elliptocytosis	
Acquired	
Drugs and toxins	
Hypersplenism	
Immune mediated	
Paroxysmal nocturnal hemoglobinuria	
Traumatic: Macro- or microvascular injury	
Ineffective Erythropoiesis	Overproduction of bilirubin
Cobalamin deficiency	
Folate deficiency	
Profound iron deficiency	
Thalassemia	
Drugs: Rifampin, Probenecid	Impaired hepatocellular uptake of bilirubin
Inherited Conditions	Impaired conjugation of bilirubin
Crigler-Najjar syndrome types I and II	
Gilbert syndrome	
Other	
Hematoma and massive blood transfusion	Overproduction of bilirubin
Direct Hyperbilirubinemia	
Inherited Conditions	
Dubin-Johnson syndrome	Impaired excretion of conjugated bilirubin
Rotor syndrome	

From Feldman M et al: *Sleisenger and Fordtran's gastrointestinal and liver disease,* ed 10, Philadelphia, 2016, Elsevier.

BILIRUBIN, URINE

See URINE BILE

BLADDER TUMOR ASSOCIATED ANTIGEN

Normal: ≤14 U/ml. Test is used to detect bladder cancer recurrence. Sensitivity 57% to 83% and specificity 68% to 72%.

Elevated in: Bladder cancer, renal stones, nephritis, UTI, hematuria, renal cancer, cystitis, recent bladder or urinary tract trauma

BLEEDING TIME (MODIFIED IVY METHOD)

See Fig. E14 for evaluation of patients with prolonged bleeding time.

Normal range: 2 to 9.5 min

Elevated in: Thrombocytopenia, capillary wall abnormalities, platelet abnormalities (Bernard-Soulier disease, Glanzmann disease), drugs (aspirin, warfarin, antiinflammatory medications, streptokinase, urokinase, dextran, β-lactam antibiotics, moxalactam), disseminated intravascular coagulation, cirrhosis, uremia, myeloproliferative disorders, von Willebrand disease.

Bleeding time tests are no longer performed at many hospitals and have been replaced by the platelet function analyzer (PFA-100) assay.

BLOOD VOLUME, TOTAL

Normal range: 60 to 80 ml/kg

Elevated in: Polycythemia vera, pulmonary disease, CHF, renal insufficiency, pregnancy, acidosis, thyrotoxicosis

Decreased in: Anemia, hemorrhage, vomiting, diarrhea, dehydration, burns, starvation

BNP

See B-TYPE NATRIURETIC PEPTIDE

BORDETELLA PERTUSSIS SEROLOGY

Test description: Polymerase chain reaction (PCR) of nasopharyngeal aspirates or secretions is used to identify *Bordetella pertussis,* the organism responsible for whooping cough.

BRCA ANALYSIS

DESCRIPTION OF ANALYSIS

Comprehensive BRCA analysis

BRCA1: Full sequence determination in both forward and reverse directions of approximately 5500 base pairs comprising 22 coding exons and one noncoding exon (exon 4) and approximately 800 adjacent base pairs in the noncoding intervening sequence (intron). Exon 1, which is noncoding, is not analyzed. The wild-type *BRCA1* gene encodes a protein comprising 1863 amino acids.

BRCA2: Full sequence determination in both forward and reverse directions of approximately 10,200 base pairs comprising 26 coding exons and approximately 900 adjacent base pairs in the noncoding intervening sequence (intron). Exon 1, which is noncoding, is not analyzed. The wild-type *BRCA2* gene encodes a protein comprising 3418 amino acids.

The noncoding intronic regions of *BRCA1* and *BRCA2* that are analyzed do not extend more than 20 base pairs proximal to the 5' end and 10 base pairs distal to the 3' end of each exon.

Single-site BRCA analysis: DNA sequence analysis for a specified mutation in *BRCA1* and/or *BRCA2.*

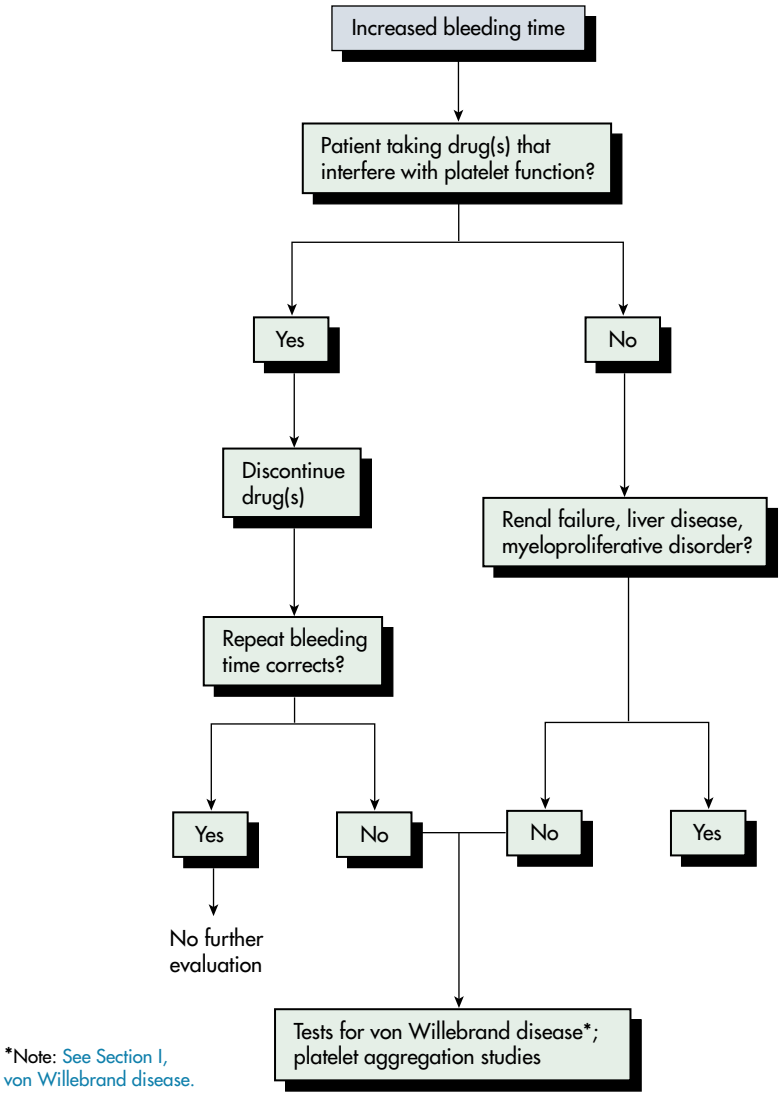

FIG. E14 An algorithm for diagnostic decisions in evaluating patients with a prolonged bleeding time. The scheme assumes that the platelet count is normal because thrombocytopenia itself can prolong the bleeding time. (Modified from Goldman L, Ausiello D [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, WB Saunders.)

Multisite 3 BRCA analysis: DNA sequence analysis of specific portions of *BRCA1* exon 2, *BRCA1* exon 20, and *BRCA2* exon 11 designed to detect only mutations 187delAG and 5385insC in *BRCA1* and 6174delT in *BRCA2.*

Interpretive Criteria:

"**Positive for a deleterious mutation**": Includes all mutations (nonsense, insertions, deletions) that prematurely terminate ("truncate") the protein product of *BRCA1* at least 10 amino acids from the C-terminus, or the protein product of *BRCA2* at least 110 amino acids from the C-terminus (based on documentation of deleterious mutations in *BRCA1* and *BRCA2*).

In addition, specific missense mutations and noncoding intervening sequence (IVS) mutations are recognized as deleterious on the basis of data derived from linkage analysis of high-risk families, functional assays, biochemical evidence, and/or demonstration of abnormal messenger ribonucleic acid (mRNA) transcript processing.

"**Genetic variant, suspected deleterious**": Includes genetic variants for which the available evidence indicates a likelihood, but not proof, that the mutation is deleterious. The specific evidence supporting such an interpretation will be summarized for individual variants on each such report.

"**Genetic variant, favor polymorphism**": Includes genetic variants for which available evidence indicates that the variant is highly unlikely to contribute substantially to cancer risk. The specific evidence supporting such an interpretation will be summarized for individual variants on each such report.

"**Genetic variant of uncertain significance**": Includes missense mutations and mutations that occur in analyzed intronic regions whose clinical significance has not yet been determined, as well as chain-terminating mutations that truncate *BRCA1* and *BRCA2* distal to amino acid positions 1853 and 3308, respectively.

"**No deleterious mutation detected**": Includes nontruncating genetic variants observed at an allele frequency of approximately 1% of a suitable control population (providing that no data suggest clinical significance), as well as all genetic variants for which published data demonstrate absence of substantial clinical significance. Also includes mutations in the protein-coding region that neither alter the amino acid sequence nor are predicted to significantly affect exon splicing, and base pair alterations in noncoding portions of the gene that have been demonstrated to have no deleterious effect on the length or stability of the mRNA transcript.

There may be uncommon genetic abnormalities in *BRCA1* and *BRCA2* that will not be detected by *BRCA* analysis. This analysis, however, is believed to rule out the majority of abnormalities in these genes, which are believed responsible for most hereditary susceptibility to breast and ovarian cancer.

"**Specific variant/mutation not identified**": Specific and designated deleterious mutations or variants of uncertain clinical significance are not present in the individual being tested. If one (or rarely two) specific deleterious mutations have been identified in a family member, a negative analysis for the specific mutation(s) indicates that the tested individual is at the general population risk of developing breast or ovarian cancer.

BREATH HYDROGEN TEST (hydrogen breath test)

Normal: This test is for bacterial overgrowth. H_2 excretion fasting: 4.6 ± 5.1, after lactulose, early increase <12. Lactulose usually results in a colonic response >30 min after ingestion.

Elevated in: A high fasting breath H_2 level and an increase of at least 12 ppm within 30 min after lactulose challenge are indicative of bacterial overgrowth in the small intestine. The increase must precede the colonic response.

False positives in: Accelerated gastric emptying, laxative use

False negatives in: Use of antibiotics and patients who are nonhydrogen producers

BUN

See UREA NITROGEN, BLOOD

C282Y AND H63D MUTATION ANALYSIS

Procedure: Detection of the C282Y and H63D mutations is accomplished by amplification of exons 2 and 4 of the *HFE* gene on chromosome 6 by polymerase chain reaction (PCR) followed by allele-specific hybridization and chemiluminescent detection of hybridized probes. H63D is viewed by some as a polymorphism rather than a mutation because of its prevalence in the population, because 15% of the individuals affected with hereditary hemochromatosis (HH) are compound heterozygotes for C282Y and H63D and about 1% of patients are H63D homozygotes, which suggests that H63D may be causative in the development of the disorder at reduced penetrance.

Interpretation of results: Homozygosity for the C282Y mutation has been associated with an increased risk of being affected with HH compared with the general population. The genotype is observed in 60% to 90% of individuals affected with HH and occurs in less than 1% of the general population. However, approximately 25% of asymptomatic individuals with this genotype do not develop the disorder.

C3

See COMPLEMENT

C4

See COMPLEMENT

CALCITONIN (serum)

Normal range: <100 pg/ml (<100 ng/L [CF: 1; SMI: 10 ng/L])

Elevated in: Medullary carcinoma of the thyroid (particularly if level >1500 pg/ml), carcinoma of the breast, apudomas, carcinoids, renal failure, thyroiditis

CALCIUM (serum)

See Figs. 15 and 16.

Normal range: 8.8 to 10.3 mg/dl (2.2 to 2.58 μmol/L [CF: 0.2495; SMI: 0.02 μmol/L])

ELEVATED

Relatively common:

Neoplasia
Bone primary
Myeloma
Acute leukemia
Nonbone solid tumors
Breast
Lung
Squamous nonpulmonary
Kidney
Neoplasm secretion of parathyroid hormone-related protein (PTHrP, "ectopic PTH")
Primary hyperparathyroidism
Thiazide diuretics
Tertiary (renal) hyperparathyroidism
Idiopathic
Spurious (artifactual) hypercalcemia
Dehydration
Serum protein elevation
Laboratory technical problem (lab error)

Relatively uncommon:

Sarcoidosis
Hyperthyroidism
Immobilization (mostly seen in children and adolescents)
Diuretic phase of acute renal tubular necrosis
Vitamin D intoxication
Milk-alkali syndrome
Addison disease
Lithium therapy
Idiopathic hypercalcemia of infancy
Acromegaly
Theophylline toxicity

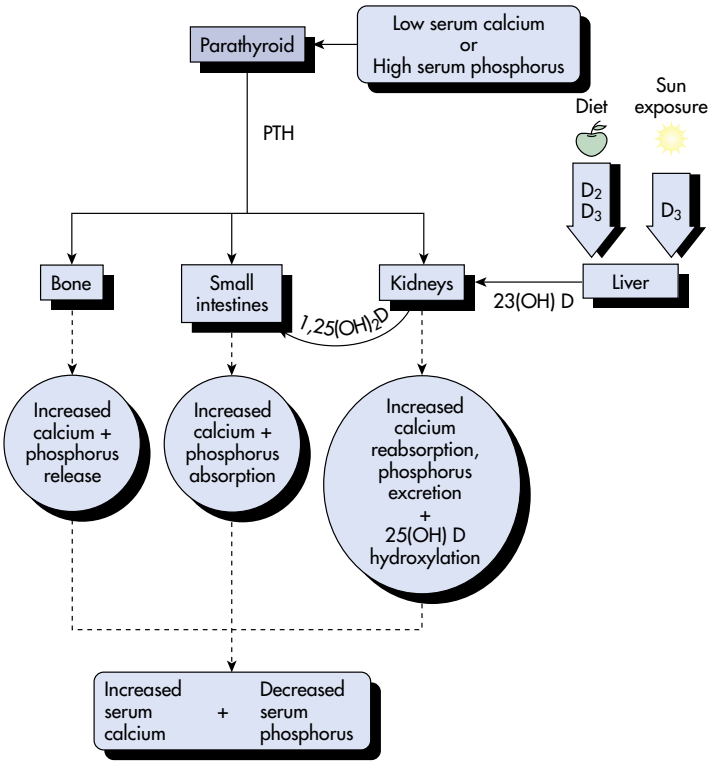

FIG. 15 Calcium homeostasis. Parathyroid hormone *(PTH)* is released from the parathyroid glands in response to hypocalcemia and hyperphosphatemia. PTH acts on bone, the small intestines, and the kidneys to effect a rise in serum calcium and a net decrease in serum phosphorus. Hydroxylation of inactive forms of vitamin D occurs in the liver and kidneys. 1,25(OH)2D facilitates intestinal absorption of calcium and phosphorus. D_2, vitamin D2; D_3, vitamin D3. (From Adams JG et al: *Emergency medicine, clinical essentials*, ed 2, Philadelphia, 2013, Elsevier.)

Table 21 describes the laboratory differential diagnosis of hypercalcemia.

Box 6 describes the differential diagnosis of hypercalcemia in older adults.

DECREASED
Artifactual
Hypoalbuminemia
Hemodilution
Primary hypoparathyroidism
Pseudohypoparathyroidism
Vitamin D related
Vitamin D deficiency
Malabsorption
Renal failure
Magnesium deficiency
Sepsis
Chronic alcoholism
Tumor lysis syndrome
Rhabdomyolysis
Alkalosis (respiratory or metabolic)
Acute pancreatitis
Drug-induced hypocalcemia
Large doses of magnesium sulfate
Anticonvulsants
Mithramycin
Gentamicin
Cimetidine

Table 22 describes the laboratory differential diagnosis of hypocalcemia.

CALCIUM, URINE

See URINE CALCIUM

CANCER ANTIGEN 15-3 (CA 15-3)

Normal: <30 U/ml
Elevated in: Approximately 80% of women with metastatic breast cancer. Clinical sensitivity is 0.60, specificity 0.87, positive predictive value 0.91. This test is generally used to predict recurrence of breast cancer and evaluate response to therapy. May also be elevated in liver cancer, pancreatic cancer, ovarian cancer, colorectal cancer. Elevations can also occur with benign breast and liver disease.

CANCER ANTIGEN 27-29 (CA 27-29)

Normal: <38 U/ml
Elevated in: Approximately 75% of women with metastatic breast cancer. Clinical sensitivity is 0.57, specificity 0.97, positive predictive value 0.83, negative predictive value 0.92. This test is generally used to predict recurrence of breast cancer and evaluate response to therapy. May also be elevated in liver cancer, pancreatic cancer, ovarian cancer, colorectal cancer. Elevations can also occur with benign breast and liver disease.

CANCER ANTIGEN 72-4 (CA 72-4)

Normal: <4.0 ng/ml
Elevated in: Gastric cancer (elevated in >50% of patients). Often used in combination with CA 72-4, CA 19-9, and CEA to monitor gastric cancer after treatment.

CANCER ANTIGEN 125 (CA 125)

Normal range: <1.4%

This test uses an antibody against antigen from tissue culture of an ovarian tumor cell line. Various published evaluations report sensitivity of about 75% to 80% in patients with ovarian carcinoma. There is also an appreciable incidence of elevated values in nonovarian malignancies and in certain benign conditions (see later). Test values may transiently increase during chemotherapy.

MALIGNANT
Epithelial ovarian carcinoma, 75% to 80% (range, 25% to 92%; better in serous than mucinous cystadenocarcinoma)
Endometrial carcinoma, 25% to 48% (2% to 90%)
Pancreatic carcinoma, 59%
Colorectal carcinoma, 20% (15% to 56%)
Endocervical adenocarcinoma, 83%
Squamous cervical or vaginal carcinoma, 7% to 14%

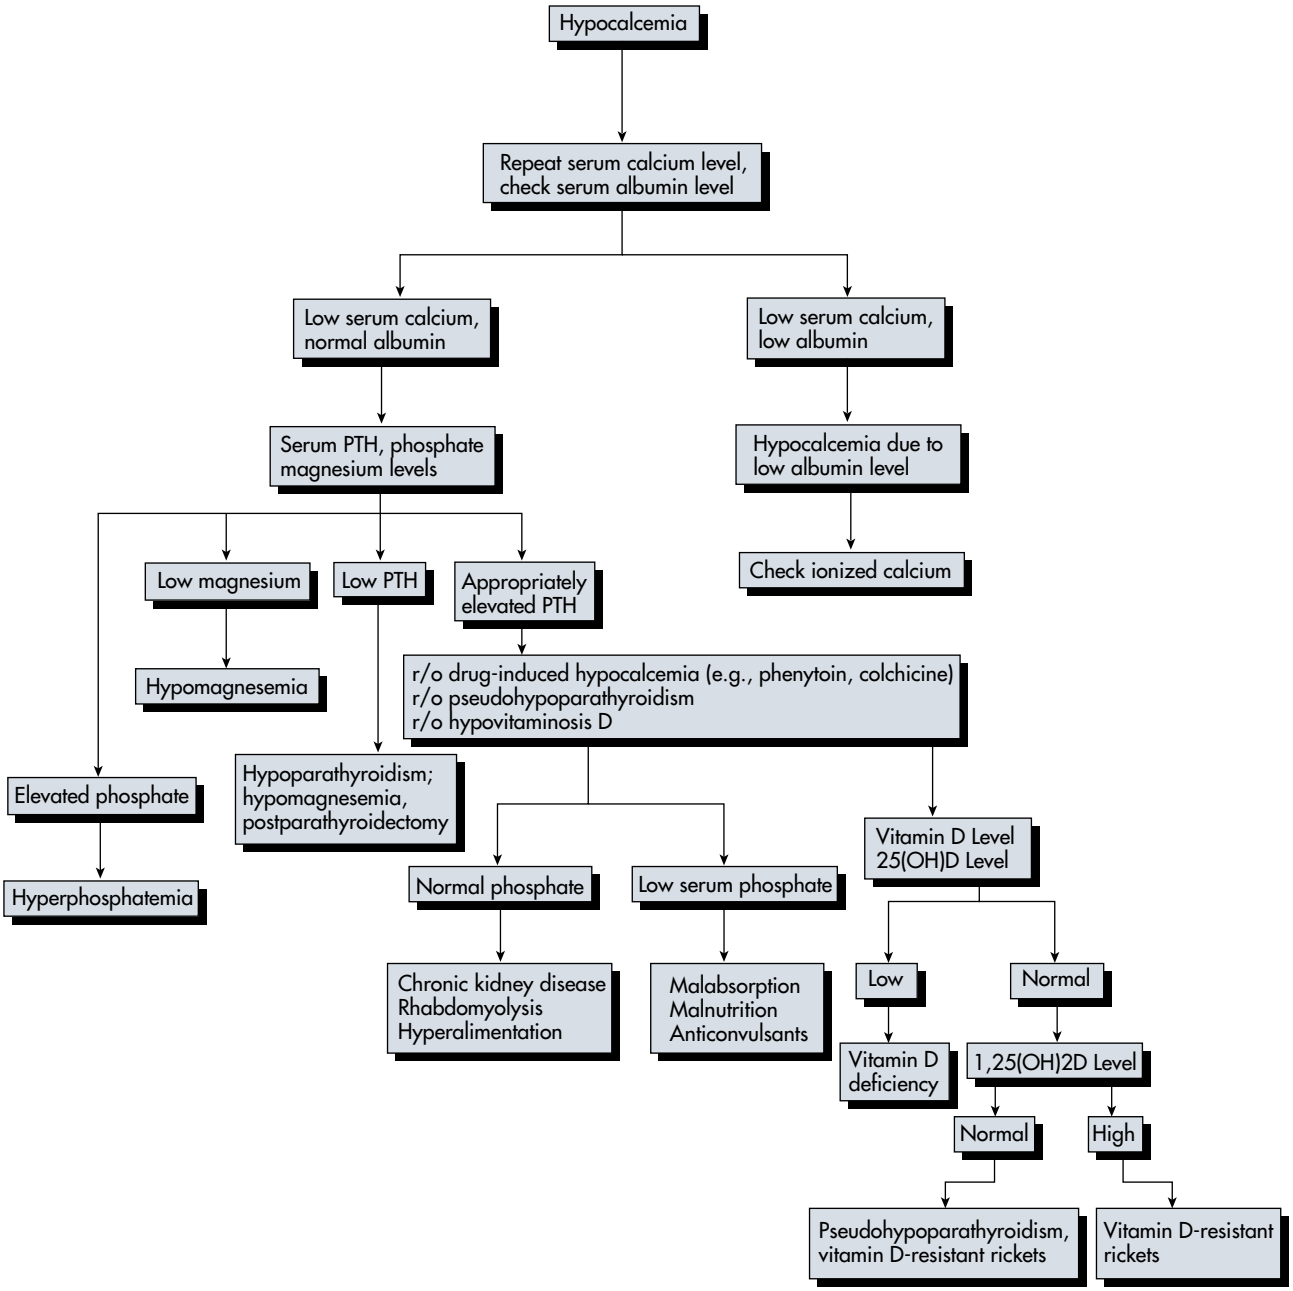

FIG. 16 Diagnostic algorithm. *PTH,* Parathyroid hormone. (From Ferri F: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging,* ed 3, Philadelphia, 2014, Saunders.)

Lung carcinoma, 32%
Breast carcinoma, 12% to 40%
Lymphoma, 35%

BENIGN

Cirrhosis, 40% to 80%
Acute pancreatitis, 38%
Acute peritonitis, 75%
Endometriosis, 88%
Acute pelvic inflammatory disease, 33%
Pregnancy first trimester, 2% to 24%
During menstruation (occasionally)
Renal failure (?frequency)
Normal persons, 0.6% to 1.4%

CAPTOPRIL STIMULATION TEST

Normal: Test performed by giving 25 mg captopril orally after overnight fast. Patient should be seated during test. After captopril, aldosterone <15 ng/dl, renin >2 ng angiotensin L/ml/hr.

Interpretation of results: In patients with primary aldosteronism, plasma aldosterone remains high and plasma renin activity remains low after captopril.

CARBAMAZEPINE (Tegretol)

Normal therapeutic range: 4 to 12 mcg/ml

CARBOHYDRATE ANTIGEN 19-9

Normal: <37.0 U/ml

TABLE 21 Laboratory Differential Diagnosis of Hypercalcemia

	PLASMA TESTS					URINE TESTS			
Diagnosis	**Ca**	**PO_4**	**PTH**	**25(OH)D**	**1,25$(OH)_2$D**	**cAMP**	**TmP/GFR**	**Ca**	**Comments**
Primary hyperparathyroidism	↑	N/↓	↑	N	N/↑	↑	↓	↑	Parathyroid adenoma most common
MEN I									Parathyroid hyperplasia; also includes pituitary and pancreatic neoplasms
MEN IIa									Parathyroid hyperplasia; also includes medullary thyroid carcinoma and pheochromocytoma
MEN IIb									Parathyroid disease uncommon, primarily medullary thyroid carcinoma and pheochromocytoma
FHH	↑	N	N/↑	N	N	N/↑	N/↓	↓↓	Autosomal dominant inheritance; hypercalcemia present within first decade; benign
Malignancy									
Solid tumor, humoral	↑	N/↓	↓	N	N	↑	↓	↑↑	Primarily epidermoid tumors; PTH-related protein(s) is mediator
Solid tumor, osteolytic	↑	N/↑	↓	N	N	↓	↑	↑↑	
Lymphoma	↑	N/↑	↓	N/↓	↑	↓	↑	↑↑	
Granulomatous disease	↑	N/↑	↓	N/↓	↑↑	↓	↑	↑↑	Sarcoid most common etiology
Vitamin D intoxication	↑	N/↑	↓	↑↑	N	↓	↑	↑↑	
Hyperthyroidism	↑	N	↓	N	N	N	N	↑↑	Plasma concentrations of T_4 and/or T_3 are elevated

Ca, Calcium; *cAMP,* cyclic adenosine monophosphate; *FHH,* familial hypocalciuric hypercalcemia; *GFR,* glomerular filtration rate; *MEN,* multiple endocrine neoplasia; *25(OH)D,* 25 hydroxyvitamin D; *PO_4*, phosphate; *PTH,* parathyroid hormone; *T_3*, triiodothyronine; *T_4*, thyroxine; *TmP,* renal threshold for phosphorus.

BOX 6 Differential Diagnosis of Hypercalcemia in Older Adults

Primary hyperparathyroidism
Malignancy
Renal failure
Addison disease
Hyperthyroidism
Immobilization
Medications: Thiazide diuretics, calcium supplements, lithium
Milk alkali syndrome
Paget disease (when immobilized)
Sarcoidosis
Tuberculosis
Vitamin D or vitamin A intoxication

Symptoms of Acute Hypercalcemia
Neurologic: Drowsiness, confusion, irritability hypotonia, coma
Gastrointestinal: Anorexia, nausea, vomiting, acute pancreatitis
Cardiovascular: Arrhythmias
Renal: Polyuria, polydipsia, dehydration

From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology*, ed 8, Philadelphia, 2017, Elsevier.

Elevated in: GI cancer, most frequently pancreatic cancer. Amount of elevation has no relation to tumor mass. Elevations can also occur with cirrhosis, cholangitis, and chronic or acute pancreatitis.

CARBON DIOXIDE, PARTIAL PRESSURE

Normal: Male: 35 to 48 mm Hg
Female: 32 to 45 mm Hg
Elevated in: Respiratory acidosis
Decreased in: Respiratory alkalosis

CARBON MONOXIDE

See CARBOXYHEMOGLOBIN

CARBOXYHEMOGLOBIN

Normal range: Saturation of hemoglobin <2%; smokers <9%
Elevated in: Smoking, exposure to smoking, exposure to automobile exhaust fumes, malfunctioning gas-burning appliances

CARCINOEMBRYONIC ANTIGEN (CEA)

Normal range:
Nonsmokers: 0 to 2.5 ng/ml (0 to 2.5 μg/L [CF: 1; SMI: 0.1 μg/L])
Smokers: 0 to 5 ng/ml (0 to 5 μg/L [CF: 1; SMI: 0.1 μg/L])
Elevated in:
Colorectal carcinomas*, pancreatic carcinomas, and metastatic disease (usually produce higher elevations: >20 ng/ml)
Carcinomas of the esophagus, stomach, small intestine, liver, breast, ovary, lung, and thyroid (usually produce lesser elevations)
Benign conditions (smoking, inflammatory bowel disease, hypothyroidism, cirrhosis, pancreatitis, infections) (usually produce levels <10 ng/ml)

CAROTENE (serum)

Normal range: 50 to 250 μg/dl (0.9 to 4.6 μmol/L [CF: 0.01863; SMI: 0.1 μmol/L])
Elevated in: Carotenemia, chronic nephritis, diabetes mellitus, hypothyroidism, nephrotic syndrome, hyperlipidemia
Decreased in: Fat malabsorption, steatorrhea, pancreatic insufficiency, lack of carotenoids in diet, high fever, liver disease

CATECHOLAMINES, URINE

See URINE CATECHOLAMINES

*To detect colorectal cancer, the sensitivity of CEA ranges from 68% for a threshold of 10 mcg/L to 82% for a threshold of 2.5 mcg/L, and the specificity ranges from 97% for a threshold of 10 mcg/L to 80% for a threshold of 2.6 mcg/L.

TABLE 22 Laboratory Differential Diagnosis of Hypocalcemia

	PLASMA TESTS					URINE TESTS					
Diagnosis	**Ca**	**PO_4**	**PTH**	**25(OH) D**	**1,25 $(OH)_2D$**	**cAMP**	**cAMP after PTH**	**TmP/ GFR**	**TmP/GFR after PTH**	**Ca**	**Comments**
Hypoparathyroidism	↓	↑	N/↓	N	↓	↓	↑↑	↑	↓↓	N/↓	Deficiency of PTH
Pseudohypoparathyroidism											
Type I	↓	↑	↑↑	N	↓	↓	NC	↑	↑	N/↓	Resistance to PTH; patients may have Albright hereditary osteodystrophy and resistance to multiple hormones
Type II	↓	N	↑↑	N	↓	↓	↑	↑	↑	N/↓	Renal resistance to cAMP
Vitamin D deficiency	↓	N/↓	↑↑	↓↓	N/↓	↑	↑	↓	↓	↓↓	Deficient supply (e.g., nutrition) or absorption (e.g., pancreatic insufficiency) of vitamin D
Vitamin D-dependent Rickets											
Type I	↓	N/↓	↑↑	N	↓	↑↑		↓		↓↓	Deficient activity of renal 25(OH)D-1α-hydroxylase
Type II	↓	N/↓	↑↑	N	↑↑	↑		↓		↓↓	Resistance to 1,25$(OH)_2D$

Ca, Calcium; *cAMP,* cyclic adenosine monophosphate; *FHH,* familial hypocalciuric hypercalcemia; *GFR,* glomerular filtration rate; *MEN,* multiple endocrine neoplasia; *NC,* no change or small increase; *(OH)D,* hydroxycalciferol D; *PO_4,* phosphate; *PTH,* parathyroid hormone; *T_3,* triiodothyronine; *T_4,* thyroxine; *TmP,* renal threshold for phosphorus.
From Moore WT, Eastman RC: *Diagnostic endocrinology*, ed 2, St Louis, 1996, Mosby.

CBC

See COMPLETE BLOOD COUNT

CD40 LIGAND

Normal: <5 mcg/L. CD40 ligand is a soluble protein that is shed from activated leukocytes and platelets and used in risk stratification for acute coronary syndrome.
Elevated in: Acute coronary syndrome. Increased CD40 ligand is associated with higher incidence of death or nonfatal myocardial infarction (MI).

CD4+ T-LYMPHOCYTE COUNT (CD4+ T cells)

Calculated as total WBC × % lymphocytes × % lymphocytes stained with CD4.

This test is used primarily to evaluate immune dysfunction in HIV infection. It is useful as a prognostic indicator and as a criterion for initiating prophylaxis for several opportunistic infections that are sequelae of HIV infection. Progressive depletion of CD4+ T-lymphocytes is associated with an increased likelihood of clinical complications (Table 23).

CEA

See CARCINOEMBRYONIC ANTIGEN

CEREBROSPINAL FLUID (CSF)

Interpretation of results:
Appearance of the fluid
- Clear: Normal.
- Yellow color (xanthochromia) in the supernatant of centrifuged CSF within 1 hour or less after collection is usually the result of previous bleeding (subarachnoid hemorrhage); it may also be caused by increased CSF protein, melanin from meningeal melanosarcomas, or carotenoids.
- Pinkish color is usually the result of a bloody tap; the color generally clears progressively from tubes 1 to 4 (the supernatant is usually crystal clear in traumatic taps).
- Turbidity usually indicates the presence of leukocytes (bleeding introduces approximately 1 WBC/500 RBCs into the CSF).

CSF pressure: Elevated pressure can be seen with meningitis, meningoencephalitis, pseudotumor cerebri, mass lesions, and intracerebral bleeding.

TABLE 23 Relation of CD4 Lymphocyte Counts to the Onset of Certain HIV-Associated Infections and Neoplasms in North America

CD4 Count (Cells/mm^3)*	Opportunistic Infection or Neoplasm	Frequency (%)†
>500	Herpes zoster, polydermatomal	5-10
200-500	*Mycobacterium tuberculosis* infection, pulmonary and extrapulmonary	2-20
	Oral hairy leukoplakia	40-70
	Candida pharyngitis (thrush)	40-70
	Recurrent *Candida* vaginitis	15-30 (F)
	Kaposi sarcoma, mucocutaneous	15-30 (M)
	Bacterial pneumonia, recurrent	15-20
	Cervical neoplasia	1-2 (F)
100-200	*Pneumocystis carinii* pneumonia	15-60
	Herpes simplex, chronic, ulcerative	5-10
	Histoplasma capsulatum infection, disseminated	0-20
	Kaposi sarcoma, visceral	3-8 (M)
	Progressive multifocal leukoencephalopathy	2-3
	Lymphoma, non-Hodgkin	2-5
<100	*Candida* esophagitis	15-20
	Mycobacterium avium-intracellulare, disseminated	25-40
	Toxoplasma gondii encephalitis	5-25
	Cryptosporidium enteritis	2-10
	CMV retinitis	20-35
	Cryptococcus neoformans encephalitis	2-5
	CMV esophagitis or colitis	6-12
	Lymphoma, central nervous system	4-8

CMV, Cytomegalovirus; *F,* exclusively in women; *HIV,* human immunodeficiency virus; *M,* almost exclusively in men.
*Table indicates CD4 count at which specific infections or neoplasms generally begin to appear. Each infection may recur or progress during the subsequent course of HIV disease.
†Even within the United States, great regional differences in the incidence of specific opportunistic infections are apparent. For example, disseminated histoplasmosis is common in the Mississippi River drainage area but very rare in individuals who have lived exclusively on the East or West Coast.
From Andreoli TE (ed): *Cecil essentials of medicine,* ed 5, Philadelphia, 2000, WB Saunders.

Cell count: In the adult the CSF is normally free of cells (although up to five mononuclear cells/mm^3 is considered normal); the presence of granulocytes is never normal.
- Neutrophils: Seen in bacterial meningitis, early viral meningoencephalitis, and early tuberculosis (TB) meningitis. Box 7 summarizes causes of increased CSF neutrophils.
- Increased lymphocytes: TB meningitis, viral meningoencephalitis, syphilitic meningoencephalitis, fungal meningitis. Causes of CSF lymphocytosis are summarized in Box 8.
- CSF plasmacytosis: Box 9 describes inflammatory and infectious causes of CSF plasmacytosis.
- CSF eosinophilia: Causes of CSF eosinophilic pleocytosis are summarized in Box 10.

BOX 7 Causes of Increased CSF Neutrophils

- Meningitis
  - Bacterial meningitis
  - Early viral meningoencephalitis
  - Early tuberculous meningitis
  - Early mycotic meningitis
  - Amebic encephalomyelitis
- Other infections
  - Cerebral abscess
  - Subdural empyema
  - AIDS-related CMV radiculopathy
- Following seizures
- Following CNS hemorrhage
  - Subarachnoid
  - Intracerebral
- Following CNS infarct
- Reaction to repeated lumbar punctures
- Injection of foreign material in subarachnoid space (e.g., methotrexate, contrast media)
- Metastatic tumor in contact with CSF

AIDS, Acquired immunodeficiency syndrome; *CMV,* cytomegalovirus; *CNS,* central nervous system; *CSF,* cerebrospinal fluid.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

BOX 8 Causes of CSF Lymphocytosis

Meningitis
- Viral meningitis
- Tuberculous meningitis
- Fungal meningitis
- Syphilitic meningoencephalitis
- Leptospiral meningitis
- Bacterial due to uncommon organisms
- Early bacterial meningitis where leukocyte counts are relatively low
- Parasitic infestations (e.g., cysticercosis, trichinosis, toxoplasmosis)
- Aseptic meningitis due to septic focus adjacent to meninges

Degenerative Disorders
- Subacute sclerosing panencephalitis
- Multiple sclerosis
- Drug abuse encephalopathy
- Guillain-Barré syndrome
- Acute disseminated encephalomyelitis

Other Inflammatory Disorders
- HaNDL syndrome (headache with neurologic deficits and CSF lymphocytosis)
- Sarcoidosis
- Polyneuritis
- CNS periarteritis

CNS, Central nervous system; *CSF,* cerebrospinal fluid.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Protein: Serum proteins are generally too large to cross the normal blood-CSF barrier; however, increased CSF protein is seen with meningeal inflammation, traumatic tap, increased CNS synthesis, tissue degeneration, obstruction to CSF circulation, and Guillain-Barré syndrome. Mean concentrations of plasma and CSF proteins are summarized in Table 24. Conditions associated with increased CSF total protein are summarized in Box 11.

Glucose
- Decreased glucose is seen with bacterial meningitis, TB meningitis, fungal meningitis, subarachnoid hemorrhage, and some cases of viral meningitis.
- A mild increase in CSF glucose can be seen in patients with very elevated serum glucose levels.

Table 25 describes CSF findings in infectious and inflammatory diseases of the central nervous system and meninges.

Causes of xanthochromia are summarized in Table 26.

CERULOPLASMIN (serum)

Normal range: 20 to 35 mg/dl (200 to 350 mg/L [CF: 10; SMI: 10 mg/L])

Elevated in: Pregnancy, estrogens, oral contraceptives, neoplastic diseases (leukemias, Hodgkin lymphoma, carcinomas), inflammatory states, systemic lupus erythematosus, primary biliary cirrhosis, rheumatoid arthritis

Decreased in: Wilson disease (values often <10 mg/dl), nephrotic syndrome, advanced liver disease, malabsorption, total parenteral nutrition, Menkes syndrome

BOX 9 Inflammatory and Infectious Causes of CSF Plasmacytosis

- Acute viral infections
- Guillain-Barré syndrome
- Multiple sclerosis
- Parasitic CNS infestations
- Sarcoidosis
- Subacute sclerosing panencephalitis
- Syphilitic meningoencephalitis
- Tuberculous meningitis

CNS, Central nervous system; *CSF,* cerebrospinal fluid.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

BOX 10 Causes of CSF Eosinophilic Pleocytosis

Commonly associated with
- Acute polyneuritis
- CNS reaction to foreign material (drugs, shunts)
- Fungal infections
- Idiopathic eosinophilic meningitis
- Idiopathic hypereosinophilic syndrome
- Parasitic infections

Infrequently associated with
- Bacterial meningitis
- Leukemia/lymphoma
- Myeloproliferative disorders
- Neurosarcoidosis
- Primary brain tumors
- Tuberculous meningoencephalitis
- Viral meningitis

CNS, Central nervous system; *CSF,* cerebrospinal fluid.
Modified from Kjeldsberg CR, Knight JA: *Body fluids: laboratory examination of amniotic, cerebrospinal, seminal, serous and synovial fluids*, ed 3, Chicago, 1993, American Society for Clinical Pathology, with permission. In McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 24 Mean Concentrations of Plasma and CSF Proteins

Protein	CSF, mg/L	Plasma/CSF Ratio
Prealbumin	17.3	14
Albumin	155.0	236
Transferrin	14.4	142
Ceruloplasmin	1.0	366
Immunoglobulin (Ig)G	12.3	802
IgA	1.3	1346
α_2-Microglobulin	2.0	1111
Fibrinogen	0.6	4940
IgM	0.6	1167
β-Lipoprotein	0.6	6213

CSF, Cerebrospinal fluid.
Adapted and updated from Felgenhauer K: Protein size and cerebrospinal fluid composition, *Klin Wochenschr* 52:1158, 1974, with permission. (McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.)

BOX 11 Conditions Associated with Increased CSF Total Protein

Traumatic Spinal Puncture
- Increased Blood-CSF Permeability
- Arachnoiditis (e.g., following methotrexate therapy)
- Meningitis (bacterial, viral, fungal, tuberculous)
- Hemorrhage (subarachnoid, intracerebral)
- Endocrine/metabolic disorders
  Milk-alkali syndrome with hypercalcemia
  Diabetic neuropathy
  Hereditary neuropathies and myelopathies
  Decreased endocrine function (thyroid, parathyroid)
  Other disorders (uremia, dehydration)

Drug Toxicity
Ethanol, phenothiazines, phenytoin

CSF Circulation Defects
Mechanical obstruction (tumor, abscess, herniated disk)
Loculated CSF effusion

Increased Immunoglobulin (Ig)G Synthesis
Multiple sclerosis

Neurosyphilis
Subacute sclerosing panencephalitis

Increased IgG Synthesis and Blood-CSF Permeability
Guillain-Barré syndrome
Collagen vascular diseases (e.g., lupus, periarteritis)
Chronic inflammatory demyelinating polyradiculopathy

-From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

CHLAMYDIA GROUP ANTIBODY SEROLOGIC TEST

Test description: Acute and convalescent sera is drawn 2 to 4 wk apart. A fourfold increase in titer between acute and convalescent sera is necessary for confirmation. A single titer ≥1:64 is considered indicative of psittacosis or lymphogranuloma venereum (LGV).

CHLAMYDIA TRACHOMATIS PCR

Test description: Test is performed on endocervical swab, urine, and intraurethral swab (see Table 27)
Normal: Negative

CHLORIDE (serum)

Normal range: 95 to 105 mEq/L (95 to 105 mmol/L [CF: 1; SMI: 1 mmol/L])
Elevated in: Dehydration, excessive infusion of normal saline solution, cystic fibrosis (sweat test), hyperparathyroidism, renal tubular disease, metabolic acidosis, prolonged diarrhea, drugs (ammonium chloride administration, acetazolamide, boric acid, triamterene)
Decreased in: Congestive heart failure, syndrome of inappropriate antidiuretic hormone secretion, Addison disease, vomiting, gastric suction, salt-losing nephritis, continuous infusion of D_5W, thiazide diuretic administration, diaphoresis, diarrhea, burns, diabetic ketoacidosis

CHLORIDE (sweat)

Normal: 0 to 40 mmol/L
Borderline/indeterminate: 41 to 60 mmol/L
Consistent with cystic fibrosis: >60 mmol/L
False low results can occur with edema, excessive sweating, and hypoproteinemia.

CHLORIDE, URINE

See URINE CHLORIDE

CHOLECYSTOKININ-PANCREOZYMIN (CCK, CCK-PZ)

Normal: <80 pg/ml
Elevated in: Pancreatic disease, celiac disease, gastric ulcer, postgastrectomy, irritable bowel syndrome (IBS), fatty food intolerance

CHOLESTEROL, HIGH-DENSITY LIPOPROTEIN

See HIGH-DENSITY LIPOPROTEIN CHOLESTEROL

CHOLESTEROL, LOW-DENSITY LIPOPROTEIN

See LOW-DENSITY LIPOPROTEIN CHOLESTEROL

CHOLESTEROL, TOTAL

Normal range: Varies with age
Generally <200 mg/dl (<5.20 mmol/L [CF: 0.02586; SMI: 0.05 mmol/L])
Elevated in: Primary hypercholesterolemia, biliary obstruction, diabetes mellitus, nephrotic syndrome, hypothyroidism, primary biliary cirrhosis, high-cholesterol diet, pregnancy third trimester, myocardial infarction, drugs (steroids, phenothiazines, oral contraceptives). Classic hyperlipidemia phenotypes are summarized in Table 28.
Decreased in: Medications (statins, niacin), starvation, malabsorption, sideroblastic anemia, thalassemia, abetalipoproteinemia, hyperthyroidism, Cushing syndrome, hepatic failure, multiple myeloma, polycythemia vera, chronic myelocytic leukemia, myeloid metaplasia, Waldenström macroglobulinemia, myelofibrosis

CHORIONIC GONADOTROPINS, HUMAN (serum) (hCG)

Normal range, serum:
Female, premenopausal: <0.8 IU/L; postmenopausal <3.3 IU/L
Male: <0.7 IU/L
Elevated in:
Pregnancy, choriocarcinoma, gestational trophoblastic neoplasia (including molar gestations), placental site trophoblastic tumors; human antimouse antibodies (HAMA) can produce false serum assay for hCG.
The principal use of this test is to diagnose pregnancy. The concentration of hCG increases significantly during the initial 6 wk of pregnancy.
Normal range: Varies with gestational stage:
1 wk: 5 to 50 mU/ml
1 to 2 wk: 50 to 550 mU/ml
2 to 3 wk: Up to 5000 mU/ml
3 to 4 wk: Up to 10,000 mU/ml
4 to 5 wk: Up to 50,000 mU/ml
2 to 3 mo: 10,000 to 100,000 mU/ml
Peak values approaching 100,000 IU/L occur 60 to 70 days following implantation.
hCG levels generally double every 1 to 3 days. In patients with concentration <2000 IU/L, an increase of serum hCG <66% after 2 days is suggestive of spontaneous abortion or ruptured ectopic gestation.

CHYMOTRYPSIN

Normal: <10 mcg/L
Elevated in: Acute pancreatitis, chronic renal failure, oral enzyme preparations, gastric cancer, pancreatic cancer

TABLE 25 Cerebrospinal Fluid Findings in Infectious and Inflammatory Diseases of the Central Nervous System

Condition	Pressure (mm H_2O)	Leukocytes/μL	Protein (mg/dl)	Sugar (mg/dl)	Specific Findings
Acute bacterial meningitis	Usually elevated; average 300	Several hundred to >10,000; usually a few thousand; occasionally <100 (especially meningococcal or early in disease); PMLs predominate	Usually 100-500, occasionally >1000	<40 in more than half the cases	Organism usually seen on smear or recovered on culture in >90% of cases
Subdural empyema	Usually elevated; average 300	<100 to a few thousand; PMLs predominate	Usually 100-500	Normal	No organisms on smear or by culture unless concurrent meningitis
Brain abscess	Usually elevated	Usually 10-200; fluid rarely is acellular; lymphocytes predominate	Usually 75-400	Normal	No organisms on smear or by culture
Ventricular empyema (rupture of brain abscess)	Elevated	Several thousand to 100,000; usually >90% PMLs	Usually several hundred	Usually <40	Organisms may be seen on smear or cultured
Cerebral epidural abscess	Slight to modest elevation	Few to several hundred or more cells; lymphocytes predominate	Usually 50-200	Normal	No organisms on smear or by culture
Spinal epidural abscess	Usually reduced with spinal block	Usually 10-100; lymphocytes predominate	Usually several hundred	Normal	No organisms on smear or by culture
Thrombophlebitis (often associated with subdural empyema)	Often elevated	Few to several hundred; PMLs and lymphocytes	Slightly to moderately elevated	Normal	No organisms on smear or by culture
Bacterial endocarditis (with embolism)	Normal or slightly elevated	Few to <100; lymphocytes and PMLs	Slightly elevated	Normal	No organisms on smear or by culture
Acute hemorrhagic encephalitis	Usually elevated	Few to >1000; PMLs predominate	Moderately elevated	Normal	No organisms on smear or by culture
Tuberculous infection	Usually elevated	Usually 25-100, rarely >500; lymphocytes predominate except in early stages when PMLs may account for 80% of cells	Nearly always elevated; usually 100-200; may be much higher if block in CSF flow	Usually reduced; <50 in 75% of cases	Acid-fast organisms may be seen on smear of protein coagulum (pellicle) or recovered from inoculated guinea pig or by culture
Cryptococcal infection	Usually elevated	Average 50 (0-800); lymphocytes predominate	Average 100; usually 20-500	Reduced in more than half of cases; often higher in patients with concomitant diabetes mellitus	Organisms may be seen in India ink preparation and on culture (Sabouraud medium); usually grow on blood agar; may produce alcohol in CSF from fermentation of glucose
Syphilis (acute)	Usually elevated	Average 500; usually lymphocytes; rarely PMLs	Average, 100; γ-globulin often high, with abnormal colloidal gold curve	Normal (rarely reduced)	Positive reagin test result for syphilis; spirochete not demonstrable by usual techniques of smear or by culture
Sarcoidosis	Normal to considerably elevated	0 to <100 mononuclear cells	Slight to moderate elevation	Normal	No specific findings

CSF, Cerebrospinal fluid; *PMLs*, polymorphonuclear leukocytes.
From Cherry JD: *Feigin and Cherry's pediatric infectious diseases*, ed 8, Philadelphia, 2019, Elsevier.

TABLE 26 Xanthochromia and Associated Diseases/Disorders

CSF Supernatant Color	Associated Diseases/Disorders
Pink	RBC lysis/hemoglobin breakdown products
Yellow	RBC lysis/hemoglobin breakdown products Hyperbilirubinemia CSF protein >150 mg/dl (1.5 g/L)
Orange	RBC lysis/hemoglobin breakdown products Hypervitaminosis A (carotenoids)
Yellow-green	Hyperbilirubinemia (biliverdin)
Brown	Meningeal metastatic melanoma

CSF, Cerebrospinal fluid; *RBC,* red blood cell.
McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Decreased in: Chronic pancreatitis, late cystic fibrosis

CIRCULATING ANTICOAGULANT (lupus anticoagulant)

Normal: Negative
Detected in: Systemic lupus erythematosus, drug-induced lupus, long-term phenothiazine therapy, multiple myeloma, ulcerative colitis, rheumatoid arthritis, postpartum, hemophilia, neoplasms, chronic inflammatory states, AIDS, nephrotic syndrome

NOTE: The name is a misnomer because these patients are prone to hypercoagulability and thrombosis.

CK

See CREATINE KINASE

CLONIDINE SUPPRESSION TEST

Interpretation of results: Clonidine inhibits neurogenic catecholamine release and will cause a decrease in plasma norepinephrine into the refer-

ence interval in hypertensive subjects without pheochromocytoma. Test is performed by giving 4.3 mcg clonidine/kg orally after overnight fast. Norepinephrine is measured at 3 hr. Result should be within established reference range and decrease to <50% of baseline concentration. Lack of decrease in norepinephrine is suggestive of pheochromocytoma.

CLOSTRIDIUM DIFFICILE TOXIN ASSAY (stool)

Normal: Negative
Detected in: Antibiotic-associated diarrhea and pseudomembranous colitis

CO

See CARBOXYHEMOGLOBIN

TABLE 27 Specimens for Detection of *Chlamydia trachomatis**

Disease	Specimen
Mucopurulent cervicitis	Endocervical swab, urine
Acute urethral syndrome (women)	Urethral swab, urine
Acute endometritis	Endometrial aspirate
Acute salpingitis	Fallopian tube biopsy
Nongonococcal urethritis (men)	Urethral swab, urine
Inclusion conjunctivitis	Conjunctival scrapings/swab
Trachoma	Conjunctival scrapings/swab
Lymphogranuloma venereum	Lymph node aspirate, biopsy of ulcerated lesion, serum
Pneumonitis (infants)	Serum, tracheobronchial aspirate, nasopharyngeal swab

*Urine is acceptable for some enzyme-linked immunoassays and for the commercial nucleic acid amplification tests.
McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

COAGULATION FACTORS

See Table 29 for characteristics of coagulation factors.
See Table 30 for differential diagnosis of low factor VIII.
Factor reference ranges:
a. V: >10%
b. VII: >10%
c. VIII: 50% to 170%
d. IX: 60% to 136%
e. X: >10%
f. XI: 50% to 150%
g. XII: >30%

Table 31 describes screening laboratory results in coagulation factor deficiencies. Characterization of coagulation factors and their deficiencies is summarized in Table 32.

COBALAMIN, SERUM

See VITAMIN B_{12}

COLD AGGLUTININS TITER

Normal range: <1:32
Elevated in:
Primary atypical pneumonia (*Mycoplasma* pneumonia), infectious mononucleosis, CMV infection
Others: Hepatic cirrhosis, acquired hemolytic anemia, frostbite, multiple myeloma, lymphoma, malaria

COMPLEMENT

Normal range:
C3: 70 to 160 mg/dl (0.7 to 1.6 g/L [CF: 0.01; SMI: 0.1 g/L])
C4: 20 to 40 mg/dl (0.2 to 0.4 g/L [CF: 0.01; SMI: 0.1 g/L])
Abnormal values:
Decreased C3: Active SLE, immune complex disease, acute glomerulonephritis, inborn C3 deficiency, membranoproliferative glomerulonephritis, infective endocarditis, serum sickness, autoimmune/chronic active hepatitis
Decreased C4: Immune complex disease, active SLE, infective endocarditis, inborn C4 deficiency, hereditary angioedema, hypergammaglobulinemic

TABLE 28 Classic Hyperlipidemia Phenotypes

WHO ICD and OMIM Numbers	Type	Particle	Triglycerides	Cholesterol	Comments
E78.3 238600	1 (familial chylomicronemia or LPL deficiency)	CM	High	Normal	Low cardiac risk; hereditary, found mostly in pediatric patients and young adults; autosomal recessive mutation in *LPL* or *APOC2; APOA5, LMF-1,* and *GPIHBP1* mutations are linked to this phenotype.
E78.0 143890	2A (heterozygous and homozygous familial hypercholesterolemia)	LDL	Normal	High	High cardiac risk; mostly polygenic disease; about 10% are monogenic; heterozygous form is due to mutations in *LDLR, APOB,* or *PCSK9*; homozygous form is due to mutations in *LDLR* or *LDLRAP1* (ARH).
E78.4 144250	2B (combined hyperlipoproteinemia)	VLDL, LDL	High	High	High cardiac risk; polygenic disease; links to mutations in *USF1, APOB,* and *LPL*
E78.2 107741	3 (dysbetalipoproteinemia)	IDL	High	High	High cardiac risk; mutations in *APOE* gene or homozygous for E2 allele of *APOE*
E78.1 144600, 145750	4 (primary hypertriglyceridemia)	VLDL	High	Normal	Lower cardiac risk than type 2 or 3; polygenic disease
E78.3 144650	5 (mixed hyperlipidemia)	VLDL, CM	High	High	Low cardiac risk; polygenic disease; 10% of patients have mutations in *LPL, APOC2,* and *APOA5*; mutations in *APOE, TRIB1, CHREBP, GALNT2, GCKR,* and *ANGPTL3* are thought to contribute to this disease.

ANGPTL3, Angiopoietin-like 3; *APOA5,* apolipoprotein A-V; *APOB,* apolipoprotein B; *APOC2,* apolipoprotein C-II; *APOE,* apolipoprotein E; *CHREBP,* carbohydrate response element binding protein (or *MLXIPL*); *CM,* chylomicron; *GALNT2,* UDP-N′-acetyl-alpha-D-galactosamine-polypeptide *N*-acetylgalactosaminyltransferase 2; *GCKR,* glucokinase regulator; *ICD,* International Classification of Diseases; *IDL,* intermediate-density lipoprotein; *LDL,* low-density lipoprotein; *LDLRAP1,* LDLR adaptor protein 1 (also known as ARH); *LPL,* lipoprotein lipase; *OMIM,* Online Mendelian Inheritance in Man; *TRIB1,* tribbles homologue 1; *USF1,* upstream transcription factor 1; *VLDL,* very-low-density lipoprotein; *WHO,* World Health Organization.
McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 29 Characteristics of Coagulation Factors

Factor	Descriptive Name	Source	Approximate Half-Life (hr)	Function
I	Fibrinogen	Liver	120	Substrate for fibrin clot (CP)
II	Prothrombin	Liver (VKD)	60	Serine protease (CP)
V	Proaccelerin, labile factor	Liver	12-36	Cofactor (CP)
VII	Serum prothrombin conversion accelerator, proconvertin	Liver (VKD)	6	(?) Serine protease (EP)
VIII	Antihemophilic factor or globulin	Endothelial cells and (?) elsewhere	12	Cofactor (IP)
IX	Plasma thromboplastin component, Christmas factor	Liver (VKD)	24	Serine protease (IP)
X	Stuart-Prower factor	Liver (VKD)	36	Serine protease (CP)
XI	Plasma thromboplastin antecedent	(?) Liver	40-84	Serine protease (IP)
XII	Hageman factor	(?) Liver	50	Serine protease contact activation (IP)
XIII	Fibrin-stabilizing factor	(?) Liver	96-180	Transglutaminase (CP)
Prekallikrein	Fletcher factor	(?) Liver	?	Serine protease contact activation (IP)
High-molecular-weight kininogen	Fitzgerald factor, Flaujeac or Williams factor	(?) Liver	?	Cofactor, contact activation (IP)

CP, Common pathway; *EP,* extrinsic pathway; *IP,* intrinsic pathway; *VKD,* vitamin K dependent.
From Noble J (ed): *Primary care medicine,* ed 3, St Louis, 2001, Mosby.

TABLE 30 Differential Diagnosis of a Low Factor VIII Level

1. FVIII <10%
   1. Severe or moderately severe hemophilia A
   2. Severe type 1 vWD
   3. Type 3 vWD
   4. Type 2N vWD
   5. Acquired hemophilia A
   6. Acquired vWD
2. FVIII: 10%-50%
   1. Mild hemophilia A
   2. Type 1 vWD
   3. Type 2N vWD
   4. Combined FVIII and FV deficiency

FV, Factor V; *FVIII,* factor VIII; *vWD,* von Willebrand disease.
From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

TABLE 31 Screening Laboratory Results in Coagulation Factor Deficiencies

Deficient Factor	Frequency	PT	PTT	TT
I (fibrinogen)	Rare	↑	↑	↑
II (prothrombin)	Very rare	↑	↑	↑
V 1:1,000,000	↑	↑	NL	
VII	1:500,000	↑	NL	NL
VIII	1:5000 (male)	NL	↑	NL
IX	1:30,000 (male)	NL	↑	NL
X 1:500,000	↑	↑	NL	
XI	Rare*	NL	↑	NL
XII or HMWK or PK†	Rare	NL	↑	NL
XIII	Rare	NL	NL	↑

↑, Increased over normal range; *HMWK,* high-molecular-weight kininogen; *NL,* normal; *PK,* prekallikrein; *PT,* prothrombin time; *PTT,* partial thromboplastin time; *TT,* thrombin time.
*Except in those of Ashkenazi Jewish descent (approximately 4% are heterozygous for factor XI deficiency).
†Not associated with clinical bleeding.
From Andreoli TE (ed): *Cecil essentials of medicine,* ed 5, Philadelphia, 2001, WB Saunders.

states, cryoglobulinemic vasculitis. NOTE: The complement system has daunting nomenclature; accordingly, some basic definitions are given in Box 12.

COMPLEMENT DEFICIENCY

Table 33 describes complement deficiency states.

COMPLETE BLOOD COUNT (CBC)

See Fig. 17, which describes an algorithm for the evaluation of patients with neutropenia.

White blood cells 3200 to 9800/mm^3 (3.2 to 9.8 × 10^9/L [CF: 0.001; SMI: 0.1 × 10^9/L])

Red blood cells
- Male: 4.3 to 5.9 × 10^6/mm^3 (4.3 to 5.9 × 10^{12}/L [CF: 0.001; SMI: 0.1 × 10^{12}/L])
- Female: 3.5 to 5 × 10^6/mm^3 (3.5 to 5 × 10^{12}/L [CF: 0.001; SMI: 0.1 × 10^{12}/L])

Hemoglobin
Male: 13.6 to 17.7 g/dl (136 to 172 g/L [CF: 10; SMI: 1 g/L])
Female: 12 to 15 g/dl (120 to 150 g/L [CF: 10; SMI: 1 g/L])

Hematocrit
- Male: 39% to 49% (0.39 to 0.49 [CF: 0.01; SMI: 0.01])
- Female: 33% to 43% (0.33 to 0.43 [CF: 0.01; SMI: 0.01])

Mean corpuscular volume (MCV): 76 to 100 μm^3 (76 to 100 fL [CF: 1; SMI: 1 fL])

Mean corpuscular hemoglobin (MCH): 27 to 33 pg (27 to 33 pg [CF: 1; SMI: 1 pg])

Mean corpuscular hemoglobin concentration (MCHC): 33 to 37 g/dl (330 to 370 g/L [CF: 10; SMI: 10 g/L])

Red blood cell distribution width index (RDW): 11.5% to 14.5%

Platelet count: 130 to 400 × 10^3/mm^3 (130-400 × 10^9/L [CF: 1; SMI: 5 × 10^9/L])

Differential:
- 2 to 6 stabs (bands, early mature neutrophils)
- 60 to 70 segs (mature neutrophils)
- 1 to 4 eosinophils
- 0 to 1 basophils
- 2 to 8 monocytes
- 25 to 40 lymphocytes

CONJUGATED BILIRUBIN

See BILIRUBIN, DIRECT

COPPER (serum)

Normal range: 70 to 140 μg/dl (11 to 22 μmol/L [CF: 0.1574, SMI: 0.2 μmol/L])

TABLE 32 Characterization of Coagulation Factors and Their Deficiencies

Factor	Molecular Weight, kDa	Gene Location	Normal Circulating Half-Life	Incidence	Inheritance	Bleeding Severity
Fibrinogen	330	4q31.3-q32.1	2-4 days	1:1 million	Recessive	Mild-severe*
II	72	11p11.2	3-4 days	Very rare	Recessive	Mild-moderate
V	330	1q24.2	36 hours	1:1 million	Recessive	Moderate
V and VIII combined	—	LMAN1:18q21.32 MCFD2:2p21	36 hours for FV; 10-14 hours for FVIII	1:2 million	Recessive	Mild-moderate
VII	50	13q34	3-6 hours	1:500,000	Recessive	Mild-severe
VIII	330	Xq28	10-14 hours	1:10,000	Sex-linked	Mild-severe
IX	56	Xq27	18-24 hours	1:30,000	Sex-linked	Mild-severe
X	58	13q34	40-60 hours	1:500,000	Recessive	Mild-severe
XI	160	4q35.2	40-70 hours	Rare†	Recessive	Mild-moderate
XII	80	5q33-qter	50-70 days	Rare	Recessive	No bleeding
PK	88	4q33-q35	Not known	Very rare	Recessive	No bleeding
HK	120	3q27	9-10 hours	Extremely rare	Recessive	No bleeding
XIII	320	A:6p25.1 B:1q31.3	11-14 days	<1:1 million	Recessive	Moderate-severe

HK, High molecular weight kininogen; *PK,* prekallikrein.
*May be associated with thrombosis.
†Rare except in those of Ashkenazi Jewish descent.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

BOX 12 Definitions

Classical pathway: C1, C4, C2, C3, and the terminal components.
Alternative pathway: Factor B, factor D, properdin, and the terminal components.
Lectin activation pathway: MBL, MASP1, MASP2, C3, and the terminal components.
Anaphylatoxins: C3a, C4a, C5a. These are mediators of smooth muscle contraction, degranulation of mast cells, enhanced neutrophil aggregation, increased vascular permeability.
Opsonization: Renders a particle more easily phagocytosed.
C3 tickover: This term occasionally is used to describe spontaneous C3 hydrolysis.
Membrane attack complex (terminal components): C5, C6, C7, C8, C9.
CH50: Used to define the dilution of serum capable of lysing 50% of sensitized sheep red cells. This assay measures the intactness of the classical pathway through the terminal components.
AH50: Used to define the dilution of serum capable of lysing 50% of nonsensitized rabbit red cells. This assay measures the intactness of the alternative pathway through the terminal components.

From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, WB Saunders.

Decreased in: Wilson disease, Menkes syndrome, malabsorption, malnutrition, nephrosis, total parenteral nutrition, acute leukemia in remission
Elevated in: Aplastic anemia, biliary cirrhosis, systemic lupus erythematosus, hemochromatosis, hyperthyroidism, hypothyroidism, infection, iron deficiency anemia, leukemia, lymphoma, oral contraceptives, pernicious anemia, rheumatoid arthritis

COPPER, URINE

See URINE COPPER

CORTICOTROPIN RELEASING HORMONE (CRH) STIMULATION TEST

Normal: A dose of 0.5 mg of dexamethasone is given every 6 hours for 2 days; 2 hours after last dose 1 mcg/kg CRH is given IV. Samples are drawn after 15 min. Normally there is a twofold to fourfold increase in mean baseline concentration of ACTH or cortisol. Cortisol >1.4 mcg/L is virtually 100% specific and 100% diagnostic.
Interpretation of results:
Normal or exaggerated response: Pituitary Cushing disease
No response: Ectopic ACTH-secreting tumor
A positive response to CRH or a suppressed response to high-dose dexamethasone has a 97% positive predictive value for Cushing disease. However, a lack of response to either test excludes Cushing disease in only 64% to 78% of patients. When the tests are considered together, negative responses from both have a 100% predictive value for ectopic ACTH secretion.

CORTISOL, PLASMA

Normal range:
Varies with time of collection (circadian variation):
8 A.M.: 4 to 19 μg/dl (110 to 520 nmol/L [CF: 27.59; SMI: 10 nmol/L])
4 P.M.: 2 to 15 μg/dl (50 to 410 nmol/L [CF: 27.59; SMI: 10 nmol/L])
Elevated in: Ectopic adrenocorticotropic hormone production (i.e., oat cell carcinoma of lung), loss of normal diurnal variation, pregnancy, chronic renal failure, iatrogenic, stress, adrenal or pituitary hyperplasia, or adenomas
Decreased in: Primary adrenocortical insufficiency, anterior pituitary hypofunction, secondary adrenocortical insufficiency, adrenogenital syndromes

C-PEPTIDE

Elevated in: Insulinoma, sulfonylurea administration
Decreased in: Insulin-dependent diabetes mellitus, factitious insulin administration

TABLE 33 Complement Deficiency States

Component	No. of Reported Patients	Mode of Inheritance	Functional Defects	Disease Associations
Classic Pathway				
C1qrs	31	ACD	Impaired IC handling, delayed C' activation, impaired immune response	CVD, 48%; infection (encapsulated bacteria), 22%; both, 18%; healthy, 12%
C4	21	ACD	Impaired C' activation in absence of specific antibody	Infection (meningococcal), 74%; healthy, 26%
C2	109	ACD		
Alternative Pathway				
D	3	ACD	Impaired IC handling, opson/phag; granulocytosis, CTX, immune response and absent SBA	CVD, 79%; recurrent infection (encapsulated bacteria), 71%
P	70	XL		
Junction of Classic and Alternative Pathways				
C3	19	ACD	Impaired CTX; absent SBA	Infection (*Neisseria,* primarily meningococcal), 58%; CVD, 4%
Terminal Components				
C5	27	ACD	Absent SBA	Both, 1%
C6	77	ACD		Healthy, 25%
C7	73	ACD		
C8	73	ACD		
C9	165	ACD	Impaired SBA	Healthy, 91%; infection, 9%
Plasma Proteins Regulating C' Activation				
C1-INH	Many	AD	Uncontrolled generation of an inflammatory mediator on C' activation	Hereditary angioedema
H	13	Acq	Uncontrolled AP activation → low C3	CVD, 40%; CVD plus infection (encapsulated bacteria), 40%; healthy, 20%
I	14	ACD	Uncontrolled AP activation → low C3	Infection (encapsulated bacteria), 100%
Membrane proteins regulating C' activation	Many	Acq	Impaired regulation of C3b and C8 deposited on host RBCs; PMN, platelets → cell lysis	Paroxysmal nocturnal hemoglobinuria
Decay-accelerating factor				
Homologous restriction factor				
CD59	>20	ACD	Impaired PMN adhesive functions (i.e., margination), CTX, C3bi-mediated opson/phag	Infection (*Staphylococcus aureus, Pseudomonas* spp.), 100%
CR3 autoantibodies				
C3 nephritic factors	>59	Acq	Stabilize AP, convertase → low C3	MPGN, 41%; PLD, 25%; infection (encapsulated bacteria), 16%; MPGN plus PLD, 10%; PLD plus infection, 5%; MPGN plus PLD plus infection, 3%; MPGN plus infection, 2%
C4 nephritic factor		Acq	Stabilize CP, C3 convertase → low C3	Glomerulonephritis, 50%; CVD, 50%

ACD, Autosomal codominant; *Acq,* acquired; *AD,* autosomal dominant; *AP,* alternative pathway; *C'*, complement; *C1-INH,* C1 esterase inhibitor; *CP,* classic pathway; *CTX,* chemotaxis; *CVD,* collagen-vascular disease; *IC,* immune complex, *MPGN,* membranoproliferative glomerulonephritis; *PLD,* partial lipodystrophy; *PMN,* polymorphonuclear neutrophil; *RBCs,* red blood cells; *SBA,* serum bactericidal activity; *XL,* X-linked.

From Mandell GL: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases,* ed 6, New York, 2005, Churchill Livingstone.

C-REACTIVE PROTEIN

Normal range: 6.8 to 820 μg/dl (68 to 8200 μg/L [CF: 10; SMI: 10 μg/L])
Elevated in: Rheumatoid arthritis, rheumatic fever, inflammatory bowel disease, bacterial infections, myocardial infarction, oral contraceptives, third trimester of pregnancy (acute phase reactant), inflammatory and neoplastic diseases. Table 34 shows a comparison of erythrocyte sedimentation rate and C-reactive protein, and Table 35 shows conditions associated with elevated C-reactive protein levels.

C-REACTIVE PROTEIN, HIGH SENSITIVITY

(hs-CRP, cardio-CRP)

This is a cardiac risk marker. It is increased in patients with silent atherosclerosis years before a cardiovascular event and is independent of cholesterol level and other lipoproteins. It can be used to help stratify cardiac risk.

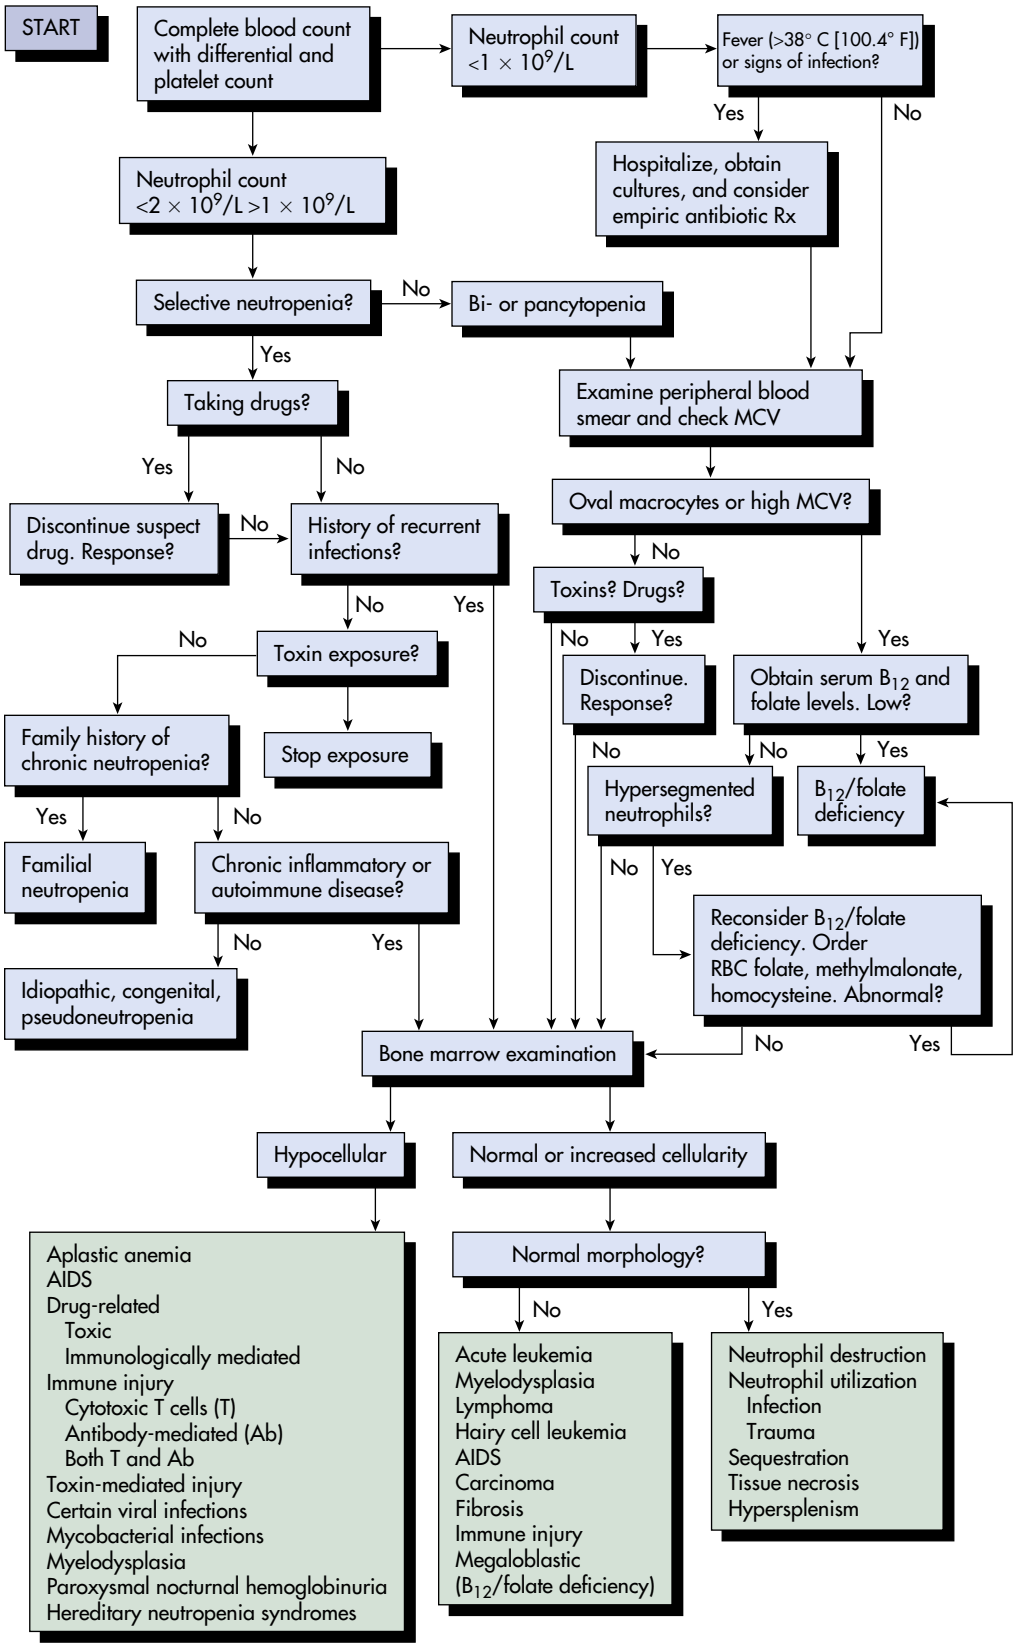

FIG. 17 A practical algorithm for the evaluation of patients with neutropenia. The fundamental diagnostic principle is that for patients with severe neutropenia or for those with bicytopenia or pancytopenia, bone marrow examination will likely be necessary unless the following diagnoses are made: (1) a nutritional (folate or vitamin B_{12}) deficiency or (2) drug- or toxin-induced neutropenia in a patient whose neutropenia resolves after discontinuation of the offending agent. *AIDS,* Acquired immunodeficiency syndrome; *MCV,* mean corpuscular volume; *RBC,* red blood cell. (From Goldman L, Ausiello D [eds]: *Cecil textbook of medicine,* ed 24, Philadelphia, 2012, WB Saunders.)

TABLE 34 Comparison of Erythrocyte Sedimentation Rate and C-Reactive Protein

	Erythrocyte Sedimentation Rate	C-Reactive Protein
Advantages	Much clinical information in the literature May reflect overall health status	Rapid response to inflammatory stimuli Wide range of clinically relevant values are detectable Unaffected by age and gender Reflects value of a single acute phase protein Can be measured on stored sera Quantitation is precise and reproducible
Disadvantages	Affected by age and gender Affected by red blood cell morphology Affected by anemia and polycythemia Reflects levels of many plasma proteins, not all of which are acute phase proteins Responds slowly to inflammatory stimuli Requires fresh sample May be affected by drugs	None

From Firestein GS et al: *Kelley's textbook of rheumatology*, ed 9, Philadelphia, 2013, WB Saunders.

TABLE 35 Conditions Associated with Elevated C-Reactive Protein Levels

Normal or Minor Elevation (<1 mg/dl)	Moderate Elevation (1-10 mg/dl)	Marked Elevation (>10 mg/dl)
Vigorous exercise Common cold Pregnancy Gingivitis Seizures Depression Insulin resistance and diabetes Several genetic polymorphisms Obesity	Myocardial infarction Malignancies Pancreatitis Mucosal infection (bronchitis, cystitis) Most connective tissue diseases Rheumatoid arthritis	Acute bacterial infection (80%-85%) Major trauma Systemic vasculitis

From Firestein GS et al: *Kelley's textbook of rheumatology*, ed 9, Philadelphia, 2013, WB Saunders.

INTERPRETATION OF RESULTS

Cardio-CRP result (mg/L)	Risk
0.6	Lowest risk
0.7-1.1	Low risk
1.2-1.9	Moderate risk
2.0-3.8	High risk
3.9-4.9	Highest risk
≥5.0	Results may be confounded by acute inflammatory disease. If clinically indicated, a repeat test should be performed in 2 or more wk.

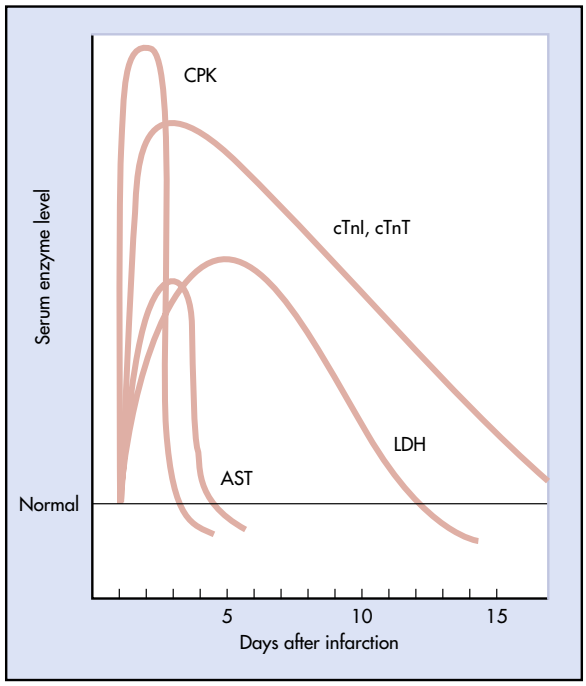

FIG. 19 Enzyme levels postmyocardial infarction. *AST,* Aspartate aminotransferase; *CPK,* creatine kinase; *cTnI,* cardiac troponin I; *cTnT,* cardiac troponin T; *LDH,* lactate dehydrogenase. (From Greene HL et al [eds]: *Decision making in medicine,* ed 2, St Louis, 1998, Mosby.)

CREATINE KINASE (CK, CPK)

Fig. E18 describes a diagnostic approach to creatine kinase elevation.

Normal range: 0 to 130 U/L (0 to 2.16 μkat/L [CF: 0.01667; SMI: 0.01 μkat/L])

Elevated in: Myocardial infarction, myocarditis, rhabdomyolysis, myositis, crush injury/trauma, polymyositis, dermatomyositis, vigorous exercise, muscular dystrophy, myxedema, seizures, malignant hyperthermia syndrome, intramuscular (IM) injections, cerebrovascular accident, pulmonary embolism and infarction, acute dissection of aorta

Decreased in: Corticosteroid use, decreased muscle mass, connective tissue disorders, alcoholic liver disease, metastatic neoplasms

CREATINE KINASE ISOENZYMES

CK-BB

Elevated in: Cerebrovascular accident, subarachnoid hemorrhage, neoplasms (prostate, gastrointestinal tract, brain, ovary, breast, lung), severe shock, bowel infarction, hypothermia, meningitis

CK-MB

Elevated in: Myocardial infarction (MI), myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, cardiac surgery, extensive rhabdomyolysis, strenuous exercise (marathon runners), mixed connective tissue disease, cardiomyopathy, hypothermia

NOTE: CK-MB exists in the blood in two subforms. MB_2 is released from cardiac cells and converted in the blood to MB_1. Rapid assay of CK-MB subforms can detect MI (CK-MB_2≥1.0 U/L, with a ratio of CK-MB_2/CK-MB_1≥1.5) within 6 hours of onset of symptoms.

Fig. 19 illustrates the time course of CK, AST, troponins, and lactate dehydrogenase (LDH) activity after acute MI.

CK-MM

Elevated in: Crush injury, seizures, malignant hyperthermia syndrome, rhabdomyolysis, myositis, polymyositis, dermatomyositis, vigorous exercise, muscular dystrophy, IM injections, acute dissection of aorta

CREATININE (serum)

Normal range: 0.6 to 1.2 mg/dl (50 to 110 μmol/L [CF: 88.4; SMI: 10 μmol/L]). Fig. 20 illustrates the relationship between creatinine clearance

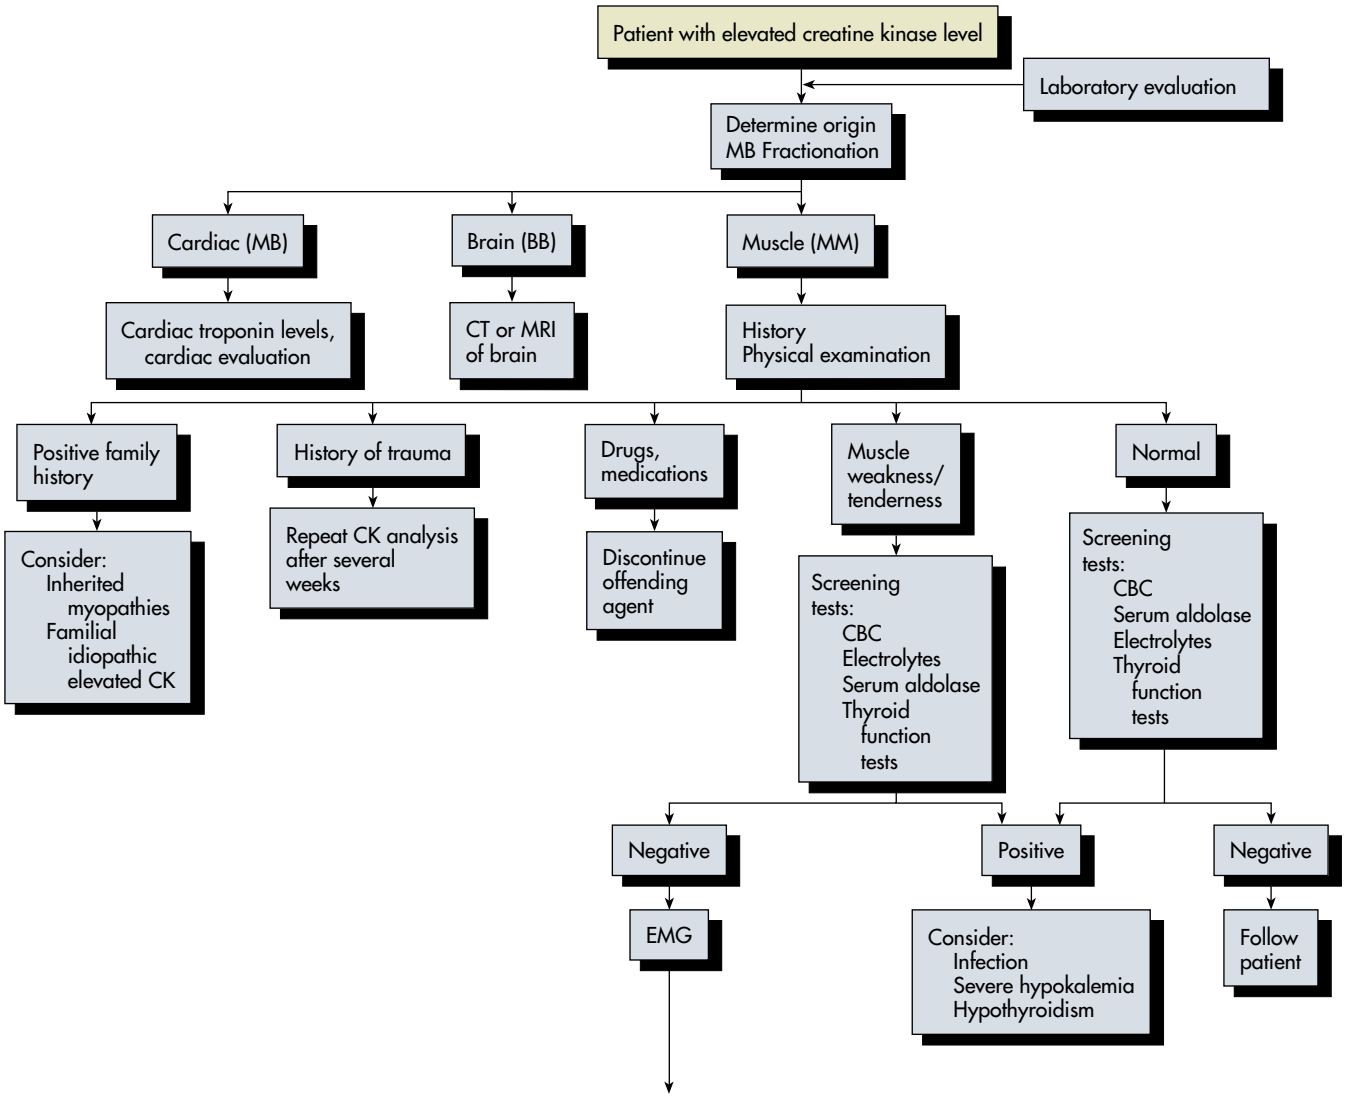

FIG. E18 Evaluation of creatine kinase elevation. *CBC,* Complete blood count; *CK,* creatine kinase; *CT,* computed tomography; *EMG,* electromyography; *MRI,* magnetic resonance imaging. (Modified and updated from Greene HL et al [eds]: *Decision making in medicine,* ed 2, St Louis, 1998, Mosby.)

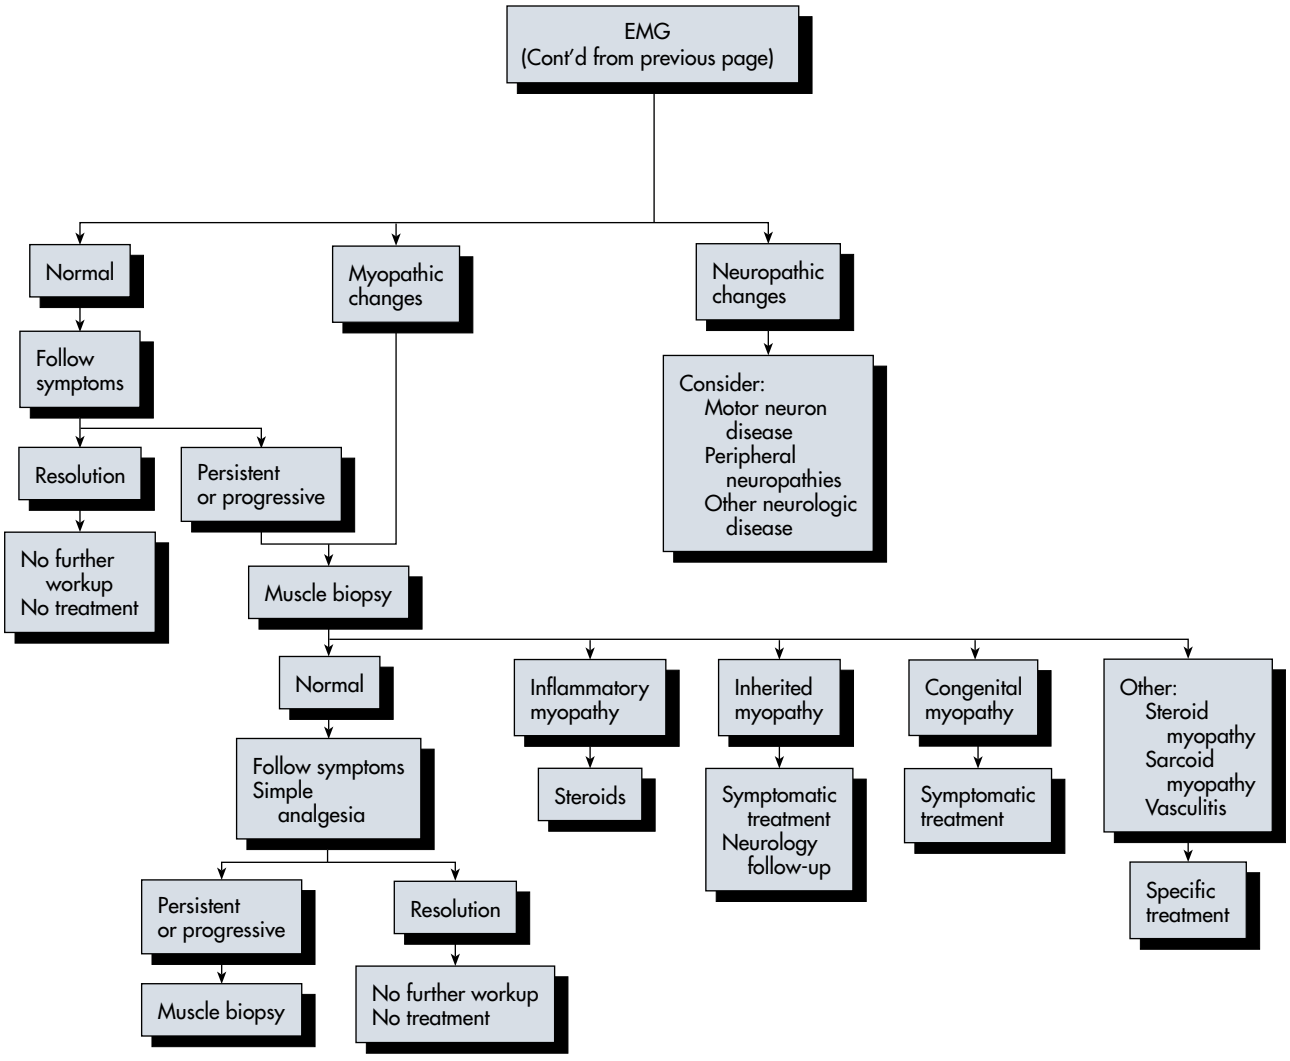

FIG. E18 cont'd

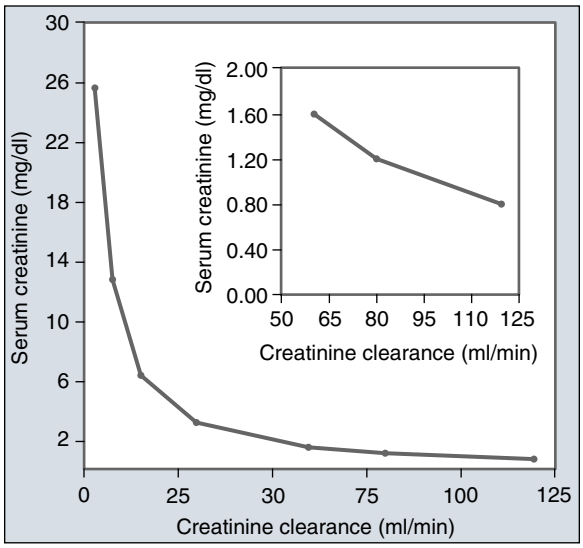

FIG. 20 Relationship between creatinine clearance and serum creatinine. In steady state, serum creatinine should increase twofold for each 50% reduction in creatinine clearance. *Inset* represents enlarged view of changes in serum creatinine as creatinine clearance decreases from 120 to 60 ml/min. If serum creatinine is 0.8 mg/dl when creatinine clearance is 120 ml/min, creatinine clearance can decrease by 33% such that increased serum creatinine is still within normal range. (From Vincent JL et al: *Textbook of critical care,* ed 6, Philadelphia, 2011, WB Saunders.)

BOX 13 Factors That May Alter Serum Creatinine (Cr) Level

Endogenous
Reduced muscle mass: ↓
Hyperbilirubinemia: ↓

Exogenous
Medications inhibiting tubular secretion (trimethoprim, cimetidine): ↑

Medications Interfering with Laboratory Assays*
Flucytosine and cefoxitin: ↑
Catecholamines: ↓

*Varies by assay type used.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult*, ed 4, Philadelphia, 2014, Elsevier.

and serum creatinine. Factors that may alter serum creatinine level are described in Box 13.
Elevated in: Renal insufficiency (acute and chronic), decreased renal perfusion (hypotension, dehydration, congestive heart failure), urinary tract infection, rhabdomyolysis, ketonemia

Drugs (antibiotics [aminoglycosides, cephalosporins], hydantoin, diuretics, methyldopa)

The RIFLE criteria for acute kidney injury is summarized in Table 36. A classification of acute kidney injury (AKI) is described in Table 37.
Falsely elevated in: Diabetic ketoacidosis, administration of some cephalosporins (e.g., cefoxitin, cephalothin)
Decreased in: Decreased muscle mass (including amputees and older persons), pregnancy, prolonged debilitation

CREATININE CLEARANCE

Normal range:
75 to 124 ml/min (1.24 to 2.08 ml/sec [CF: 0.01667; SMI: 0.02 ml/sec])
Table 38 shows equations commonly used to estimate renal clearance.

TABLE 36 RIFLE Criteria for Acute Kidney Injury

	GFR and Serum Creatinine Changes	Urine Volume Changes
R (Risk)	Increase in SCreat >1.5×	Urine volume <0.5 ml/kg/hr >6 hr
	Decrease in GFR >25%	
I (Injury)	Increase in SCreat >2×	Urine volume <0.5 ml/kg/hr >12 hr
	Decrease in GFR >50%	
F (Failure)	Increase in SCreat >3×	Urine volume <0.3 ml/kg/hr >24 hr
	Decrease in GFR >75%	Anuria >12 hr
	SCreat >4 mg/dl	
L (Loss)	Complete loss of kidney function >4 wk	
E (ESRD)	End-stage kidney disease >3 mo	

GFR, Glomerular filtration rate; *SCreat,* serum creatinine.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 37 New Classification for Acute Kidney Injury (AKI) Criteria

Stage	Serum Creatinine Criteria	Urine Output Criteria
1	>0.3 mg/dl (26.4 μmol/L) or >150% to 200%	<0.5 ml/kg for >6 hr
2	>200%-300%	<0.5 ml/kg for >12 hr
3	>300%, 4 mg/dl (354 μmol/L) or acute increase of >0.5 mg/dl	<0.3 ml/kg for >24 hr or anuria >12 hr

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

The Cockcroft-Gault formula to calculate creatinine clearance is described in Box 14.
Elevated in: Pregnancy, exercise
Decreased in: Renal insufficiency, drugs (cimetidine, procainamide, antibiotics, quinidine)

CREATININE, URINE

See URINE CREATININE

CRYOGLOBULINS (serum)

Normal range: Not detectable
Present in: Collagen vascular diseases, chronic lymphocytic leukemia, hemolytic anemias, multiple myeloma, Waldenström macroglobulinemia, chronic active hepatitis, Hodgkin disease

CRYPTOSPORIDIUM ANTIGEN BY EIA (stool)

Normal range: Not detected
Present in: Cryptosporidiosis

CSF

See CEREBROSPINAL FLUID

CYSTATIN C

Normal: Cystatin C is a cysteine protease inhibitor that is produced at a constant rate by all nucleated cells. It is freely filtered by the glomerulus and reabsorbed (but not secreted) by the renal tubules with no extrarenal excretion. Its concentration is not affected by diet, muscle mass, or acute inflammation. Normal range when measured by particle-enhanced nephelometric immunoassay (PENIA) is <0.28 mg/L.

TABLE 38 Equations Commonly Used to Estimate Renal Clearance[1,2,3,4,5]

Equation	Measure	Equation	Considerations
Cockcroft-Gault	CrCl (ml/min)	(140 – age) BW/(SCr × 72) (0.85 if female)	• Inaccurate in patients with acutely changing renal function • Weight parameter is controversial in obese patients
Reexpressed MDRD (4 variable)	GFR (ml/min/1.73 m^2)	$175 \times SCr^{-1.154} \times age^{-0.203} \times$ (0.742 if female) × (1.21 if AA)	• Inaccurate in patients with acutely changing renal function • Must be individualized for BSA by multiplying estimated GFR × (estimated BSA/1.73 m^2) • Little information available in obese, elderly, or hepatic disease patients
Obesity 1 (Winter et al.[2])	CrCl (ml/min)	(140 – age) BW/(S_{Cr} × 72) × (0.85 if female)Use various weights	• Underweight use actual weight • Normal weight use ideal weight • If BMI 26-50, use adjusted weight using 40% factor = [(actual – ideal weight) × 0.40] + ideal weight
Obesity 2 (Demirovic et al.[5])	CrCl (ml/min)	(140 – age) LBW/(S_{Cr} × 72) × (0.85 if female)	• For BMI >40 kg/m^2 • LBW_{male} = (9270 × TBW)/(6680 + 216 × BMI) • LBW_{female} = (9270 × TBW)/(8780 + 244 × BMI)
Cystatin C	eGFR (ml/min)	$135 \times \min(S_{Cr}/\kappa, 1)\alpha \times \max(S_{Cr}/\kappa, 1)^{-0.601} \times \min(S_{cys}/0.8, 1)^{-0.375} \times \max(S_{cys}/0.8, 1)^{-0.711} \times 0.995^{Age} \times 0.969$ [if female] × 1.08 [if AA] κ = –0.7 (if female), 0.9 (if male) α = –0.248 (if female), 0.207 (if male) $\min(S_{Cr}/\kappa$ or 1) = minimum of S_{Cr}/κ or 1max (S_{Cr}/κ or 1) = maximum of S_{Cr}/κ or 1min (S_{cys}/0.8, 1) = minimum of S_{cys}/0.8 or 1max (S_{cys}/0.8, 1) = maximum of S_{cys}/0.8 or 1	

AA, African American; *BMI,* body mass index; *BSA,* body surface area; *BW,* body weight in kg; *CrCl,* creatinine clearance; *eGFR,* estimated glomerular filtration rate; *LBW,* lean body weight; *GFR,* glomerular filtration rate; *MDRD,* Modification of Diet in Renal Disease equation; S_{Cr}, serum creatinine; S_{cys}, serum cystatin C; *TBW,* total body weight.
Ideal weight = (height in inches – 60) × 2.3 + 50 kg for males or 45.5 kg for females.

From Parrillo JE, Dellinger RP: Critical care medicine, principles of diagnosis and management in the adult, ed 5, Philadelphia, 2019, Elsevier.

BOX 14 Cockcroft-Gault Formula to Calculate Creatinine Clearance (C_{cr})

$$C_{cr} = \frac{(140 - \text{age in year}) \times (\text{lean body weight in kg})}{S_{cr} \text{ in mg/dl} - 72}$$

Elevated in: Renal disorders. Good predictor of the severity of acute tubular necrosis. Cystatin C increases more rapidly than creatinine in the early stages of GFR impairment. The cystatin C concentration is an independent risk factor for heart failure in older adults and appears to provide a better measure of risk assessment than the serum creatinine concentration.

CYSTIC FIBROSIS PCR

Test description: Test can be performed on whole blood or tissue. Common mutations in the cystic fibrosis transmembrane regulator (CFTR) gene can be used to detect 75%-80% of mutant alleles.

CYTOMEGALOVIRUS BY PCR

Test description: Test can be performed on whole blood, plasma, or tissue. Qualitative PCR is highly sensitive but may not be able to differentiate between latent and active infection.

D-DIMER

Normal range: <0.5 mcg/ml
Elevated in: DVT, pulmonary embolism, high levels of rheumatoid factor, activation of coagulation and fibrolytic system from any cause

D-dimer assay by enzyme-linked immunosorbent assay (ELISA) assists in the diagnosis of DVT and pulmonary embolism. This test has significant limitations because it can be elevated whenever the coagulation and fibrinolytic systems are activated and can also be falsely elevated with high rheumatoid factor levels.

A positive D-dimer is suggestive but not diagnostic for pulmonary embolism (PE). Patients with positive D-dimer and clinical suspicion for PE need additional tests such as chest CT to confirm diagnosis.

PE might be ruled out in patients with negative D-dimer and low pretest probability for PE.

DEHYDROEPIANDROSTERONE SULFATE

Normal:
Males:

Ages 19-30:	125-619 mcg/dl
31-50:	59-452 mcg/dl
51-60:	20-413 mcg/dl
61-83:	10-285 mcg/dl

Females:

Ages 19-30:	29-781 mcg/dl
31-50:	12-379 mcg/dl
Postmenopausal:	30-260 mcg/dl

Elevated in: Hirsutism, congenital adrenal hyperplasia, adrenal carcinomas, adrenal adenomas, polycystic ovary syndrome, ectopic ACTH-producing tumors, Cushing disease, spironolactone

DEHYDROTESTOSTERONE (serum, urine)

Normal:
Serum: Males: 30 to 85 ng/dl; females: 4 to 22 ng/dl
Urine, 24 h: Males: 20 to 50 mcg/day; females: <8 mcg/day
Elevated in: Hirsutism
Decreased in: 5-α-reductase deficiency, hypogonadism

TABLE 38 Equations Commonly Used to Estimate Renal Clearance[1,2,3,4,5]

Equation	Measure	Equation	Considerations
Cockcroft-Gault	CrCl (ml/min)	(140 – age) BW/(SCr × 72) (0.85 if female)	• Inaccurate in patients with acutely changing renal function • Weight parameter is controversial in obese patients
Reexpressed MDRD (4 variable)	GFR (ml/min/1.73 m^2)	$175 \times SCr^{-1.154} \times age^{-0.203} \times$ (0.742 if female) × (1.21 if AA)	• Inaccurate in patients with acutely changing renal function • Must be individualized for BSA by multiplying estimated GFR × (estimated BSA/1.73 m^2) • Little information available in obese, elderly, or hepatic disease patients
Obesity 1 (Winter et al.[2])	CrCl (ml/min)	(140 – age) BW/(S_{Cr} × 72) × (0.85 if female)Use various weights	• Underweight use actual weight • Normal weight use ideal weight • If BMI 26-50, use adjusted weight using 40% factor = [(actual – ideal weight) × 0.40] + ideal weight
Obesity 2 (Demirovic et al.[5])	CrCl (ml/min)	(140 – age) LBW/(S_{Cr} × 72) × (0.85 if female)	• For BMI >40 kg/m^2 • LBW_{male} = (9270 × TBW)/(6680 + 216 × BMI) • LBW_{female} = (9270 × TBW)/(8780 + 244 × BMI)
Cystatin C	eGFR (ml/min)	$135 \times \min(S_{Cr}/\kappa, 1)\alpha \times \max(S_{Cr}/\kappa, 1)^{-0.601} \times \min(S_{cys}/0.8, 1)^{-0.375} \times \max(S_{cys}/0.8, 1)^{-0.711} \times 0.995^{Age} \times 0.969$ [if female] × 1.08 [if AA] κ = –0.7 (if female), 0.9 (if male) α = –0.248 (if female), 0.207 (if male) $\min(S_{Cr}/\kappa$ or 1) = minimum of S_{Cr}/κ or 1max (S_{Cr}/κ or 1) = maximum of S_{Cr}/κ or 1min (S_{cys}/0.8, 1) = minimum of S_{cys}/0.8 or 1max (S_{cys}/0.8, 1) = maximum of S_{cys}/0.8 or 1	

AA, African American; *BMI,* body mass index; *BSA,* body surface area; *BW,* body weight in kg; *CrCl,* creatinine clearance; *eGFR,* estimated glomerular filtration rate; *LBW,* lean body weight; *GFR,* glomerular filtration rate; *MDRD,* Modification of Diet in Renal Disease equation; S_{Cr}, serum creatinine; S_{cys}, serum cystatin C; *TBW,* total body weight.
Ideal weight = (height in inches – 60) × 2.3 + 50 kg for males or 45.5 kg for females.

From Parrillo JE, Dellinger RP: Critical care medicine, principles of diagnosis and management in the adult, ed 5, Philadelphia, 2019, Elsevier.

BOX 14 Cockcroft-Gault Formula to Calculate Creatinine Clearance (C_{cr})

$$C_{cr} = \frac{(140 - \text{age in year}) \times (\text{lean body weight in kg})}{S_{cr} \text{ in mg/dl} - 72}$$

Elevated in: Renal disorders. Good predictor of the severity of acute tubular necrosis. Cystatin C increases more rapidly than creatinine in the early stages of GFR impairment. The cystatin C concentration is an independent risk factor for heart failure in older adults and appears to provide a better measure of risk assessment than the serum creatinine concentration.

CYSTIC FIBROSIS PCR

Test description: Test can be performed on whole blood or tissue. Common mutations in the cystic fibrosis transmembrane regulator (CFTR) gene can be used to detect 75%-80% of mutant alleles.

CYTOMEGALOVIRUS BY PCR

Test description: Test can be performed on whole blood, plasma, or tissue. Qualitative PCR is highly sensitive but may not be able to differentiate between latent and active infection.

D-DIMER

Normal range: <0.5 mcg/ml
Elevated in: DVT, pulmonary embolism, high levels of rheumatoid factor, activation of coagulation and fibrolytic system from any cause

D-dimer assay by enzyme-linked immunosorbent assay (ELISA) assists in the diagnosis of DVT and pulmonary embolism. This test has significant limitations because it can be elevated whenever the coagulation and fibrinolytic systems are activated and can also be falsely elevated with high rheumatoid factor levels.

A positive D-dimer is suggestive but not diagnostic for pulmonary embolism (PE). Patients with positive D-dimer and clinical suspicion for PE need additional tests such as chest CT to confirm diagnosis.

PE might be ruled out in patients with negative D-dimer and low pretest probability for PE.

DEHYDROEPIANDROSTERONE SULFATE

Normal:
Males:

Ages 19-30:	125-619 mcg/dl
31-50:	59-452 mcg/dl
51-60:	20-413 mcg/dl
61-83:	10-285 mcg/dl

Females:

Ages 19-30:	29-781 mcg/dl
31-50:	12-379 mcg/dl
Postmenopausal:	30-260 mcg/dl

Elevated in: Hirsutism, congenital adrenal hyperplasia, adrenal carcinomas, adrenal adenomas, polycystic ovary syndrome, ectopic ACTH-producing tumors, Cushing disease, spironolactone

DEHYDROTESTOSTERONE (serum, urine)

Normal:
Serum: Males: 30 to 85 ng/dl; females: 4 to 22 ng/dl
Urine, 24 h: Males: 20 to 50 mcg/day; females: <8 mcg/day
Elevated in: Hirsutism
Decreased in: 5-α-reductase deficiency, hypogonadism

TABLE 39 Applications for Direct and Indirect Antiglobulin Techniques

	Applications	Purpose	What Is Detected
Direct antiglobulin test (DAT)	Investigation of HTR	To detect circulating donor red cells that are sensitized with recipient antibody. A positive DAT is the first immunohematologic evidence of a hemolytic reaction after transfusion	DAT positive owing to IgG and/or C3d depending on the antibodies responsible
	Diagnosis of HDFN	To detect maternal antibodies that have crossed the placenta to sensitize fetal red cells	DAT almost always positive as a result of IgG; occasionally C3d if ABO antibodies involved
	Diagnosis of AIHA	To detect autoantibody sensitizing a patient's own red cells	Warm autoantibodies: DAT almost always positive owing to IgG Cold autoantibodies: DAT may be due to C3d only
	Investigation of drug-induced hemolysis	To detect antidrug/red cell antibodies and/or subsequent activation of the complement system	DAT may be positive owing to IgG, C3d, or both, depending on the mechanism involved
	Antibody detection (or antibody screen)	To detect clinically significant IgG alloantibodies in the recipient	Recipient IgG antibodies bound to reagent screening cells*
	Antibody identification	To specifically identify those antibodies detected by reagent screening cells or by donor red cells	Recipient IgG antibodies bound to reagent cells from a panel of 10-12 donors*
	Crossmatching	To detect antibodies that may have been missed by the antibody screen because of absence of the corresponding antigen or presence of a dosing antibody	Recipient IgG antibodies bound to donor red cells*
	Red cell antigen typing	To type patient or donor red cells for antigens that can be detected by IgG antisera reactive only by the AGT. A common example of this would be the weak D test	Specific binding of reagent IgG antibodies to red cells positive for the corresponding antigen

AGT, Antihuman globulin test; *AIHA,* autoimmune hemolytic anemia; *C3,* complement component 3; *HDFN,* hemolytic disease of the fetus and newborn; *HTR,* hemolytic transfusion reaction; *Ig,* immunoglobulin.
*If complement is fixed in vitro, it may be detected if polyspecific antiglobulin is used.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.

DEOXYCORTICOSTERONE (11-deoxycorticosterone, DOC) (serum)

Normal: 2 to 19 ng/dl. Normal secretion depends on ACTH and is suppressible by dexamethasone.
Elevated in: Adrenogenital syndromes due to 17- and 11-hydroxylase deficiencies, pregnancy
Decreased in: Preeclampsia

DEXAMETHASONE SUPPRESSION TEST, OVERNIGHT

Normal: Test is performed by giving 1 mg dexamethasone orally at 11 PM and measuring serum cortisol at 8 AM the following morning. Normal response is cortisol suppression to <3 mcg/dl; if dose of 4 mg dexamethasone is given, cortisol suppression will be to <50% of baseline.
Interpretation of results: Cushing syndrome (<10 mcg/dl), endogenous depression (half of patients suppress test values <5 mcg/dl). Most patients with pituitary Cushing disease demonstrate suppression, whereas patients with adrenal adenoma, carcinoma, and ectopic ACTH-producing tumors do not.

DIGOXIN

Normal therapeutic range: 0.5 to 2 ng/ml
Elevated in: Impaired renal function, excessive dosing, concomitant use of quinidine, amiodarone, verapamil, fluoxetine, nifedipine. Toxicity may occur at a lower blood concentration in the presence of hypokalemia, hypomagnesemia, and hypercalcemia. See Table 39.

DILANTIN

See PHENYTOIN

DIRECT ANTIGLOBULIN (Coombs Direct)

Normal: Negative
Positive: Autoimmune hemolytic anemia, erythroblastosis fetalis, transfusion reactions, drugs (α-methyldopa, penicillins, tetracycline, sulfonamides, levodopa, cephalosporins, quinidine, insulin)
False positive: May be seen with cold agglutinins

DISACCHARIDE ABSORPTION TESTS

Normal: Test is used to diagnose malabsorption due to disaccharide deficiency. It is performed by giving disaccharide orally 1 g/kg body weight to a total of 25 g. Blood is drawn at 0, 30, 60, 90, and 120 min. Normal response is a change in glucose from fasting value >30 mg/dl, inconclusive when increase is 20-30 mg/dl, abnormal when increase is >20 mg/dl. Test can also be performed by measuring air at 0, 30, 60, 90, and 120 min. Normal is H_2>20 ppm above baseline level before a colonic response.
Decreased in: Disaccharide deficiency (lactose, fructose, sorbitol), celiac disease, sprue, acute gastroenteritis

DOC

See DEOXYCORTICOSTERONE

DONATH-LANDSTEINER (D-L) TEST FOR PAROXYSMAL COLD HEMOGLOBINURIA

Normal: No hemolysis
Interpretation of results: Hemolysis indicates presence of bithermic cold hemolysins or Donath-Landsteiner antibodies (D-L Ab)

DOPAMINE

Normal range: 175 pg/ml
Elevated in: Pheochromocytomas, neuroblastomas, stress, vigorous exercise, certain foods (bananas, chocolate, coffee, tea, vanilla)

D-XYLOSE ABSORPTION

Normal range: 21% to 31% excreted in 5 hours
Decreased in: Malabsorption syndrome

D-XYLOSE ABSORPTION TEST

Normal range:
URINE: ≥4 g/5 hours (5-hour urine collection in adults >12 yr [25-g dose])
SERUM: ≥25 mg/dl (adult, 1 hour, 25-g dose, normal renal function)
Normal results: In patients with malabsorption, normal results suggest pancreatic disease as an etiology of the malabsorption.
Abnormal results: Celiac disease, Crohn disease, tropical sprue, surgical bowel resection, AIDS. False positives can occur with decreased renal function, dehydration/hypovolemia, surgical blind loops, decreased gastric emptying, vomiting.

ELECTROPHORESIS, HEMOGLOBIN

See HEMOGLOBIN ELECTROPHORESIS

ELECTROPHORESIS, PROTEIN

See PROTEIN ELECTROPHORESIS

ENA COMPLEX

See EXTRACTABLE NUCLEAR ANTIGEN

ENDOMYSIAL ANTIBODIES

Normal: Not detected
Present in: Celiac disease, dermatitis herpetiformis

EOSINOPHIL COUNT

Normal range: 1% to 4% eosinophils (0-440/mm^3)
Elevated in
HELMINTHIC PARASITE
Ascaris lumbricoides (invasive larval stage)
Hookworms (invasive larval stage)
Strongyloides stercoralis (initial infection and autoinfection)
Trichinosis
Filariasis
Echinococcus granulosus and *E. multilocularis*
Toxocara species
Animal hookworms
Angiostrongylus cantonensis and *A. costaricensis*
Schistosomiasis
Liver flukes
Fasciolopsis buski
Anisakiasis
Capillaria philippinensis
Paragonimus westermani
"Tropical eosinophilia" (unidentified microfilariae)
NOTE: Table 40 describes an approach to investigation of eosinophilia in returning travelers.
OTHER INFECTIONS/INFESTATIONS
Pulmonary aspergillosis
Severe scabies
ALLERGIES
Asthma
Hay fever
Drug reactions
Atopic dermatitis
AUTOIMMUNE AND RELATED DISORDERS
Polyarteritis nodosa
Necrotizing vasculitis
Eosinophilic fasciitis
Pemphigus
NEOPLASTIC DISEASES
Hodgkin disease
Mycosis fungoides
Chronic myelocytic leukemia
Eosinophilic leukemia
Polycythemia vera
Mucin-secreting adenocarcinomas
IMMUNODEFICIENCY STATES
Hyperimmunoglobulin E with recurrent infection
Wiskott-Aldrich syndrome
OTHER
Addison disease
Inflammatory bowel disease
Dermatitis herpetiformis
Toxic/chemical syndrome
Eosinophilic myalgia syndrome, tryptophan, toxic oil syndrome
Hypereosinophilic syndrome (unknown etiology)

Fig. 21 describes an algorithm for patients with eosinophil disorders.
Table 41 describes hematopoietic neoplasms accompanied by eosinophilia.

TABLE 40 Eosinophilia Investigation in Returning Travelers

History	Allergies
	Drugs and vitamins (L-tryptophan)
	Regions, localities, and duration of exposure
Physical examination	Skin, subcutaneous tissues
	Liver/spleen
	Signs of other systemic disease
Initial investigations	Full blood count and differential white blood cell count
	Stool examination for ova and parasites (×3) Urine analysis
	Examination of midday urine for ova and parasites (×3) (in those who have traveled to Africa or the Middle East)
Further investigations as suggested by travel and exposure from history	*Strongyloides* culture and serologic testing; duodenal aspirate (strongyloidiasis, hookworm)
	Serologic testing (schistosomiasis, filariasis); day/night blood films (filariasis)
Further studies if suggested by history and physical examination	Skin snips (onchocerciasis)
	Chest x-ray examination (hydatid cyst, tropical pulmonary eosinophilia, paragonimiasis)
	Soft tissue x-ray examination (cysticercosis); sputum examination for ova and parasites (paragonimiasis)
	Abdominal ultrasound examination (hydatid cyst)
	Cystoscopy with or without biopsy (schistosomiasis)
	Rectal snips (schistosomiasis)

From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

Table 42 describes the differential diagnosis of childhood eosinophilia.

EPINEPHRINE, PLASMA

Normal range: 0 to 90 pg/ml
Elevated in: Pheochromocytomas, neuroblastomas, stress, vigorous exercise, certain foods (bananas, chocolate, coffee, tea, vanilla), hypoglycemia

EPSTEIN-BARR VIRUS SEROLOGY (BOX 15)

Normal range: IgG anti-viral capsid antigen (VCA) <1:10 or negative>
Abnormal: IgG anti-VCA >1:10 or positive indicates either current or previous infection
IgM anti-VCA >1:10 or positive indicates current or recent infection
Anti-Epstein-Barr virus nuclear antigen (EBNA) ≥1.5 or positive indicates previous infection

Table 43 and Fig. 22 describe test interpretation.

ERYTHROCYTE SEDIMENTATION RATE (ESR, sed rate, sedimentation rate)

See Table 44 for erythrocyte sedimentation rate ranges in health.
Normal range: Male: 0 to 15 mm/hr
Female: 0 to 20 mm/hr
Elevated in: Collagen vascular diseases, infections, myocardial infarction, neoplasms, inflammatory states (acute phase reactant), hyperthyroidism, hypothyroidism, rouleaux formation
Decreased in: Sickle cell disease, polycythemia, corticosteroids, spherocytosis, anisocytosis, hypofibrinogenemia, increased serum viscosity

ERYTHROPOIETIN (EP)

Normal: 3.7 to 16.0 IU/L by radioimmunoassay

Erythropoietin is a glycoprotein secreted by the kidneys that stimulates RBC production by acting on erythroid-committed stem cells.

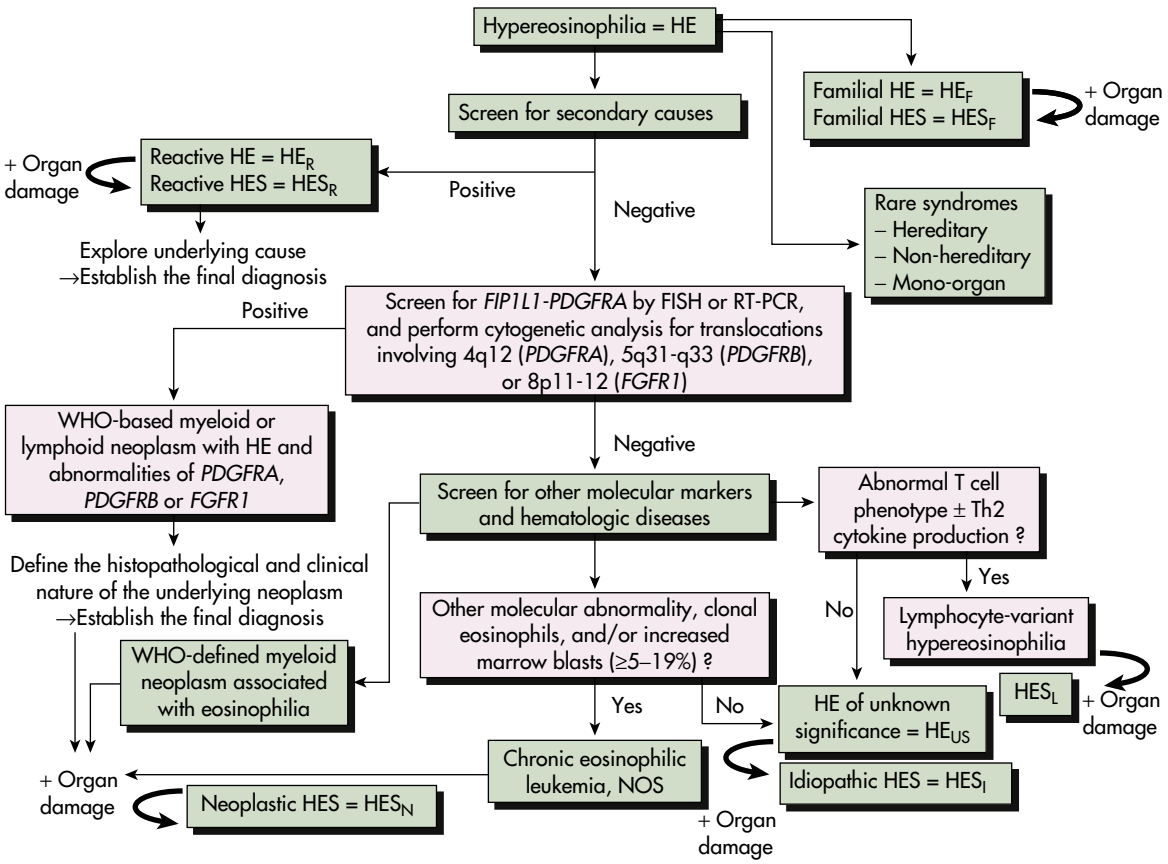

FIG. 21 Diagnostic algorithm for patients with eosinophil disorders. The first important step in the algorithm is to confirm the presence of hypereosinophilia *(HE)*, defined by a persistent (>4 weeks) increase in eosinophils above 1500/μL blood. The next important question is whether HE is reactive (HE_R) or neoplastic (clonal = HE_N) in nature. In patients with HE_N, WHO criteria should be applied in order to define the underlying molecular lesion. In addition, morphologic and histopathologic criteria are used to arrive at a final diagnosis regarding the underlying disease. In patients with HE_R, an underlying disease must also be defined. In both groups of patients, the next important question is whether (or not) HE-related organ damage is present. If such organopathy is found, it is appropriate to diagnose the (additional) presence of HES. According to the underlying etiology (disease), HES is classified again into HES_R and HES_N. In some patients with HES, a clonal T-cell population, but no lymphoproliferative disease, is detected. In these patients, the HES_L variant is diagnosed. If no clonal T cells and no underlying reactive or neoplastic condition is detected in a patient with HES, the (provisional) diagnosis of an HES_I is established. If no underlying disease and no HES are detected, the patient has HE_{US} by definition. Familial cases of HE or HES are very rare, and the same holds true for hereditary syndromes and mono-organ syndromes accompanied by HE. *FISH,* Fluorescence in situ hybridization; *HES,* hypereosinophilic syndrome; *NOS,* not otherwise specified; *RT-PCR,* reverse transcription polymerase chain reaction; *WHO,* World Health Organisation. (From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.)

Increased in:
Extremely high: Generally seen in patients with severe anemia (Hct, <25; Hb<7) such as in cases of aplastic anemia, severe hemolytic anemia, hematologic cancers
Very high: Patients with mild to moderate anemia (Hct, 25 to 35; Hb, 7 to 10)
High: Patients with mild anemia (e.g., AIDS, myelodysplasia)

Erythropoietin can be inappropriately elevated in patients with malignant neoplasms, renal cysts, postrenal transplant, meningioma, hemangioblastoma, and leiomyoma.

Decreased in: Renal failure, polycythemia vera, autonomic neuropathy

ESTRADIOL (serum)

Normal range:
Female, premenopausal: 30 to 400 pg/ml, depending on phase of menstrual cycle
Female, postmenopausal: 0 to 30 pg/ml
Male, adult: 10 to 50 pg/ml

Decreased in: Ovarian failure

Elevated in: Tumors of ovary, testis, adrenal, or nonendocrine sites (rare)

TABLE 41 Hematopoietic Neoplasms Accompanied by Eosinophilia

Neoplasms in Which Eosinophils Are Likely to Be Clonal Cells
Acute eosinophilic leukemia (AEL)
Chronic eosinophilic leukemia (CEL)
Acute myeloid leukemia with inv(16) (FAB AML M4eo)
Chronic myeloid leukemia (CML –*BCR-ABL1*+)
Myeloid neoplasms with *PDGFR* abnormalities (WHO types)
Hematopoietic neoplasms with *FGFR1* abnormalities (WHO types)
Smoldering systemic mastocytosis
Aggressive systemic mastocytosis (ASM)
Mast cell leukemia (MCL)
SM-AHN (SM-CEL)
Neoplasms in Which Eosinophils May or May Not Be Part of the Malignant Clone
Other myeloproliferative neoplasms (MPN) with eosinophiliaa
Myelodysplastic syndromes (MDS) with eosinophilia
Other MDS/MPN overlap syndromes with eosinophilia[a]
Indolent systemic mastocytosis
Neoplasms in Which Eosinophils Usually Are Not Part of the Malignant Clone
Hodgkin disease
B- or T-cell non-Hodgkin lymphoma
Acute lymphoblastic leukemia (ALL)
Chronic lymphocytic leukemia (CLL)
Langerhans cell histiocytosis

AHN, Associated hematologic neoplasm; *FAB,* French–American–British Cooperative Study Group; *SM,* systemic mastocytosis; *WHO,* World Health Organization.
[a]Other MPN or MPN/MDS: Neoplasms where no abnormalities in the *PDGFR* or *FGFR1* genes are detectable.
From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

ESTROGEN

Normal range (serum):

Males:	20-80 pg/ml
Females:	
Follicular:	60-200 pg/ml
Luteal:	160-400 pg/ml
Postmenopausal:	<130 pg/ml

Normal Range (urine):

Males:	4-23 μg/g creatinine
Females:	
Follicular:	7-65 μg/g creatinine
Midcycle:	32-104 μg/g creatinine
Luteal:	8-135 μg/g creatinine

Elevated in: Hyperplasia of adrenal cortex, ovarian tumors producing estrogen, granulosa and thecal cell tumors, testicular tumors
Decreased in: Menopause, hypopituitarism, primary ovarian malfunction, anorexia nervosa, hypofunction of adrenal cortex, ovarian agenesis, psychogenic stress, gonadotropin-releasing hormone deficiency

ETHANOL (blood)

Normal range: Negative (values <10 mg/dl are considered negative)
Ethanol is metabolized at 10-25 mg/dl/hr. Levels ≥80 mg/dl are considered evidence of impairment for driving. Fatal blood concentration is considered to be >400 mg/dl. Table 45 summarizes the influence of acute ethanol ingestion on ethanol levels and behavior.

EXTRACTABLE NUCLEAR ANTIGEN (ENA complex, anti-RNP antibody, anti-sm, anti-Smith)

Normal: Negative
Present in: Systemic lupus erythematosus, rheumatoid arthritis, Sjögren syndrome, mixed connective tissue disease

TABLE 42 Differential Diagnosis of Childhood Eosinophilia

Physiologic
Prematurity
Infants receiving hyperalimentation
Hereditary
Infectious
Parasitic (with tissue-invasive helminths, e.g., trichinosis, strongyloidiasis, pneumocystosis, filariasis, cysticercosis, cutaneous and visceral larva migrans, echinococcosis)
Bacterial (brucellosis, tularemia, cat-scratch disease, *Chlamydia*)
Fungal (histoplasmosis, blastomycosis, coccidioidomycosis, allergic bronchopulmonary aspergillosis)
Mycobacterial (tuberculosis, leprosy)
Viral (HIV-1, HTLV-1, hepatitis A, hepatitis B, hepatitis C, Epstein-Barr virus)
Pulmonary
Allergic (rhinitis, asthma)
Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome)
Loeffler syndrome
Hypersensitivity pneumonitis
Eosinophilic pneumonia (chronic, acute)
Pulmonary interstitial eosinophilia
Dermatologic
Atopic dermatitis
Pemphigus
Dermatitis herpetiformis
Infantile eosinophilic pustular folliculitis
Eosinophilic fasciitis (Schulman syndrome)
Eosinophilic cellulitis (Wells syndrome)
Kimura disease (angiolymphoid hyperplasia with eosinophilia)
Hematologic/Oncologic
Neoplasm (lung, gastrointestinal, uterine)
Leukemia/lymphoma
Myelofibrosis
Myeloproliferative (FIP1L1–PDGFRA-positive) hypereosinophilic syndrome
Lymphatic hypereosinophilic syndrome
Systemic mastocytosis
Immunologic
T-cell immunodeficiencies
Hyper-IgE (Job) syndrome
Wiskott-Aldrich syndrome
Graft-versus-host disease
Drug hypersensitivity
Postirradiation
Postsplenectomy
Endocrine
Addison disease
Hypopituitarism
Cardiovascular
Loeffler disease (fibroplastic endocarditis)
Congenital heart disease
Hypersensitivity vasculitis
Eosinophilic myocarditis
Gastrointestinal
Benign proctocolitis
Inflammatory bowel disease
Eosinophilic gastrointestinal diseases (EGID)
FIP1L1-PDGFRA, FIP1-like 1–platelet-derived growth factor receptor α.

Ig, Immunoglobulin.
From Kliegman RM: *Nelson textbook of pediatrics*, ed 21, Philadelphia, 2020, Elsevier.

BOX 15 Epstein-Barr Virus-Associated Malignancies

Malignancy	Epstein-Barr Virus Frequency
Hodgkin disease	≈40%
Non-Hodgkin lymphomas	
Burkitt lymphoma	20%-95%
Diffuse large B-cell lymphoma and $CD30^+$ $Ki\text{-}1^+$ anaplastic large cell lymphoma	10%-35%
Lymphomatoid granulomatosis	80%-95%
T cell-rich B-cell lymphoma	20%
Angioimmunoblastic lymphoma	>80%
T-cell, NK cell, and T/NK-cell lymphomas	30%-90%
Nasopharyngeal carcinoma	>95%
Gastric adenocarcinoma	5%-10%
Pyothorax-associated lymphoma	>95%
Leiomyosarcoma in immunocompromised patients	>95%

NK, Natural killer.
From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, WB Saunders, 2013.

TABLE 43 Antibody Tests in Epstein-Barr Viral Infection

	Appearance	Peak	Disappears
Heterophil Ab	3-5 days after onset of Sx (range, 0-21 days)	During second wk after onset of Sx (1-4 wk)	2-3 mo after onset of Sx (still found at 1 yr in 20% of cases)
VCA-IgM	Beginning of Sx (1 wk before to 1 wk after Sx begin)	During first wk after onset of Sx (0-21 days)	2-3 mo after onset of Sx (1-6 mo)
VCA-IgG	3 days after onset of Sx (0-2 wk)	During second wk after onset of Sx (1-3 wk)	Decline to lower level, then persists for life
EBNA-IgG	3 wk after onset of Sx (1-4 wk)	8 mo after appearance (3-12 mo)	Lifelong
EA-D	5 days after onset of Sx (during first 1-2 wk after onset of Sx)	14-21 days after onset of Sx (1-4 wk)	9 wk after appearance (2-6 mo)
EBNA-IgM	Same as VCA-IgM	Same as VCA-IgM	Same as VCA-IgM

Ab, Antibody; *EA,* early antigen; *EBNA,* Epstein-Barr virus nuclear antigen; *Ig,* immunoglobulin; *Sx,* symptoms; *VCA,* viral capsid antigen.
From Ravel R: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

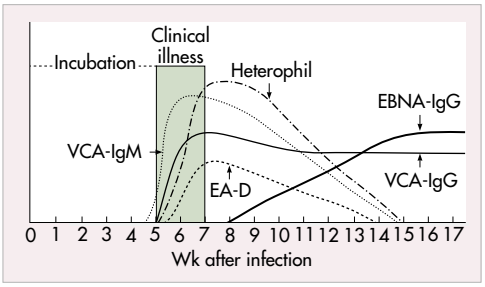

FIG. 22 Tests in Epstein-Barr viral infection. See Table 43 for abbreviations. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

TABLE 44 Erythrocyte Sedimentation Ranges in Health

Age Range (Yr)	ESR Mean (mm in 1 h)
10-19	8
20-29	10.8
30-39	10.4
40-49	13.6
50-59	14.2
60-69	16
70-79	16.5
80-91	15.8
Pregnancy	
Early gestation	48 (62 if anaemic)
Later gestation	70 (95 if anaemic)

ESR, Erythrocyte sedimentation range.
From Bain BJ et al: *Dacie and Lewis practical haematology*, ed 12, Philadelphia, 2017, Elsevier.

TABLE 45 Influence of Acute Ethanol Ingestion on Ethanol Levels and Behavior

Ounces	Blood Concentration	Influence
1-2	10-50 mg/dl (2.2-10.9 mmol/L)	None to mild euphoria
3-4	50-100 mg/dl (10.9-21.7 mmol/L or greater)	Mild influence on stereoscopic vision and dark adaptation
	100 mg/dl (21.7 mmol/L)	Legally intoxicated
4-6	100-150 mg/dl (21.7-32.6 mmol/L)	Euphoria; disappearance of inhibition; prolonged reaction time
6-7	150-200 mg/dl (32.6-43.4 mmol/L)	Moderately severe poisoning; reaction time greatly prolonged; loss of inhibition and slight disturbances in equilibrium and coordination
8-9	200-250 mg/dl (43.4-54.3 mmol/L)	Severe degree of poisoning; disturbances of equilibrium and coordination; retardation of the thought processes and clouding of consciousness
10-15	250-400 mg/dl (54.3-86.8 mmol/L)	Deep, possibly fatal, coma

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

FACTOR V LEIDEN

Test description: PCR test performed on whole blood or tissue. This single mutation, found in 2% to 8% of the general Caucasian population, is the single most common cause of hereditary thrombophilia.

FASTING BLOOD SUGAR

See GLUCOSE, FASTING

FBS

See GLUCOSE, FASTING

FDP

See FIBRIN DEGRADATION PRODUCT

FECAL FAT, QUANTITATIVE (72-hr collection)

Normal range: 2 to 6 g/24 hr (7 to 21 mmol/dl [CF: 3.515; SMI: 1 mmol/dl])
Elevated in: Malabsorption syndrome

FECAL GLOBIN IMMUNOCHEMICAL TEST

Normal: Negative. This test is performed by immunochromatography on a cellulose strip that has been impregnated with various antibodies. The test uses a small amount of toilet water as the specimen and is placed onto absorbent pads of card similar to traditional occult blood (OB) card. There is no direct handling of stool. This test is specific for the globin portion of the hemoglobin molecule, which confers lower GI bleeding specificity. It specifically detects blood from the lower GI tract; guaiac tests are not lower GI specific. It is more sensitive than typical Hemoccult test (detection limit 50 mcg Hb/g feces versus >500 mcg Hb/g feces for Hemoccult). It has no dietary restrictions and gives no false-positives due to plant peroxidases and red meats. It has no medication restrictions. Iron supplements and NSAIDs do not cause false positives. Vitamin C does not cause false-negatives.
Positive in: Lower GI bleeding

FERRITIN (serum)

Normal range: 18 to 300 ng/ml (18 to 300 μg/L [CF: 1; SMI: 10 μg/L])
Elevated in: Hyperthyroidism, inflammatory states, liver disease (ferritin elevated from necrotic hepatocytes), neoplasms (neuroblastomas, lymphomas, leukemia, breast carcinoma), iron replacement therapy, hemochromatosis, hemosiderosis. Table 46 summarizes hereditary iron overload disorders.
Decreased in: Iron deficiency anemia

TABLE 46 Hereditary Iron Overload Disorders

Disorder	Gene, Chromosome Location	Inheritance	Plasma Transferrin Saturation	Plasma Ferritin	Iron Deposition Sites	Clinical Manifestations
Hereditary hemochromatosis, *HFE*-associated (type 1; OMIM 235200)	*HFE*, 6p21	Autosomal recessive	Early increase; >45%	Later increase after third decade	Parenchymal iron overload affecting hepatocytes, heart, pancreas, other organs	Liver and heart disease, diabetes, gonadal failure, arthritis, skin pigmentation
Hereditary hemochromatosis, TfR2-associated (type 3; OMIM 604250)	*TFR2*, 7q22	Autosomal recessive	Early increase; >45%	Later increase after third decade	Parenchymal iron overload affecting hepatocytes, heart, pancreas, other organs	Liver and heart disease, diabetes, gonadal failure, arthritis, skin pigmentation
Juvenile hemochromatosis, hemojuvelin-associated (type 2A; OMIM 602390)	*HJV,* 1q21	Autosomal recessive	Early increase; >45%	Increased by second decade	Parenchymal iron overload affecting hepatocytes, heart, pancreas, other organs	As for hereditary hemochromatosis, but liver involvement less prominent
Juvenile hemochromatosis, hepcidin-associated (type 2B; OMIM 613313)	*HAMP*, 19q13	Autosomal recessive	Early increase; >45%	Increased by second decade	Parenchymal iron overload affecting hepatocytes, heart, pancreas, other organs	As for hereditary hemochromatosis, but liver involvement less prominent
Hemochromatosis, DMT1-associated (OMIM 206100)	*SCL11A2,* 12q13	Autosomal recessive	Early increase; >45%	Normal to moderately elevated	Hepatic iron overload, predominantly in hepatocytes	Severe microcytic anemia, liver dysfunction
Atransferrinemia (OMIM 209300)	*TF*, 3q22	Autosomal recessive	No plasma transferrin	Increased	Parenchymal iron overload affecting hepatocytes, heart, pancreas; no iron in bone marrow or spleen	Transfusion-dependent iron deficiency anemia, growth retardation, poor survival
Aceruloplasminemia (OMIM 604290)	*CP*, 3q24-q25	Autosomal recessive	Decreased	Increased	Marked iron accumulation in basal ganglia, liver, pancreas	Diabetes, progressive neurologic disease, retinal degeneration
Hemochromatosis, ferroportin-associated, with impaired iron export (type 4A; OMIM 606069)	*SLC40A1*, 2q32	Autosomal dominant	Remains normal or low	Early increase	Predominantly macrophage iron deposition	None
Hemochromatosis, ferroportin-associated, with hepcidin resistance (type 4B; OMIM 606069)	*SLC40A1*, 2q32	Autosomal dominant	Early increase; >45%	Early increase	Parenchymal iron overload affecting hepatocytes, heart, pancreas, other organs	Similar to HFE-associated hemochromatosis

OMIM, Online Mendelian Inheritance in Man.
From Hoffman R et al: *Hematology, basic principles and practice*, ed 6, Philadelphia, 2013, WB Saunders.

BOX 16 Etiopathophysiologic Classification of Folate Deficiency

- Nutritional causes
  - Decreased dietary intake: Poverty and famine, institutionalized individuals (psychiatric/nursing homes)/chronic debilitating disease, prolonged feeding of infants with goat's milk, special slimming diets or food fads (folate-rich foods not consumed), cultural/ethnic cooking techniques (food folate destroyed)
  - Decreased diet and increased requirements
    - Physiologic: Pregnancy and lactation, prematurity, hyperemesis gravidarum, infancy
    - Pathologic
      - Intrinsic hematologic diseases involving hemolysis with compensatory erythropoiesis, abnormal hematopoiesis, or bone marrow infiltration with malignant disease
      - Dermatologic disease: Psoriasis
  - Folate malabsorption
    - With normal intestinal mucosa
      - Drugs: Sulfasalazine, pyrimethamine, proton pump inhibitors (via inhibition of proton-coupled folate transporter [PCFT])
      - Hereditary folate malabsorption (mutations in PCFTs) (rare)
    - With mucosal abnormalities: Tropical and nontropical sprue, regional enteritis
- Defective cerebral spinal fluid folate transport: Cerebral folate deficiency (mutation or autoantibodies to folate receptors) (rare)
- Inadequate cellular utilization
  1. Folate antagonists (methotrexate)
  2. Hereditary enzyme deficiencies involving folate
- Drugs (multiple effects on folate metabolism): Alcohol, sulfasalazine, triamterene, pyrimethamine, trimethoprim-sulfamethoxazole, diphenylhydantoin, barbiturates

From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

α-1 FETOPROTEIN

Normal range: 0 to 20 ng/ml (0 to 20 μg/L [CF: 1; SMI: 1 μg/L])
Elevated in: Hepatocellular carcinoma (usually values >1000 ng/ml), germinal neoplasms (testis, ovary, mediastinum, retroperitoneum), liver disease (alcoholic cirrhosis, acute hepatitis, chronic active hepatitis), fetal anencephaly, spina bifida, basal cell carcinoma, breast carcinoma, pancreatic carcinoma, gastric carcinoma, retinoblastoma, esophageal atresia

FIBRIN DEGRADATION PRODUCT (FDP)

Normal range: <10 μg/ml
Elevated in: Disseminated intravascular coagulation, primary fibrinolysis, pulmonary embolism, severe liver disease
NOTE: The presence of rheumatoid factor may cause falsely elevated FDP.

FIBRINOGEN

Normal range: 200 to 400 mg/dl (2 to 4 g/L [CF: 0.01; SMI: 0.1 g/L])
Elevated in: Tissue inflammation or damage (acute phase protein reactant), oral contraceptives, pregnancy, acute infection, myocardial infarction
Decreased in: Disseminated intravascular coagulation, hereditary afibrinogenemia, liver disease, primary or secondary fibrinolysis, cachexia

FOLATE (folic acid)

Normal range: Plasma: 2 to 10 ng/ml (4 to 22 nmol/L [CF: 2.266; SMI: 2 nmol/L])
Red blood cells: 140 to 960 ng/ml (550 to 2200 nmol/L [CF: 2.266; SMI: 10 nmol/L])
Decreased in: Folic acid deficiency (inadequate intake, malabsorption), alcoholism, drugs (methotrexate, trimethoprim, phenytoin, oral contraceptives, Azulfidine), vitamin B_{12} deficiency (defective red cell folate absorption), hemolytic anemia. Box 16 summarizes an etiophysiologic classification of folate deficiency.
Elevated in: Folic acid therapy

FOLLICLE-STIMULATING HORMONE (FSH)

Normal range: 5-20 mIU/ml
Elevated in: Menopause, primary gonadal failure, alcoholism, castration, Klinefelter syndrome, gonadotropin-secreting pituitary hormones
Decreased in: Pregnancy, polycystic ovary disease, anorexia nervosa, anterior pituitary hypofunction

FREE T4

See T_4, FREE

FREE THYROXINE INDEX

Normal range: 1.1 to 4.3
INCREASED THYROXINE OR FREE THYROXINE VALUES
Laboratory error
Primary hyperthyroidism (T4/T3 type)
Severe thyroxine-binding globulin elevation
Excess therapy of hypothyroidism
Excessive dose of levothyroxine
Active thyroiditis (subacute, painless, early active Hashimoto disease)
Familial dysalbuminemic hyperthyroxinemia (some FT4 kits, especially analog types)
Peripheral resistance to T4 syndrome
Amiodarone or propranolol
Postpartum transient toxicosis
Factitious hyperthyroidism
Jod-Basedow (iodine-induced) hyperthyroidism
Severe nonthyroid illness
Acute psychosis (especially paranoid schizophrenia)
T4 sample drawn 2 to 4 hr after levothyroxine dose
Struma ovarii
Pituitary thyroid-stimulating hormone-secreting tumor
Certain x-ray contrast media (Telepaque and Oragrafin)
Acute porphyria
Heparin effect (some T4 and FT4 kits)
Amphetamine, heroin, methadone, and phencyclidine abuse
Perphenazine or 5-fluorouracil
Antithyroid or anti-IgG heterophil (HAMA) autoantibodies
"T4" hyperthyroidism
Hyperemesis gravidarum; about 50% of patients
High altitudes
DECREASED THYROXINE OR FREE THYROXINE VALUES
Laboratory error
Primary hypothyroidism
Severe nonthyroid illness
Lithium therapy
Severe thyroxine-binding globulin decrease (congenital, disease, or drug-induced) or severe albumin decrease
Dilantin, Depakene, or high-dose salicylate drugs
Pituitary insufficiency
Large doses of inorganic iodide (e.g., saturated solution of potassium iodide)
Moderate or severe iodine deficiency
Cushing syndrome
High-dose glucocorticoid drugs
Pregnancy, third trimester (low normal or small decrease)
Addison disease; some patients (30%)
Heparin effect (a few FT4 kits)
Desipramine or amiodarone drugs
Acute psychiatric illness

FTA-ABS (serum)

Normal: Nonreactive
Reactive in: Syphilis, other treponemal diseases (yaws, pinta, bejel), SLE, pregnancy

FUROSEMIDE STIMULATION TEST

Normal: Test is performed by giving 60 mg furosemide orally after overnight fast. Patient should be on a normal diet without medications the wk before the test. Normal results: renin 1 to 6 ng angiotensin L/ml/hr.
Elevated in: Renovascular hypertension, Bartter syndrome, high-renin essential hypertension, pheochromocytoma
No response in:
Primary aldosteronism, low-renin essential hypertension, hyporeninemic hypoaldosteronism

GAMMA-GLUTAMYL TRANSFERASE (GGT)

See γ-GLUTAMYL TRANSFERASE

GASTRIN (serum)

Normal range: 0 to 180 pg/ml (0 to 180 ng/L [CF: 1; SMI: 10 ng/L])
Elevated in: Zollinger-Ellison syndrome (gastrinoma), pernicious anemia, hyperparathyroidism, retained gastric antrum, chronic renal failure, gastric ulcer, chronic atrophic gastritis, pyloric obstruction, malignant neoplasms of the stomach, H_2-blockers, omeprazole, calcium therapy, ulcerative colitis, rheumatoid arthritis

GASTRIN STIMULATION TEST

Normal: Gastrin stimulation test after calcium infusion is performed by giving a calcium infusion (15 mg/kg in 500 ml normal saline over 4 hours). Serum is drawn in fasting state before infusion and at 1, 2, 3, and 4 hr. Normal response is little or no increase over baseline gastrin level.
Elevated in: Gastrinoma (gastrin >400 pg/ml), duodenal ulcer (gastrin level increase <400 ng/L)
Decreased in: Pernicious anemia, atrophic gastritis

GLIADIN ANTIBODIES, IGA AND IGG

Normal: <25 U, equivocal 20-25 U, positive >25 U. Test is useful to monitor compliance with gluten-free diet in patients with celiac disease.
Elevated in: Celiac disease with dietary noncompliance

GLOMERULAR BASEMENT MEMBRANE (GBM) ANTIBODY

Normal: Negative
Present in: Goodpasture syndrome

GLOMERULAR FILTRATION RATE

See Box 17 for a summary of common equations for calculating GFR or creatinine clearance. Chronic kidney disease stages based on GFR are summarized in Table 47.
Normal:

Ages 20-29	116 ml/min/1.73 m^2
Ages 30-39	107 ml/min/1.73 m^2
Ages 40-49	99 ml/min/1.73 m^2
Ages 50-59	93 ml/min/1.73 m^2
Ages 60-69	85 ml/min/1.73 m^2
Ages >75	75 ml/min/1.73 m^2

Decreased in: Renal insufficiency, decreased renal blood flow

GLUCAGON

Normal: 20 to 100 pg/ml
Elevated in: Glucagonoma (900 to 7800 pg/ml), chronic renal failure, diabetes mellitus, glucocorticoids, insulin, nifedipine, danazol, sympathomimetic amines
Decreased in: Hyperlipoproteinemia (types III, IV), beta-blockers, secretin

GLUCOSE, FASTING (FBS, FASTING BLOOD SUGAR)

Fig. E23 describes the approach to hypoglycemia. An algorithm for evaluation of hypoglycemia in children is described in Fig. E24.

BOX 17 Common Equations for Estimating Glomerular Filtration Rate or Creatinine Clearance

Cockcroft-Gault (C_{Cr} · BSA/1.73 m^2)
For men: $C_{Cr} = [(140 - age) \cdot weight\ (kg)]/S_{Cr} \cdot 72$
For women: $C_{Cr} = ([(140 - age) \cdot weight\ (kg)]/S_{Cr} \cdot 72) \cdot 0.85$

MDRD (1)
$GFR = 170 \cdot [S_{Cr}]^{-0.999} \cdot [age]^{-0.176} \cdot [0.762\ if\ patient\ is\ female] \cdot [1.18\ if\ patient\ is\ black] \cdot [BUN]^{-0170} \cdot [Alb]^{0.318}$

MDRD (2)
$GFR = 186 \cdot [S_{Cr}]^{-1.154} \cdot [age]^{-0.203} \cdot [0.742\ if\ patient\ is\ female] \cdot [1.212\ if\ patient\ is\ black]$

Jellife (1) (C_{Cr} · BSA/1.73 m^2)
For men: $(98 - [0.8 \cdot (age - 20)])/S_{Cr}$
For women: $(98 - [0.8 \cdot (age - 20)])S_{Cr} \cdot 0.90$

Jellife (2)
For men: $(100/S_{Cr})^{-12}$
For women: $(80/S_{Cr})^{-7}$

Mawer
For men: $weight \cdot [29.3 - (0.203 \cdot age)] \cdot [1 - (0.03 \cdot SCr)]$
For women: $weight \cdot [25.3 - (0.175 \cdot age)] \cdot [1 - (0.03 \cdot SC_r)]$

Bjornsson
For men: $[27 - (0.173 \cdot age)] \cdot weight \cdot 0/S_{Cr}$
For women: $[25 - (0.175 \cdot age)] \cdot weight \cdot 0.07/S_{Cr}$

Gates
For men: $(89.4 \cdot S_{Cr}^{-1.2}) + (55 - age) \cdot (0.447 \cdot S_{Cr}^{-1.1})$
For women: $(89.4 \cdot S_{Cr}^{-1.2}) + (55 - age) \cdot (0.447 \cdot S_{Cr}^{-1.1})$

Salazar-Corcoran
For men: $[137 - age] \cdot [(0.285 \cdot weight) + (12.1 \cdot height^2)]/(51 \cdot S_{Cr})$
For women: $[146 - age] \cdot [(0.287 \cdot weight) + (9.74 \cdot height^2)]/(60 \cdot S_{Cr})$

Alb, Albumin; *BSA,* body surface area; *BUN,* blood urea nitrogen; *Ccr,* creatinine clearance; *MDRD,* Modification of Diet in Renal Disease; *Scr,* serum creatinine.
From Vincent JL et al: *Textbook of critical care,* ed 6, Philadelphia, 2011, WB Saunders.

TABLE 47 Chronic Kidney Disease Stages

Stage	eGFR (ml/min/1.73 m^2)	Urinalysis Findings
1	≥90	Hematuria, proteinuria, or imaging abnormalities at >3 mo
2	60-89	Hematuria, proteinuria, or imaging abnormalities at >3 mo
3	30-59	↑ or normal
4	15-29	↑ or normal
5	0-14	↑ or normal

eGFR, Estimated glomerular filtration rate.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 4, Philadelphia, 2014, Elsevier.

Normal range: 60 to 99 mg/dl (3.8 to 6.0 mmol/L [CF: 0.05551; SMI: 0.1 mmol/L])
Elevated in: Diabetes mellitus, stress, infections, myocardial infarction, cerebrovascular accident, Cushing syndrome, acromegaly, acute pancreatitis, glucagonoma, hemochromatosis, drugs (glucocorticoids, diuretics [thiazides, loop diuretics]), glucose intolerance, impaired fasting glucose
Decreased in: Sulfonylurea therapy, insulin therapy, reactive hypoglycemia (e.g., subtotal gastrectomy), starvation, insulinoma, glycogen storage disorders, severe liver disease or renal disease, ethanol-induced hypoglycemia, mesenchymal tumors that secrete insulin-like hormones

GLUCOSE, POSTPRANDIAL

Normal range: <140 mg/dl (<7.8 mmol/L [CF: 0.05551; SMI: 0.1 mmol/L])
Elevated in: Diabetes mellitus, glucose intolerance

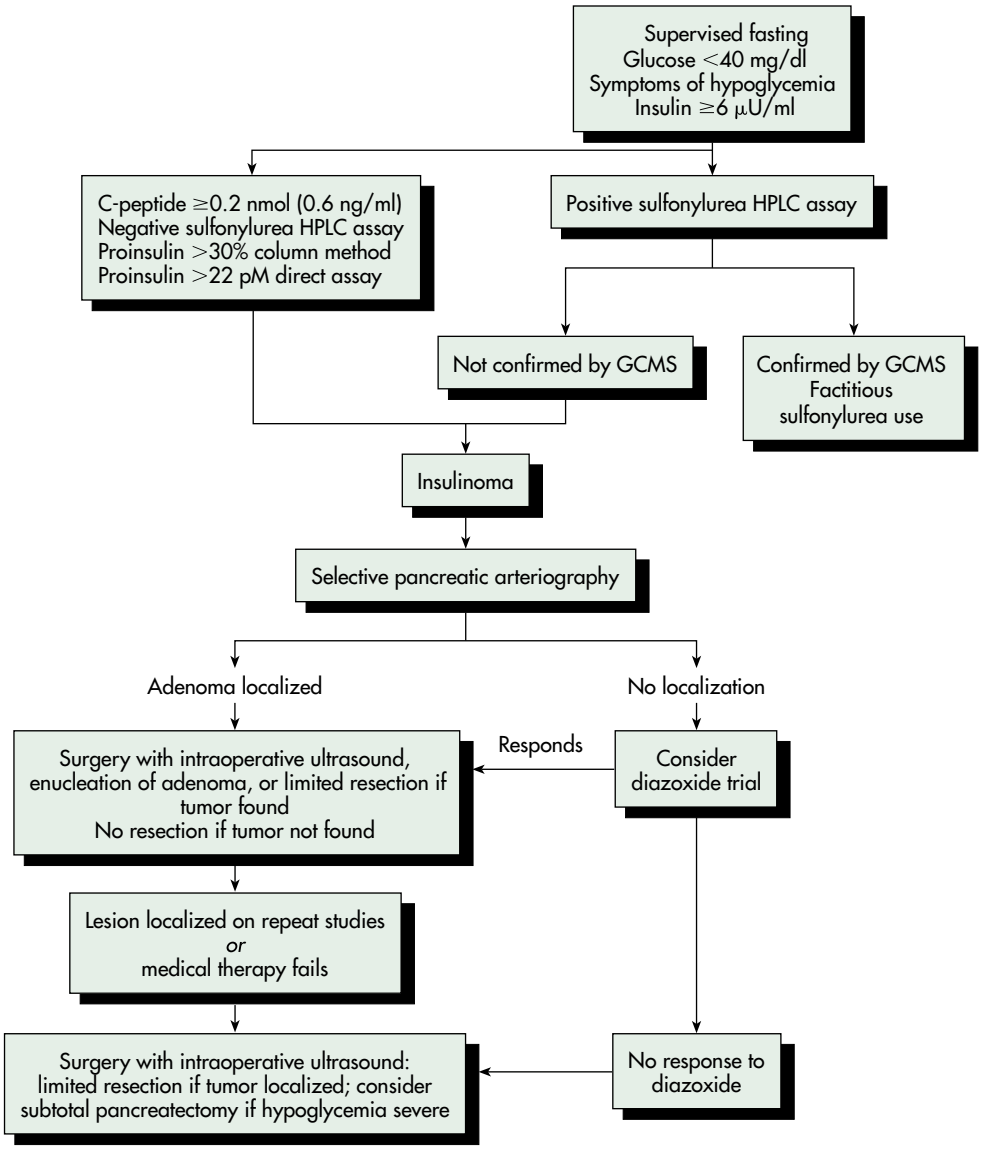

FIG. E23 Diagnostic evaluation of patients with documented hypoglycemia and elevated insulin. *GCMS,* Gas chromatography mass spectrometry; *HPLC,* high-pressure liquid chromatography. (Modified and updated from Moore WT, Eastman RC: *Diagnostic endocrinology,* ed 2, St Louis, 1996, Mosby.)

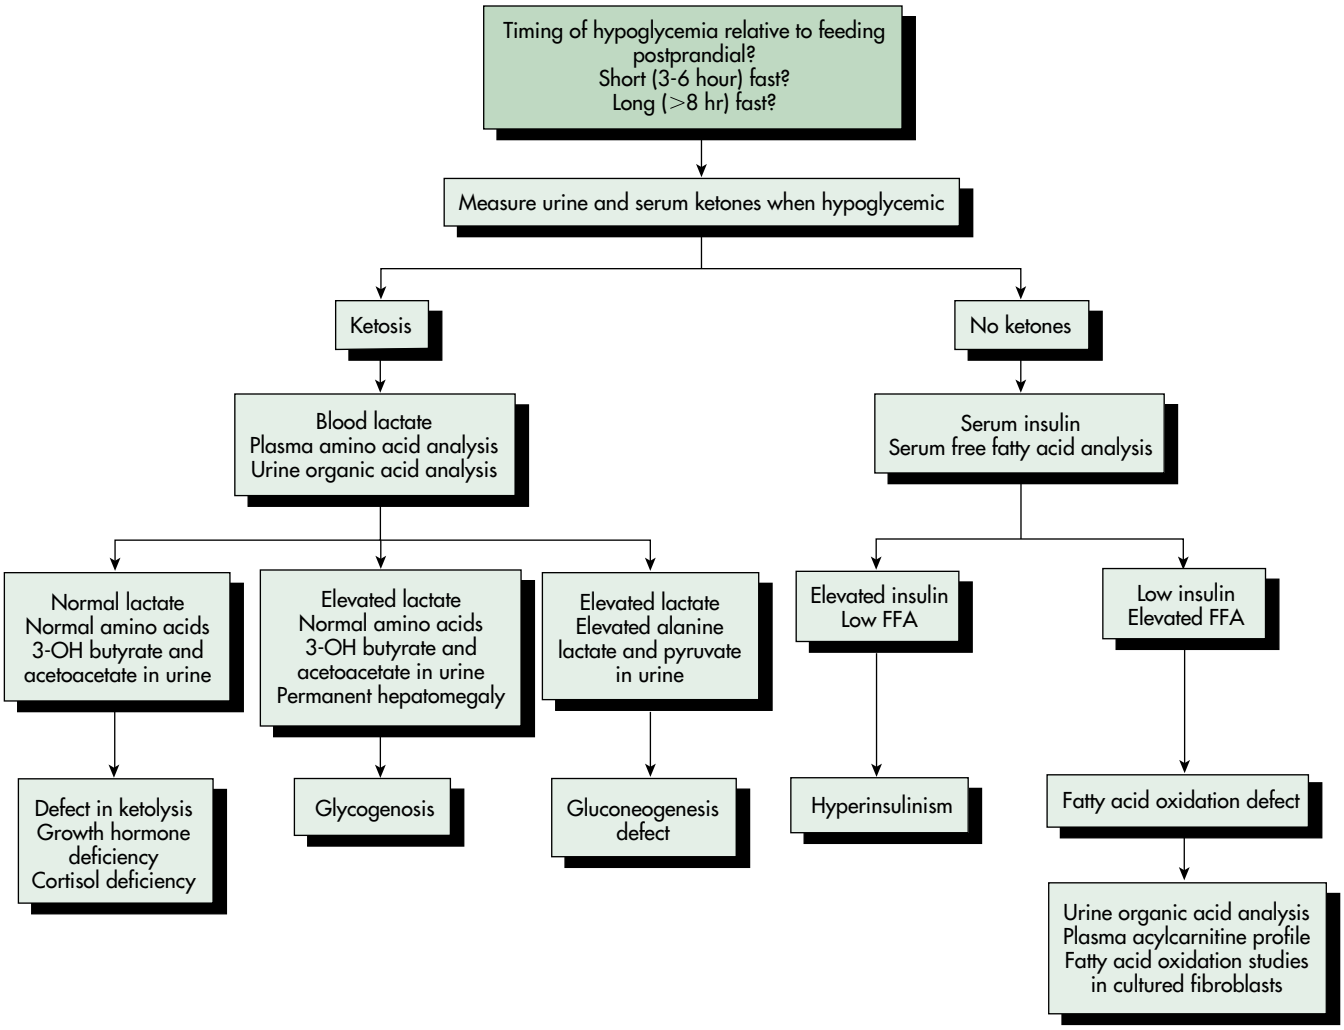

FIG. E24 Algorithm for evaluation of hypoglycemia in children. *FFA,* Free fatty acid. (From Fuhrman BP et al: *Pediatric critical care*, ed 4, Philadelphia, 2011, WB Saunders.)

TABLE 48 Glycemic Goals in Adults*

	Hemoglobin A_{1c} (%)	Preprandial Glucose		Postprandial Glucose**	
		mg/dl	mmol/L	mg/dl	mmol/L
ADA†: Adults	<7.0‡	80-130	4.4-7.2	<180	<10.0
Pregnant adults	<6.0	60-99	3.3-5.5	100-129	5.6-7.2
Older adults:					
Healthy	<7.5	90-130	5.0-7.2	90-150	5.0-8.3
Intermediate	<8.0	90-150	5.0-8.3	100-180	5.6-10.0
Poor health	<8.5	100-180	5.6-10.0	110-200	6.1-11.1
AACE§¶	≤6.5	≤110	≤6.1	≤140	<7.8

*Youth <18 years of age: Goal hemoglobin A_{1c}<7.5%.
**1 to 2 hours after beginning a meal for adults, except bedtime for older adults.
†American Diabetes Association (2015); Chiang et al (2014).
‡Lower goals may be appropriate for selected individuals if this can be accomplished safely (without significant hypoglycemia). Higher goals may be appropriate in some individuals (e.g., with a history of severe hypoglycemia, limited life expectancy, advanced complications, extensive comorbid conditions, or long-standing diabetes in whom the goal is difficult to achieve with appropriate education, monitoring, and therapies, including insulin).
§AACE, American Association of Clinical Endocrinologists, 2015.
¶For patients without concurrent serious illness and at low hypoglycemia risk.
AACE, American Association of Clinical Endocrinologists; *ADA,* American Diabetes Association.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Decreased in: Post gastrointestinal resection, reactive hypoglycemia, hereditary fructose intolerance, galactosemia, leucine sensitivity

GLUCOSE TOLERANCE TEST

Normal values above fasting: 30 min: 30 to 60 mg/dl (1.65 to 3.3 mmol/L [CF: 0.05551; SMI: 0.1 mmol/L])
60 min: 20 to 50 mg/dl (1.1 to 2.75 mmol/L [CF: 0.05551; SMI: 0.1 mmol/L])
120 min: 5 to 15 mg/dl (0.28 to 0.83 mmol/L [CF: 0.05551; SMI: 0.1 mmol/L])
180 min: Fasting level or below
Abnormal in: Glucose intolerance, diabetes mellitus, Cushing syndrome, acromegaly, pheochromocytoma, gestational diabetes

GLUCOSE-6-PHOSPHATE DEHYDROGENASE (G6PD) Screen (blood)

Normal: G6PD enzyme activity detected
Abnormal: If a deficiency is detected, quantitation of G6PD is necessary; a G6PD screen may be falsely interpreted as "normal" after an episode of hemolysis because most G6PD-deficient cells have been destroyed.

γ-GLUTAMYL TRANSFERASE (GGT)

Normal range: 0 to 30 U/L (0.050 μkat/L [CF: 0.01667; SMI: 0.01 μkat/L])
Elevated in: Chronic alcoholic liver disease, neoplasms (hepatoma, metastatic disease to the liver, carcinoma of the pancreas), systemic lupus erythematosus, congestive heart failure, trauma, nephrotic syndrome, sepsis, cholestasis, drugs (phenytoin, barbiturates)

GLYCOHEMOGLOBIN (glycated glycosylated hemoglobin), (HbA1c)

Normal range: 4.0% to 5.9%. Glycemic goals in adults are summarized in Table 48.

Elevated in: Uncontrolled diabetes mellitus (glycated hemoglobin levels reflect the level of glucose control over the preceding 120 days), lead toxicity, alcoholism, iron deficiency anemia, hypertriglyceridemia
Decreased in: Hemolytic anemias, decreased red blood cell survival, pregnancy, acute or chronic blood loss, chronic renal failure, insulinoma, congenital spherocytosis, hemoglobin S, C, and D diseases

GROWTH HORMONE

Normal: Male: 1 to 9 ng/ml; female: 1 to 16 ng/ml
Elevated in: Pituitary gigantism, acromegaly, ectopic GH secretion, cirrhosis, renal failure, anorexia nervosa, stress, exercise, prolonged fasting, amphetamines, beta-blockers, insulin, levodopa, metoclopramide, clonidine, vasopressin, human growth hormone (HGH) supplementation
Decreased in: Hypopituitarism, pituitary dwarfism, adrenocortical hyperfunction, bromocriptine, corticosteroids, glucose

GROWTH HORMONE RELEASING HORMONE (GHRH)

Normal: <50 pg/ml
Elevated in: Acromegaly caused by GHRH secretion by neoplasms

GROWTH HORMONE SUPPRESSION TEST (after glucose)

Normal: Test is done by giving 1.75 g glucose/kg orally after overnight fast. Blood is drawn at baseline, after 60 min, and after 120 min of glucose load. Normal response is growth hormone suppression to <2 ng/ml or undetectable levels.
Abnormal: There is no or incomplete suppression from the high basal level in gigantism or acromegaly.

HAM TEST (acid serum test)

Normal: Negative
Positive in: Paroxysmal nocturnal hemoglobinuria
False-positive in: Hereditary or acquired spherocytosis, recent transfusion with aged red blood cells, aplastic anemia, myeloproliferative syndromes, leukemia, hereditary dyserythropoietic anemia type II

HAPTOGLOBIN (serum)

Normal range: 50 to 220 mg/dl (0.50 to 2.2 g/L [CF: 0.01; SMI: 0.01 g/L])
Elevated in: Inflammation (acute phase reactant), collagen vascular diseases, infections (acute phase reactant), drugs (androgens), obstructive liver disease
Decreased in: Hemolysis (intravascular more than extravascular), megaloblastic anemia, severe liver disease, large tissue hematomas, infectious mononucleosis, drugs (oral contraceptives)

HBA_{1C}

See GLYCOHEMOGLOBIN

HDL

See HIGH-DENSITY LIPOPROTEIN CHOLESTEROL

HELICOBACTER PYLORI (serology, stool antigen)

Normal range: Not detected
Detected in: *H. pylori* infection. Positive serology can indicate current or past infection. Positive stool antigen test indicates acute infection (sensitivity and specificity >90%). Stool testing should be delayed at least 4 wk after eradication therapy.

HEMATOCRIT

Normal range: Male: 39% to 49% (0.39 to 0.49 [CF: 0.01; SMI: 0.01])
Female: 33% to 43% (0.33 to 0.43 [CF: 0.01; SMI: 0.01])
Elevated in: Polycythemia vera, smoking, chronic obstructive pulmonary disease, high altitudes, dehydration, hypovolemia
Decreased in: Blood loss (gastrointestinal, genitourinary) anemia

HEMOGLOBIN

Normal range: Male: 13.6 to 17.7 g/dl (136 to 172 g/L [CF: 10; SMI: 1 g/L])
Female: 12.0 to 15.0 g/dl (120 to 150 g/L [CF: 10; SMI: 1 g/L])
Elevated in: Hemoconcentration, dehydration, polycythemia vera, chronic obstructive pulmonary disease, high altitudes, false elevations (hyperlipemic plasma, white blood cells >50,000/mm^3), stress
Decreased in: Hemorrhagic (gastrointestinal, genitourinary) anemia

$HEMOGLOBIN\ A_{1C}$

See GLYCOHEMOGLOBIN

HEMOGLOBIN ELECTROPHORESIS

Table 49 describes neonatal hemoglobin electrophoresis patterns, Table 50 summarizes types of hemoglobin, and Table 51 describes classifications of hemoglobinopathies.
Normal range:
HbA_1: 95% to 98%
HbA_2: 1.5% to 3.5%
HbF: <2%
HbC: Absent
HbS: Absent

HEMOGLOBIN, GLYCATED

See GLYCOHEMOGLOBIN

HEMOGLOBIN, GLYCOSYLATED

See GLYCOHEMOGLOBIN

HEMOGLOBIN H

See Table 50.
Normal: Negative

TABLE 49 Neonatal Hemoglobin (Hb) Electrophoresis Patterns*

FA	Fetal Hb and adult normal Hb; the normal newborn pattern.
FAV	Indicates the presence of both HbF and HbA. However, an anomalous band (V) is present, which does not appear to be any of the common Hb variants.
FAS	Indicates fetal Hb, adult normal HbA, and HbS, consistent with benign sickle cell trait.
FS	Fetal and sickle HbS without detectable adult normal HbA. Consistent with clinically significant homozygous sickle Hb genotype (S/S) or sickle β-thalassemia, with manifestations of sickle cell anemia during childhood.
FC†	Designates the presence of HbC without adult normal HbA. Consistent with clinically significant homozygous HbC genotype (C/C), resulting in a mild hematologic disorder presenting during childhood.
FSC	HbS and HbC present. This heterozygous condition could lead to the manifestations of sickle cell disease during childhood.
FAC	HbC and adult normal HbA present, consistent with benign HbC trait.
FSA	Heterozygous HbS/β-thalassemia, a clinically significant sickling disorder.
F†	Fetal HbF is present without adult normal HbA. Although this may indicate a delayed appearance of HbA, it is also consistent with homozygous β-thalassemia major, or homozygous hereditary persistence of fetal HbF.
FV†	Fetal HbF and an anomalous Hb variant (V) are present.
AF	May indicate prior blood transfusion. Submit another filter paper blood specimen when the infant is 4 mo of age, at which time the transfused blood cells should have been cleared.

NOTE: HbA: α2β2; HbF: α2γ2; HbA2: α2δ2.
*Hemoglobin variants are reported in order of decreasing abundance; for example, FA indicates more fetal than adult hemoglobin.
†Repeat blood specimen should be submitted to confirm the original interpretation.
From Tschudy MM, Arcara KM: *The Harriet Lane handbook,* ed 19, Philadelphia, 2012, Mosby.

TABLE 50 Types of Hemoglobin

	Hemoglobin	Structure	Comment
Normal	A	$\alpha_2\beta_2$	97% of adult hemoglobin
	A_2	$\alpha_2\delta_2$	2% of adult Hb; elevated in β-thalassemia
	F	$\alpha_2\gamma_2$	Normal Hb in fetus from 3rd to 9th mo; increased in β-thalassemia
Abnormal chain production	H	β_4	Found in α-thalassemia, biologically useless
	Barts	γ_4	Found in α-thalassemia, biologically useless
Abnormal chain structure	S	$\alpha_2\beta_2$	Substitution of valine for glutamic acid in position 6 of β chain
	C	$\alpha_2\beta_2$	Substitution of lysine for glutamic acid in position 6 of β chain

From Ballinger A: *Kumar & Clark's essentials of clinical medicine,* ed 6, Edinburgh, 2012, WB Saunders.

Present in: Hemoglobin H disease, alpha-thalassemia trait, unstable hemoglobin disorders

HEMOGLOBIN, URINE

See URINE HEMOGLOBIN, FREE

HEMOSIDERIN, URINE

See URINE HEMOGLOBIN, FREE

HEPARIN-INDUCED THROMBOCYTOPENIA ANTIBODIES

Normal: Antigen assay: Negative, <0.45; weak, 0.45-1.0; strong, >1.0
Elevated in: Heparin-induced thrombocytopenia

HEPATITIS A ANTIBODY

Normal: Negative
Present in: Viral hepatitis A; can be IgM or IgG (if IgM, acute hepatitis A; if IgG, previous infection with hepatitis A)

TABLE 51 Classification of Hemoglobinopathies

Structural hemoglobinopathies—hemoglobins with altered amino acid sequences that result in deranged function or altered physical or chemical properties
Abnormal hemoglobin polymerization—HBS
Altered oxygen affinity
High affinity—polycythemia
Low affinity—cyanosis, pseudoanemia
Hemoglobins that oxidize readily
Unstable hemoglobins, hemolytic anemia, jaundice
M hemoglobins—methemoglobinemia, cyanosis
Thalassemias—defective production of globin chains
α-Thalassemias
β-Thalassemias
δβ-, γδβ-, αβ-Thalassemias
Structural hemoglobinopathies—structurally abnormal Hb associated with coinherited thalassemia phenotype
HbE
Hb constant spring
Hb lepore
Hereditary persistence of fetal hemoglobin—persistence of high levels of HbF into adult life
Pancellular—all red blood cells contain elevated HbF levels
Nondeletion forms
Deletion forms
Hb Kenya
Heterocellular—only specific subpopulation of red blood cells contain elevated levels of HbF
Acquired hemoglobinopathies
Methemoglobin due to toxic exposures
Sulfhemoglobin due to toxic exposures
Carboxyhemoglobin
HbH in erythroleukemia
Elevated HbF in states of erythroid stress and bone marrow dysplasia, usually heterocellular

Hb, Hemoglobin.
From Hoffman R: *Hematology: Basic principles and practice*, ed 6, Philadelphia, 2013, WB Saunders.

See Fig. 25 for serologic tests in HAV infection.
See Table 52 for serologic and virologic tests for hepatitis viruses.

HEPATITIS A VIRUS-IGM ANTIBODY

Appearance: About the same time as clinical symptoms (3 to 4 wk after exposure; range, 14 to 60 days), or just before beginning of AST/ALT elevation (range, 10 days before to 7 days after)
Peak: About 3 to 4 wk after onset of symptoms (1 to 6 wk)
Becomes nondetectable: 3 to 4 mo after onset of symptoms (1 to 6 mo). In a few cases HAV-IgM antibody can persist as long as 12 to 14 mo.

HAV TOTAL ANTIBODY

Appearance: About 3 wk after IgM becomes detectable (therefore about the middle of clinical symptom period to early convalescence)
Peak: About 1-2 mo after onset
Becomes nondetectable: Remains elevated for life but can somewhat slowly fall

HEPATITIS A VIRAL INFECTION

Best all-purpose test(s) to diagnose acute HAV infection = HAV-Ab (IgM)
Best all-purpose test(s) to demonstrate past HAV infection/immunity = HAV-Ab (total)

HEPATITIS B SURFACE ANTIGEN (HBsAg)

Normal: Not detected
Detected in: Acute viral hepatitis type B, chronic hepatitis B
Appearance: 2 to 6 wk after exposure (range, 6 days to 6 mo); 5% to 15% of patients are negative at onset of jaundice
Peak: 1 to 2 wk before to 1 to 2 wk after onset of symptoms
Becomes nondetectable: 1 to 3 mo after peak (range, 1 wk to 5 mo)

HEPATITIS B VIRAL INFECTION

See Table 53

Figs. 26, 27, and 28 illustrate antigens and antibodies in hepatitis B infection.

HB_S
-Ag:
HB_SAg: Shows current active hepatitis B virus (HBV) infection.
Persistence over 6 mo indicates carrier/chronic HBV infection.
HBV nucleic acid probe: Present before and longer than HB_SAg.
More reliable marker for increased infectivity than HB_SAg and/or HB_eAg.
-Ab:
HB_SAb-total: Shows previous healed HBV infection and evidence of immunity.
HB_C
-Ab:
HB_CAb-IgM: Shows either acute or very recent infection by HBV.

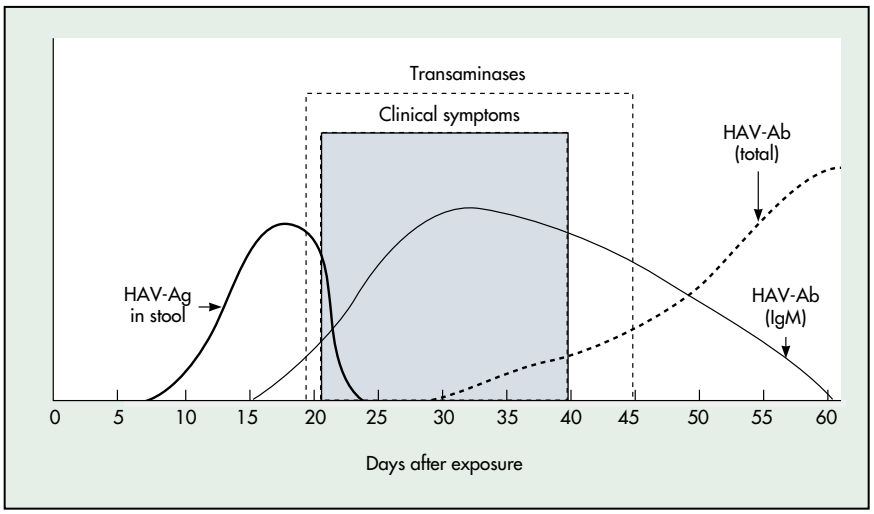

FIG. 25 Serologic tests in hepatitis A viral infection. *HAV,* Hepatitis A virus; *HAV-Ab,* hepatitis A virus antibodies test; *HAV-Ag,* hepatitis A virus antigen test; *Ig,* immunoglobulin. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

TABLE 52 Serologic and Virologic Tests for Hepatitis Viruses

	IgM Anti-HAV	IgG Anti-HAV	HBsAg	Anti-HBs	IgM Anti-HBVc	HBeAg	Anti-HBe	HBV DNA	Anti-HCV Screen	HCV RNA	Anti-HDV	Anti-HEV

DNA, Deoxyribonucleic acid; *HAV,* hepatitis A virus; *HBeAg,* hepatitis E antigen; *HBsAg,* hepatitis B surface antigen; *HBV,* hepatitis B virus; *HCV,* hepatitis C virus; *HDV,* hepatitis D virus; *HEV,* hepatitis E virus; *Ig,* immunoglobulin; *RNA,* ribonucleic acid; *TX,* Texas; +, positive;–,negative.

Data from CDC: Surveillance for acute hepatitis, United States, 2007, *MMWR* 58(SS-3), 2009.

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, Philadelphia, 2017, Elsevier.

TABLE 53 Serologic Markers of Hepatitis B Infection

	HBsAg	anti-HBc	anti-HBs	IgM anti-HBc
Susceptible to infection	Negative	Negative	Negative	Negative
Immune due to natural infection	Negative	Positive	Positive	Negative
Immune due to hepatitis B vaccination	Negative	Negative	Positive	Negative
Acutely infected	Positive	Positive	Negative	Positive
Chronically infected	Positive	Positive	Negative	Negative

HBsAg, Hepatitis B surface antigen; *Ig,* immunoglobulin.

From Ballinger A: *Kumar & Clark's essentials of clinical medicine,* ed 6, Edinburgh, 2012, WB Saunders.

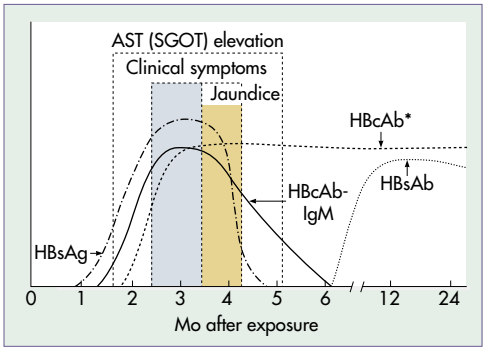

FIG. 26 Hepatitis B virus surface antigen-antibody and core antibodies. Note "core window." *HB_CAb = HB_CAb-IgM + HBCAb-IgG (combined). *AST,* Aspartate aminotransferase; *HBcAb,* hepatitis B core antibody; *HBsAb,* hepatitis B surface antibody; *HBsAg,* hepatitis B surface antigen; *Ig,* immunoglobulin; *SGOT,* serum glutamic-oxaloacetic transaminase. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

In convalescent phase of acute HBV, may be elevated when HB_SAg has disappeared (core window).

Negative HB_CAb-IgM with positive HB_SAg suggests either very early acute HBV or carrier/chronic HBV.

HB_CAb-total: Only useful to show past HBV infection if HB_SAg and HB_cAb-IgM are both negative.

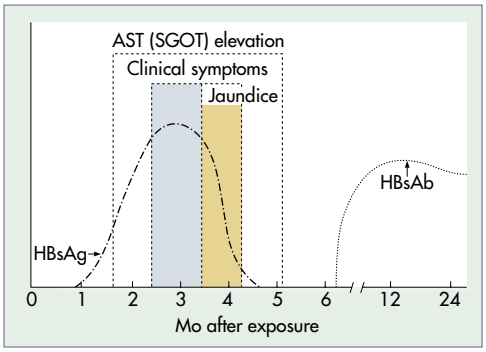

FIG. 27 Hepatitis B virus surface antigen and antibody (HB_SAg and HB_SAb-total). *AST,* Aspartate aminotransferase; *SGOT,* serum glutamic-oxaloacetic transaminase. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

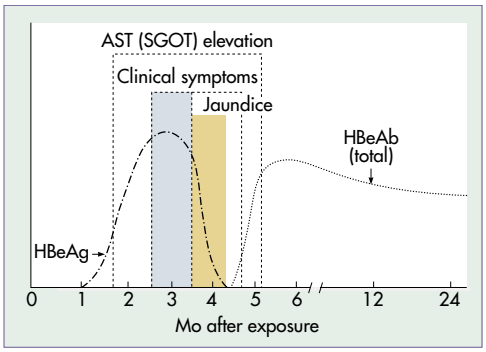

FIG. 28 HBVe antigen and antibody. *AST,* Aspartate aminotransferase; *HBeAb,* hepatitis B e-antibody; *SGOT,* serum glutamic-oxaloacetic transaminase. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

HB_E

-Ag:

HB_e-AbAg: When present, especially without HB_eAb, suggests increased patient infectivity.

HB_eAb-total: When present, suggests less patient infectivity.

HB_SAg positive, HB_CAb negative

About 5% (range, 0% to 17%) of patients with early-stage HBV acute infection (HB_CAb rises later)
HB_SAg positive, HB_CAb positive, HB_SAb negative
Most of the clinical symptom stage
Chronic HBV carriers without evidence of liver disease ("asymptomatic carriers")
Chronic HBV hepatitis (chronic persistent type or chronic active type)
HB_SAg negative, HB_CAb positive, HB_SAb negative
Late clinical symptom stage or early convalescence stage (core window)
Chronic HBV infection with HB_SAg below detection levels with current tests
Old previous HBV infection
HB_SAg negative, HB_CAb positive, HB_SAb positive
Late convalescence to complete recovery
Old infection

HEPATITIS C VIRAL INFECTION

Fig. 29 illustrates antigens and antibodies in hepatitis C infection. Table 54 summarizes interpretation of patterns of HCV markers.

HEPATITIS C RNA

Normal: Negative
Elevated in: Hepatitis C. Detection of hepatitis C-RNA is used to confirm current infection and to monitor treatment. Quantitative assays (viral load) are needed before treatment to assess response (<2 log decrease after 12-wk treatment indicates lack of response).

HCV
-Ag:
HCV nucleic acid probe: Shows current infection by HCV (especially with PCR amplification).
-Ab:
HCV-Ab (IgG): Current, convalescent, or old HCV infection.

HAV
-Ag:
HAV-Ag by EM: Shows presence of virus in stool early in infection.
-Ab:
HAV-Ab (IgM): Current or recent HAV infection.
HAV-Ab (total): Convalescent or old HAV infection.

HEPATITIS D VIRAL INFECTION

Fig. 30 illustrates antigens and antibodies in hepatitis D infection.
Best current all-purpose screening test = HDV-Ab (total)
Best test to differentiate acute from chronic infection = HDV-Ab (IgM)

DELTA HEPATITIS COINFECTION (acute HDV1 acute HBV) or Superinfection (acute HDV1 chronic HBV)

HDV
-Ag:
HDV-Ag: Shows current infection (acute or chronic) by HDV.
HDV nucleic acid probe: Detects antigen before and longer than HDV-Ag by EIA.
-Ab:
HDV-Ab (IgM): High elevation in acute HDV; does not persist.
Low or moderate elevation in convalescent HDV; does not persist.

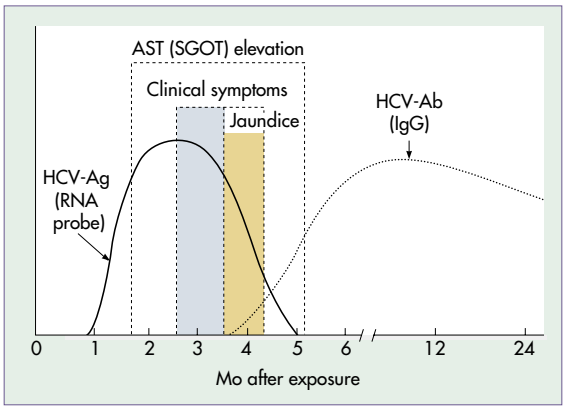

FIG. 29 Hepatitis C virus antigen and antibody. *AST,* Aspartate aminotransferase; *HCV-Ab,* hepatitis C virus antibody; *HCV-Ag,* hepatitis C virus core antigen; Ig, immunoglobulin; *RNA,* ribonucleic acid; *SGOT,* serum glutamic-oxaloacetic transaminase. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

TABLE 54 Interpretation of Patterns of HCV Markers

Interpretation	Anti-HCV	RIBA	HCV RNA
Acute HCV infection	–	–	+
Active HCV infection	+	+	+
Possible HCV clearance	+	+	–
False-positive HCV test	+	–	–
Requires further study	+	Indeterminate*	–

HCV, Hepatitis C; *RIBA,* recombinant immunoassay; *RNA,* ribonucleic acid.
*Indeterminate result: Only one band positive, or more than one band and nonspecific reactivity.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

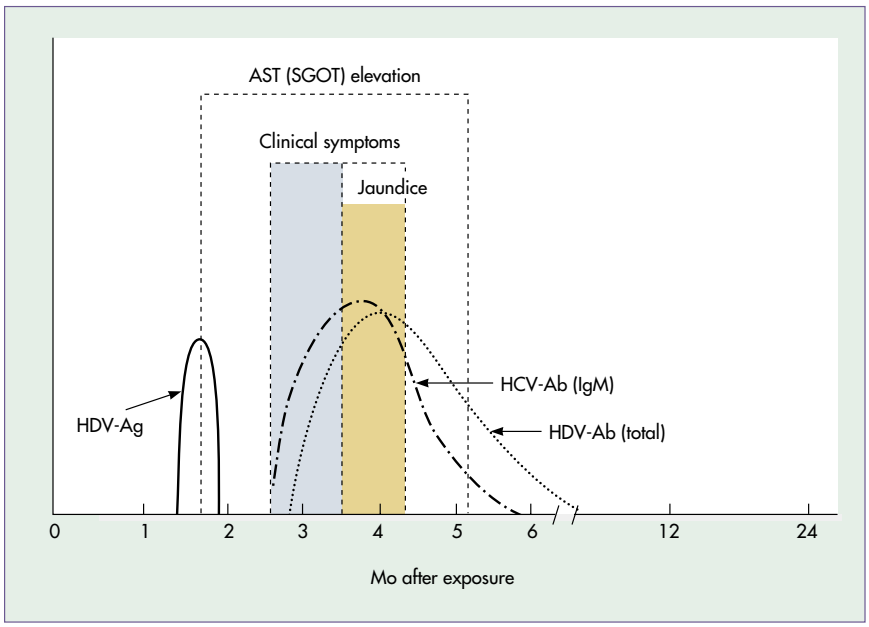

FIG. 30 Hepatitis D virus antigen and antibodies. *AST,* Aspartate aminotransferase; *HCV-Ab,* hepatitis C virus antibody; *HDV-Ab,* hepatitis D virus antibody; *HDV-Ag,* hepatitis D virus antigen; *Ig,* immunoglobulin; *SGOT,* serum glutamic-oxaloacetic transaminase. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

TABLE 55 Significant Human Apolipoproteins

Apolipoprotein	Major Lipoproteins	Mr* (kDa)	Amino Acids	Chromosome	PLASMA CONCENTRATION	
					mmol/L	mg/dl
A-I	HDL	29	243-245	11	32-46	90-130
A-II	HDL	17.4	154	1	18-29	30-50
A-IV	HDL, LDL	44.5	396	11		
(a)	Lp(a)	350-700	Variable	6		
B-100	VLDL, IDL, LDL	512.7	4536	2	1.5-1.8	80-100
B-48	CM	240.8	2152	2	<0.2	<5
C-I	CM, LDL	6.6	57	19	6.1-10.8	4-7
C-II	CM, LDL	8.9	78 or 79	19	3.4-9.1	3-8
C-III	CM	8.8	79	11	9.1-17.1	8-15
D	HDL	19	169	3		
E	CM, LDL, IDL	34.1	299	19	0.8-1.6	3-6
F	HDL, LDL, VLDL	29	162	12		8.35
H	VLDL	50	326	17		20
J	HDL	80	449	8		
L	HDL	39-42	383	22	Not present in plasma	
M	HDL, LDL, VLDL, CM	26	188	6		2-15
0	HDL, LDL, VLDL	22.3	198	X		

CM, Chylomicron; *HDL,* high-density lipoprotein; *IDL,* intermediate-density lipoprotein; *LDL,* low-density lipoprotein; *Lp(a),* lipoprotein A; *VLDL,* very-low-density lipoprotein.
*Relative molecular mass.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Low to high persistent elevation in chronic HDV (depends on degree of cell injury and sensitivity of the assay).
HDV-Ab (total): High elevation in acute HDV; does not persist.
High persistent elevation in chronic HDV.

HDV-AG

Detected by DNA probe, less often by immunoassay
Appearance: Prodromal stage (before symptoms); just at or after initial rise in ALT (about a wk after appearance of HB_SAg and about the time HB_CAb-IgM level begins to rise)
Peak: 2 to 3 days after onset
Becomes nondetectable: 1 to 4 days (may persist until shortly after symptoms appear)

HDV-AB (IgM)

Appearance: About 10 days after symptoms begin (range, 1 to 28 days)
Peak: About 2 wk after first detection
Becomes nondetectable: About 35 days (range, 10 to 80 days) after first detection (most other IgM antibodies take 3 to 6 mo to become nondetectable)

HDV-AB (total)

Appearance: About 50 days after symptoms begin (range, 14 to 80 days); about 5 wk after HDV-Ag (range, 3 to 11 wk)
Peak: About 2 wk after first detection
Becomes nondetectable: About 7 mo after first detection (range, 4 to 14 mo)

HER-2/*NEU*

Normal: Negative
Present in: 25% to 30% of primary breast cancers. It can also be found in other epithelial tumors, including lung, hepatocellular, pancreatic, colon, stomach, ovarian, cervical, and bladder cancer. Trastuzumab (Herceptin) is a humanized monoclonal antibody against Her-2/*neu*. This test is useful to identify patients with metastatic; recurrent; and/or treatment-refractory, unresectable, locally advanced breast cancer for trastuzumab treatment.

HERPES SIMPLEX VIRUS (HSV)

Test description: The PCR test can be performed on serum biopsy samples, CSF, vitreous humor.

HFE SCREEN FOR HEREDITARY HEMOCHROMATOSIS

Test description: PCR test can be performed on whole blood or tissue. One mutation (C282Y) and two polymorphisms (H63D, S65C) account for the majority of alleles associated with this disease.

HETEROPHIL ANTIBODY

Normal: Negative
Positive in: Infectious mononucleosis

HIGH-DENSITY LIPOPROTEIN (HDL) CHOLESTEROL

Normal range:
Male: 40 to 70 mg/dl (0.8 to 1.8 mmol/L [CF: 0.02586; SMI: 0.05 mmol/L])
Female: 50 to 90 mg/dl (1.1 to 2.35 mmol/L [CF: 0.02586; SMI: 0.05 mmol/L])
Increased in: Use of gemfibrozil, statins, fenofibrate, nicotinic acid, estrogens, regular aerobic exercise, small (1 oz) daily alcohol intake
Decreased in: Deficiency of apoproteins, liver disease, probucol ingestion, Tangier disease
NOTE: A cholesterol/HDL ratio >4.0 is associated with increased risk of coronary artery disease. Table 55 summarizes significant human apolipoproteins.

HLA ANTIGENS

Associated disorders: See Table 56

HOMOCYSTEINE (plasma)

Normal range:

0-30 yr:	4.6-8.1 µmol/L
30-59 yr:	6.3-11.2 µmol/L (males), 4.5-7.9 µmol/L (females)
>59 yr:	5.8-11.9 µmol/L

Increased: Thrombophilic states, B_6, B_{12}, folic acid, riboflavin deficiency, pregnancy, homocystinuria
NOTE: An increased homocysteine level is an independent risk factor for atherosclerosis.

HUMAN CHORIONIC GONADOTROPIN (hCG)

Normal range: Varies with gestational stage:

TABLE 56 HLA Antigens Associated with Specific Diseases

Antigen	Condition	Antigen	Condition
HLA-B27	Ankylosing spondylitis	HLA-B8, Dw3	Celiac disease
	Reiter syndrome	HLA-B8, Dw3	Dermatitis herpetiformis
	Psoriatic arthritis	HLA-B8	Myasthenia gravis
HLA-A10, B18, Dw2	C2 deficiency	HLA-B8	Chronic active hepatitis in children
HLA-A2, B40, Cw3	C4 deficiency	HLA-Drw4	Active chronic hepatitis in adults
HLA-B7, Dw2	Multiple sclerosis	HLA-B13, Bw17	Psoriasis
HLA-A3	Hemochromatosis		

HLA, Human leukocyte antigen.
From Cerra FB: *Manual of critical care,* St Louis, 1987, Mosby.

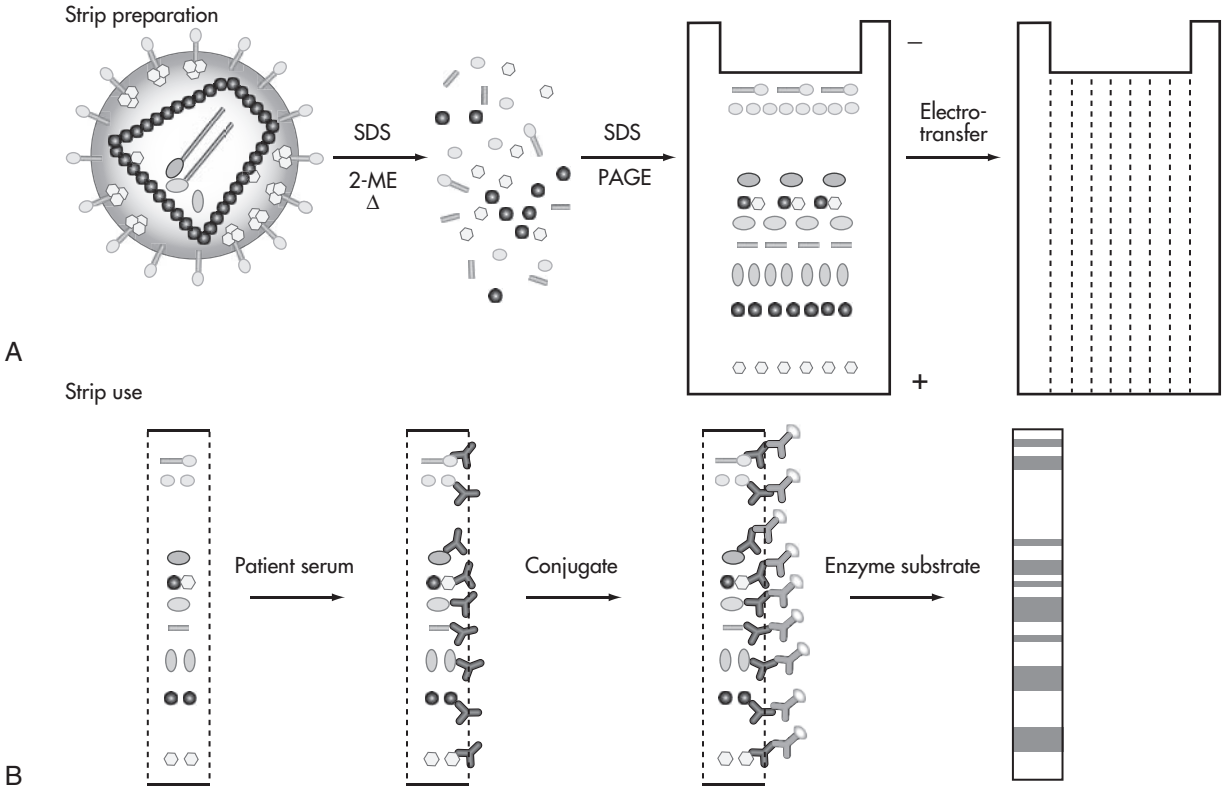

FIG. 31 Human immunodeficiency virus *(HIV)* Western blot. A, Western blot strips are prepared with purified HIV virions that are disrupted with ionic detergent and reducing agent, subjected to sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE), and electrotransferred to solid strips, typically of nitrocellulose. **B,** Strips are sequentially incubated with patient sample (serum, plasma, saliva, or urine); enzyme-conjugated antihuman IgG; and enzyme substrate. The positions of enzymes bound identify the presence of antibody to individual HIV proteins. (From Bennett JE et al: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases,* ed 8, Philadelphia, 2015, WB Saunders.)

1 wk:	5-50 mU/ml
1-2 wk:	50-550 mU/ml
2-3 wk:	up to 5000 mU/ml
3-4 wk:	up to 10,000 mU/ml
4-5 wk:	up to 50,000 mU/ml
2-3 mo:	10,000-100,000 mU/ml

Elevated in: Normal pregnancy, hydatidiform mole, choriocarcinoma, germ cell tumors of testicle, some nontrophoblastic neoplasms (e.g., neoplasms of cervix, gastrointestinal tract, ovary, lung, breast)

HUMAN HERPES VIRUS 8 (HHV8)

Test description: PCR test can be performed on whole blood, tissue, bone marrow, and urine. HHV8 is found in all forms of Kaposi sarcoma.

HUMAN IMMUNODEFICIENCY VIRUS ANTIBODY, TYPE 1 (HIV-1)

Normal range: Not detected
Abnormal result: HIV antibodies usually appear in the blood 1 to 4 mo after infection.
Testing sequence:
ELISA is the recommended initial screening test. Sensitivity and specificity are >99%. False-positive ELISA may occur with autoimmune disorders, administration of immune globulin manufactured before 1985, within 6 wk of testing, in the presence of rheumatoid factor, in the presence of DLA-DR antibodies in multigravida female, with administration of influenza vaccine within 3 mo of testing, with hemodialysis, with positive plasma reagin test, and with certain medical disorders (hemophilia, hypergammaglobulinemia, alcoholic hepatitis).
A positive ELISA is confirmed with Western blot (Fig. 31). False-positive Western blot may result from connective tissue disorders, human

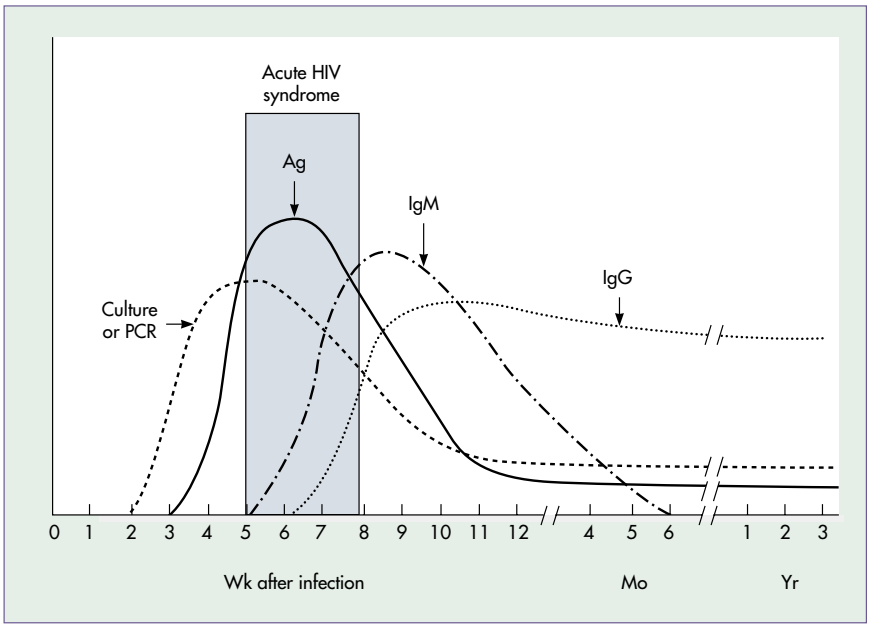

FIG. 32 Tests in human immunodeficiency virus *(HIV)*-1 infection. *Ag,* Antigen; *Ig,* immunoglobulin; *PCR,* polymerase chain reaction. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

leukocyte antigen antibodies, polyclonal gammopathies, hyperbilirubinemia, presence of antibody to another human retrovirus, or cross-reaction with other non–virus-derived proteins in healthy persons. Undetermined Western blot may occur in AIDS patients with advanced immunodeficiency (caused by loss of antibodies) and in recent HIV infections.

PCR is used to confirm indeterminate Western blot results or negative results in persons with suspected HIV infection.

Fig. 32 describes tests in HIV infection; indications for plasma HIV RNA testing are described in Table 57.

HUMAN IMMUNODEFICIENCY VIRUS TYPE 1 (HIV-1) Antigen (p24), Qualitative (p24 antigen)

Normal range: Negative. This test detects uncomplexed HIV-1 p24 antigen. The core protein p24 is the first detectable protein encoded by the group-specific antigen *(gag)* gene. This protein is a marker for viremia. This test should not be used in place of HIV-1 antibody testing as a screen for HIV-1 infection. HIV-1 p24 may be detectable in the first mo of acute HIV-1 infection and generally falls to undetectable levels during the asymptomatic stage of HIV-1 infection. A negative result does not exclude the possibility of infection or exposure to HIV-1. It is recommended that a negative result be followed with repeat testing at least 8 wk after the original test. This test is used primarily for screening of donated blood and plasma and as an aid for the prognosis of HIV-1 infection.

HUMAN IMMUNODEFICIENCY VIRUS TYPE 1 (HIV-1) VIRAL LOAD

Normal range: HIV-1 RNA, quant. bDNA 3: Less than 50 copies/ml or less than 1.7 log copies/ml

This test should be used only in individuals with documented HIV-1 infection for monitoring the progression of infection, response to antiretroviral therapy, and disease prognosis. It is not indicated for diagnosis of HIV infection.

HUMAN PAPILLOMA VIRUS (HPV)

Test description: PCR test can be performed on cervical smears, biopsies, scrapings, liquid cytology specimen, and anogenital tissues.

HUNTINGTON DISEASE PCR

Test description: PCR can be performed on whole blood. Huntington disease is caused by the expansion of the trinucleotide repeat cytosine-adenine-guanine (CAG) within IT 15 (huntingtin). Pre- and post-test counseling should be performed when ordering this test.

TABLE 57 Indications for Plasma HIV RNA Testing*

Clinical Indication	Information	Use
Syndrome consistent with acute HIV infection	Establishes diagnosis when HIV antibody test is negative or indeterminate	Diagnosis†
Initial evaluation of newly diagnosed HIV infection	Baseline viral load set point	Decision to start or defer therapy
Every 3-4 mo in patients not on therapy	Changes in viral load	Decision to start therapy
4-8 wk after initiation of antiretroviral therapy	Initial assessment of drug efficacy	Decision to continue or change therapy
3-4 mo after start of therapy	Maximal effect of therapy	Decision to continue or change therapy
Every 3-4 mo in patients on therapy	Durability of antiretroviral effect	Decision to continue or change therapy
Clinical event or significant decline in CD4+ T cells	Association with changing or stable	Decision to continue, initiate, or change

*Acute illness (e.g., bacterial pneumonia, tuberculosis, herpes simplex virus [HSV], *Pneumocystis carinii pneumonia* [PCP]) and immunizations can cause increase in plasma HIV RNA for 2-4 wk; viral load testing should not be performed during this time. Plasma HIV RNA results should usually be verified with a repeat determination before starting or making changes in therapy. HIV RNA should be measured using the same laboratory and the same assay.

†Diagnosis of HIV infection determined by HIV RNA testing should be confirmed by standard methods (e.g., Western blot serology) performed 2-4 mo after the initial indeterminate or negative test.

HIV, Human immunodeficiency virus; *RNA,* ribonucleic acid.

From Report of the NIH Panel to Define Principles of Therapy of HIV Infection, *MMWR Recomm Rep* 47(RR-5):1-41, 1998.

HYDROGEN BREATH TEST

IMMUNE COMPLEX ASSAY

Normal: Negative
Detected in: Collagen vascular disorders, glomerulonephritis, neoplastic diseases, malaria, primary biliary cirrhosis, chronic acute hepatitis, bacterial endocarditis, vasculitis

IMMUNOGLOBULINS

Normal range:
IgA: 50-350 mg/dl (0.5-3.5 g/L [CF: 0.01; SMI: 0.01 g/L])
IgD: <6 mg/dl (<60 mg/L [CF: 0.01; SMI: 0.01 g/L])
IgE: <25 μg/dl (<0.00025 g/L [CF: 0.01; SMI: 0.01 g/L])
IgG: 800-1500 mg/dl (8-15 g/L [CF: 0.01; SMI: 0.01 g/L])
IgM: 45-150 mg/dl (0.45-1.5 g/L [CF: 0.01; SMI: 0.01 g/L])

Table 58 summarizes biologic properties of human immunoglobulin isotopes. Box 18 summarizes selected conditions associated with monoclonal immunoglobulins. Disease states associated with polyclonal hyperimmunoglobulinemia are described in Table 59.

Elevated in:
IgA: Lymphoproliferative disorders, Berger nephropathy, chronic infections, autoimmune disorders, liver disease
IgE: Allergic disorders, parasitic infections, immunologic disorders, IgE myeloma (see Box 19 for summary of nonallergic diseases associated with high levels of IgE. Box 20 summarizes conditions with very high IgE levels)
IgG: Chronic granulomatous infections, infectious diseases, inflammation, myeloma, liver disease
IgM: Primary biliary cirrhosis, infectious diseases (brucellosis, malaria), Waldenström macroglobulinemia, liver disease

Decreased in:
IgA: Nephrotic syndrome, protein-losing enteropathy, congenital deficiency, lymphocytic leukemia, ataxia-telangiectasia, chronic sinopulmonary disease
IgE: Hypogammaglobulinemia, neoplasms (breast, bronchial, cervical), ataxia-telangiectasia, primary biliary cirrhosis (see Box 19)
IgG: Congenital or acquired deficiency, lymphocytic leukemia, phenytoin, methylprednisolone, nephrotic syndrome, protein-losing enteropathy
IgM: Congenital deficiency, lymphocytic leukemia, nephrotic syndrome

INDIRECT ANTIGLOBULIN (Coombs Indirect)

Normal: Negative
Positive: Acquired hemolytic anemia, incompatible cross-matched blood, anti-Rh antibodies, drugs (methyldopa, mefenamic acid, levodopa)

BOX 18 Selected Conditions Associated with Monoclonal Immunoglobulins

- Multiple myeloma
- Macroglobulinemia of Waldenström
- Chronic lymphocytic leukemia
- Other leukemias
- Lymphomas
- "Benign" monoclonal gammopathy
- Systemic capillary leak syndrome
- Amyloidosis
- Chronic liver disease such as chronic active hepatitis, primary biliary cirrhosis
- Autoimmune disorders, including rheumatoid arthritis, systemic lupus erythematosus, thyroiditis, pernicious anemia, polyarteritis nodosa, Sjögren syndrome
- Gaucher disease
- Malignancies of various types
- Hereditary spherocytosis
- HIV infection, including AIDS

AIDS, Acquired immune deficiency syndrome; *HIV,* human immunodeficiency virus.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Fig. 33 illustrates the mechanism of Coombs test.

INFLUENZA A AND B TESTS

Test description: PCR can be performed on nasopharyngeal swab, wash, or aspirate
Normal: Negative

INSULIN AUTOANTIBODIES

Normal: Negative
Present in: Exogenous insulin from insulin therapy. The presence of islet cell antibodies indicates ongoing beta cell destruction. This test is useful in the early diagnosis of type 1a diabetes mellitus and in the identification of patients at high risk for type 1a diabetes.

INSULIN, FREE

Normal: <17 mcU/ml
Elevated in: Insulin overdose, insulin resistance syndromes, endogenous hyperinsulinemia

TABLE 59 Polyclonal Hyperimmunoglobulinemias: Some Associated Disease States

Condition	Immunoglobulin (Ig) Classes
Immunodeficiency Diseases	
Hyperimmunoglobulin E and recurrent infections	IgE
Wiskott-Aldrich syndrome	IgA, IgE
"Dysgammaglobulinemia type I"	IgM
Hyperimmunoglobulin A and recurrent infections	IgA
Acquired immune deficiency syndrome (AIDS)	All classes
Infections	
Congenital infections (syphilis, toxoplasmosis, rubella, cytomegalovirus)	IgM
Infectious mononucleosis	IgM or all
Trypanosomiasis	IgM or all
Intestinal parasitism	All classes
Several helminthic infections	IgE
Visceral larva migrans	All classes
Chronic granulomatous disease of childhood	All classes
Leprosy	All classes
Chronic infection in general	All classes, with a preference for IgG
Liver Diseases	
Chronic active hepatitis	IgG predominates
Acute hepatitis	IgG predominates
Biliary cirrhosis	IgM predominates
Lupoid hepatitis	All classes
Pulmonary Disorders	
Pulmonary hypersensitivity syndrome	All classes
Sarcoidosis	All classes
Berylliosis	All classes
"Autoimmune" Disorders	
Systemic lupus erythematosus	All classes
Rheumatoid arthritis	IgA or all
Many "autoimmune" states such as thyroiditis	All classes
Scleroderma	All classes
Cold agglutinin disease	IgM
Anaphylactoid purpura	IgA
Miscellaneous	
Down syndrome	All classes
Amyloidosis	All classes
Narcotic addiction	IgM
Renal tubular disease	All classes

McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods,* ed 23, St Louis, 2017, Elsevier.

Decreased in: Inadequately treated type 1 diabetes mellitus

INSULIN-LIKE GROWTH FACTOR-1 (IGF-1) (Serum)

Normal range:

Ages 16-24:	182-780 ng/ml
Ages 25-39:	114-492 ng/ml
Ages 40-54:	90-360 ng/ml
Ages >55:	71-290 ng/ml

BOX 19 Nonallergic Diseases Associated with Altered Total Serum Immunoglobulin E Levels

Increased Levels (≥500 IU/ml)

Parasitic Diseases
Ascariasis
Visceral larva migrans
Capillariasis
Paragonimiasis
Fascioliasis
Schistosomiasis
Hookworm
Trichinosis
Filariasis
Strongyloidiasis
Echinococcosis
Onchocerciasis
Malaria

Infections
Allergic bronchopulmonary mycosis
Systemic candidiasis
Coccidioidomycosis
Leprosy
Epstein-Barr virus mononucleosis
Cytomegalovirus mononucleosis
Viral respiratory infections
Human immunodeficiency virus (HIV) type 1 infections
Pertussis

Cutaneous Diseases
Alopecia areata
Bullous pemphigoid
Chronic acral dermatitis
Streptococcal erythema nodosum

Other Diseases and Disorders
Nephrotic syndrome
Drug-induced interstitial nephritis
Liver disease
Cystic fibrosis
Kawasaki disease
Infantile polyarteritis nodosa
Primary pulmonary hemosiderosis
Guillain-Barré syndrome
Burns
Rheumatoid arthritis
Bone marrow transplantation
Cigarette smoking
Alcoholism

Neoplastic Diseases
Hodgkin disease
Immunoglobulin E (IgE) myeloma
Bronchial carcinoma

Immunodeficiency Diseases
Wiskott-Aldrich syndrome
Hyper-IgE syndrome
Thymic hypoplasia (DiGeorge syndrome)
Cellular immunodeficiency with immunoglobulins (Nezelof syndrome)
Selective IgA deficiency

Medications
Enfuvirtide
Pholcodine

Decreased Levels (<5 IU/ml)
Familial IgE deficiency and recurrent sinopulmonary infections
Human T cell lymphotropic virus type 1 infections
Primary biliary cirrhosis

From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, WB Saunders.

Elevated in: Adolescence, acromegaly, pregnancy, precocious puberty, obesity
Decreased in: Malnutrition, delayed puberty, diabetes mellitus, hypopituitarism, cirrhosis, old age

INSULIN-LIKE GROWTH FACTOR-II

Normal range: 288 to 736 ng/ml
Elevated in: Hypoglycemia associated with non-islet cell tumors, hepatoma, and Wilms tumor
Decreased in: Growth hormone deficiency

INTERNATIONAL NORMALIZED RATIO (INR)

The INR is a comparative rating of prothrombin time (PT) ratios. The INR represents the observed PT ratio adjusted by the International Reference Thromboplastin. It provides a universal result indicative of what the patient's PT result would have been if measured using the primary World Health Organization International Reference reagent. For proper interpretation of INR values, the patient should be on stable anticoagulant therapy.

BOX 20 Conditions Associated with Unusually High Serum Immunoglobulin E Concentrations (≥500 IU/ml)

Allergic bronchopulmonary mycosis
Allergic fungal sinusitis
Atopic dermatitis
Human immunodeficiency virus (HIV) infection
Hyperimmunoglobulin E (hyper-IgE) syndrome
Immunoglobulin E myeloma
Kimura disease
Lymphoma
Netherton syndrome
Systemic helminthic parasitosis
Tuberculosis

From Adkinson NF et al: *Middleton's allergy principles and practice*, ed 8, Philadelphia, 2014, WB Saunders.

RECOMMENDED INR RANGES

Proximal deep vein thrombosis:	2-3
Pulmonary embolism:	2-3
Transient ischemic attacks:	2-3
Atrial fibrillation:	2-3
Mechanical prosthetic valves:	2.5-3.5
Recurrent venous thromboembolic disease:	2.5-3.5

INTRINSIC FACTOR ANTIBODIES

Normal: Negative
Present in: Pernicious anemia (>50% of patients). Cyanocobalamin may give false-positive results.

IRON (Serum)

Normal: Male: 65 to 175 mcg/dl; female: 50 to 1170 mcg/dl
Elevated in: Hemochromatosis, excessive iron therapy, repeated transfusions, lead poisoning, hemolytic anemia, aplastic anemia, pernicious anemia
Decreased in: Iron deficiency anemia, hypothyroidism, chronic infection

IRON-BINDING CAPACITY, TOTAL (TIBC)

Normal range: 250 to 460 μg/dl (45 to 82 μmol/L [CF: 0.1791; SMI: 1 μmol/L])
Elevated in: Iron deficiency anemia, pregnancy, polycythemia, hepatitis, weight loss
Decreased in: Anemia of chronic disease, hemochromatosis, chronic liver disease, hemolytic anemias, malnutrition (protein depletion)
Table 60 describes TIBC and serum iron abnormalities.

IRON SATURATION (% Transferrin Saturation)

Normal:
Male: 20% to 50%
Female: 15% to 50%
Elevated in: Hemochromatosis, excessive iron intake, aplastic anemia, thalassemia, vitamin B_6 deficiency
Decreased in: Hypochromic anemias, GI malignancy

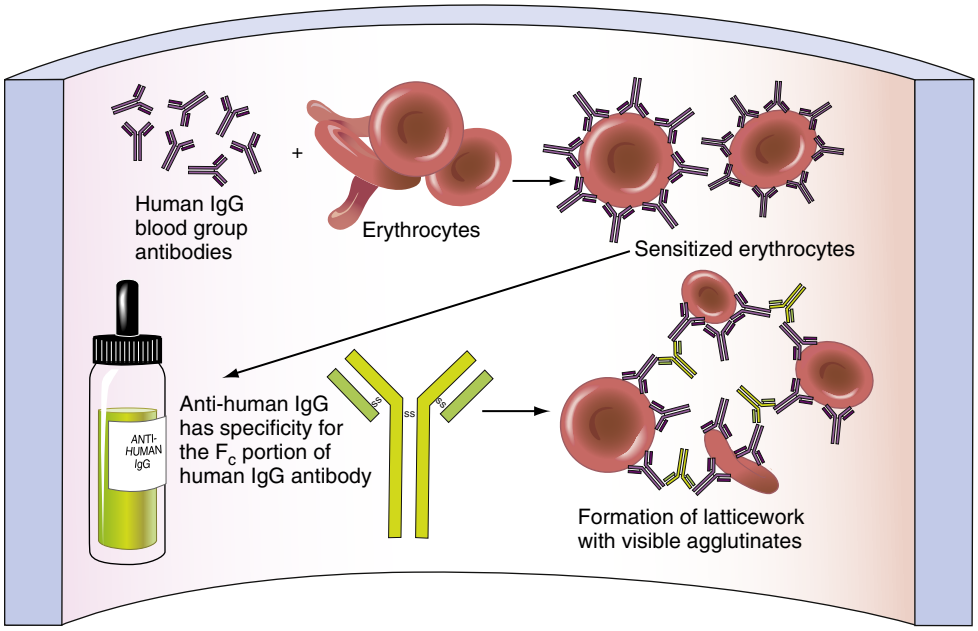

FIG. 33 Antihuman globulin antibodies form a bridge between adjacent erythrocytes sensitized with human immunoglobulin *(Ig)*G or complement components. (From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.)

TABLE 60 Serum Iron and Total Iron-Binding Capacity Patterns

SI↓	TIBC↓	Chronic diseases; uremia
SI↓	TIBC↑	Chronic iron deficiency anemia; pregnancy in third trimester
SI↑	TIBC↓	Hemochromatosis iron therapy overload (TIBC may be normal); hemolytic anemia; thalassemia; lead poisoning; megaloblastic anemia; aplastic, pyridoxine deficiency, or other sideroblastic anemias
SI↑	TIBC↑	Oral contraceptives; acute hepatitis (some report TIBC is low normal); chronic hepatitis (some patients)
SI↑	TIBCNL	B_{12} or folate deficiency
SI↓	TIBCNL	Chronic iron deficiency (some patients); acute infection, surgery, tissue damage
SI NL	TIBC↑	B_{12}/folate deficiency plus iron deficiency

NL, Normal; *SI,* serum iron; *TIBC,* total iron-binding capacity.
From Ravel R: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

LACTATE (blood)

Normal range: 0.5 to 2.0 mEq/L
Elevated in: Tissue hypoxia (shock, respiratory failure, severe CHF, severe anemia, carbon monoxide or cyanide poisoning), systemic disorders (liver or renal failure, seizures), abnormal intestinal flora (d-lactic acidosis), drugs or toxins (salicylates, ethanol, methanol, ethylene glycol), G6PD deficiency

LACTATE DEHYDROGENASE (LDH)

Normal range: 50 to 150 U/L (0.82 to 2.66 μkat/L [CF: 0.01667; SMI: 0.02 μkat/L])
Elevated in: Infarction of myocardium, lung, kidney
Diseases of cardiopulmonary system, liver, collagen, central nervous system
Hemolytic anemias, megaloblastic anemias, transfusions, seizures, muscle trauma, muscular dystrophy, acute pancreatitis, hypotension, shock, infectious mononucleosis, inflammation, neoplasia, intestinal obstruction, hypothyroidism

LACTATE DEHYDROGENASE ISOENZYMES

Normal range:
LDH_1: 22%-36% (cardiac, red blood cell) (0.22-0.36 [CF: 0.01, SMI: 0.01])
LDH_2: 35%-46% (cardiac, red blood cell) (0.35-0.46)
LDH_3: 13%-26% (pulmonary) (0.15-0.26)
LDH_4: 3%-10% (striated muscle, liver) (0.03-0.1)
LDH_5: 2%-9% (striated muscle, liver) (0.02-0.09)

Normal ratios:
c. LDH_1<LDH_2
d. LDH_5<LDH_4
Abnormal values:
LDH1 >LDH2: Myocardial infarction (can also be seen with hemolytic anemias, pernicious anemia, folate deficiency, renal infarct)
LDH5 >LDH4: Liver disease (cirrhosis, hepatitis, hepatic congestion)

LACTOSE TOLERANCE TEST (serum)

Normal: Test is performed by giving 2 g/kg body weight lactose orally and drawing glucose level at 0, 30, 45, 60, and 90 min. Normal response is change in glucose from fasting value to >30 mg/dl. Inconclusive response is increase of 20-30 mg/dl, abnormal response is increase <20 mg/dl. Table 61 summarizes laboratory tests in the differential diagnosis of diarrhea.
Abnormal in: Lactase deficiency

LAP SCORE

See LEUKOCYTE ALKALINE PHOSPHATASE

LEAD

Normal: Child, <10 mcg/dl; adult, <25 mcg/dl; acceptable for industrial exposure, <50 mcg/dl
Elevated in: Lead exposure, lead poisoning

LDH

See LACTATE DEHYDROGENASE

LDL

See LOW-DENSITY LIPOPROTEIN CHOLESTEROL

LEGIONELLA PNEUMOPHILA PCR

Test description: PCR can be performed on lung tissue, water sputum, bronchoalveolar lavage, and other respiratory fluids.

LEGIONELLA TITER

Normal: Negative
Positive in: Legionnaires disease (presumptive: ≥1:256 titer; definitive: fourfold titer increase to ≥1:128)

LEUKOCYTE ALKALINE PHOSPHATASE (LAP)

Normal range: 13 to 100 (33 to 188 U)
Elevated in: Leukemoid reactions, neutrophilia secondary to infections (except in sickle cell crisis—no significant increase in LAP score), Hodgkin disease, polycythemia vera, hairy cell leukemia, aplastic anemia, Down syndrome, myelofibrosis
Decreased in: Acute and chronic granulocytic leukemia, thrombocytopenic purpura, paroxysmal nocturnal hemoglobinuria, hypophosphatemia, collagen disorders

LEUKOCYTE COUNT

See COMPLETE BLOOD COUNT

LIPASE

Normal range: 0 to 160 U/L (0 to 2.66 μkat/L [CF: 0.01667; SMI: 0.02 μkat/L])
Elevated in: Acute pancreatitis, perforated peptic ulcer, carcinoma of pancreas (early stage), pancreatic duct obstruction, bowel infarction, intestinal obstruction

LIPOPROTEIN(a)

Normal: Male: 1.35 to 19.6 mg/dl; female: 1.24 to 20.1 mg/dl. Fig. 34 illustrates lipoprotein structure. Table 62 summarizes the major classes of human plasma lipoproteins. The chemical composition of major classes of plasma lipoproteins is described in Table 63.
Elevated in: Coronary artery disease, uncontrolled diabetes, hypothyroidism, chronic renal failure, pregnancy, tobacco use, infections, nephritic syndrome
Decreased in: Niacin, omega-3 fatty acids, estrogens, tamoxifen, statins

LIPOPROTEIN CHOLESTEROL, HIGH-DENSITY

See HIGH-DENSITY LIPOPROTEIN CHOLESTEROL

TABLE 61 Laboratory Tests in the Differential Diagnosis of Diarrhea

Test	Method	Use
Initial Screening Tests		
Fecal leukocytes	Wright stain or methylene blue	Identify inflammatory diarrhea
Fecal occult blood test	Immunochemical	Detect blood
Fecal osmotic gap	290 − 2 × (fecal $Na^+ + K^+$)	Distinguish secretory vs. osmotic diarrhea
Stool alkalinization	Color change after adding NaOH to stool/urine	Phenolphthalein laxative ingestion
Infectious Causes		
Stool bacterial culture	Routine culture and sensitivity	Identify *Shigella, Salmonella*
Stool special culture	Specialized culture and serotyping	Identify *E. coli* 0157:H7, *Yersinia*, *Campylobacter*
Stool *C. difficile* toxin assay	EIA for toxins A and B	Pseudomembranous colitis
HIV serology	EIA, Western blot	HIV enteritis
Stool rotavirus screen	EIA for antigen	Rotavirus enteritis
Stool ova and parasites	Concentration and stains	Enteric parasitic infection
Stool mycobacteria	Acid-fast stain, culture and sensitivity, PCR	*Mycobacterium*, antibiotic selection
Stool *E. histolytica* Ag	EIA for antigen	*Entamoeba histolytica*
Stool *Giardia* Ag	EIA for antigen	*Giardia lamblia*
Stool *Cryptosporidium* Ag	EIA for antigen	*Cryptosporidium parvum*
Endocrine Causes		
Urine 5-HIAA or blood serotonin	HPLC	Carcinoid syndrome
Serum VIP	RIA	VIPoma
Serum TSH, free T4	Immunoassay	Hyperthyroidism
Serum gastrin	RIA	Zollinger-Ellison syndrome
Serum calcitonin	RIA	Hypocalcemia-related diarrhea
Serum somatostatin	RIA	Somatostatinoma
Malabsorption		
Lactose tolerance test	See text	Lactase deficiency
Stool reducing sugars	Clinitest tablets	Carbohydrate intolerance
Sweat chloride	See text	Cystic fibrosis
D-Xylose absorption test	See text	Evaluate pancreatic and jejunal function
Fecal fat stain	Fat stain	Lipid malabsorption
Serum carotene	Spectrophotometry	Lipid malabsorption
^{14}C-glyceryl trioleate test malabsorption	See text	Lipid malabsorption
Serum IgA	Nephelometry	Rule out IgA deficiency
Antitissue transglutaminase antibody	EIA	Celiac disease
Hydrogen breath test	Electrochemical hydrogen monitorinomatography g	Carbohydrate malabsorption
Bacterial colony count	Small bowel aspirate and quantitative culture	Bacterial overgrowth
Other		
Serum ionized calcium	Ion-specific electrode	Hypocalcemia-related diarrhea
Serum protein and albumin	Nephelometry, photometry	IBD, protein-losing enteropathy
Stool alpha-1-antitrypsin	Nephelometry	Protein-losing enteropathy
Quantitative immunoglobulins	Nephelometry	Agammaglobulinemia
7α-Hydroxy-4-cholestin-3-one	HPLC	Bile salt malabsorption
Fecal elastase or pancreolauryl test	EIA	Pancreatic insufficiency
Intestinal biopsy	Endoscopic or open biopsy	Whipple disease, MAI, abetalipoproteinemia, neoplasia, lymphoma, amyloidosis, eosinophilic gastroenteritis, agammaglobulinemia, intestinal lymphangiectasia, Crohn disease, tuberculosis, graft-versus-host disease, *Giardia*, other parasitic infections, collagenous colitis, microscopic colitis
Extraintestinal causes	See text	Hyperthyroidism, diabetes, hypoparathyroidism, adrenal cortical insufficiency, hormone-secreting tumors

5-HIAA, 5-Hydroxyindoleacetic acid; *Ab*, antibody; *Ag*, antigen; *EIA*, enzyme immunoassay; *HIV*, human immunodeficiency virus; *HPLC*, high-performance liquid chromatography; *IBD*, inflammatory bowel disease; *Ig*, immunoglobulin; *MAI, Mycobacterium avium-intracellulare*; *PCR*, polymerase chain reaction; *RIA*, radioimmunoassay; *T4*, thyroxine; *TSH*, thyroid-stimulating hormone; *VIP*, vasoactive intestinal peptide; *VIPoma*, vasoactive intestinal peptide tumor.

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

LIPOPROTEIN CHOLESTEROL, LOW-DENSITY

See LOW-DENSITY LIPOPROTEIN CHOLESTEROL

LIVER KIDNEY MICROSOME TYPE 1 ANTIBODIES (LKM1)

Normal: <20 U

Elevated in: Autoimmune hepatitis type 2

LKM1

See LIVER KIDNEY MICROSOME TYPE 1 ANTIBODIES

LOW-DENSITY LIPOPROTEIN (LDL) CHOLESTEROL

Normal range: 50 to 130 mg/dl (1.30 to 1.68 mmol/L [CF: 0.02586; SMI: 0.05 mmol/L]). Fig. 35 illustrates the LDL receptor pathway and regulation of cholesterol metabolism.

<70	Optimal in diabetics, prior MI, and patients with cardiac risk factors
100-129	Near or above optimal
130-159	Borderline high
160-189	High
≥190	Very high

LUPUS ANTICOAGULANT

See CIRCULATING ANTICOAGULANT

LUTEINIZING HORMONE

Normal range: 5-25 mIU/ml
Elevated in: Postmenopause, pituitary adenoma, primary gonadal dysfunction, polycystic ovary syndrome
Decreased in: Severe illness, anorexia nervosa, malnutrition, pituitary or hypothalamic impairment, severe stress

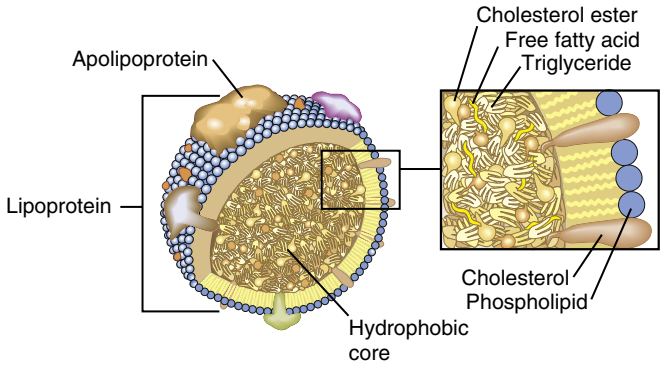

FIG. 34 Lipoprotein structure. Lipoproteins are spherical particles with a hydrophobic core and an amphiphilic surface. The surface consists of a single layer of phospholipids. This surface layer also contains proteins and free cholesterol. The hydrophobic core mainly contains triglycerides and cholesterol esters (From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.)

LYME DISEASE ANTIBODY TITER

Normal range: Negative
Positive result: Fig. 36 illustrates the usual serologic response in Lyme disease.

A serologic test is not necessary or helpful for several days after a tick bite because it is only 40% to 50% sensitive in this stage, and a negative test does not rule out the diagnosis.

LYMPHOCYTES

Normal range:
15% to 40%
Total lymphocyte count = 800-2600/mm3
Total T lymphocyte = 800-2200/mm3
CD4 lymphocytes = ≥ 400/mm3
CD8 lymphocytes = 200 to 800/mm3
Normal CD4/CD8 ratio is 2.0.
Elevated in: Chronic infections, infectious mononucleosis and other viral infections, chronic lymphocytic leukemia, Hodgkin disease, ulcerative colitis, hypoadrenalism, idiopathic thrombocytopenia
Decreased in:
AIDS, bone marrow suppression from chemotherapeutic agents or chemotherapy, aplastic anemia, neoplasms, steroids, adrenocortical hyperfunction, neurologic disorders (multiple sclerosis, myasthenia gravis, Guillain-Barré syndrome)
CD4 lymphocytes are calculated as total white blood cells × % lymphocytes × % lymphocytes stained with CD4. They are decreased in AIDS and other immune dysfunction.
Table 64 describes various lymphocyte abnormalities in peripheral blood.
Box 21 summarizes key causes of lymphocytopenia.

TABLE 62 Major Classes of Human Plasma Lipoproteins: Physicochemical Characteristics

Particle	Electrophoretic Mobility*	Major Apolipoproteins	Diameter (Å)	Density (kg/L)	Sf†
Chylomicrons	Origin	ApoA-I, A-IV, B-48, C-I, C-II, C-III, E	750-12,000	<0.95	>400
VLDL	Pre-β	ApoB-100, C-I, C-II, C-III, E	300-700	0.95-1.006	20-400
IDL	β or pre-β	ApoB-100, E1.006-1.019	12-20		
LDL	B	ApoB-100	180-300	1.019-1.063	0-12
HDL_2	A	ApoA-I, A-II, E	50-120	1.063-1.125	
HDL_3	A	ApoA-II, A-I, E	50-120	1.125-1.210	
Lp(a)	Pre-β	ApoB-100, Apo(a)		1.045-1.080	

HDL_2, Ultracentrifugation subclass of high-density lipoprotein; *HDL_3*, ultracentrifugation subclass of high-density lipoprotein; *IDL*, intermediate-density lipoprotein; *LDL*, low-density lipoprotein; *Lp(a)*, lipoprotein A; *VLDL*, very-low-density lipoprotein.
*Agarose gel electrophoresis.
†Svedberg flotation rate.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 63 Chemical Composition of Major Classes of Plasma Lipoproteins

	Protein (%)*	Free Cholesterol (%)	Cholesterol Esters (%)	Triglyceride (%)	Phospholipid (%)
Chylomicrons	1-2	1-3	2-4	80-95	3-6
VLDL	6-10	4-8	16-22	45-65	15-20
IDL	Intermediate between VLDL and LDL				
LDL	18-22	6-8	45-50	4-8	18-24
HDL	45-55	3-5	15-20	2-7	26-32

HDL, High-density lipoprotein; *IDL*, intermediate-density lipoprotein; *LDL*, low-density lipoprotein; *VLDL*, very-low-density lipoprotein.
*Percentage of dry weight.
McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.
Data from Albers (1974), Gaubatz et al (1983), Fless et al (1984), Gotto et al (1986), Gries et al (1988), and Hegele (2009).

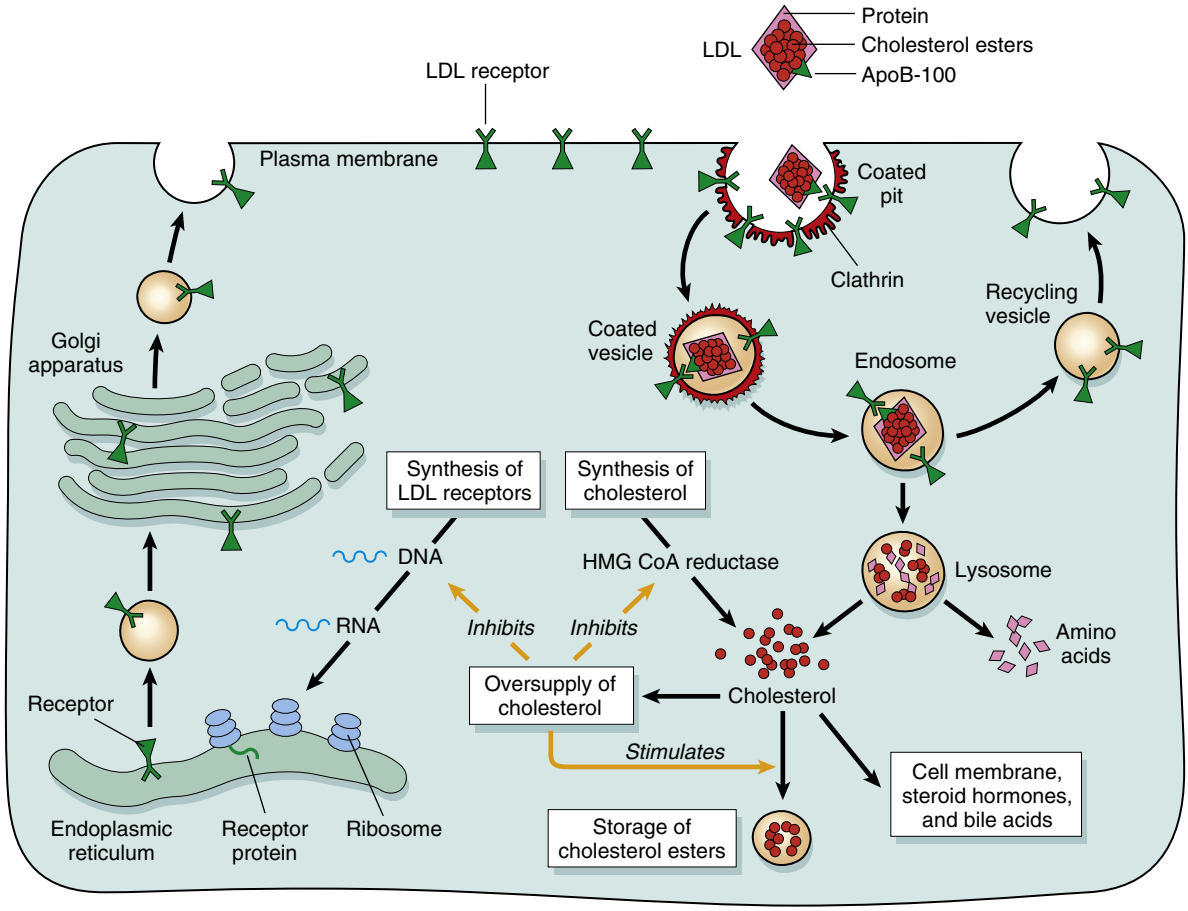

FIG. 35 The low-density lipoprotein *(LDL)* receptor pathway and regulation of cholesterol metabolism. *Apo,* Apolipoprotein; *DNA,* deoxyribonucleic acid; *HMG CoA,* 3-hydroxy-3-methylglutaryl coenzyme A; *RNA,* ribonucleic acid. (From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.)

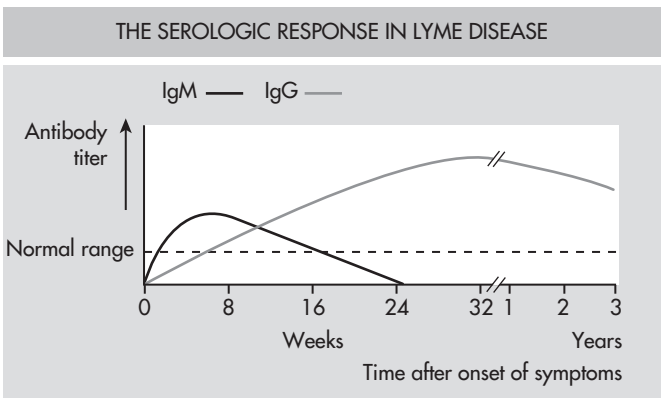

FIG. 36 Immunoglobulin (Ig)M and IgG responses in Lyme disease.

TABLE 64 Differential Diagnosis of Abnormal Lymphocytes in Peripheral Blood

Lymphocyte Type	Usual Disease Association	Cytologic Features	Laboratory Features	Clinical Features
Small lymphocyte	Chronic lymphocytic leukemia	B-cell surface markers with low concentration of surface immunoglobulin, CD5 antigen	Hypogammaglobulinemia in 50%; positive direct Coombs test in 15%; on node biopsy, diffuse, well-differentiated lymphocytic infiltrate	Elderly adults; presentation runs gamut from asymptomatic with lymphocytosis only to bulky disease with adenopathy, splenomegaly, and "packed" bone marrow
Atypical lymphocyte	Infectious mononucleosis, other viral illnesses	Suppressor T-cell markers	Heterophil agglutinin; positive serology for Epstein-Barr virus, cytomegalovirus, toxoplasma, HBsAg	Pharyngitis, fever, adenopathy, rash, splenomegaly, palatal petechiae, jaundice
Plasmacytoid lymphocyte	Waldenström macroglobulin anemia	Cytoplasmic IgM, periodic acid-Schiff positivity	IgM paraprotein, rouleaux, cryoglobulins	Adenopathy, splenomegaly, absence of bone lesions, hyperviscosity syndrome, cryopathic phenomena
Lymphoblast	ALL	Terminal transferase positivity, common ALL antigen, B- or T-precursor markers	Anemia, granulocytopenia, thrombocytopenia, hyperuricemia, diffuse bone marrow infiltration	Peak incidence in childhood, acute onset, bone pain frequent
Lymphosarcoma cell	Lymphocytic lymphoma	B-cell surface markers with high concentration of monoclonal surface immunoglobulin	Nodular or diffuse, poorly differentiated lymphocytic lymphoma on node biopsy, patchy, peritrabecular bone marrow involvement	Middle-aged to older adults, generalized adenopathy, constitutional symptoms
Sézary cell	Cutaneous lymphomas	T-lymphocyte surface markers	Skin biopsy is diagnostic	Exfoliative erythroderma, cutaneous plaques or tumors
Hairy cell	Hairy cell leukemia	B-lymphocyte markers, cytoplasmic projections, tartrate-resistant acid phosphatase, interleukin-2 receptors, CD11 antigen	Pancytopenia	Middle-aged males, moderate to marked splenomegaly without adenopathy
Prolymphocyte	Prolymphocytic leukemia	B-cell surface markers with high concentration of surface immunoglobulin, CD5 negative	Marked lymphocytosis (frequently >100 × 10^9/L)	Elderly adults, massive splenomegaly, minimum adenopathy, poor response to therapy

ALL, Acute lymphoblastic leukemia; *HBsAg,* Hepatitis B surface antigen; *Ig,* immunoglobulin.
From Stein JH (ed): *Internal medicine,* ed 5, St Louis, 1998, Mosby.

BOX 21 Key Causes of Lymphocytopenia

Destructive: Radiation, chemotherapy, corticosteroids
Debilitative: Starvation, aplastic anemia, terminal cancer, collagen vascular disease, renal failure
Infectious: Viral hepatitis, influenza, typhoid fever, TB
AIDS-associated: HIV cytopathic effect, nutritional imbalance, drug effect
Congenital immunodeficiency: Wiskott-Aldrich syndrome
Abnormal lymphatic circulation: Intestinal lymphangiectasia, obstruction, thoracic duct drainage/rupture, CHF

AIDS, Acquired immunodeficiency syndrome; *CHF,* congestive heart failure; *HIV,* human immunodeficiency virus; *TB,* tuberculosis.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

MAGNESIUM (serum)

See Figs. 37 and 38.

Normal range: 1.8 to 3.0 mg/dl (0.80 to 1.20 mmol/L [CF: 0.4114; SMI: 0.02 mmol/L])

CAUSES OF HYPERMAGNESEMIA

Decreased renal excretion
- Renal failure—glomerular filtration rate less than 30 ml/min
- Hyperparathyroidism
- Hypothyroidism
- Addison disease
- Lithium intoxication
- Familial hypocalciuric hypercalcemia

Other causes: Usually in association with decrease in glomerular filtration rate
- Endogenous loads
  - Diabetic ketoacidosis
  - Severe tissue injury: Burns
- Exogenous loads
  - Gastrointestinal
    - Magnesium-containing laxatives and antacids
    - High-dose vitamin D analogs

Parenteral: Management of toxemia of pregnancy

CAUSES OF HYPOMAGNESEMIA

Alcohol abuse
Diuretic use
Renal losses
Acute and chronic renal failure
Postobstructive diuresis
Acute tubular necrosis
Chronic glomerulonephritis
Chronic pyelonephritis
Interstitial nephropathy
Renal transplantation
Gastrointestinal losses

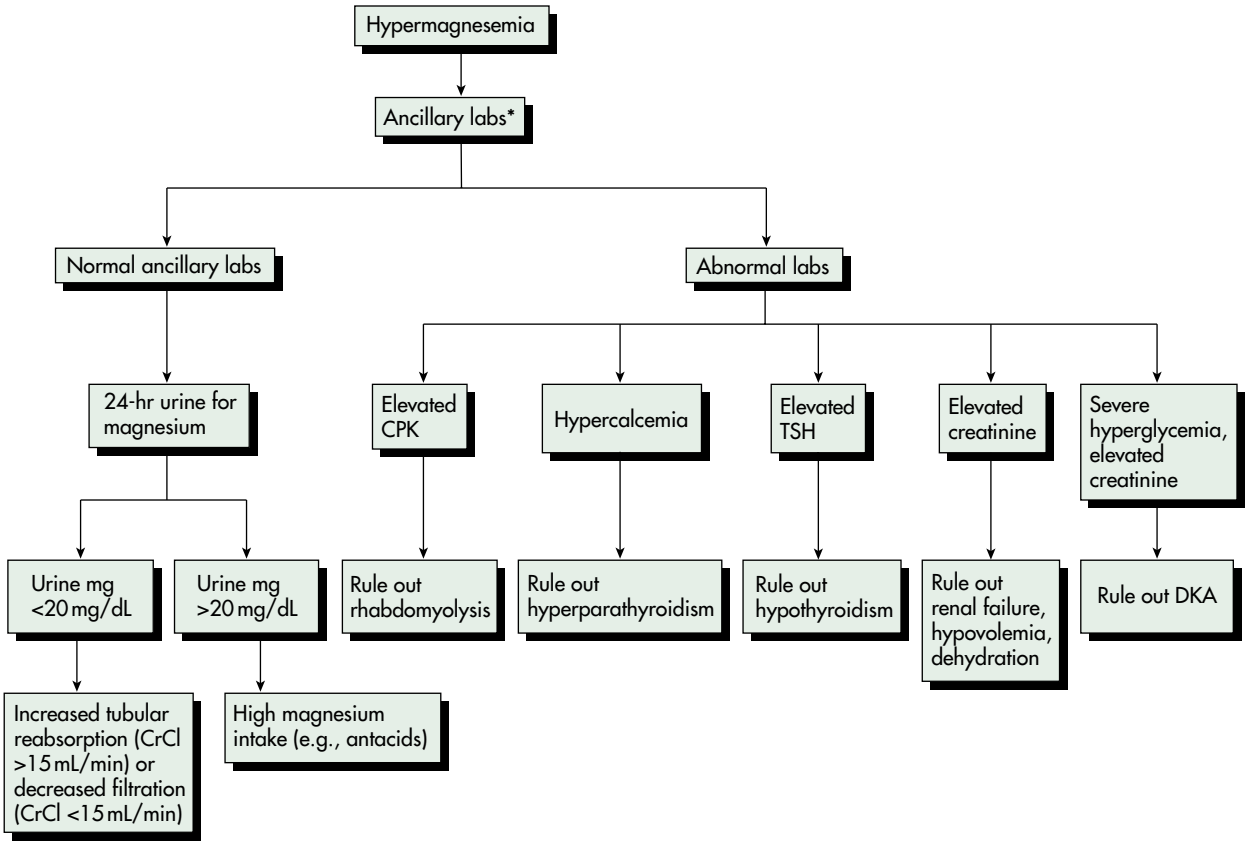

FIG. 37 Diagnostic algorithm for hypermagnesemia. *Serum electrolytes, calcium, blood urea nitrogen (BUN), creatinine, glucose, thyroid stimulating hormone (TSH), creatine phosphokinase (CPK). *CrCl,* Creatinine clearance; *DKA,* diabetic ketoacidosis. (From Ferri F: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging,* ed 3, Philadelphia, 2014, WB Saunders.)

Chronic diarrhea
Nasogastric suctioning
Short bowel syndrome
Protein-calorie malnutrition
Bowel fistula
Total parenteral nutrition
Acute pancreatitis
Endocrine
Diabetes mellitus
Hyperaldosteronism
Hyperthyroidism
Hyperparathyroidism
Acute intermittent porphyria
Pregnancy
Drugs
Aminoglycosides
Amphotericin
β-agonists
Cisplatin
Cyclosporine
Diuretics
Foscarnet
Pentamidine
Theophylline
Congenital disorders
Familial hypomagnesemia
Maternal diabetes
Maternal hypothyroidism
Maternal hyperparathyroidism

MEAN CORPUSCULAR VOLUME (MCV)

Normal range: 76 to 100 μm^3 (76 to 100 fL) (76-100 fL [CF: 1; SMI: 1 fL])

Table 65 summarizes clinical conditions not to be confused with megaloblastosis. See Tables 66, 67, and 68 for descriptions of MCV abnormalities. Table 69 describes the usefulness of the MCV and RBC distribution width in the diagnosis of anemia. Table 70 describes peripheral blood film evaluation in a patient with red cell membrane disorder.

METANEPHRINES, URINE

See URINE METANEPHRINES

METHYLMALONIC ACID (Serum)

Normal: <0.2 µmol/L
Elevated in: Vitamin B_{12} deficiency, pregnancy, methylmalonic acidemia

MITOCHONDRIAL ANTIBODY (AMA)

Normal: Negative
Present in: Primary biliary cirrhosis (>90% of patients)

MONOCYTE COUNT

Normal range: 2% to 8%
Elevated in: Viral diseases, parasites, infections, neoplasms, inflammatory bowel disease, monocytic leukemia, lymphomas, myeloma, sarcoidosis

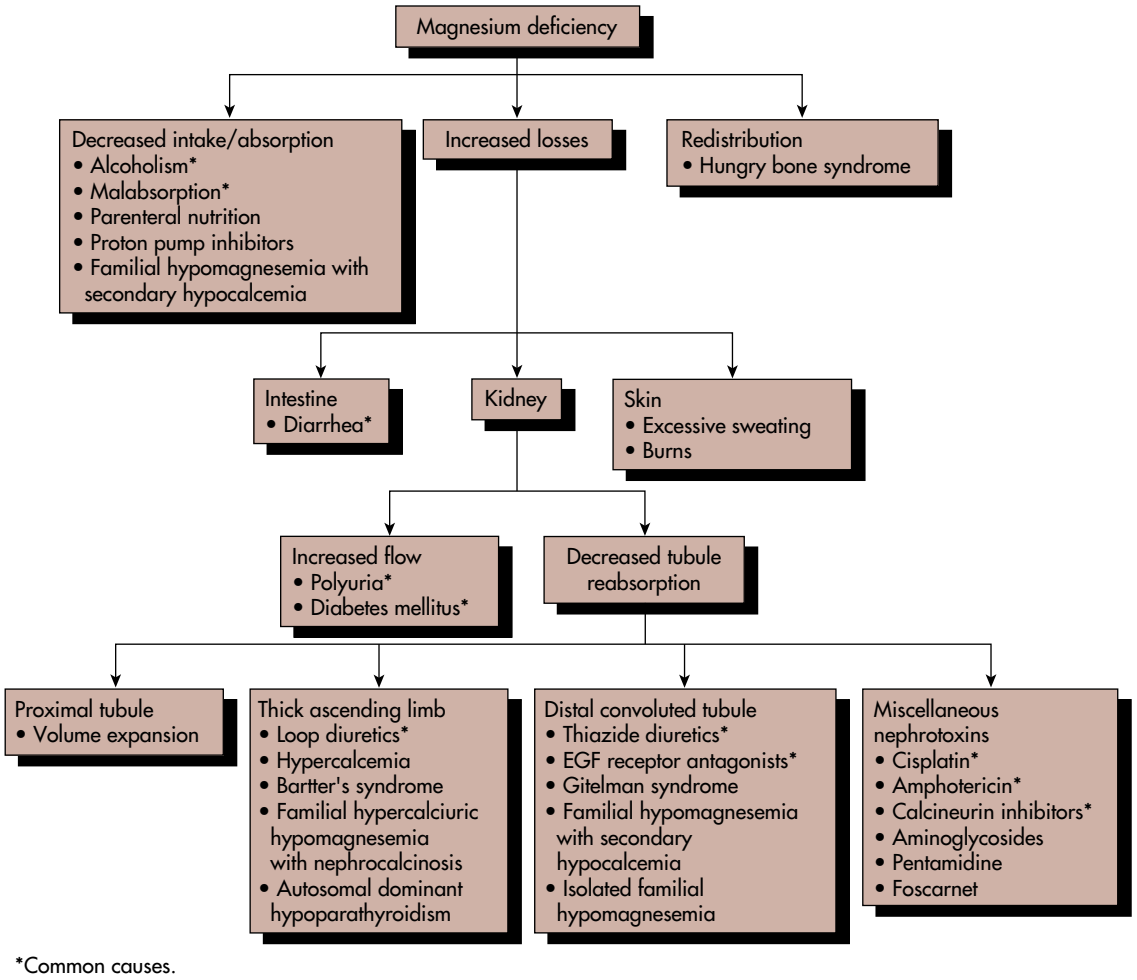

FIG. 38 Causes of magnesium deficiency. *EGF,* Epidermal growth factor. (From Skorecki K et al: *Brenner & Rector's the kidney*, ed 10, Philadelphia, 2016, Elsevier.)

TABLE 65 Clinical Conditions Not to Be Confused with Megaloblastosis

Macrocytosis* without Megaloblastosis†
Reticulocytosis
Liver disease
Aplastic anemia
Myelodysplastic syndromes (especially 5q-)
Multiple myeloma
Hypoxemia
Smokers
Spurious Increases in MCV without Macro-Ovalocytosis‡
Cold agglutinin disease
Marked hyperglycemia
Leukocytosis
Older individuals

MCV, Mean corpuscular volume.
*The central pallor that normally occupies about one third of the normal red blood cell is decreased in macro-ovalocytes. This contrasts with the finding of thin macrocytes, in which the central pallor is increased.
†Although megaloblastosis implies that a bone marrow test has been performed, with the addition of highly sensitive tests for the specific diagnosis of cobalamin and folate deficiency, the need for a bone marrow test is often dictated by the urgency to make the diagnosis.
‡When the Coulter counter readings of a high MCV are not confirmed by looking at the peripheral smear.
From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

Decreased in: Aplastic anemia, lymphocytic leukemia, glucocorticoid administration

See Table 71 for changes in monocyte number.

MYCOPLASMA PNEUMONIAE PCR

Test description: PCR can be performed on sputum, bronchoalveolar lavage, nasopharyngeal and throat swabs, other respiratory fluids, and lung tissue

MYELIN BASIC PROTEIN, CEREBROSPINAL FLUID

Normal: <2.5 ng/ml
Elevated in: Multiple sclerosis, CNS trauma, stroke, encephalitis

MYOGLOBIN, URINE

See URINE MYOGLOBIN

TABLE 66 Some Causes of Increased Mean Corpuscular Volume (Macrocytosis)

Causes	% of all Macrocytosis Patients*	% of Macrocytosis in Each Disease†
Common		
Folate or B_{12} deficiency	20-30 (5-50)‡	80-90 (4-100)
Chronic liver disease	15-20 (6-28)	25-30 (8-65)
Chronic alcoholism	10-12 (3-15)	60 (26-90)
Cytotoxic chemotherapy	10-15 (2-20)	30-40 (13-82)
Cardiorespiratory abnormality	8 (7-9.5)	?
Reticulocytosis	6-7 (0-15)	Depends on severity
Myelodysplastic syndromes	Frequent over age 40 yr	>60 in RAEB and RARS
Unexplained	25 (22.5-27)	—
Normal newborn		
Less Common	**<4%**	
Noncytotoxic drugs > Zidovudine		
Phenytoin		30 (14-50)
Azathioprine		
Hypothyroidism		20-30 (8-55)
Chronic leukemia/myelofibrosis		
Radiotherapy for malignancy		
Chronic renal disease (occasional patients)		
Distance-runner macrocytosis (some persons)		
Down syndrome		
Artifactual (e.g., cold agglutinins)		

RAEB, Refractory anemia with excessive blasts; *RARS,* refractory anemia with ring sideroblasts (formerly called "IASA," or idiopathic acquired sideroblastic anemia).
*Percentage of all patients with macrocytosis.
†Percentage of patients with each condition listed who have macrocytosis.
‡Numbers in parentheses are literature range.
From Ravel R: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

TABLE 67 Some Causes of Decreased Mean Corpuscular Volume (Microcytosis)

Common	Less Common
Chronic iron deficiency	Some cases of polycythemia
α- or β-thalassemia (minor)	Some cases of lead poisoning
Anemia of chronic disease	Some cases of congenital spherocytosis
	Some cases of sideroblastic anemia
	Certain abnormal hemoglobins (HbE, Hb Lepore)

Hb, Hemoglobin.
From Ravel R: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

TABLE 68 Differential Diagnosis of Microcytic Hypochromic Anemia

Decreased Body Iron Stores
Iron-deficiency anemia
Normal or increased body iron stores
Anemia of chronic disease
Defective absorption, transport, or use of iron
Iron-refractory, iron-deficiency anemia after parenteral iron
Atransferrinemia
Aceruloplasminemia
Divalent metal transporter 1 (DMT1 or SLC11A2) deficiency
Ferroportin-associated hemochromatosis with impaired iron export (type 4A)
Heme oxygenase 1 deficiency
Disorders of globin synthesis
Thalassemia
Other microcytic hemoglobinopathies
Disorders of heme synthesis: Sideroblastic anemias
Hereditary
Acquired

From Hoffman R et al: *Hematology, basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

TABLE 69 Usefulness of the Mean Corpuscular Value and Red Blood Cell Distribution Width in the Diagnosis of Anemia

	Low MCV (<80fL)	Normal MCV (80-99fL)	High MCV (≥100fL)
Normal RDW	Anemia of chronic disease	Acute blood loss	Aplastic anemia
	α- or β-thalassemia trait	Anemia of chronic disease	Chronic liver disease
	Hemoglobin E trait	Anemia of renal disease	Chemotherapy, antivirals, or alcohol
Elevated RDW	Iron deficiency	Early iron, folate, or vitamin B_{12} deficiency	Folate or vitamin B_{12} deficiency
	Sickle cell–β-thalassemia	Dimorphic anemia (for example, iron + folate deficiency)	Immune hemolytic anemia
		Sickle cell anemia	Cytotoxic chemotherapy
		Sickle cell disease	Chronic liver disease
		Chronic liver disease	Myelodysplasia
		Myelodysplasia	Hereditary spherocytosis, hereditary elliptocytosis, congenital hemoglobinopathies, and RBC enzymopathies

MCV, mean corpuscular value; *RBC,* red blood cell; *RDW,* red blood cell distribution width.
From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 70 Peripheral Blood Film Evaluation in a Patient with Red Cell Membrane Disorder

Shape	Pathobiology	Diagnosis
Microspherocytes	Loss of membrane lipids leading to a reduction of surface area resulting from deficiencies of spectrin, ankyrin, or band 3 and protein 4.2 Removal of membrane material from antibody-coated red cells by macrophages Removal of membrane-associated Heinz bodies, with the adjacent membrane lipids, by the spleen	HS Immunohemolytic anemias Heinz body hemolytic anemias
Elliptocytes	Permanent red cell deformation resulting from a weakening of skeletal protein interactions (such as the spectrin dimer-dimer contact). This facilitates disruption of existing protein contacts during shear-stress-induced elliptical deformation. Subsequently, new protein contacts are formed that stabilize elliptical shape Unknown	Mild common HE Iron deficiency, megaloblastic anemias, myelofibrosis, myelophthisic anemias, myelodysplastic syndrome, thalassemias
Poikilocytes/fragments	Weakening of skeletal protein contacts resulting from skeletal protein mutations Unknown	Hemolytic HE/HPP Iron deficiency, megaloblastic anemias, myelofibrosis, myelophthisic anemias, myelodysplastic syndrome, thalassemias
Schistocytes, fragmented red cells	Red cells "torn" by mechanical trauma (fibrin strands, turbulent flow)	"Microangiopathic" hemolytic anemia associated with disseminated intravascular coagulation, thrombotic thrombocytopenic purpura, vasculitis, heart valve prostheses
Acanthocytes	Uptake of cholesterol and its preferential accumulation in the outer leaflet of the lipid bilayer Selective accumulation of sphingomyelin in the outer lipid leaflet Unknown	Spur cell hemolytic anemia in severe liver disease Abetalipoproteinemia Chorea-acanthocytosis syndrome, malnutrition, hypothyroidism, McLeod phenotype
Echinocytes	Expansion of the surface area of the outer hemileaflet of lipid bilayer relative to the inner hemileaflet Unknown	Hemolytic anemia associated with hypomagnesemia and hypophosphatemia in malnourished patients, pyruvate kinase deficiency; in vitro artifact of low blood storage (ATP depletion), contact with glass or elevated pH Hemolysis in long-distance runners, renal failure
Stomatocytes	Expansion of the surface area of the inner hemileaflet of the bilayer relative to the outer leaflet Unknown	Exposure of red cells to cationic anesthetics in vitro; in vivo the drug concentrations may not be sufficient to produce similar effect Alcoholism, inherited disorders of membrane permeability (hereditary stomatocytosis)
Target cells	Absolute excess of membrane lipids (both cholesterol and phospholipids: "symmetric" lipid gain), followed by an increase of cell surface area Relative excess of surface area because of a decrease in cell volume	Obstructive jaundice, liver disease with intrahepatic cholestasis Thalassemias and some hemoglobinopathies (C, D, E)

ATP, Adenosine triphosphate; *HE,* hereditary elliptocytosis; *HPP,* hereditary pyropoikilocytosis; *HS,* hereditary spherocytosis.
From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

TABLE 71 Changes in Monocyte Number

Monocytosis
Infections: Tuberculosis, granulomatous infection, brucellosis, subacute bacterial endocarditis
Connective tissue disorder
Recovery from myelosuppression
Hematologic malignancies
  MDS, MPD, MDS-MPD overlap, CMML
  Acute and chronic monocytic leukemia, myelomonocytic leukemia
  Hodgkin and non-Hodgkin lymphomas
Monocytopenia
Hairy cell leukemia
MonoMAC syndrome
Aplastic anemia
Drugs: Chemotherapy, IFN-α, glucocorticoids (transient)
Radiation therapy

CMML, Chronic myelomonocytic leukemia; *IFN,* interferon; *MDS,* myelodysplastic syndrome; *monoMAC,* monocytopenia and mycobacterium avium complex syndrome; *MPD,* myeloproliferative disorder.
From Hoffman R: *Hematology, basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

NEISSERIA GONORRHOEAE PCR

Test description: Test can be performed on endocervical swab, urine, and intraurethral swab
Normal: Negative

NEUTROPHIL COUNT

Normal range: 50% to 70%
Subsets:
Stabs (bands, early mature neutrophils): 2% to 6%
Segs (mature neutrophils): 60% to 70%
Elevated in: Acute bacterial infections, acute myocardial infarction, stress, neoplasms, myelocytic leukemia
Decreased in: Viral infections, aplastic anemias, immunosuppressive drugs, radiation therapy to bone marrow, agranulocytosis, drugs (antibiotics, antithyroidals, clopidogrel), lymphocytic and monocytic leukemias

Box 22 describes various drugs that can cause neutropenia. Table 72 describes miscellaneous inherited neutropenia disorders. Classification of neutropenia is covered in Table 73. Table 74 lists drugs associated with agranulocytosis. Table 75 describes causes of neutrophilia.

BOX 22 Drugs That Cause Neutropenia

Antiarrhythmics: Tocainide, procainamide, propranolol, quinidine
Antibiotics: Chloramphenicol, penicillins, sulfonamides, *p*-aminosalicylic acid (PAS), rifampin, vancomycin, isoniazid, nitrofurantoin
Antimalarials: Dapsone, quinine, pyrimethamine
Anticonvulsants: Phenytoin, mephenytoin, trimethadione, ethosuximide, carbamazepine
Hypoglycemic agents: Tolbutamide, chlorpropamide
Antihistamines: Cimetidine, brompheniramine, tripelennamine
Antihypertensives: Methyldopa, captopril
Antiinflammatory agents: Aminopyrine, phenylbutazone, gold salts, ibuprofen, indomethacin
Antithyroid agents: Propylthiouracil, methimazole, thiouracil
Diuretics: Acetazolamide, hydrochlorothiazide, chlorthalidone
Phenothiazines: Chlorpromazine, promazine, prochlorperazine
Immunosuppressive agents: Antimetabolites
Cytotoxic agents: Alkylating agents, antimetabolites, anthracyclines, *Vinca* alkaloids, cisplatin, hydroxyurea, dactinomycin
Other agents: Recombinant interferons, allopurinol, ethanol, levamisole, penicillamine, zidovudine, streptokinase, carbamazepine, clopidogrel, ticlopidine

Modified and updated from Goldman L, Ausiello D (eds): *Cecil textbook of medicine,* ed 22, Philadelphia, 2004, WB Saunders.

TABLE 72 Miscellaneous Inherited Neutropenia Disorders

Diagnosis	Genetics	Mapping	Mutant Gene	Additional Features
Hyper IgM syndrome, type 1	X-L	Xq26	*CD40L*	↓IgG, IgA, IgE, autoimmune cytopenias
Hermansky-Pudlak syndrome, type 2	AR	5q14.1	*AP3B1*	↓IgG, partial albinism, platelet dysfunction
Griscelli syndrome, type 1	AR	15q21	*MYO5A*	Neurologic dysfunction, partial albinism
Griscelli syndrome, type 2	AR	15q21	*RAB27A*	Same as type 1 plus hemophagocytosis
Chédiak-Higashi syndrome	AR	1q42.1-q42.2	*LYST (CHSI)*	Immunodeficiency, partial albinism
Poikiloderma with neutropenia	AR	16q13	*C160RF57*	Rash, short stature, dystrophic nails
P14 deficiency	AR	1q22	*MAPBPIP*	Immunodeficiency, hypopigmentation
Cohen syndrome	AR	8q22-q23	*VPS13B/COH1*	Retinopathy, retardation, skeletal anomalies
Charcot-Marie-Tooth syndrome, type 2	AD	19p13.2	*DMN2*	Axonal demyelinating neuropathy

AD, Autosomal dominant; *AR,* autosomal recessive; *Ig,* immunoglobulin; *X-L,* X-linked recessive.
Data compiled from Online Mendelian Inheritance in Man (http://ncbi.nlm.nih.gov/omim); From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

TABLE 73 Classification of Neutropenia

Congenital	
Primary	Autoimmune neutropenia
	Pure white cell aplasia
	Idiopathic
	Thymoma
	Hematologic malignancies (e.g., T-LGL leukemia)
	Infections/postinfectious
	Viral
	Measles, mumps, roseola, rubella,
	RSV, influenza
	Hepatitis A, B, and C
	CMV, EBV, HIV
	Parvovirus
	Bacterial
	Tuberculosis
	Brucellosis
	Tularemia
	Typhoid fever
	Rickettsial
	Rocky Mountain spotted fever
	Ehrlichiosis
	Fungal
	Histoplasmosis
	Parasitic
	Malaria, leishmaniasis
	Autoimmune conditions (e.g., SLE, RA)
	Drugs and chemicals
	Neutropenia associated with immunodeficiency
	Severe nutritional deficiencies
	Neutropenia caused by increased margination
	Iatrogenic (e.g., hemodialysis)

CMV, Cytomegalovirus; *EBV,* Epstein-Barr virus; *HIV,* human immunodeficiency virus; *RA,* refractory anemia; *RSV,* respiratory syncytial virus; *SLE,* systemic lupus erythematosus; *T-LGL,* T-cell large granular lymphocyte.
Modified from Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 74 Drugs Associated with Agranulocytosis

	ETIOLOGIC FRACTION	
	Agranulocytosis (%)	Aplastic Anemia (%)
Overall	64	62
IAAAS	12	27
United States	72	17
Thailand	70	2
Drugs associated with agranulocytosis (IAAAS and other drugs of interest)		
Acetyldigoxin		
ACE inhibitors		
Allopurinol		
Amodiaquine		
Bezafibrate		
β-Blockers		
β-Lactam antibiotics		
Carbamazepine		
Cinepazide		
Corticosteroids		
Cotrimoxazole, other sulfonamides		
Dipyridamole		
Deferasirox (Exjade)		
Dipyrone		
Histamine-2 receptor antagonist		
Indomethacin		
Isoniazid		
Macrolides		
Mefloquine		
Nifedipine		
Phenytoin		
Procainamide		
Salicylates		
Sulfasalazine		
Sulfonylureas		
Tetracyclines		
Thenalidine		
Thyrostatics		
Troxerutin		

ACE, Angiotensin-converting enzyme; *IAAAS,* International Agranulocytosis and Aplastic Anemia Study.
Modified from Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 75 Causes of Neutrophilia

Hematologic malignancy (CML, CNL, CMML)
Infection
Inflammation, physiologic stress, hemorrhage, hemolysis
Hereditary or congenital neutrophilias
Smoking
Drugs: Colony-stimulating factors, glucocorticoids, epinephrine, lithium
Nonhematologic malignancy
Asplenia
Obesity
Recovery from neutropenia

CML, Chronic myeloid leukemia; *CMML,* chronic myelomonocytic leukemia; *CNL,* chronic neutrophilic leukemia.
From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

NOREPINEPHRINE

Normal range: 0 to 600 pg/ml
Elevated in: Pheochromocytomas, neuroblastomas, stress, vigorous exercise, certain foods (bananas, chocolate, coffee, tea, vanilla)

5′-NUCLEOTIDASE

Normal range: 2-16 IU/L (3-27 × 10^8 kat/L [CF: 1.67 × 10^8; SMI: 1 × 10^8 kat/L])
Elevated in: Biliary obstruction, metastatic neoplasms to liver, primary biliary cirrhosis, renal failure, pancreatic carcinoma, chronic active hepatitis

OSMOLALITY (serum)

Normal range: 280 to 300 mOsm/kg (280 to 300 mmol/kg [CF: 1; SMI: 1 mmol/kg])

It can also be estimated by the following formula:

$$2\,([Na] + [K] + \text{glucose}/18 + \text{BUN}/2.8)$$

The relationship between plasma osmolality and plasma arginine vasopressin is illustrated in Fig. 39.

The relationships between plasma and urine osmolality are illustrated in Fig. 40.

Elevated in: Dehydration, hypernatremia, diabetes insipidus, uremia, hyperglycemia, mannitol therapy, ingestion of toxins (ethylene glycol, methanol, ethanol), hypercalcemia, diuretics
Decreased in: Syndrome of inappropriate diuretic hormone secretion, hyponatremia, overhydration, Addison disease, hypothyroidism

OSMOLALITY, URINE

Normal range: 50 to 1200 mOsm/kg (50 to 1200 mmol/kg [CF: 1; SMI: 1 mmol/kg])
Elevated in: Syndrome of inappropriate antidiuretic hormone secretion, dehydration, glycosuria, adrenal insufficiency, high-protein diet
Decreased in: Diabetes insipidus, excessive water intake, IV hydration with D_5W, acute renal insufficiency, glomerulonephritis

The relationship between plasma urine osmolality and plasma arginine vasopressin in patients with polyuria is illustrated in Fig. 41. Box 23 describes urine osmolality variances in common clinical situations.

OSMOTIC FRAGILITY TEST

Normal: Hemolysis begins at 0.50, w/v [5.0 g/L] and is complete at 0.30, w/v [3.0 g/L] NaCl.
Elevated in: Hereditary spherocytosis, hereditary stomatocytosis, spherocytosis associated with acquired immune hemolytic anemia
Decreased in: Iron deficiency anemia, thalassemias, liver disease, leptocytosis associated with asplenia

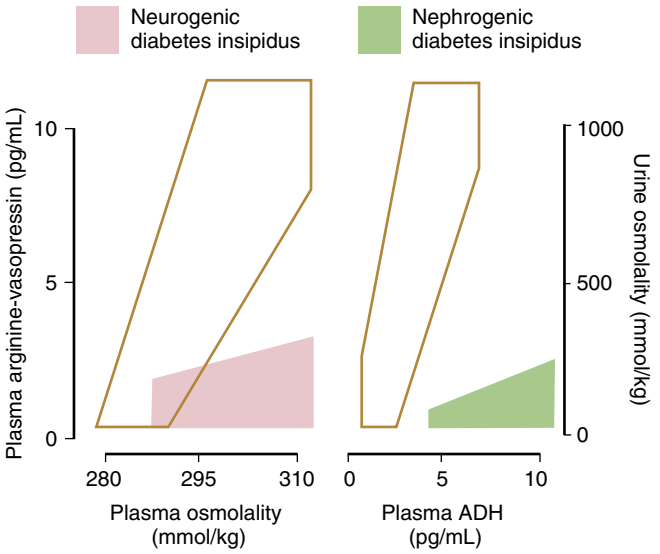

FIG. 39 *Left,* Relationship between plasma arginine vasopressin *(AVP/ADH)* and plasma osmolality during the infusion of hypertonic saline. Patients with primary polydipsia and nephrogenic diabetes insipidus *(DI)* have values within the normal range *(open area),* in contrast to patients with neurogenic DI, who show a subnormal plasma ADH response to a rise in osmolality *(pink). Right,* Relationship between urine osmolality and plasma ADH during dehydration and water loading. Patients with primary polydipsia and neurogenic DI have values within the normal range *(open area),* in contrast to patients with nephrogenic DI, who have hypotonic urine despite high plasma ADH *(green).* (Redrawn from Bichet DG: Diabetes insipidus and vasopressin. FIG. 40 Relationships between plasma and urine osmolality. *ADH,* Antidiuretic hormone. (From Vincent JL et al: *Textbook of critical care*, ed 7, Philadelphia, 2017, Elsevier.)

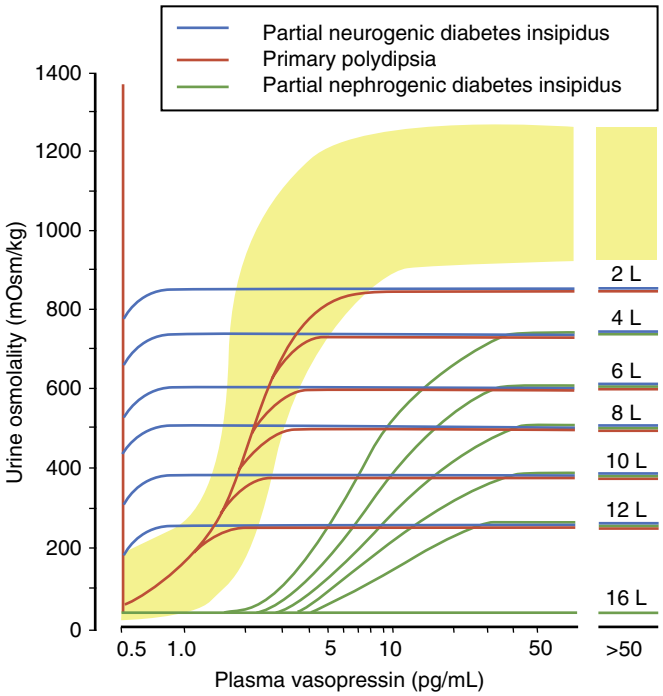

FIG. 41 The relationship between urine osmolality (Uosm) and plasma arginine vasopressin (AVP/ADH) in patients with polyuria of diverse causes and severity. Each of the three categories of polyuria is described by its own family of sigmoid curves of differing heights. Differences in height within a family reflect differences in maximum concentrating capacity caused by "washout" of the medullary concentration gradient. They are proportional to the severity of the polyuria (indicated in liters per day at the right end of each plateau). The normal response is depicted in yellow. The three categories of polyuria differ principally in the ascending portion of the dose-response curve. In patients with partial neurogenic diabetes insipidus *(DI),* the curve lies to the left of normal, reflecting increased sensitivity to the antidiuretic effects of very low concentrations of plasma ADH. In contrast, in patients with partial nephrogenic DI, the curve lies to the right of normal, reflecting decreased sensitivity to ADH. In primary polydipsia, the relationship of Uosm to ADH remains relatively normal. (Redrawn from Bichet DG: Diabetes insipidus and vasopressin. In Moore WT, Eastman RC [eds]: *Diagnostic endocrinology,* ed 2, St Louis, 1996, Mosby, p 158, with permission.) (McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.)

BOX 23 Urine Osmolality in Common Clinical Situations

High Urine Osmolality
AKI or when assessing effective circulating volume
Prerenal states
Volume depletion (GI losses, renal losses, skin losses, third spacing)
Heart failure
Cirrhosis
Hypoalbuminemia
Hyponatremia
Prerenal states
Volume depletion (GI losses, renal losses, skin losses, third spacing)
Heart failure
Cirrhosis
Hypoalbuminemia
Syndrome of inappropriate ADH secretion
Hypernatremia
GI losses (vomiting, diarrhea, nasogastric tube, fistula)
Skin losses (fever, exercise, ventilation)
Sodium overload (received excess normal saline or sodium bicarbonate)
Mineralocorticoid excess
Seizures (↑ intracellular osmoles → water shifts → transient increase in serum Na)

Low Urine Osmolality
AKI or when assessing effective circulating volume
Euvolemic or hypervolemic
Established AKI
Chronic kidney disease
Hyponatremia
In process of correcting hyponatremia
Primary polydipsia
Extremely low solute intake (tea and toast diet or beer potomania)
Hypernatremia
Osmotic diuresis (glucose, mannitol, urea)
Loop diuretics
Nephrogenic DI
Central DI

ADH, Antidiuretic hormone; AKI, acute kidney injury; DI, diabetes insipidus; GI, gastrointestinal.
From Ronco C: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.

PARACENTESIS FLUID

Testing and evaluation of results:

Process the fluid as follows:
- Tube 1: LDH, glucose, albumin
- Tube 2: Protein, specific gravity
- Tube 3: Cell count and differential
- Tube 4: Save until further notice

Draw serum LDH, protein, albumin.

Gram stain, acid-fast bacilli stain, bacterial and fungal cultures, amylase, and triglycerides should be ordered only when clearly indicated; bedside inoculation of blood-culture bottles with ascitic fluid improves sensitivity in detecting bacterial growth.

If malignant ascites is suspected, consider a carcinoembryonic antigen level on the paracentesis fluid and cytologic evaluation.

In suspected spontaneous bacterial peritonitis (SBP) the incidence of positive cultures can be increased by injecting 10 to 20 ml of ascitic fluid into blood culture bottles.

Peritoneal effusion can be subdivided as exudative or transudative based on its characteristics (see Section II).

The serum-ascites albumin gradient (serum albumin level-ascitic fluid albumin level [SAAG]) correlates directly with portal pressure and can also be used to classify ascites. Patients with gradients ≥1.1 g/dl have portal hypertension, and those with gradients ≤1.1 g/dl do not; the accuracy of this method is >95%.

For the differential diagnosis of ascites, refer to Section II.

An ascitic fluid polymorphonuclear leukocyte count >500/μl is suggestive of SBP.

A blood-ascitic fluid albumin gradient. Box 24 summarizes causes of peritoneal effusions. Useful criteria for evaluation of peritoneal lavage is summarized in Box 25. Recommended tests in peritoneal effusions are summarized in Box 26.

PARATHYROID HORMONE (PTH)

Normal:

Serum, intact molecule 10-65 pg/ml

Plasma 1.0-5.0 pmol/L

Elevated in: Hyperparathyroidism (primary or secondary), pseudohypoparathyroidism, anticonvulsants, corticosteroids, lithium, isoniazid (INH), rifampin, phosphates, Zollinger-Ellison syndrome, hereditary vitamin D deficiency

Decreased in: Hypoparathyroidism, sarcoidosis, cimetidine, beta-blockers, hyperthyroidism, hypomagnesemia

Plasma 1.0-5.0 pmol/L

Elevated in: Hyperparathyroidism (primary or secondary), pseudohypoparathyroidism, anticonvulsants, corticosteroids, lithium, isoniazid (INH), rifampin, phosphates, Zollinger-Ellison syndrome, hereditary vitamin D deficiency

Decreased in: Hypoparathyroidism, sarcoidosis, cimetidine, beta-blockers, hyperthyroidism, hypomagnesemia

BOX 24 Causes of Peritoneal Effusions

Transudates: Increased Hydrostatic Pressure or Decreased Plasma Oncotic Pressure
Congestive heart failure
Hepatic cirrhosis
Hypoproteinemia (e.g., nephrotic syndrome)

Exudates: Increased Capillary Permeability or Decreased Lymphatic Resorption
Infections
- Primary bacterial peritonitis
- Secondary bacterial peritonitis (e.g., appendicitis, bowel rupture)
- Tuberculosis

Neoplasms
- Hepatoma
- Lymphoma
- Mesothelioma
- Metastatic carcinoma
- Ovarian carcinoma
- Prostate cancer

Trauma
Pancreatitis
Bile peritonitis (e.g., ruptured gallbladder)

Chylous Effusion
Damage to or obstruction of thoracic duct (e.g., trauma, lymphoma, carcinoma, tuberculosis and other granulomas [e.g., sarcoidosis, histoplasmosis], parasitic infestation)

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

BOX 25 Criteria for Evaluation of Peritoneal Lavage

Positive Result
Aspiration of >15 ml gross blood on catheter placement
Grossly bloody lavage fluid
RBC >100,000/μL after blunt trauma
RBC >50,000/μL after penetrating trauma
WBC >500/μL
Amylase >110 U/dl

Indeterminate Result
Small amount of gross blood on catheter placement
RBC 50,000-100,000/μL after blunt trauma
RBC 1000-50,000/μL after penetrating trauma
WBC 100-500/μL

Negative Result
RBC <50,000/μL after blunt trauma
RBC <1000/μL after penetrating trauma
WBC <100/μL

RBC, Red blood cells; *WBC,* white blood cells.

PARIETAL CELL ANTIBODIES

Normal: Negative
Present in: Pernicious anemia (>90%), atrophic gastritis (up to 50%), thyroiditis (30%), Addison disease, myasthenia gravis, Sjögren syndrome, type 1 DM

PARTIAL THROMBOPLASTIN TIME (PTT), ACTIVATED PARTIAL THROMBOPLASTIN TIME (APTT)

See Table 76 for interpretation of coagulation protein screening tests.
Normal range: 25 to 41 sec
Elevated in: Heparin therapy, coagulation factor deficiency (I, II, V, VIII, IX, X, XI, XII), liver disease, vitamin K deficiency, disseminated intravascular coagulation, circulating anticoagulant, warfarin therapy, specific factor inhibition (penicillin [PCN] reaction, rheumatoid arthritis), thrombolytic therapy, nephrotic syndrome
NOTE: Useful to evaluate the intrinsic coagulation system.

BOX 26 Recommended Tests in Peritoneal Effusions

Useful in Most Patients
Gross examination
Cytology
Stains and culture for microorganisms
Serum-ascites albumin concentration gradient

Useful in Selected Disorders
Total leukocyte and differential cell counts
RBC count (lavage)
Bilirubin
Creatinine/urea nitrogen
Enzymes (ADA, ALP, amylase, LD, telomerase)
Lactate
Cholesterol (malignant ascites)
Fibronectin
Tumor markers (CEA, PSA, CA 19-9, CA 15-3, CA-125)
Immunocytology/flow cytometry
Tuberculostearic acid

ADA, Adenosine deaminase; *ALP,* alkaline phosphatase; *LD,* lactate dehydrogenase; *RBC,* red blood cell.
Modified from Kjeldsberg CR, Knight JA: *Body fluids: Laboratory examination of amniotic, cerebrospinal, seminal, serous and synovial fluids*, ed 3, Chicago, 1993, American Society for Clinical Pathology, with permission. In McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

PEPSINOGEN I

Normal: 124 to 142 ng/ml
Elevated in: Zollinger–Ellison (ZE) syndrome, duodenal ulcer, acute gastritis
Decreased in: Atrophic gastritis, gastric carcinoma, myxedema, pernicious anemia, Addison disease

PH, BLOOD

Normal values:
Arterial: 7.35 to 7.45
Venous: 7.32 to 7.42
For abnormal values, refer to ARTERIAL BLOOD GASES.

PH, URINE

See URINE pH

PHENOBARBITAL

Normal therapeutic range:
15 to 30 mc g/ml for epilepsy control

PHENYTOIN (Dilantin)

Normal therapeutic range: 10 to 20 mcg/ml

PHOSPHATASE, ACID

See ACID PHOSPHATASE

PHOSPHATASE, ALKALINE

See ALKALINE PHOSPHATASE

PHOSPHATE (serum)

Normal range: 2.5 to 5 mg/dl (0.8-1.6 mmol/L [CF: 0.3229; SMI: 0.05 mmol/L])
DECREASED
Parenteral hyperalimentation
Diabetic acidosis

Alcohol withdrawal
Severe metabolic or respiratory alkalosis
Antacids that bind phosphorus
Malnutrition with refeeding using low-phosphorus nutrients
Renal tubule failure to reabsorb phosphate (Fanconi syndrome; congenital disorder; vitamin D deficiency)
Glucose administration
Nasogastric suction

TABLE 76 Clinical Peculiarities of Coagulation Protein Screening Tests

Long aPTT, normal or long PT, no bleeding	Normal aPTT, PT, *with bleeding*
Long aPTT only	
Factor XII deficiency	Factor XIII deficiency or inhibitor
Prekallikrein deficiency	α_2-Antiplasmin deficiency or defect
High-molecular-weight kininogen	Plasminogen activator inhibitor deficiency or defect
Lupus anticoagulant	α_1-Antitrypsin Pittsburgh defect
Long aPTT and PT	
Dysfibrinogenemia with fibrinopeptide B release	
Lupus anticoagulant	

aPTT, Activated partial thromboplastin time; *PT,* prothrombin time.
From Hoffman R et al: *Hematology: Basic principles and practice,* ed 5, Philadelphia, 2009, Churchill Livingstone.

Malabsorption
Gram-negative sepsis
Primary hyperthyroidism
Chlorothiazide diuretics
Therapy of acute severe asthma
Acute respiratory failure with mechanical ventilation
INCREASED
Renal failure
Severe muscle injury
Phosphate-containing antacids
Hypoparathyroidism
Tumor lysis syndrome
For a diagnostic algorithm of hyperphosphatemia, see Fig. 42.
For a diagnostic algorithm for hypophosphatemia, see Fig. 43.
For causes and treatment of hypophosphatemia see Tables 77 and 78.

PLASMINOGEN

Normal: Immunoassay (antigen): <20 mg/dl
Elevated in: Infection, trauma, neoplasm, myocardial infarction (acute phase reactant), pregnancy, bilirubinemia
Decreased in: disseminated intravascular coagulation (DIC), severe liver disease, thrombolytic therapy with streptokinase or urokinase, alteplase

PLATELET AGGREGATION

Normal: Full aggregation (generally >60%) in response to epinephrine, thrombin, ristocetin, adenosine diphosphate (ADP), collagen
Elevated in: Heparin, hemolysis, lipemia, nicotine, hereditary and acquired disorders of platelet adhesion, activation, and aggregation

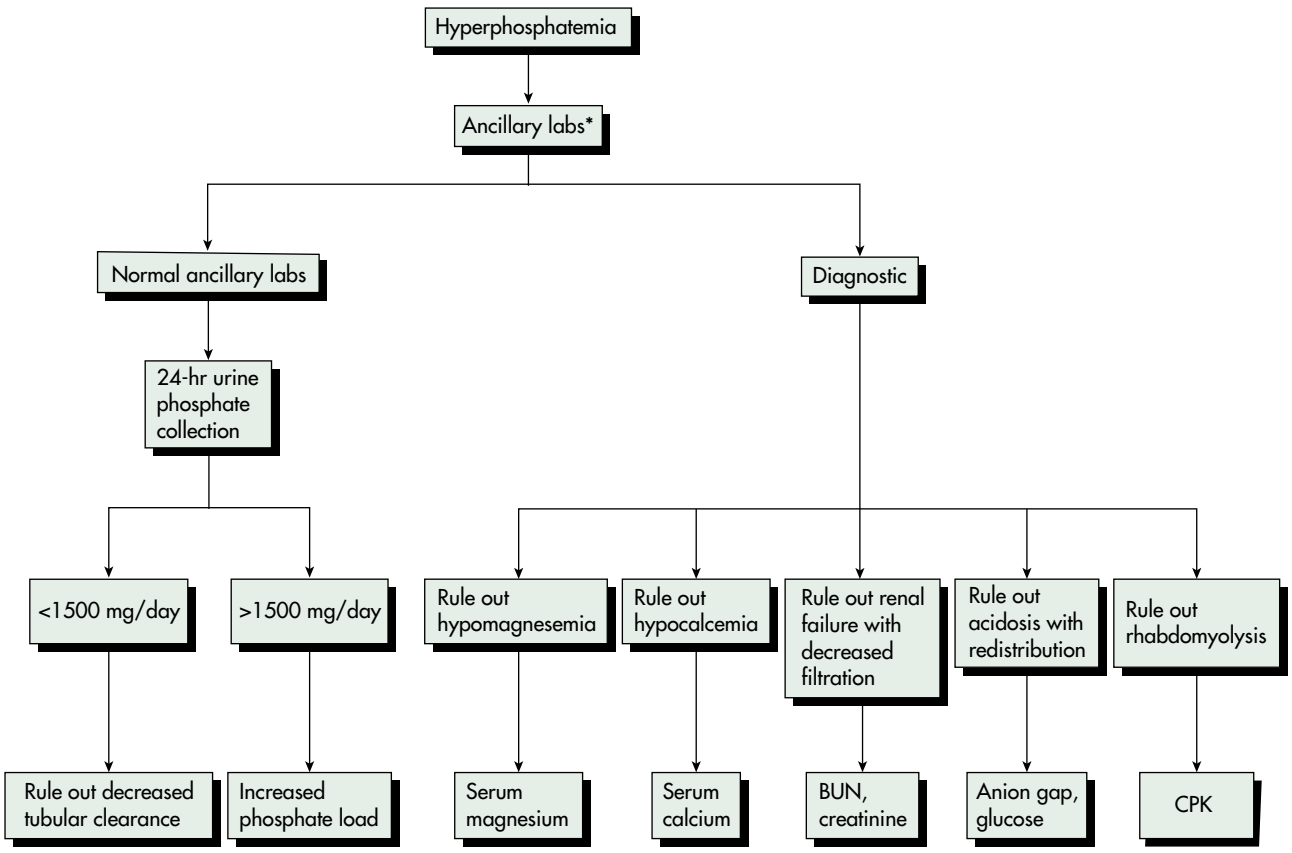

FIG. 42 Diagnostic algorithm for hyperphosphatemia. *Serum calcium, electrolytes, creatinine, glucose, arterial blood gases (ABGs), urinalysis, creatine phosphokinase (CPK), magnesium. *BUN,* Blood urea nitrogen. (From Ferri F: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging*, ed 4, Philadelphia, 2017, WB Saunders.)

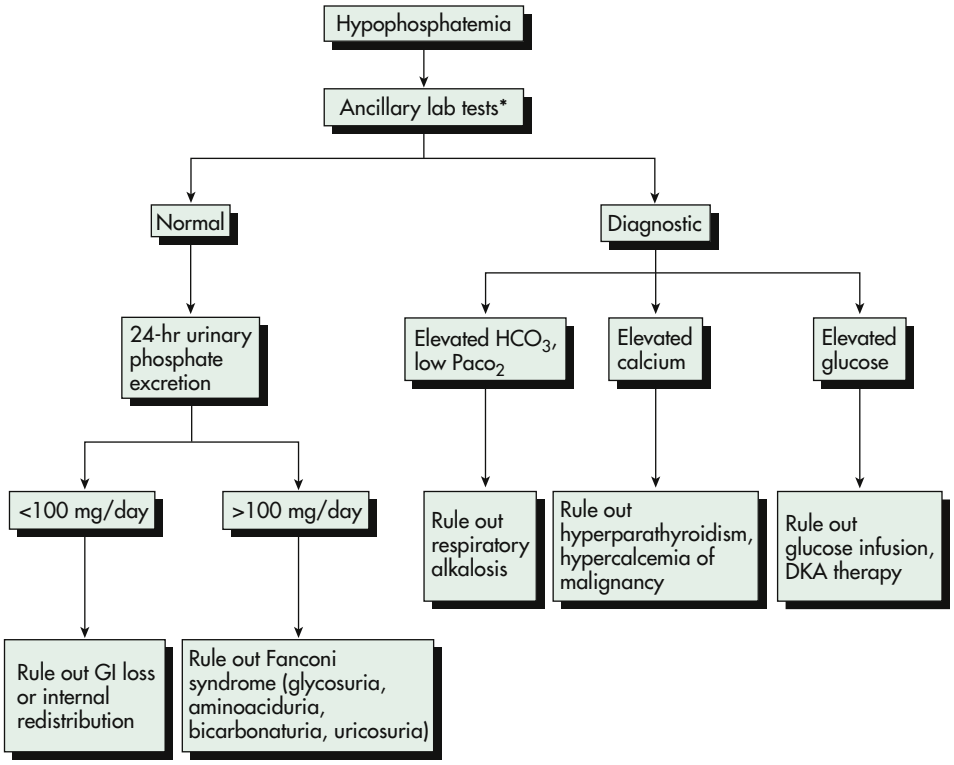

FIG. 43 Diagnostic algorithm for hypophosphatemia. *Serum creatinine, blood urea nitrogen (BUN), electrolytes, magnesium, calcium, glucose, urinalysis, creatine phosphokinase (CPK). *DKA,* Diabetic ketoacidosis; *GI,* gastrointestinal; *$Paco_2$,* partial pressure of carbon dioxide in the arterial blood. (From Ferri F: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging*, ed 4, Philadelphia, 2017, WB Saunders.)

Decreased in: Aspirin, some penicillins, chloroquine, chlorpromazine, clofibrate, captopril, Glanzmann thrombasthenia, Bernard-Soulier syndrome, Wiskott-Aldrich syndrome, cyclooxygenase deficiency. In von Willebrand disease there is normal aggregation with ADP, collagen, and epinephrine but abnormal agglutination with ristocetin.

PLATELET ANTIBODIES

Normal: Absent
Present in: Idiopathic thrombocytopenic purpura (ITP) (>90% of patients with chronic ITP). Patients with nonimmune thrombocytopenias may have false-positive results.

PLATELET COUNT

See Fig. E44 for evaluation of thrombocytosis. Box E27 describes testing for thrombocytopenia. See Table 79 for differential diagnosis. Table 80 describes antibody-mediated thrombocytopenic disorders caused by autoantibodies, alloantibodies, or potentially both. Tables 81 and 82 indicate differential diagnosis of thrombocytopenia in newborns and differential diagnosis of thrombocytopenia in pregnancy, respectively. Table 83 describes laboratory tests used to investigate a patient with thrombocytopenia.
Normal range: 130 to 400 × 103/mm3 (130-400 × 109/L [CF: 1; SMI: 5 × 109/L])
Elevated in
REACTIVE THROMBOCYTOSIS
Infections or inflammatory states: Vasculitis, allergic reactions, etc.
Surgery and tissue damage: Myocardial infarction, pancreatitis, etc.
Postsplenectomy state
Malignancy: Solid tumors, lymphoma
Iron deficiency anemia, hemolytic anemia, acute blood loss
Uncertain etiology
Rebound effect after chemotherapy or immune thrombocytopenia
Renal disorders: Renal failure, nephrotic syndrome
MYELOPROLIFERATIVE DISORDERS
Chronic myeloid leukemia
Primary thrombocythemia
Polycythemia vera
Idiopathic myelofibrosis
Decreased:
Increased destruction (see Table 84)
  Immunologic
    Drugs: Quinine, quinidine, digitalis, procainamide, thiazide diuretics, sulfonamides, phenytoin, aspirin, penicillin, heparin, gold, meprobamate, sulfa drugs, phenylbutazone, NSAIDs, methyldopa, cimetidine, furosemide, INH, cephalosporins, chlorpropamide, organic arsenicals, chloroquine
    Idiopathic thrombocytopenic purpura
    Transfusion reaction: Transfusion of platelets with platelet antigen HPA-1a (PL^{A1}) in recipients without PL^{A1}
    Fetal/maternal incompatibility
    Vasculitis (e.g., systemic lupus erythematosus)
    Autoimmune hemolytic anemia
    Lymphoreticular disorders (e.g., chronic lymphocytic leukemia)
Nonimmunologic
  Prosthetic heart valves
  Thrombotic thrombocytopenic purpura
  Sepsis
  Disseminated intravascular coagulation
  Hemolytic-uremic syndrome
  Giant cavernous hemangioma
Decreased production
  Abnormal marrow
    Marrow infiltration (e.g., leukemia, lymphoma, fibrosis)
    Marrow suppression (e.g., chemotherapy, alcohol, radiation)
  Hereditary disorders (see Table 85)
    Wiskott-Aldrich syndrome: X-linked disorder characterized by thrombocytopenia, eczema, and repeated infections
    May-Hegglin anomaly: Increased megakaryocytes but ineffective thrombopoiesis
  Vitamin deficiencies (e.g., vitamin B_{12}, folic acid)

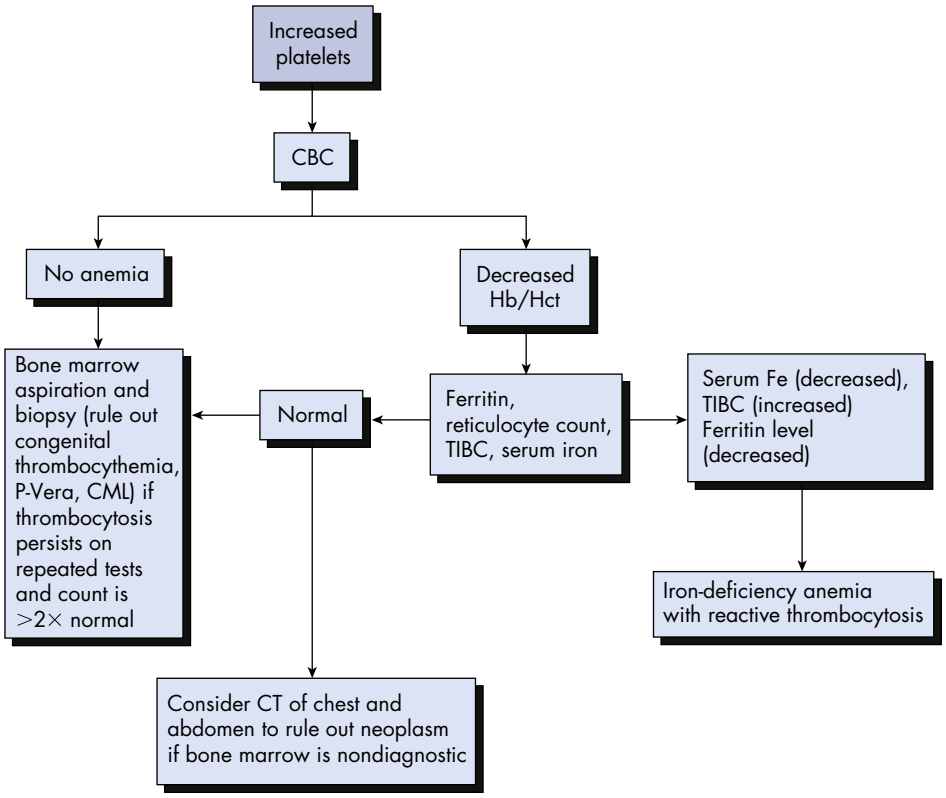

FIG. E44 Thrombocytosis diagnosis. *CBC,* Complete blood count; *CML,* chronic myelogenous leukemia; *CT,* computed tomography; *Hb/Hct,* hemoglobin/hematocrit; *P-Vera,* polycythemia vera; *TIBC,* total iron-binding capacity. (From Ferri FF: *Ferri's best test: a practical guide to clinical laboratory medicine and diagnostic imaging*, ed 4, Philadelphia, 2017, Elsevier Mosby.)

BOX E27 Thrombocytopenia Diagnostic Imaging

Best Test
None

Ancillary Test
CT of abdomen if splenomegaly is present

Lab Evaluation

Best Test
Bone marrow examination

Ancillary Tests
CBC, PT, PTT
LDH
HIV, ANA
Antiplatelet Ab
D-dimer
Antiglobulin (Coombs) test

Ab, Antibody; *ANA,* antibody to nuclear antigens; *CBC,* complete blood count; *CT,* computed tomography; *HIV,* human immunodeficiency virus; *LDH,* lactic dehydrogenase; *PT,* prothrombin time; *PTT,* partial thromboplastin time.
From Ferri FF: *Ferri's best test: A practical guide to clinical laboratory medicine and diagnostic imaging,* ed 4, Philadelphia, 2017, Elsevier Mosby.

TABLE 77 Causes of Hypophosphatemia

Decreased Phosphate Intake
- Starvation, inadequate phosphate intake, chronic diarrhea, chronic alcoholism
- Total parenteral nutrition with insufficient phosphate content

Increased Loss of Phosphate
- Increased renal phosphate excretion
  - Primary hyperparathyroidism
  - Secondary hyperparathyroidism: Vitamin D deficiency or resistance (including 1α-hydroxylase deficiency, VDR mutations, VDDR); imatinib
  - Excess FGF-23 or phosphatonins: X-linked hypophosphatemia, AD hypophosphatemic rickets, tumor-induced osteomalacia, epidermal nevus, McCune-Albright syndrome
  - Fanconi syndrome, cystinosis, Wilson disease, Dent disease, Lowe syndrome, multiple myeloma, amyloidosis, heavy-metal toxicity, rewarming of hyperthermia, Na/Pi-IIa and Na/Pi-IIc mutation (HHRH)
  - PTHrP-dependent hypercalcemia of malignancy
  - Hypomagnesemia
- Decreased intestinal absorption
  - Vitamin D deficiency or resistance (VDDR I and II)
  - Malabsorption
- Increased intestinal loss
  - Phosphate binding antacids used in treating peptic ulcers
- Increased loss from other routes
  - Skin: Severe burns
  - Vomiting

Phosphate Shifting from Extracellular Compartment to Cells and Bones
- Diabetic ketoacidosis
- Alcohol intoxication
- Acute respiratory alkalosis, salicylate intoxication, gram-negative sepsis, toxic shock syndrome, acute gout
- Refeeding syndromes from starvation, anorexia nervosa, hepatic failure: Acute intravenous glucose, fructose, glycerol
- Rapid cellular proliferation: Intensive erythropoietin therapy, GM-CSF therapy, leukemic blast crisis
- Recovery from hypothermia
- Heat stroke
- Post parathyroidectomy; "hungry bone" disease: Osteoblastic metastases, antiresorptive treatment of severe Paget disease
- Catecholamine (albuterol, dopamine, terbutaline, epinephrine)
- Thyrotoxic periodic paralysis
- Hypocalcemic periodic paralysis

Miscellaneous

Hyperaldosteronism
- Oncogenic hypophosphatemia
- Post kidney transplantation
- Post partial hepatectomy
- High-dose corticosteroids, estrogens
- Medications: Ifosfamide; toluene; calcitonin; bisphosphonate; tenofovir; paraquat, cisplatin; acetazolamide and other diuretics
- Post obstructive diuresis

AD, Autosomal dominant; *FGF-23,* fibroblast growth factor 23; *GM-CSF,* granulocyte-macrophage colony-stimulating factor; *HHRH,* hereditary hypophosphatemic rickets with hypercalciuria; *Na/Pi-II,* type II sodium-dependent phosphate cotransporter; *PTHrP,* parathyroid hormone-related peptide; *VDDR,* vitamin D-dependent rickets; *VDR,* vitamin D receptor.
From Skorecki K et al*: Brenner & Rector's the kidney,* ed 10, Philadelphia, 2016, Elsevier.

Splenic sequestration, hypersplenism
Dilutional, secondary to massive transfusion

PLATELET FUNCTION ANALYSIS 100 ASSAY (PFA)

Normal: This test is a two-component assay where blood is aspirated through two capillary tubes, one of which is coated with collagen and ADP (COL/ADP) and the other with collagen and epinephrine (COL/EPI). The test measures the ability of platelets to occlude an aperture in a biologically active membrane treated with COL/ADP and COL/EPI. During the test, the platelets adhere to the surface of the tube and cause blood flow to cease. The closing time refers to the cessation of blood flow and is reported in conjunction with the hematocrit and platelet count. Hematocrit count must be >25% and platelet count >50 K/microliter for the test to be performed.

TABLE 78 Treatment of Hypophosphatemia

Therapy	Dosage	Administration
Mild and Moderate Hypophosphatemia		
	Low-fat milk	Phosphate 0.9 mg/ml
	Buffered Na phosphate (Fleet enema)	1-3 g/day in 4 divided doses
	Neutra-Phos (250 mg elemental phosphorus per capsule)	1-3 g/day in 4 divided doses
	Calcitriol	30-70 ng/kg body weight per day
Asymptomatic Severe Hypophosphatemia		
Elemental phosphate	2.5 mg/kg body weight	IV over 6 hr
Symptomatic Severe Hypophosphatemia		
Elemental phosphate	5 mg/kg body weight	IV over 6 hr

IV, Intravenously.
From Skorecki et al: *Brenner & Rector's the kidney,* ed 10, Philadelphia, 2016, Elsevier.

TABLE 79 Differential Diagnosis of Thrombocytopenia in Suspected Disseminated Intravascular Coagulation

Differential Diagnosis	Additional Diagnostic Clues
DIC	Prolonged aPTT and PT, increased FDP, low levels of AT or protein C
Sepsis without DIC	Positive (blood) cultures, positive sepsis criteria, hematophagocytosis in BM aspirate
Massive blood loss	Major bleeding, low hemoglobin, prolonged aPTT and PT
Thrombotic microangiopathy	Schistocytes in blood smear, Coombs-negative hemolysis, fever, neurologic symptoms, renal insufficiency, coagulation test results usually normal, ADAMTS13 levels decreased
Heparin-induced thrombocytopenia	Use of heparin, venous or arterial thrombosis, positive HIT test (usually immunoassay for heparin-platelet factor 4 antibodies), increase in platelet count after cessation of heparin; coagulation tests usually normal
Immune thrombocytopenia	Antiplatelet antibodies, normal or increased number of megakaryocytes in BM aspirate, TPO decreased; coagulation tests usually normal
Drug-induced thrombocytopenia	Decreased number of megakaryocytes in BM aspirate or detection of drug-induced antiplatelet antibodies, increase in platelet count after cessation of drug; coagulation test results usually normal

ADAMTS13, A disintegrin and metalloproteinase with a thrombospondin type 1 motif, member 13; *aPTT,* activated partial thromboplastin time; *AT,* antithrombin; *BM,* bone marrow; *DIC,* disseminated intravascular coagulation; *FDP,* fibrin degradation product; *HIT,* heparin-induced thrombocytopenia; *PT,* prothrombin time; *TPO,* thrombopoietin.
From Hoffman R: *Hematology, basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

COL/ADP: 70 to 120 sec
COL/EPI: 75 to 120 sec
Elevated in: Acquired platelet dysfunction, von Willebrand disease, anemia, thrombocytopenia, use of aspirin and NSAIDs

PLEURAL FLUID

Testing and evaluation of results

Pleural effusion fluid should be differentiated in exudate or transudate.
- The initial laboratory studies should be aimed only at distinguishing an exudate from a transudate.
- Tube 1: Protein, LDH, albumin.
- Tubes 2, 3, 4: Save the fluid until further notice. In selected patients with suspected empyema, a pH level may be useful (generally ≤7.0). See following for proper procedure to obtain a pH level from pleural fluid.

A serum/effusion albumin gradient of ≤1.2 g/dl is indicative of exudative effusions, especially in patients with congestive heart failure (CHF) treated with diuretics.

TABLE 80 Antibody-Mediated Thrombocytopenic Disorders Caused by Autoantibodies (Immune Thrombocytopenia), Alloantibodies (Neonatal Alloimmune Thrombocytopenia), or Potentially Both (Posttransfusion Purpura)

	Immune Thrombocytopenia	Neonatal Alloimmune Thrombocytopenia	Posttransfusion Purpura
Immune reaction	Autoimmune	Alloimmune	Features of both allo- and autoimmunity
Incidence	5 per 100,000 population	40 per 100,000 births (or 1 per 2500)	1 per 100,000 blood transfusions
Principal antigenic target	GPIIb/IIIa	HPA-1a	HPA-1a plus autoantigens
Nature of the antibody	Intermittent	Persistent (past 1 yr)	Persistent often at high titers
Mode of sensitization	Autoantibody	Alloantibody	Features of allo- and autoantibodies
Sensitizing event	Mostly unknown; some viral illnesses, chronic infection	Exposure to fetal platelet antigens early in first pregnancy	Blood transfusion (RBCs or platelets) 5-10 days earlier
Bleeding frequency	Uncommon	Common	Very common
Epidemiology	Higher incidence in children and elderly adults; female predominance in early adulthood	Majority affects fetus or newborn carrying the HPA-1a antigen	Almost all are HPA-1bb women sensitized by previous transfusion or pregnancy

GP, Glycoprotein; *HPA,* human platelet antigen; *RBC,* red blood cell.
From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 81 Differential Diagnosis of Thrombocytopenia in Newborns

Perinatal Hypoxemia
Placental Insufficiency
Congenital Infection
- Sepsis
- Toxoplasmosis
- Rubella
- Cytomegalovirus

Autoimmune
- Maternal immune thrombocytopenia
- Maternal systemic lupus erythematosus

Disseminated Intravascular Coagulation
Maternal Drug Exposure
Congenital Heart Disease
Hereditary Thrombocytopenia
- MYH9 macrothrombocytopenia (including May-Hegglin anomaly)
- Thrombocytopenia absent radii syndrome
- Amegakaryocytic thrombocytopenia
- Wiskott-Aldrich syndrome
- Fanconi anemia

Hemangioma with Thrombocytopenia
- Kasabach-Merritt syndrome

Bone Marrow Infiltration
- Congenital leukemia

From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 82 Differential Diagnosis of Thrombocytopenia in Pregnancy

Incidental thrombocytopenia of pregnancy (gestational thrombocytopenia)
Preeclampsia or eclampsia[a]
DIC secondary to:
- Abruptio placentae
- Endometritis
- Amniotic fluid embolism
- Retained fetus
- Preeclampsia or eclampsia[a]

Peripartum or postpartum thrombotic microangiopathy
- TTP
- HssUS

DIC, Disseminated intravascular coagulation; *HUS,* hemolytic uremic syndrome; *TTP,* thrombotic thrombocytopenic purpura.
[a]Preeclampsia or eclampsia usually is not associated with overt DIC.
From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

Note the appearance of the fluid:
- A grossly hemorrhagic effusion can be a result of a traumatic tap, neoplasm, or an embolus with infarction.
- A milky appearance indicates either of the following:
  - Chylous effusion: Caused by trauma or tumor invasion of the thoracic duct; lipoprotein electrophoresis of the effusion reveals chylomicrons and triglyceride levels >115 mg/dl.
  - Pseudochylous effusion: Often seen with chronic inflammation of the pleural space (e.g., TB, connective tissue diseases).

If transudate, consider CHF, cirrhosis, chronic renal failure, and other hypoproteinemic states and perform subsequent workup accordingly.
If exudate, consider ordering these tests on the pleural fluid:
- Cytologic examination for malignant cells (for suspected neoplasm).
- Gram stain, cultures (aerobic and anaerobic), and sensitivities (for suspected infectious process).
- AFB stain and cultures (for suspected TB).
- pH: A value <7.0 suggests parapneumonic effusion or empyema; a pleural fluid pH must be drawn anaerobically and iced immediately; the syringe should be prerinsed with 0.2 ml of 1:1000 heparin.
- Glucose: A low glucose level suggests parapneumonic effusions and rheumatoid arthritis.
- Amylase: A high amylase level suggests pancreatitis or ruptured esophagus.
- Perplexing pleural effusions are often a result of malignancy (e.g., lymphoma, malignant mesothelioma, ovarian carcinoma), TB, subdiaphragmatic processes, prior asbestos exposure, and postcardiac injury syndrome.

Box 28 Describes a cellular differential of pleural effusions. Features differentiating exudative from transudative pleural effusion are summarized in Table 86.

POTASSIUM (serum)

Normal range: 3.5 to 5 mEq/L (3.5 to 5 mmol/L [CF: 1; SMI: 0.1 mmol/L])

CAUSES OF HYPERKALEMIA

See Fig. E45 for evaluation and treatment of hyperkalemia, and Fig. E46 for electrocardiographic changes in hyperkalemia.

Pseudohyperkalemia
- Hemolysis of sample
- Thrombocytosis
- Leukocytosis
- Laboratory error

Increased potassium intake and absorption
- Potassium supplements (oral and parenteral)
- Dietary: Salt substitutes

TABLE 83 Laboratory Tests Used to Investigate a Patient with Thrombocytopenia

Test	Rationale
Common Tests	
CBC	Isolated thrombocytopenia usually is caused by platelet destruction, but involvement of all cell lines suggests underproduction or sequestration
Examination of the blood film	Pseudothrombocytopenia (platelet clumps) Toxic changes and granulocyte "left shift" suggest septicemia Atypical lymphocytes suggest viral infection RBC fragments suggest TTP or HUS Parasites (e.g., in malaria) White cell inclusions suggest hereditary macrothrombocytopenia
Blood cultures	Bacteremia, fungemia
ANA test	Systemic lupus erythematosus
Direct antiglobulin test	Exclude immune hemolysis accompanying ITP (Evans syndrome)
Coagulation Assays	
aPTT, PT (INR), thrombin time, fibrinogen, D-dimer assay	DIC
LA assay (nonspecific inhibitor), anticardiolipin and anti-β_2-glycoprotein I assays	aPL antibody syndrome
Serum protein electrophoresis; IgG, IgM, IgA levels	ITP associated with lymphoproliferative disorder (monoclonal); hypersplenism associated with chronic hepatitis (polyclonal)
HIV serologic studies	HIV-associated thrombocytopenia
BM aspiration, biopsy	Assess megakaryocyte numbers and morphology; exclude primary BM disorder
Specialized Tests	
GP-specific platelet antibody assays (e.g., MAIPA)	Relatively specific assay for primary and secondary ITP
Drug-dependent increase in platelet-associated IgG	Specific assay for D-ITP
Drug-dependent platelet activation test (e.g., platelet serotonin release assay) or PF4-heparin (or PF4-polyanion) ELISA	HIT
Radionuclide platelet life span study with imaging (e.g., In platelet survival study)	Define the mechanism of thrombocytopenia; identify an "accessory" spleen postsplenectomy

ANA, Antinuclear antibody; *aPL,* antiphospholipid; *aPTT,* activated partial thromboplastin time; *BM,* bone marrow; *CBC,* complete blood count; *DIC,* disseminated intravascular coagulation; *D-ITP,* drug-induced immune thrombocytopenia; *ELISA,* enzyme-linked immunosorbent assay; *GP,* glycoprotein; *HIT,* heparin-induced thrombocytopenia; *HIV,* human immunodeficiency virus; *HUS,* hemolytic uremic syndrome; *Ig,* immunoglobulin; *INR,* international normalized ratio; *ITP,* idiopathic (immune) thrombocytopenic purpura; *LA,* lupus anticoagulant; *MAIPA,* monoclonal antibody immobilization of platelet antigens; *PF4,* platelet factor 4; *PT,* prothrombin time; *RBC,* red blood cell; *TTP,* thrombotic thrombocytopenic purpura.

From Hoffman R: *Hematology: basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 84 Mechanisms of Platelet Destruction

Type of Thrombocytopenia	Specific Example(s)
Immune Mediated	
Autoantibody-mediated platelet destruction by reticuloendothelial system (RES)	Primary immune thrombocytopenic purpura; secondary immune thrombocytopenia associated with lymphoproliferative disease; collagen vascular disease; infections such as infectious mononucleosis; human immunodeficiency virus syndrome
Alloantibody-mediated platelet destruction by RES	Neonatal alloimmune thrombocytopenia; posttransfusion purpura; passive alloimmune thrombocytopenia; alloimmune platelet transfusion refractoriness
Drug-dependent, antibody-mediated platelet destruction by RES	Drug-induced immune thrombocytopenic purpura (e.g., quinine)
Platelet activation by binding of immunoglobulin G (IgG) Fc of drug-dependent IgG to platelet FcγIIa receptors	Heparin-induced thrombocytopenia
Non-Immune Mediated	
Platelet activation by thrombin or proinflammatory cytokines	Disseminated intravascular coagulation; septicemia/systemic inflammatory response syndromes
Platelet destruction via ingestion by macrophages (hemophagocytosis)	Infections; certain malignant lymphoproliferative disorders
Platelet destruction through platelet interactions with altered von Willebrand factor	Thrombotic thrombocytopenic purpura; hemolytic-uremic syndrome; aortic stenosis
Platelet losses on artificial surfaces	Cardiopulmonary bypass surgery; use of intravascular catheters
Decreased platelet survival associated with cardiovascular disease	Congenital and acquired heart disease; cardiomyopathy; pulmonary embolism

McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Modified with permission from Warkentin TE, Kelton JG: Thrombocytopenia due to platelet destruction and hypersplenism. In Hoffman R et al (eds): *Hematology: Basic principles and practice.* Philadelphia, 2005, Elsevier Churchill Livingstone, pp 2305-2325.

- Stored blood
- Potassium-containing medications

Impaired renal excretion
- Acute renal failure
- Chronic renal failure
- Tubular defect in potassium secretion
  - Renal allograft
  - Analgesic nephropathy
  - Sickle cell disease
  - Obstructive uropathy
- Hypoaldosteronism
  - Primary (Addison disease)
  - Secondary
    - Hyporeninemic hypoaldosteronism (type IV renal tubular acidosis [RTA])
    - Congenital adrenal hyperplasia
    - Drug-induced
    - NSAIDs
    - ACE inhibitors
    - Heparin
    - Cyclosporine
- Transcellular shifts
  - Acidosis
  - Hypertonicity
  - Insulin deficiency
  - Drugs
    - β-blockers
    - Digitalis toxicity
    - Succinylcholine
  - Exercise
  - Hyperkalemic periodic paralysis

Cellular injury
- Rhabdomyolysis
- Severe intravascular hemolysis
- Acute tumor lysis syndrome
- Burns and crush injuries

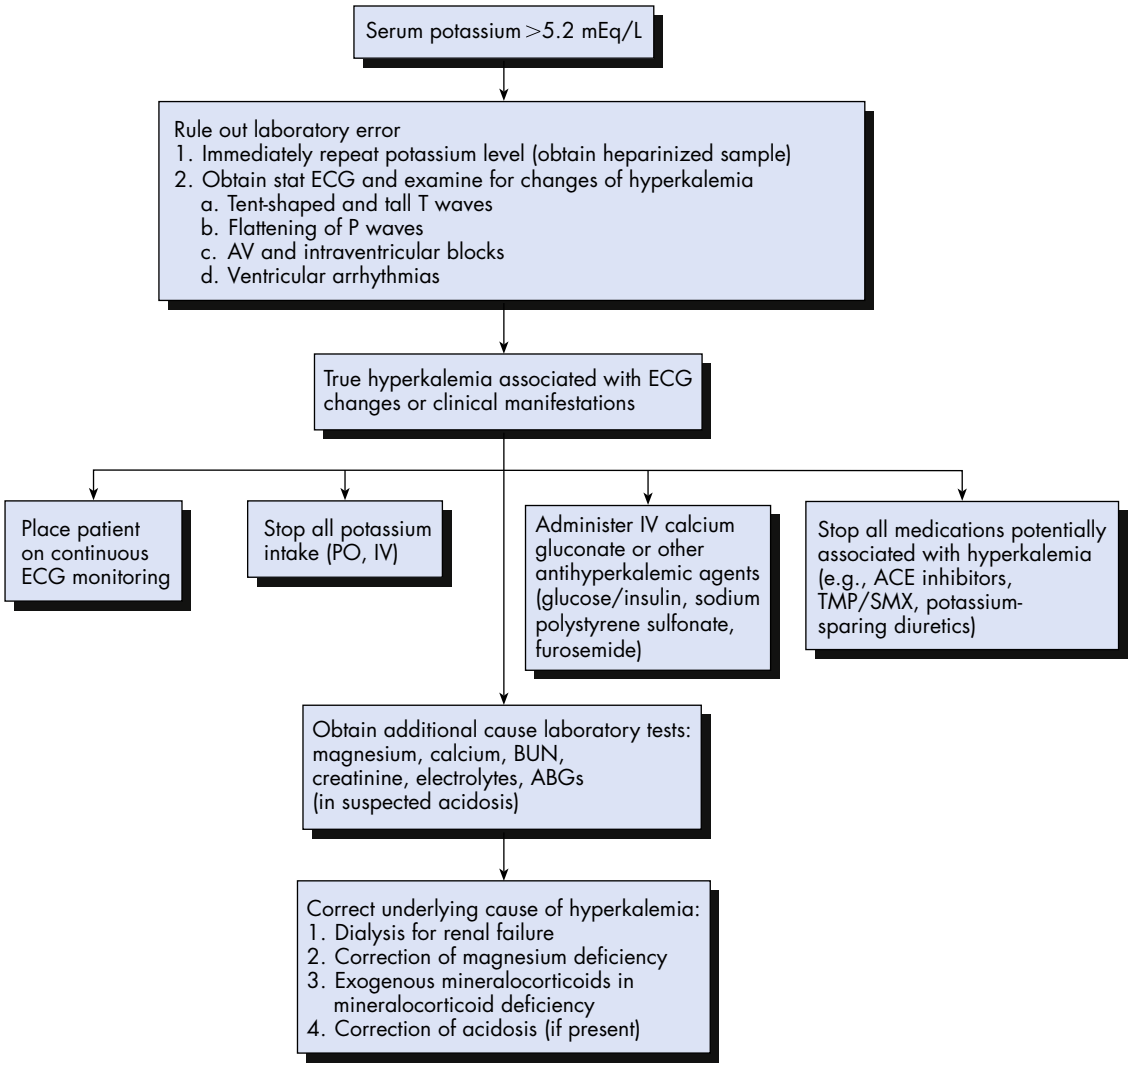

FIG. E45 Evaluation and treatment of hyperkalemia. *ABGs,* Arterial blood gases; *ACE,* angiotensin-converting enzyme; *AV,* atrioventricular; *BUN,* blood urea nitrogen; *ECG,* electrocardiogram; *IV,* intravenous; *PO,* oral; *TMP/SMX,* trimethoprim-sulfamethoxazole. (From Ferri F: *Practical guide to the care of the medical patient,* ed 9, St Louis, 2014, Mosby.)

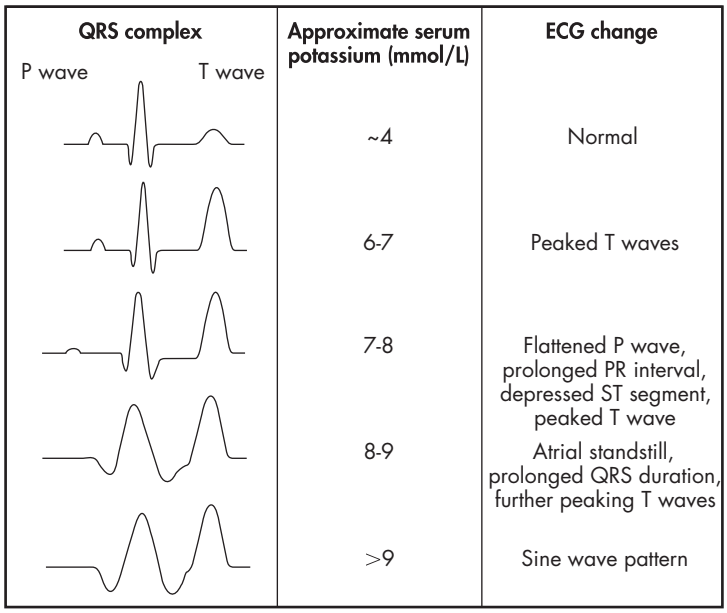

FIG. E46 Electrocardiographic changes in hyperkalemia. Progressive hyperkalemia results in identifiable changes in the electrocardiogram *(ECG).* These include peaking of the T wave, flattening of the P wave, prolongation of the PR interval, ST segment depression, prolongation of the QRS complex, and eventually, progression to a sine wave pattern. Ventricular fibrillation may occur at any time during this progression. (From Feehally J et al: *Comprehensive clinical nephrology,* ed 3, St Louis, 2007, Mosby.)

TABLE 85 Classification of Inherited Thrombocytopenias by Platelet Size

Small Platelets (MPV <7 fL)	Normal-Sized Platelets (MPV 7-11 fL)	Large Platelets (MPV >11 fL)
Wiskott-Aldrich syndrome	Congenital amegakaryocytic thrombocytopenia	*MYH9*-related disorders
X-linked thrombocytopenia	Thrombocytopenia absent radius syndrome	Bernard-Soulier syndrome
	Radioulnar synostosis with amegakaryocytic thrombocytopenia	Gray platelet syndrome
	RUNX1 mutations (FPD/AML)	Velocardiofacial syndrome
	ANKRD26-related thrombocytopenia	*GATA*-1 mutations
	CYCS-related thrombocytopenia	Type 2B von Willebrand disease
		Platelet-type von Willebrand disease
		Paris-Trousseau (Jacobsen) syndrome
		TUBB1-related macrothrombocytopenia
		Thrombocytopenia associated with sitosterolemia

MPV, Mean platelet volume.

In McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Modified with permission from Kumar R, Kahr WHA: Congenital thrombocytopenia: Clinical manifestations, laboratory abnormalities, and molecular defects of a heterogeneous group of conditions. In Rao AK (ed): *Hematology/oncology clinics of North America: disorders of the platelets,* vol 27, Philadelphia, 2013, Elsevier, pp 465-494.

BOX 28 Cellular Differential of Pleural Effusions

Neutrophilia (>50%)
Bacterial pneumonia (parapneumonic effusion)
Pulmonary infarction
Pancreatitis
Subphrenic abscess
Early tuberculosis
Transudates (>10%)

Lymphocytosis (>50%)
Tuberculosis
Viral infection
Malignancy (lymphoma, other neoplasms)
True chylothorax
Rheumatoid pleuritis
Systemic lupus erythematosus
Uremic effusions
Transudates (≈30%)

Eosinophilia (>10%)
Pneumothorax (air in pleural space)
Trauma
Pulmonary infarction
Congestive heart failure
Infection (especially parasitic, fungal)
Hypersensitivity syndromes
Drug reaction
Rheumatologic diseases
Hodgkin disease
Idiopathic

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 86 Features Differentiating Exudative from Transudative Pleural Effusion

Feature	Transudate	Exudate
Appearance	Serous	Cloudy
Leukocyte count	<10,000/mm^3	>50,000/mm^3
pH	>7.2	<7.2
Protein	<3.0 g/dl	>3.0 g/dl
Ratio of pleural fluid protein to serum	<0.5	>0.5
Lactate dehydrogenase (LDH)	<200 IU/L	>200 IU/L
Ratio of pleural fluid LDH to serum	<0.6	>0.6
Glucose	≥60 mg/dl	<60 mg/dl

From Bennett JE et al: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases*, ed 8, Philadelphia, 2015, WB Saunders.

CAUSES OF HYPOKALEMIA

For the clinical approach to hypokalemia, see Fig. 47.

- Decreased intake
  - Decreased dietary potassium
  - Impaired absorption of potassium
  - Clay ingestion
  - Kayexalate
- Increased loss
  - Renal
    - Hyperaldosteronism

Treatment of megaloblastic anemia
Acute mountain sickness

POTASSIUM, URINE

See URINE POTASSIUM

PROCAINAMIDE

Normal therapeutic range: 4 to 10 mcg/ml

PROGESTERONE (serum)

Normal:
Female: Follicular phase: 15 to 70 ng/dl
Luteal phase: 200 to 2500 ng/dl
Male: 15 to 70 ng/dl
Elevated in: Congenital adrenal hyperplasia, clomiphene, corticosterone, 11-deoxycortisol, dihydroprogesterone, molar pregnancy, lipoid ovarian tumor
Decreased in: Primary or secondary hypogonadism, oral contraceptives, ampicillin, threatened abortion

PROLACTIN

See Fig. E48 for the evaluation of hyperprolactinemia.
Normal range: <20 ng/ml (<20 μg/L [CF: 1; SMI: 1 μg/L])
Elevated in: Prolactinomas (level >200 micrograms/L highly suggestive), drugs (phenothiazines, cimetidine, tricyclic antidepressants, metoclopramide, estrogens, antihypertensives [methyldopa], verapamil, haloperidol), postpartum, stress, hypoglycemia, hypothyroidism, chronic liver disease, end-stage renal disease, brain radiation therapy, polycystic ovary syndrome, seizures, exercise, coitus, lactation. Mild hyperprolactinemia (<100 micrograms/L) can also be caused by large sellar masses, including nonfunctioning pituitary adenoma.

PROSTATE-SPECIFIC ANTIGEN (PSA)

Normal range: 0 to 4 ng/ml
Table 87 describes age-specific reference ranges for PSA.
Elevated in: Benign prostatic hypertrophy, carcinoma of prostate, prostatitis, postrectal examination, prostate trauma.
Factors affecting serum PSA are described in Table 88.
NOTE: Measurement of free PSA is useful to assess the probability of prostate cancer in patients with normal digital rectal examination and total PSA between 4 and 10 ng/ml. In these patients, the global risk of prostate cancer is 25%; however, if the free PSA is >25%, the risk of prostate cancer decreases to 8%, whereas if the free PSA is <10%, the risk of cancer increases to 56%. Free PSA is also useful to evaluate the aggressiveness of prostate cancer. A low free PSA percentage generally indicates a high-grade cancer, whereas a high free PSA percentage is generally associated with a slower-growing tumor.
Decreased in: 5-α reductase inhibitors (finasteride, dutasteride), saw palmetto use, antiandrogens

PROSTATIC ACID PHOSPHATASE

Normal: 0 to 0.8 U/L
Elevated in: Prostate cancer (especially in metastatic prostate cancer), BPH, prostatitis, post-prostate surgery or manipulation, hemolysis, androgens, clofibrate
Decreased in: Ketoconazole

PROTEIN (serum)

Normal range: 6 to 8 g/dl (60 to 80 g/L [CF: 10; SMI: 1 g/L])
Elevated in: Dehydration, multiple myeloma, Waldenström macroglobulinemia, sarcoidosis, collagen vascular diseases
Decreased in: Malnutrition, low-protein diet, overhydration, malabsorption, pregnancy, severe burns, neoplasms, chronic diseases, cirrhosis, nephrosis

PROTEIN C ASSAY

See Table 89 and Fig. 49.

TABLE 87 Age-Specific Reference Ranges for PSA

	Serum PSA (ng/ml)		
Age (yr)	Whites	Japanese	African Americans
40-49	0-2.5	0-2.0	0-2.0
50-59	0-3.5	0-3.0	0-4.0
60-69	0-4.5	0-4.0	0-4.5
70-79	0-6.5	0-5.0	0-5.5

PSA, Prostate-specific antigen.
From Nseyo UO (ed): *Urology for primary care physicians,* Philadelphia, 1999, WB Saunders.

TABLE 88 Factors Affecting Serum PSA

Factors Affecting Serum PSA	Duration of Effect
Prostate cell number	NA
Prostate size	NA
Recent ejaculation	6-48 hours
Prostate manipulation	
Vigorous massage	1 wk
Cystoscopy	1 wk
Prostate biopsy	4-6 wk
Prostatitis	
Acute	3-6 mo
Chronic	Unknown
Prostate cancer	NA
Drugs: finasteride*	3-6 mo

NA, Not applicable; *PSA,* prostate-specific antigen.
*Lowers PSA for as long as patient is on the medication.
From Nseyo UO (ed): *Urology for primary care physicians,* Philadelphia, 1999, Saunders.

TABLE 89 Assay Measurement in Heterozygote Protein C Deficiency

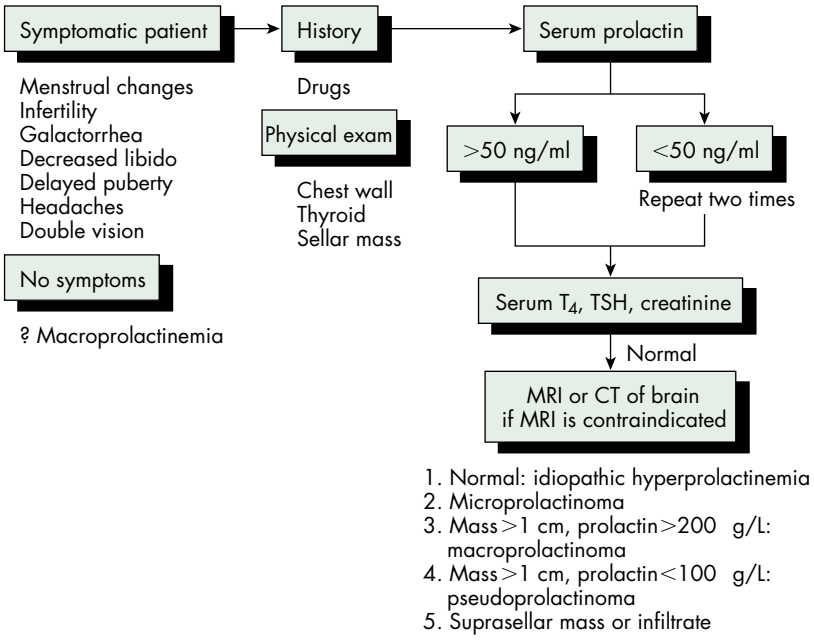
	ACTIVITY		
Type	Antigen	Amidolytic	Coagulant
I	Low	Low	Low
II	Normal	Low	Low
	Normal	Normal	Low

From Hoffman R et al: *Hematology: Basic principles and practice,* ed 5, Philadelphia, 2009, Churchill Livingstone.

Normal: 70% to 140%
Elevated in: Oral contraceptives, stanozolol
Decreased in: Congenital protein C deficiency, warfarin therapy, Vitamin K deficiency, renal insufficiency, consumptive coagulopathies

PROTEIN ELECTROPHORESIS (serum)

Normal range:
Albumin: 60% to 75% (0.6 to 0.75 [CF: 0.01; SMI: 0.01])
α-1: 1.7% to 5% (0.02 to 0.05)
α-2: 6.7% to 12.5% (0.07 to 0.13)
β: 8.3% to 16.3% (0.08 to 0.16)
γ: 10.7% to 20% (0.11 to 0.2)
Albumin: 3.6 to 5.2 g/dl (36 to 52 g/L [CF: 0.01; SMI: 1 g/L])
α-1: 0.1 to 0.4 g/dl (1 to 4 g/L)
α-2: 0.4 to 1 g/dl (4 to 10 g/L)



NOTE: Refer to Section I for additional information on Prolactinoma.

FIG. E48 Approach to hyperprolactinemia. *CT,* Computed tomography; *MRI,* magnetic resonance imaging; *T4,* thyroxine; *TSH,* thyroid-stimulating hormone. (From Copeland LJ: *Textbook of gynecology,* ed 2, Philadelphia, 2000, WB Saunders.)

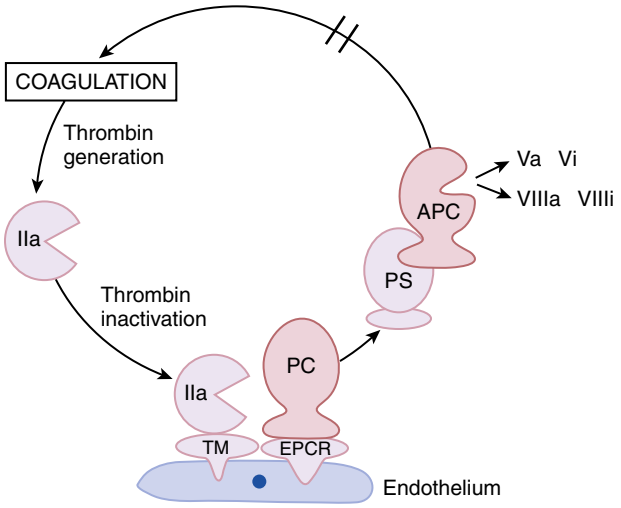


FIG. 49 Protein C pathway. Activation of coagulation triggers thrombin *(IIa)* generation. Excess thrombin binds to thrombomodulin *(TM)* on the endothelial cell surface. Once bound, the substrate specificity of thrombin is altered such that it no longer acts as a procoagulant but becomes a potent activator of protein C *(PC)*. The endothelial cell protein C receptor *(EPCR)* binds protein C and presents it to thrombomodulin-bound thrombin for activation. Activated protein C *(APC)*, together with its cofactor protein S *(PS)*, binds to the activated platelet surface and proteolytically degrades factors Va and VIIIa into inactive fragments *(Vi and VIIIi)*. Degradation of these activated cofactors inhibits thrombin generation *(double bar)*. (From Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.)

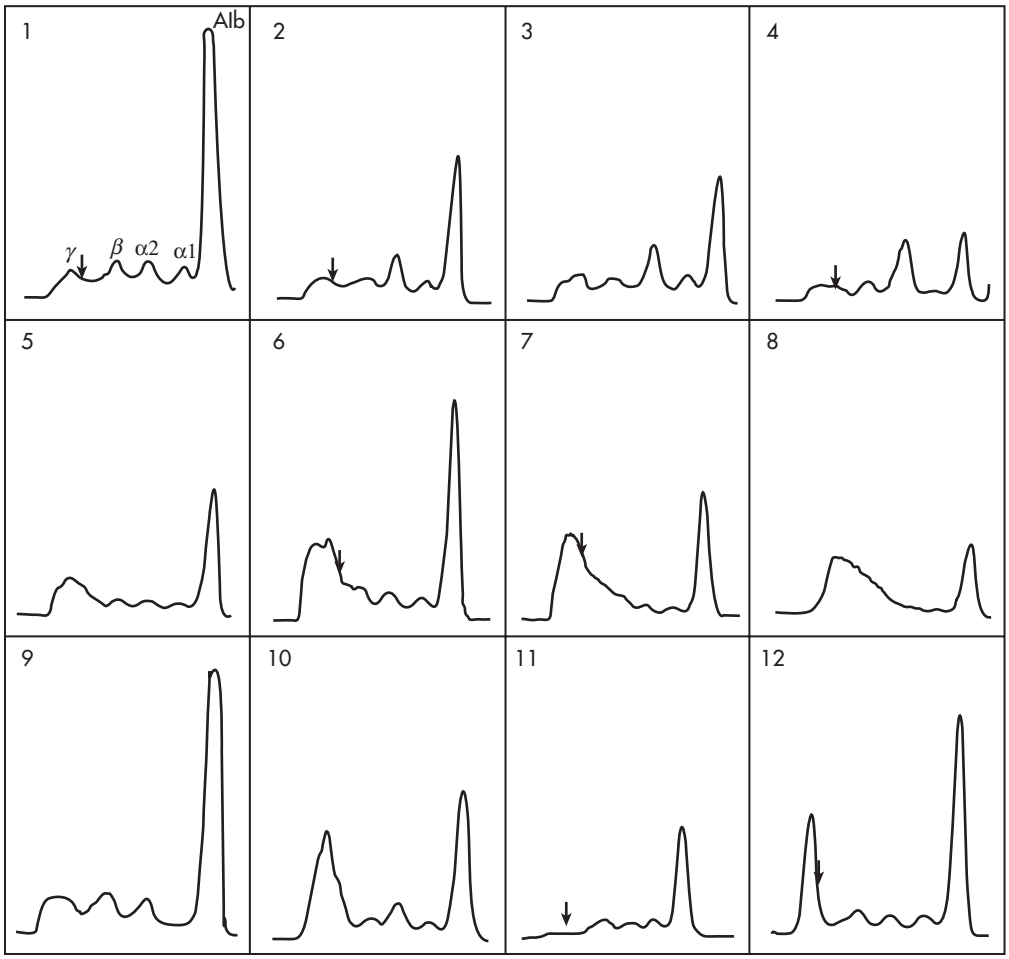

FIG. 50 Typical serum protein electrophoretic patterns. ***1,*** Normal (*arrow* near γ region indicates serum application point). ***2,*** Acute reaction pattern. ***3,*** Acute reaction or nephrotic syndrome. ***4,*** Nephrotic syndrome. ***5,*** Chronic inflammation, cirrhosis, granulomatous diseases, rheumatoid-collagen group. ***6,*** Same as 5, but γ elevation is more pronounced. There is also partial (but not complete) β-γ fusion. ***7,*** Suggestive of cirrhosis but could be found in the granulomatous diseases or the rheumatoid-collagen group. ***8,*** Characteristic pattern of cirrhosis. ***9,*** α-1 Antitrypsin deficiency with mild γ elevation suggesting concurrent chronic disease. ***10,*** Same as 5, but the γ elevation is marked. The configuration of the γ peak superficially mimics that of myeloma, but is more broad-based. There are superimposed acute reaction changes. ***11,*** Hypogammaglobulinemia or light-chain myeloma. ***12,*** Myeloma, Waldenström macroglobulinemia, idiopathic or secondary monoclonal gammopathy. (From Ravel R [ed]: *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.)

β: 0.5 to 1.2 g/dl (5 to 12 g/L)
γ: 0.6 to 1.6 g/dl (6 to 16 g/L)

Elevated in:
Albumin: Dehydration
α-1: Neoplastic diseases, inflammation
α-2: Neoplasms, inflammation, infection, nephrotic syndrome
β: Hypothyroidism, biliary cirrhosis, diabetes mellitus
γ: See IMMUNOGLOBULINS

Decreased in:
Albumin: Malnutrition, chronic liver disease, malabsorption, nephrotic syndrome, burns, systemic lupus erythematosus
α-1: Emphysema (α-1 antitrypsin deficiency), nephrosis
α-2: Hemolytic anemias (decreased haptoglobin), severe hepatocellular damage
β: Hypocholesterolemia, nephrosis
γ: See IMMUNOGLOBULINS

Fig. 50 describes serum protein electrophoretic patterns.

TABLE 90 Assay Measurements in Heterozygote Protein S Deficiency

	ACTIVITY		
Type	**Protein S Total Antigen**	**Protein S Free Antigen**	**Protein S Activity**
I (Classic)	Low	Low	Low
II	Normal	Normal	Low
III	Normal	Low	Low

From Hoffman R et al: *Hematology: Basic principles and practice,* ed 5, Philadelphia, 2009, Churchill Livingstone.

TABLE 91 Causes of Increased Prothrombin Time/International Normalized Ratio (PT/INR) and/or Activated Partial Prothrombin Time (APTT)

Increased PT/INR—Defect in Extrinsic Pathway
- Deficiency or inhibitor of factor VII
- Early warfarin (Coumadin) therapy
- Early liver disease

Increased APTT—Defect in Intrinsic Pathway
- Deficiency or inhibitor of factors XII, XI, IX, or VIII
- Heparin (though usually affects PT as well)
- Liver disease (though usually affects PT as well)
- Lupus anticoagulant (may affect PT as well)

Increased PT/INR and APTT—Defect in Common Pathway or Combined Defect in Extrinsic and Intrinsic Pathways
- Heparin (all serine proteases affected, especially II and X)
- Disseminated intravascular coagulation (all factors, including pro- and anticoagulants, affected)
- Liver disease (all factors except VIII affected)
- Warfarin (factors II, VII, IX, and X affected)
- Vitamin K deficiency (factors II, VII, IX, and X affected)
- Direct thrombin inhibitors
- Lupus anticoagulant

Modified from: Rizoli S, Aird WC: Coagulopathy. In Vincent JL et al (eds): *Textbook of critical care,* ed 6, Philadelphia, 2011, Elsevier.

PROTEIN S ASSAY

See Table 90.
Normal: 65% to 140%
Elevated in: Presence of lupus anticoagulant
Decreased in: Hereditary deficiency, acute thrombotic events, DIC, surgery, oral contraceptives, pregnancy, hormone replacement therapy, l-asparaginase treatment

PROTHROMBIN TIME (PT)

See Table 91.
Normal range: 10 to 12 sec
Elevated in: Liver disease, oral anticoagulants (warfarin), heparin, factor deficiency (I, II, V, VII, X), disseminated intravascular coagulation, vitamin K deficiency, afibrinogenemia, dysfibrinogenemia, drugs (salicylate, chloral hydrate, diphenylhydantoin, estrogens, antacids, phenylbutazone, quinidine, antibiotics, allopurinol, anabolic steroids). Table 92 describes a differential diagnosis of abnormal coagulation screening tests.
Decreased in: Vitamin K supplementation, thrombophlebitis, drugs (glutethimide, estrogens, griseofulvin, diphenhydramine)

PROTOPORPHYRIN (Free erythrocyte)

Normal range: 16 to 36 μg/dl of red blood cells (0.28 to 0.64 μmol/L [CF: 0.0177; SMI: 0.02 μmol/L])
Elevated in: Iron deficiency, lead poisoning, sideroblastic anemias, anemia of chronic disease, hemolytic anemias, erythropoietic protoporphyria

TABLE 92 Differential Diagnosis of Abnormal Coagulation Screening Tests

Abnormal Activated Partial Thromboplastin Time (APTT) Alone
- Associated with bleeding: VIII, IX, and XI defects
- Not associated with bleeding: XII, prekallikrein (PK), high molecular weight kininogen, lupus anticoagulants

Abnormal Prothrombin Time (PT) Alone
- Factor VII defects

Combined Abnormal APTT and PT
- Medical conditions: Anticoagulants, disseminated intravascular coagulation (DIC), liver disease, vitamin K deficiency, massive transfusion
- Rarely dysfibrinogenemia; factor X, V, and II defects

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

PSA

See PROSTATE-SPECIFIC ANTIGEN

PT

See PROTHROMBIN TIME

PTH

See PARATHYROID HORMONE

PTT

See PARTIAL THROMBOPLASTIN TIME

RAPID PLASMA REAGIN (RPR)

Description: Non-treponemal test traditionally used as a screening test for syphilis. It is a quantitative test and antibody titers can be monitored to assess treatment response.
Normal: Negative
Positive: Syphilis. False-positive results may occur with pregnancy, autoimmune diseases, tuberculosis, and other inflammatory conditions. Positive results should be confirmed with treponemal serologic tests (e.g., T-pallidum enzyme immunoassay [TP-EIA])

RDW

See RED BLOOD CELL DISTRIBUTION WIDTH

RED BLOOD CELL (RBC) COUNT

Normal range:
Male: 4.3 to 5.9 $\times 10^6$/mm^3 (4.3 to 5.9 $\times 10^{12}$/L [CF: 1; SMI: 0.1 $\times 10^{12}$/L])
Female: 3.5 to 5 $\times 10^6$/mm^3 (3.5 to 5 $\times 10^{12}$/L [CF: 1; SMI: 0.1 $\times 10^{12}$/L])
Elevated in: Polycythemia vera, smokers, high altitude, cardiovascular disease, renal cell carcinoma and other erythropoietin-producing neoplasms, stress, hemoconcentration/dehydration
Decreased in: Anemias, hemolysis, chronic renal failure, hemorrhage, failure of marrow production

RED BLOOD CELL DISTRIBUTION WIDTH (RDW)

Measures variability of red cell size (anisocytosis)
Normal range: 11.5 to 14.5
Normal RDW and elevated mean corpuscular volume (MCV): Aplastic anemia, preleukemia
Normal MCV: Normal, anemia of chronic disease, acute blood loss or hemolysis, chronic lymphocytic leukemia (CLL), chronic myelocytic leukemia, nonanemic enzymopathy or hemoglobinopathy
Decreased MCV: Anemia of chronic disease, heterozygous thalassemia
Elevated RDW and elevated MCV: Vitamin B_{12} deficiency, folate deficiency, immune hemolytic anemia, cold agglutinins, CLL with high count, liver disease

Normal MCV: Early iron deficiency, early vitamin B_{12} deficiency, early folate deficiency, anemic globinopathy
Decreased MCV: Iron deficiency, red blood cell fragmentation, HbH disease, thalassemia intermedia

See Table 93 for combining the reticulocyte count and RBC parameters for diagnosis.

TABLE 93 Combining the Reticulocyte Count and Red Blood Cell Parameters for Diagnosis

MCV, RDW	Reticulocyte Count <100,000/µL	Reticulocyte Count ≥100,000/µL
Low, normal	Anemia of chronic disease	
Normal, normal	Anemia of chronic disease	
High, normal	Chemotherapy, antivirals, or alcohol Aplastic anemia	Chronic liver disease
Low, high	Iron-deficiency anemia	Sickle cell–β-thalassemia
Normal, high	Early iron, folate, vitamin B_{12} deficiency Myelodysplasia	Sickle cell anemia, sickle cell disease
High, high	Folate or vitamin B_{12} deficiency Myelodysplasia	Immune hemolytic anemia Chronic liver disease

MCV, Mean corpuscular volume; *RDW,* red blood cell distribution width.
From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

RED BLOOD CELL FOLATE

See FOLATE

RED BLOOD CELL MASS (volume)

Normal range:
Male: 20 to 36 ml/kg body weight (1.15-1.21 L/m^2 body surface area)
Female: 19 to 31 ml/kg body weight (0.95-1.00 L/m^2 body surface area)
Elevated in: Polycythemia vera, hypoxia (smokers, high altitude, cardiovascular disease), hemoglobinopathies with high oxygen affinity, erythropoietin-producing tumors (renal cell carcinoma)
Decreased in: Hemorrhage, chronic disease, failure of marrow production, anemias, hemolysis

RED BLOOD CELL MORPHOLOGY

Table 94 describes features of the peripheral blood smear. Table 95 summarizes peripheral blood film evaluation in a patient with red cell membrane disorder. See Fig. 51 for useful peripheral blood and RBC features in the evaluation of anemia.

RENIN (serum)

Elevated in: Drugs (thiazides, estrogen, minoxidil), chronic renal failure, Bartter syndrome, pregnancy (normal), pheochromocytoma, renal hypertension, reduced plasma volume, secondary aldosteronism
Decreased in: Adrenocortical hypertension, increased plasma volume, primary aldosteronism, drugs (propranolol, reserpine, clonidine)

Table 96 describes typical renin-aldosterone patterns in various conditions.

TABLE 94 Features of the Peripheral Blood Smear

Red Blood Cell Morphology	Definition	Interpretation
Polychromasia	Large, bluish RBCs lacking normal central pallor on peripheral blood smear; bluish stain is the result of residual ribonucleic acid	Rapid production and release of RBCs from BM; elevated reticulocyte count; most commonly seen in any hemolytic anemia and states of increased RBC turnover
Basophilic stippling	Many small bluish dots in portion of erythrocytes; comes from staining of clustered polyribosomes in young circulating RBCs	Seen in a variety of erythropoietic disorders, including acquired (e.g., myelodysplasia) and congenital hemolytic anemias and occasionally in lead poisoning
Pappenheimer bodies	Several grayish, irregularly shaped inclusions in a portion of erythrocytes visible on peripheral smear; composed of aggregates of ribosomes, ferritin, and mitochondria	Erythropoietic malfunction in congenital anemias such as hemoglobinopathies, particularly with splenic hypofunction or acquired anemias such as megaloblastic anemia
Heinz bodies	Several grayish, round inclusions visible after supravital staining with methyl crystal violet of the peripheral blood smear, often in the context of bite cells; represent aggregates of denatured hemoglobin	Indicative of oxidative injury to the erythrocyte, such as occurs in G6PD deficiency and other RBC enzymopathies or unstable hemoglobins
Howell-Jolly bodies	Usually one or at most a few purplish inclusions in the erythrocyte visible on the routine peripheral blood smear; represent residual fragments of nuclei containing chromatin	Associated with states of splenic hypofunction, splenic atrophy, splenic thrombosis, or after splenectomy
Schistocytes	RBCs that are fragmented into a variety of shapes and sizes, including helmet-shaped cells; indicative of shearing of the erythrocyte within the circulation	Associated with microangiopathic hemolytic anemias, including DIC, TTP, HUS, or aHUS, as well as other mechanical causes of hemolysis, such as prosthetic heart valves or severe cardiac valvular stenosis
Spherocytes	RBCs that have lost their central pallor and appear spherical; indicative of loss of cytoskeletal integrity from internal or external causes	Associated with hereditary spherocytosis, autoimmune hemolytic anemia; may also be observed in addition to schistocytes in the presence of microangiopathic hemolytic anemia
Teardrop cells	Pear-shaped erythrocytes visible on peripheral blood smear; indicative of mechanical stress on the RBC during release from the BM or passage through the spleen	Seen in a variety of conditions along with other poikilocytes, including severe iron deficiency anemia, congenital anemias such as thalassemias, hemoglobinopathies, and acquired disorders such as megaloblastic anemia. As isolated poikilocyte, teardrop RBCs may be initial changes of myelophthisis (BM replacement or infiltration), e.g., myelodysplastic syndrome or myelofibrosis.
Burr cells (echinocytes)	RBCs that have smooth undulations present on the surface circumferentially; pathogenesis unknown	Indicative of uremia when present on a properly made peripheral blood smear
Spur cells (acanthocytes)	RBCs that have spiny points present on the surface circumferentially; reflective of abnormal lipid composition of RBC membrane	Most commonly indicative of hemolytic anemia of advanced liver disease when present in significant numbers; also seen in abetalipoproteinemia and in RBCs lacking the Kell blood group antigen

aHUS, Atypical hemolytic uremic syndrome; *BM,* bone marrow; *DIC,* disseminated intravascular coagulation; *G6PD,* glucose-6-phosphate dehydrogenase; *HUS,* hemolytic uremic syndrome; *RBC,* red blood cell; *TTP,* thrombotic thrombocytopenic purpura.
From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 95 Peripheral Blood Film Evaluation in a Patient with Red Cell Membrane Disorder

Shape	Pathobiology	Diagnosis
Microspherocytes	Loss of membrane lipids leading to a reduction of surface area resulting from deficiencies of spectrin, ankyrin, or band 3 and protein 4.2; removal of membrane material from antibody-coated red cells by macrophages; removal of membrane-associated Heinz bodies, with the adjacent membrane lipids, by the spleen	HS Immunohemolytic anemias; Heinz body hemolytic anemias
Elliptocytes	Permanent red cell deformation resulting from a weakening of skeletal protein interactions (such as the spectrin dimer-dimer contact). This facilitates disruption of existing protein contacts during shear stress-induced elliptical deformation. Subsequently, new protein contacts are formed that stabilize elliptical shape; unknown	Mild common HE; iron deficiency, megaloblastic anemias, myelofibrosis, myelophthisic anemias, myelodysplastic syndrome, thalassemias
Poikilocytes/Fragments	Weakening of skeletal protein contacts resulting from skeletal protein mutations; unknown	Hemolytic HE/HPP; iron deficiency, megaloblastic anemias, myelofibrosis, myelophthisic anemias, myelodysplastic syndrome, thalassemias
Schistocytes, fragmented red cells	Red cells "torn" by mechanical trauma (fibrin strands, turbulent flow)	"Microangiopathic" hemolytic anemia associated with disseminated intravascular coagulation, thrombotic thrombocytopenic purpura, vasculitis, heart valve prostheses
Acanthocytes	Uptake of cholesterol and its preferential accumulation in the outer leaflet of the lipid bilayer; selective accumulation of sphingomyelin in the outer lipid leaflet; unknown	Spur cell hemolytic anemia in severe liver disease; abetalipoproteinemia; chorea-acanthocytosis syndrome, malnutrition, hypothyroidism; McLeod phenotype
Echinocytes	Expansion of the surface area of the outer hemileaflet of lipid bilayer relative to the inner hemileaflet; unknown	Hemolytic anemia associated with hypomagnesemia and hypophosphatemia in malnourished patients, pyruvate kinase deficiency; in vitro artifact of low blood storage (ATP depletion), contact with glass or elevated pH Hemolysis in long-distance runners, renal failure
Stomatocytes	Expansion of the surface area of the inner hemileaflet of the bilayer relative to the outer leaflet; unknown	Exposure of red cells to cationic anesthetics in vitro; in vivo the drug concentrations may not be sufficient to produce similar effect; alcoholism, inherited disorders of membrane permeability (hereditary stomatocytosis)
Target cells	Absolute excess of membrane lipids (both cholesterol and phospholipids: "symmetric" lipid gain), followed by an increase of cell surface area; relative excess of surface area because of a decrease in cell volume	Obstructive jaundice, liver disease with intrahepatic cholestasis; thalassemias and some hemoglobinopathies (C, D, E)

ATP, Adenosine triphosphate; *HE,* hereditary elliptocytosis; *HPP,* hereditary pyropoikilocytosis; *HS,* hereditary spherocytosis.
From Hoffman R et al: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, WB Saunders.

RESPIRATORY SYNCYTIAL VIRUS (RSV) SCREEN

Test description: PCR test can be performed on nasopharyngeal swab, wash, or aspirate

RETICULOCYTE COUNT

See Fig. E52, Fig. 53, and Table 97.
Normal range: 0.5% to 1.5%
Elevated in: Hemolytic anemia (sickle cell crisis, thalassemia major, autoimmune hemolysis), hemorrhage, postanemia therapy (folic acid, ferrous sulfate, vitamin B_{12}), chronic renal failure
Decreased in: Aplastic anemia, marrow suppression (sepsis, chemotherapeutic agents, radiation), hepatic cirrhosis, blood transfusion, anemias of disordered maturation (iron deficiency anemia, megaloblastic anemia, sideroblastic anemia, anemia of chronic disease)

RHEUMATOID FACTOR

Normal: Negative. Present in titer >1:20
RHEUMATIC DISEASES
Rheumatoid arthritis
Sjögren syndrome
Systemic lupus erythematosus
Polymyositis/dermatomyositis
Mixed connective tissue disease
Scleroderma
INFECTIOUS DISEASES
Subacute bacterial endocarditis
Tuberculosis
Infectious mononucleosis
Hepatitis
Syphilis
Leprosy
Influenza
MALIGNANCIES
Lymphoma
Multiple myeloma
Waldenström macroglobulinemia
Postradiation or postchemotherapy
MISCELLANEOUS
Normal adults, especially the elderly
Sarcoidosis
Chronic pulmonary disease (interstitial fibrosis)
Chronic liver disease (chronic active hepatitis, cirrhosis)
Mixed essential cryoglobulinemia
Hypergammaglobulinemic purpura

RNP

See EXTRACTABLE NUCLEAR ANTIGEN

RPR

See RAPID PLASMA REAGIN

ROTAVIRUS SEROLOGY

Test description: PCR test is performed on stool specimen
Normal: Negative

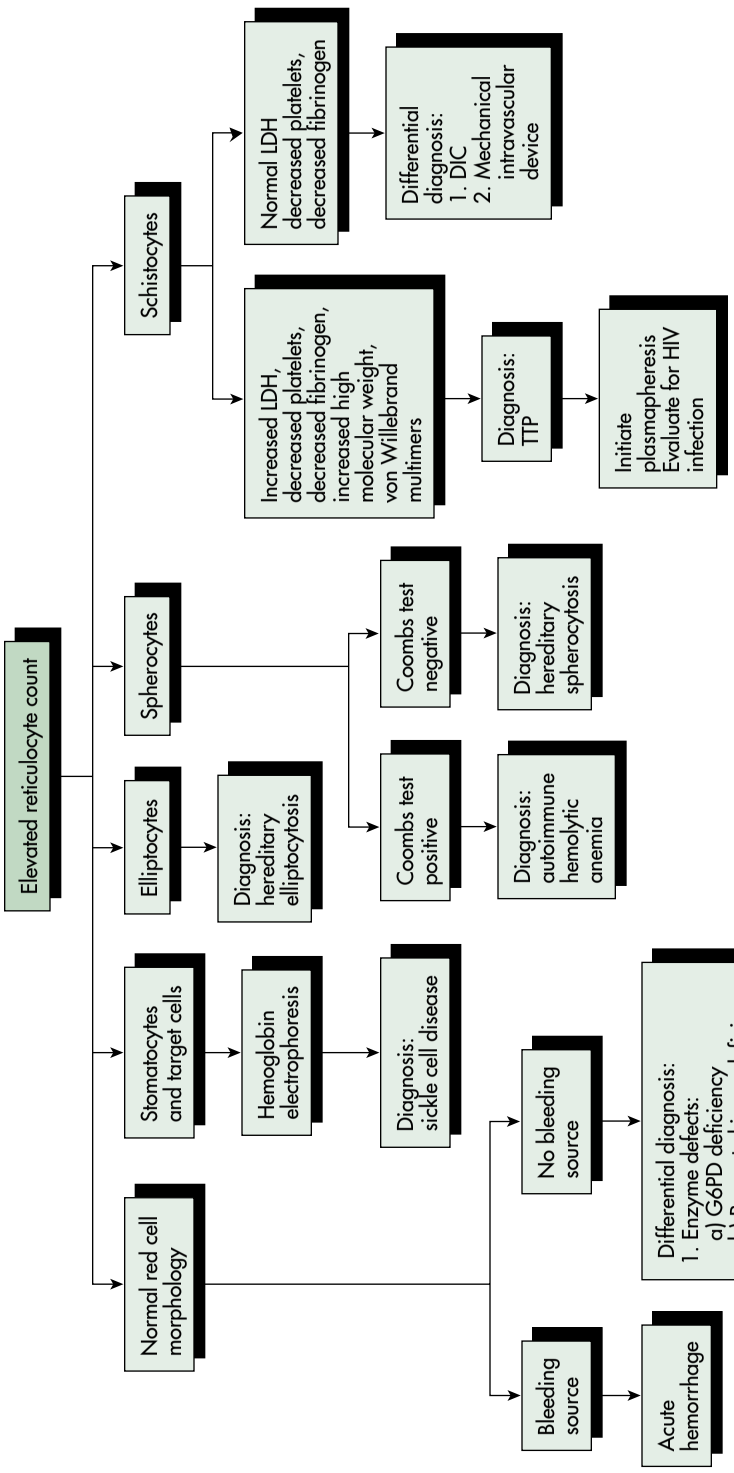

FIG. E52 Differential diagnosis of elevated reticulocyte count. *DIC*, Disseminated intravascular coagulation; *G6PD*, glucose-6-phosphate dehydrogenase; *HIV*, human immunodeficiency virus; *LDH*, lactic dehydrogenase; *TTP*, thrombotic thrombocytopenic purpura. (From Rakel RE [ed]: *Principles of family practice*, ed 7, Philadelphia, 2007, WB Saunders.)

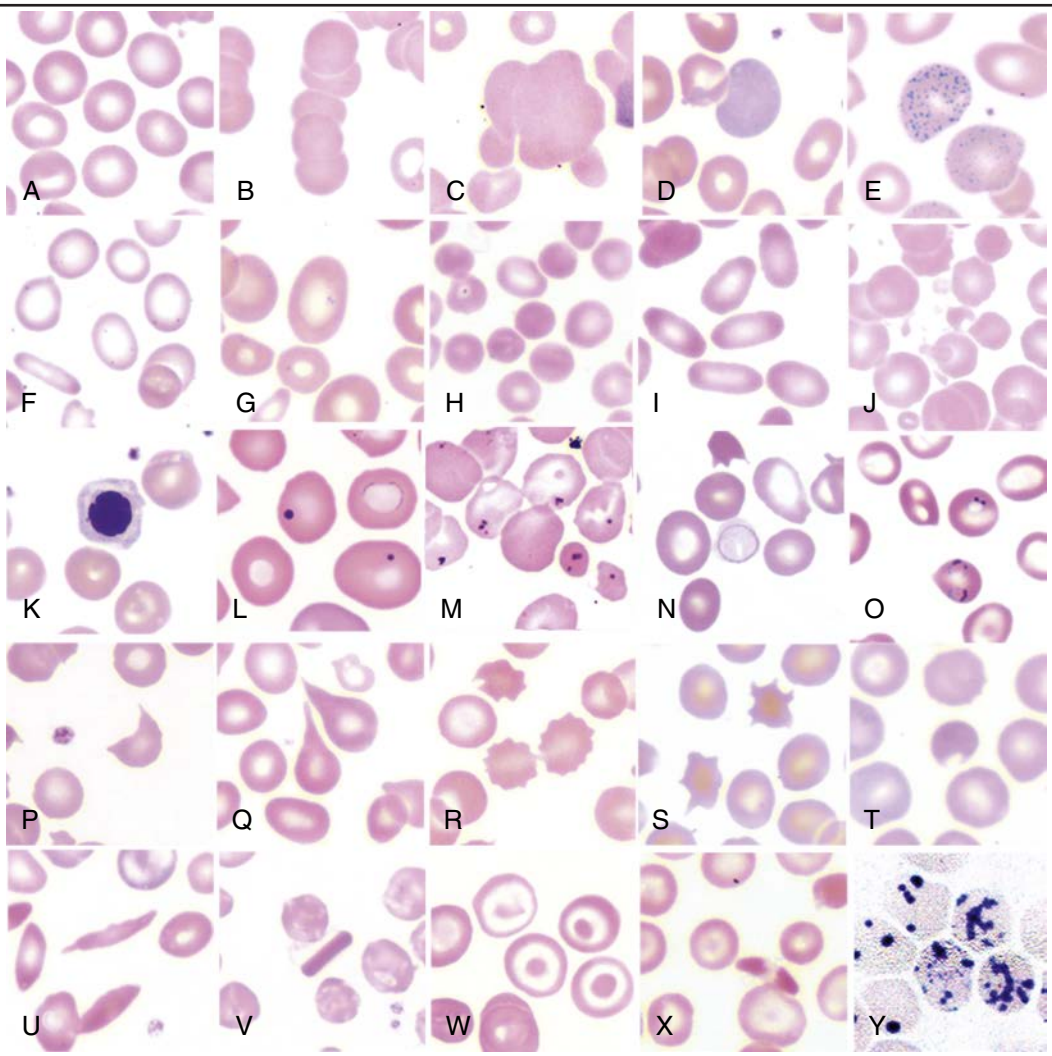

FIG. 51 Useful peripheral blood and red blood cell features in the evaluation of anemia. A, Normal red blood cells *(RBCs).* Note that the central pallor is one-third the diameter of the entire cell. **B,** Rouleaux formation is indicative of increased plasma protein. **C,** Agglutination indicates an antibody-mediated process such as cold agglutinin disease. **D,** Polychromatophilic cell. The gray-blue color is attributable to RNA and the cell is equivalent to a reticulocyte, which must be identified with a reticulocyte stain. **E,** Basophilic stippling. This also is attributable to increased RNA caused either by a left shift in erythroid cells or lead toxicity. **F,** Hypochromic microcytic cells typical of iron-deficiency anemia. Note the widened central pallor and the "pencil" cell in the *lower left*. **G,** Macroovalocyte as can be seen in either megaloblastic anemia or myelodysplastic syndrome. **H,** Microspherocytes typical of hereditary spherocytosis. **I,** Elliptocytes (ovalocytes) from a patient with hereditary elliptocytosis. **J,** RBC fragments from thermal injury (burn patient). **K,** Nucleated RBC. **L,** Howell-Jolly bodies indicative of splenic dysfunction or absence. **M,** Pappenheimer bodies from a patient with sideroblastic anemia. **N,** Cabot ring, as can be seen in megaloblastic anemia or MDS. **O,** Malarial parasites *(Plasmodium falciparum)*. **P,** Schistocyte typical of a microangiopathic hemolytic anemia. **Q,** Tear-drop form indicates marrow fibrosis and extramedullary hematopoiesis. **R,** Echinocyte (Burr cell) with rounded edges. **S,** Acanthocyte (spur cell) with more irregular pointed ends. This was from a patient with neuroacanthocytosis. They can also be seen in patients with liver disease and lipid abnormalities. **T,** "Bite" cell from a patient with glucose-6-phosphate dehydrogenase *(G6PD)* deficiency. **U,** Sickle cell, from a patient with homozygous sickle cell disease. **V,** Hemoglobin C crystal. **W,** Target cells. **X,** Hemoglobin C disease. Note that the RBC in center has condensed hemoglobin at each pole. **Y,** Heinz body preparation (supravital stain) from a patient with G6PD deficiency. Note that the cells to the right have increased precipitated hemoglobin. (From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.)

TABLE 96 Typical Renin-Aldosterone Patterns in Various Conditions

	Plasma Renin	Aldosterone
Primary aldosteronism	Low	High
"Low-renin" essential hypertension	Low	Normal
Cushing syndrome	Low	Low-normal
Licorice ingestion syndrome	Low	Low
High-salt diet	Low	Low
Oral contraceptives	High	Normal
Cirrhosis	High	High
Malignant hypertension	High	High
Unilateral renal disease	High	High
"High-renin" essential hypertension	High	High
Pregnancy	High	High
Diuretic overuse	High	High
Juxtaglomerular tumor (Bartter syndrome)	High	High
Low-salt diet	High	High
Addison disease	High	Low
Hypokalemia	High	Low

From Ravel R (ed): *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

Rotavirus Serology

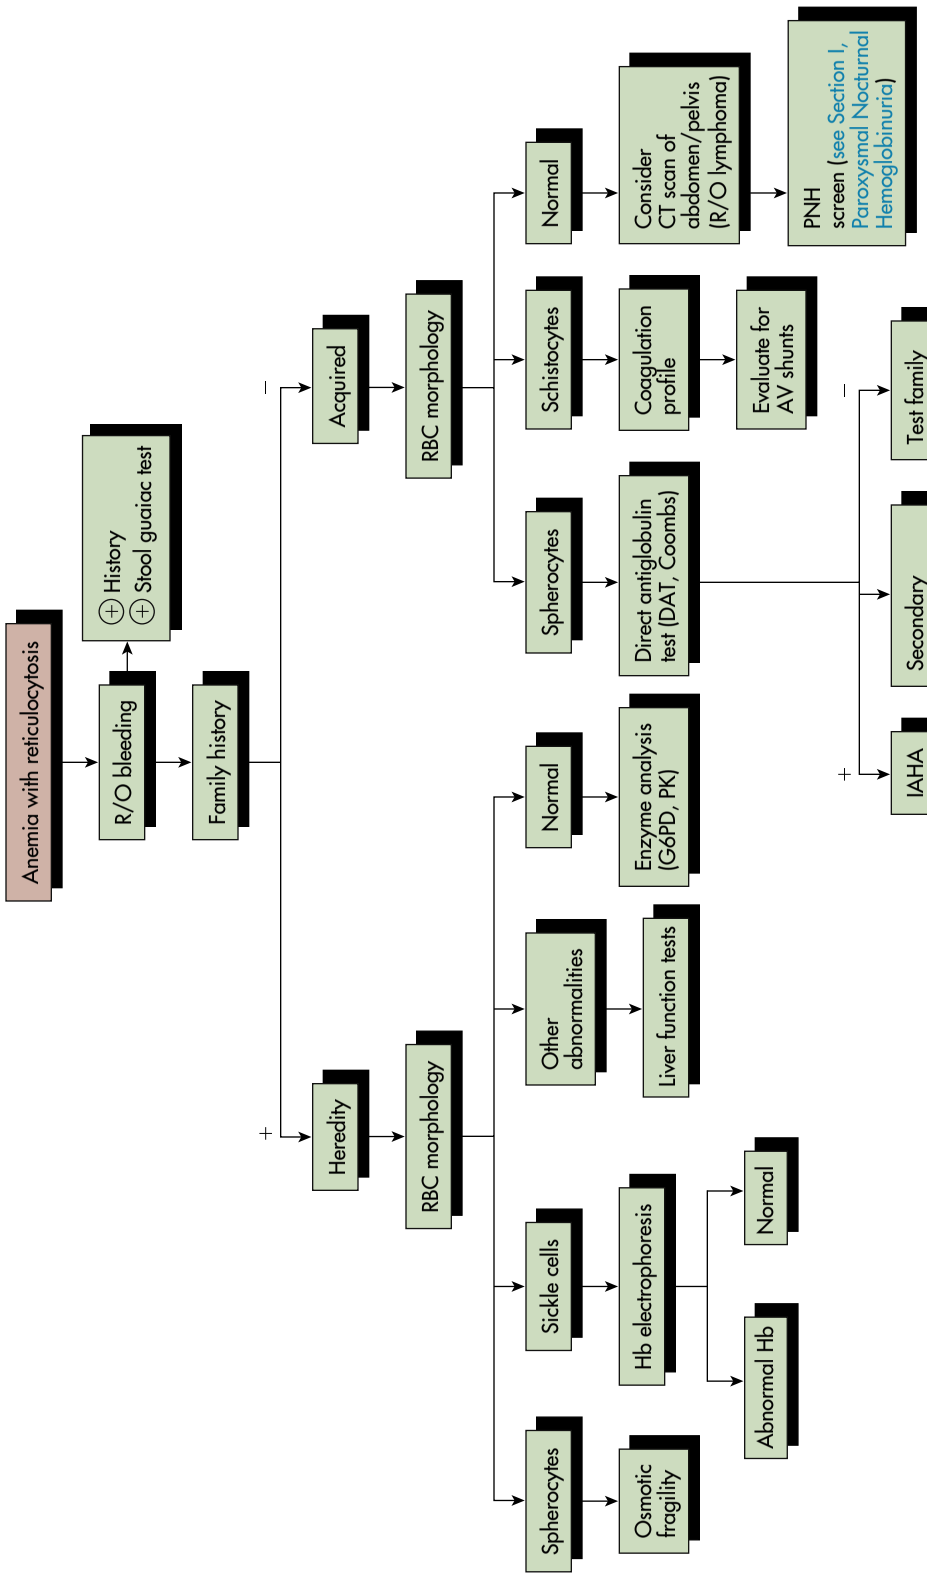

FIG. 53 Evaluation of patients with hemolytic anemia. *AV,* Arteriovenous; *CT,* computed tomography; *G6PD,* glucose-6-phosphate dehydrogenase; *Hb,* hemoglobin; *IAHA,* idiopathic autoimmune hemolytic anemia; *LS,* liver spleen; *PK,* pyruvate kinase; *PNH,* paroxysmal nocturnal hemoglobinuria; *RBC,* red blood cell, *R/O,* rule out.

TABLE 97 Combining the Reticulocyte Count and Red Blood Cell Parameters for Diagnosis

MCV, RDW	Reticulocyte Count <75,000/µL	Reticulocyte Count >100,000/µL
Low, Normal	Anemia of chronic disease	
Normal, Normal	Anemia of chronic disease	
High, Normal	Chemotherapy/antivirals/ alcohol Aplastic anemia	Chronic liver disease
Low, High	Iron deficiency anemia	Sickle cell-β-thalassemia
Normal, High	Early iron, folate, vitamin B_{12} deficiency Myelodysplasia	Sickle cell anemia, sickle cell disease
High, High	Folate or vitamin B_{12} deficiency Myelodysplasia	Immune hemolytic anemia Chronic liver disease

MCV, Mean corpuscular volume; *RDW,* red blood cell distribution width.
From Hoffman R et al: *Hematology: Basic principles and practice,* ed 5, Philadelphia, 2009, Churchill Livingstone.

TABLE 98 Semen Analysis Reference Ranges

Color	Grayish white
pH	7.3-7.8 (literature range, 7.0-7.8)
Volume	2.0-5.0 ml (literature range, 1.5-6.0 ml)
Sperm count	20-250 million/ml (literature range for upper limit varies from 100-250 million/ml)
Motility	>60% motile <3 hours after specimen is obtained (literature range, >40% to >70%)
% Normal sperm	>60% (literature range, >60% to >70%)
Viscosity	Can be poured from a pipet in droplets rather than a thick strand

From Ravel R (ed): *Clinical laboratory medicine,* ed 6, St Louis, 1995, Mosby.

SED RATE

SEDIMENTATION RATE
See ERYTHROCYTE SEDIMENTATION RATE

SEMEN ANALYSIS
Table 98 describes semen analysis reference ranges.

SGOT
See ASPARTATE AMINOTRANSFERASE

SGPT
See ASPARTATE AMINOTRANSFERASE

SICKLE CELL TEST
Normal: Negative
Positive in: Sickle cell anemia, sickle cell trait, combination of *Hb S* gene with other disorders such as alpha-thalassemia, beta-thalassemia.

SMOOTH MUSCLE ANTIBODY
Normal: Negative
Present in: Chronic acute hepatitis, primary sclerosing cholangitis, primary biliary cirrhosis, autoimmune hepatitis, infectious mononucleosis

SODIUM (serum)
Normal range: 135 to 147 mEq/L (135 to 147 mmol/L [CF: 1; SMI: 1 mmol/L]). Electrolyte concentrations in extracellular and intracellular fluid are summarized in Table 99.

HYPONATREMIA

See Fig. 54.

Common causes of hyponatremia and electrolyte patterns in serum and urine with normal renal function are described in Table 100. Table E101 describes drugs associated with hyponatremia.

Sodium and water depletion (deficit hyponatremia)

Loss of gastrointestinal secretions with replacement of fluid but not electrolytes

TABLE 99 Electrolyte Concentrations in Extracellular and Intracellular Fluids

	PLASMA		INTERSTITIAL FLUID		PLASMA WATER		CELL WATER (MUSCLE)	
	(mmol/L)	(mmol/L)	(mmol/L)	(mmol/L)	(mmol/L)	(mmol/L)	(mmol/L)	(mmol/L)

TABLE E101 Drugs Associated with Hyponatremia*

Vasopressin Analogs	Drugs That Potentiate Renal Action of Vasopressin
Desmopressin (DDAVP)	Chlorpropamide
Oxytocin	Cyclophosphamide
	Nonsteroidal anti inflammatory agents
	Acetaminophen (paracetamol)
Drugs That Enhance Vasopressin Release	Drugs That Cause Hyponatremia by Unknown Mechanisms
Chlorpropamide	*Haloperidol*
Clofibrate	Fluphenazine
Carbamazepine-oxcarbazepine	Amitriptyline
Vincristine	Thioridazine
Nicotine	Fluoxetine
Narcotics	*Methamphetamine (MDMA or Ecstasy)*
Antipsychotics/antidepressants	Sertraline
Ifosfamide	

Italics: The common causes.
*Not including diuretics.
From Johnson RJ, Feehally J: *Comprehensive clinical nephrology,* ed 2, St Louis, 2000, Mosby.

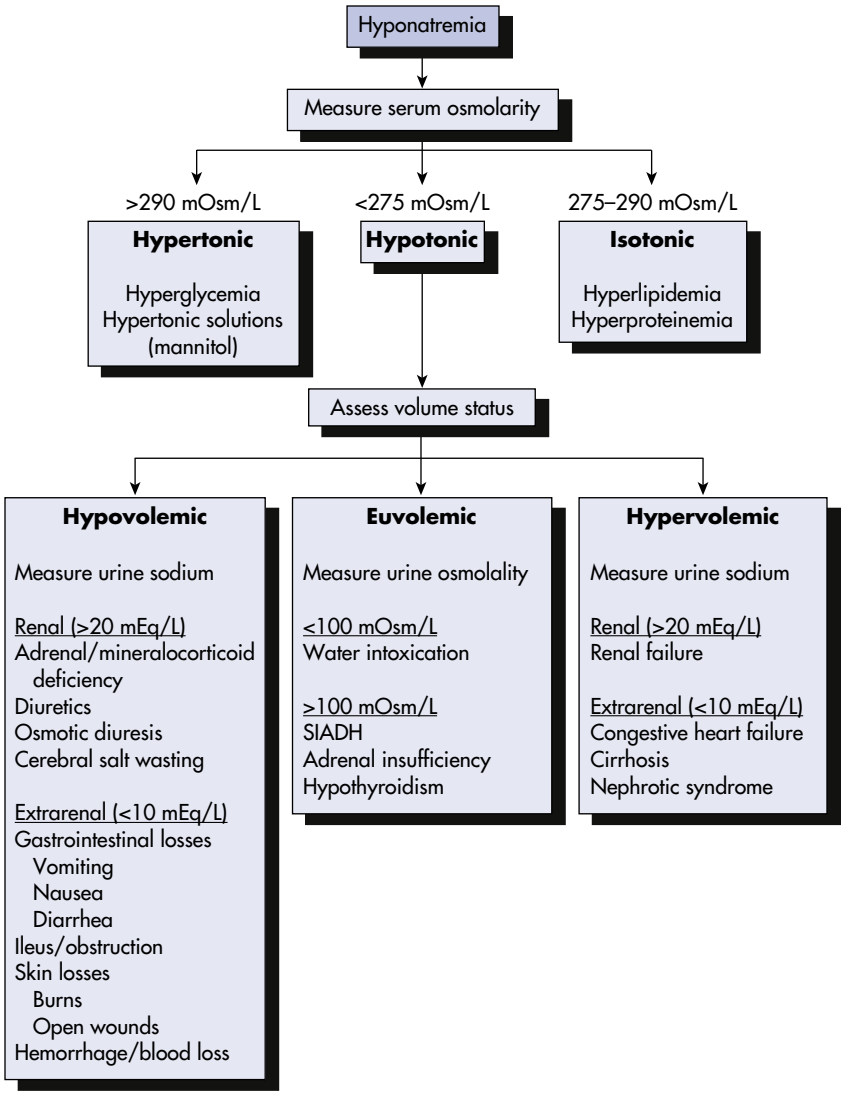

FIG. 54 Algorithm for diagnosis and treatment of hyponatremia. *SIADH,* Syndrome of inappropriate antidiuretic hormone. (From Cameron JL, Cameron AM: *Electrolyte disorders: current surgical therapy*, ed 10, Philadelphia, 2011, WB Saunders.)

TABLE 100 Common Causes of Hyponatremia and Electrolyte Patterns in Serum and Urine with Normal Renal Function*

Cause	Serum Na	Urine Na (UNa)	Urine Osmolality	Serum K	24-Hour UNa
1. Overhydration	Low	Low	Low	Normal or low	Low
2. Diuretics	Low	Low	Low	Low	High
3. SIADH†	Low	High	High	Normal or low	High
4. Adrenal failure	Low	Mildly elevated	Normal	High	High
5. Bartter syndrome	Low	Low	Low	Low	High
6. Diabetic hyperosmolarity‡	Low	Normal	Normal	High	Normal

*All Na and K values are concentrations, except for 24-hour UNa, which is the total number of milliequivalents of Na excreted in 24 hours in the urine.
†Secretion of inappropriate levels of antidiuretic hormone.
‡In this condition, serum glucose is markedly elevated.
SIADH, Syndrome of inappropriate antidiuretic hormone.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Vomiting
Diarrhea
Tube drainage
Loss from skin with replacement of fluids but not electrolytes
Excessive sweating
Extensive burns
Loss from kidney
Diuretics
Chronic renal insufficiency (uremia) with acidosis
Metabolic loss
Starvation with acidosis
Diabetic acidosis
Endocrine loss
Addison disease

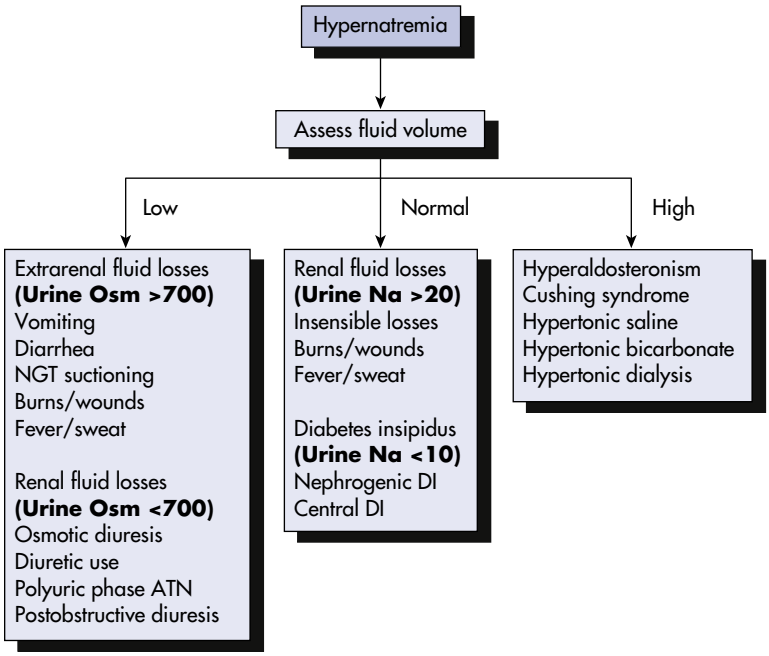

FIG. 55 Algorithm for evaluation of hypernatremia. *ATN,* Acute tubular necrosis; *DI,* diabetes insipidus; *NGT,* nasogastric tube. (From Cameron JL, Cameron AM: *Electrolyte disorders: current surgical therapy*, ed 10, Philadelphia, 2011, Saunders.)

TABLE 102 Common Causes of Hypernatremia and Electrolyte Patterns in Serum and Urine with Normal Renal Function*

Cause	Serum Na	Urine Na (UNa)	Urine Osmolality	Serum K	24-Hour UNa
1. Dehydration	High	High	High	Normal	Varies
2. Diabetes insipidus	High	Low	Low	Normal	Low
3. Cushing disease or syndrome	High	Low	Normal	Low	Low

*All Na and K values are concentrations, except for 24-hour UNa, which is the total number of milliequivalents of Na excreted in 24 hours in the urine.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Sudden withdrawal of long-term steroid therapy
Iatrogenic loss from serous cavities
Paracentesis or thoracentesis
Excessive water (dilution hyponatremia)
Excessive water administration
Congestive heart failure
Cirrhosis
Nephrotic syndrome
Hypoalbuminemia (severe)
Acute renal failure with oliguria
Inappropriate antidiuretic hormone (IADH) syndrome
Intracellular loss (reset osmostat syndrome)
False hyponatremia (actually a dilutional effect)
Marked hypertriglyceridemia
Marked hyperproteinemia
Severe hyperglycemia

HYPERNATREMIA
See Fig. 55.
Common causes of hypernatremia and electrolyte patterns in serum and urine with normal renal function are summarized in Table 102.
Dehydration is the most frequent overall clinical finding in hypernatremia.
Deficient water intake (either orally or intravenously)
Excess kidney water output (diabetes insipidus, osmotic diuresis)
Excess skin water output (excess sweating, loss from burns)
Excess gastrointestinal tract output (severe protracted vomiting or diarrhea without fluid therapy)
Accidental sodium overdose
High-protein tube feedings

STREPTOZYME

See ANTISTREPTOLYSIN O TITER

SUCROSE HEMOLYSIS TEST (sugar water test)

Normal: Absence of hemolysis
Positive in: Paroxysmal nocturnal hemoglobinuria
False-positive: Autoimmune hemolytic anemia, megaloblastic anemias
False-negative: May occur with use of heparin or EDTA

SUDAN III STAIN (qualitative screening for fecal fat)

Normal: Negative. Test should be preceded by diet containing 100 to 150 g of dietary fat/day for 1 wk, avoidance of high-fiber diet, and avoidance of suppositories or oily material before specimen collection.
Positive in: Steatorrhea, use of castor oil or mineral oil droplets

SYNOVIAL FLUID ANALYSIS

Table 103 describes the classification and interpretation of synovial fluid analysis. An algorithm for analysis of joint fluid is illustrated in Fig. 56.

TABLE 103 Classification and Interpretation of Synovial Fluid Analysis

Group	Diseases	Appearance	Viscosity	Mucin Clot	WBC/mm³	% PMN	Glucose (mg/dl) (Blood-Synovial Fluid)	Protein (g/dl)
Normal	—	Clear	↑	Firm	<200	<25	<10	<2.5
I (noninflammatory)	Osteoarthritis, aseptic necrosis, traumatic arthritis, erythema nodosum, osteochondritis dissecans	Clear, yellow (may be xanthochromic if traumatic arthritis)	↑	Firm	↑ Up to 10,000	<25	<10	<2.5
II (inflammatory)	Crystal-induced arthritis, rheumatoid arthritis, Reiter syndrome, collagen vascular disease, psoriatic arthritis, serum sickness, rheumatic fever	Clear, yellow, turbid	↓	Friable	↑↑Up to 100,000	40-90	<40	<2.5
III (septic)	Bacterial (staphylococcal, gonococcal, tuberculosis)	Turbid	↓/↑	Friable	↑↑↑ Up to 5 million	40-100	20-100	>2.5

↑, Elevated; ↑↑, markedly high; ↓, decreased; *PMN,* polymorphonuclear leukocytes; *WBC,* white blood cell. Note that there is considerable overlap in the numbers listed above.

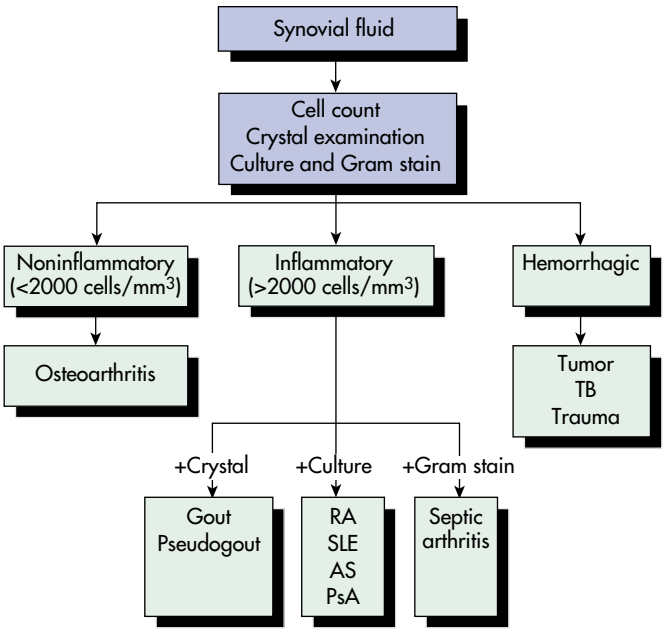

FIG. 56 Algorithm for analysis of joint fluid. Examples of inflammatory arthritis are indicated, although many conditions can produce these findings. *AS,* Ankylosing spondylitis; *PsA,* psoriatic arthritis; *RA,* rheumatoid arthritis; *SLE,* systemic lupus erythematosus; *TB,* tuberculosis. (From Goldman L, Schafer AI: *Goldman's Cecil medicine*, ed 24, Philadelphia, 2012, WB Saunders.)

T_3 (triiodothyronine)

See Table 104 for T_3 abnormalities.

Normal range: 75 to 220 ng/dl (1.2 to 3.4 nmol/L [CF: 0.01536; SMI: 0.1 nmol/L])

Abnormal values:

Elevated in hyperthyroidism (usually earlier and to a greater extent than serum T_4).

Useful in diagnosing:

T_3 hyperthyroidism (thyrotoxicosis): Increased T_3, normal free thyroxine index (FTI).

Toxic nodular goiter: Increased T_3, normal or increased T_4.

Iodine deficiency: Normal T_3, possibly decreased T_4.

Thyroid replacement therapy with liothyronine (Cytomel): Normal T_4, increased T_3 if patient is symptomatically hyperthyroid.

Not ordered routinely but indicated when hyperthyroidism is suspected and serum-free T_4 or FTI inconclusive.

T_3 RESIN UPTAKE (T_3RU)

Normal range: 25% to 35%

Abnormal values: Increased in hyperthyroidism. T_3 resin uptake (T_3RU or RT_3U) measures the percentage of free T_4 (not bound to protein); it does not measure serum T_3 concentration; T_3RU and other tests that reflect thyroid hormone binding to plasma protein are also known as *thyroid hormone-binding ratios* (THBR).

T_4, FREE (Free thyroxine)

Normal range: 0.8 to 2.8 ng/dl

Elevated in:

Graves disease, toxic multinodular goiter, toxic adenoma, iatrogenic and factitious causes, transient hyperthyroidism

Serum-free T_4 directly measures unbound thyroxine. Free T_4 can be measured by equilibrium dialysis (gold standard of free T_4 assays) or by immunometric techniques (influenced by serum levels of lipids, proteins, and certain drugs). The FTI can also be easily calculated by multiplying T_4 times T_3RU and dividing the result by 100; the FTI corrects for any abnormal T_4 values secondary to protein binding: FTI = $T_4 \times T_3RU/100$.

Normal values equal 1.1 to 4.3.

T_4, SERUM T_4

Normal range: 0.8 to 2.8 ng/dl (10 to 36 pmol/L [CF: 12.87; SMI: 1 pmol/L])

Abnormal values: Serum thyroxine (T_4)

Elevated in:

Graves disease

Toxic multinodular goiter

Toxic adenoma

Iatrogenic and factitious

Transient hyperthyroidism

Subacute thyroiditis

TABLE 103 Classification and Interpretation of Synovial Fluid Analysis

Group	Diseases	Appearance	Viscosity	Mucin Clot	WBC/mm³	% PMN	Glucose (mg/dl) (Blood-Synovial Fluid)	Protein (g/dl)
Normal	—	Clear	↑	Firm	<200	<25	<10	<2.5
I (noninflammatory)	Osteoarthritis, aseptic necrosis, traumatic arthritis, erythema nodosum, osteochondritis dissecans	Clear, yellow (may be xanthochromic if traumatic arthritis)	↑	Firm	↑ Up to 10,000	<25	<10	<2.5
II (inflammatory)	Crystal-induced arthritis, rheumatoid arthritis, Reiter syndrome, collagen vascular disease, psoriatic arthritis, serum sickness, rheumatic fever	Clear, yellow, turbid	↓	Friable	↑↑Up to 100,000	40-90	<40	<2.5
III (septic)	Bacterial (staphylococcal, gonococcal, tuberculosis)	Turbid	↓/↑	Friable	↑↑↑ Up to 5 million	40-100	20-100	>2.5

↑, Elevated; ↑↑, markedly high; ↓, decreased; *PMN,* polymorphonuclear leukocytes; *WBC,* white blood cell. Note that there is considerable overlap in the numbers listed above.

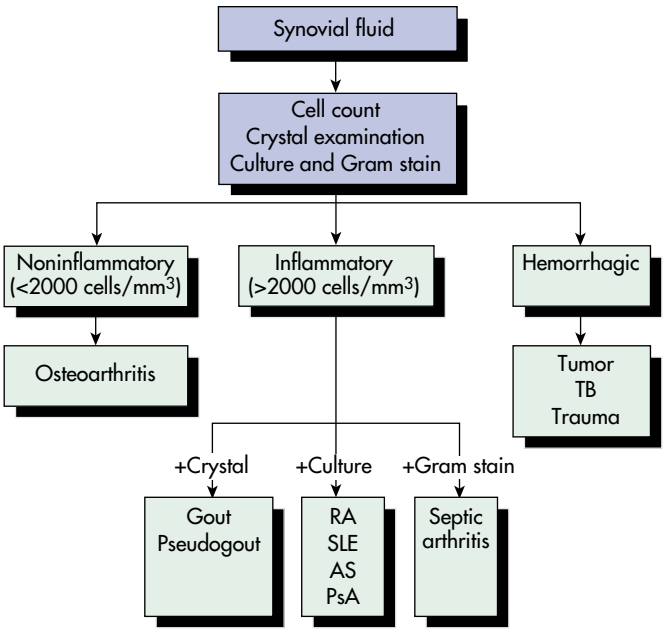

FIG. 56 Algorithm for analysis of joint fluid. Examples of inflammatory arthritis are indicated, although many conditions can produce these findings. *AS,* Ankylosing spondylitis; *PsA,* psoriatic arthritis; *RA,* rheumatoid arthritis; *SLE,* systemic lupus erythematosus; *TB,* tuberculosis. (From Goldman L, Schafer AI: *Goldman's Cecil medicine*, ed 24, Philadelphia, 2012, WB Saunders.)

T_3 (triiodothyronine)

See Table 104 for T_3 abnormalities.

Normal range: 75 to 220 ng/dl (1.2 to 3.4 nmol/L [CF: 0.01536; SMI: 0.1 nmol/L])

Abnormal values:

Elevated in hyperthyroidism (usually earlier and to a greater extent than serum T_4).

Useful in diagnosing:

T_3 hyperthyroidism (thyrotoxicosis): Increased T_3, normal free thyroxine index (FTI).

Toxic nodular goiter: Increased T_3, normal or increased T_4.

Iodine deficiency: Normal T_3, possibly decreased T_4.

Thyroid replacement therapy with liothyronine (Cytomel): Normal T_4, increased T_3 if patient is symptomatically hyperthyroid.

Not ordered routinely but indicated when hyperthyroidism is suspected and serum-free T_4 or FTI inconclusive.

T_3 RESIN UPTAKE (T_3RU)

Normal range: 25% to 35%

Abnormal values: Increased in hyperthyroidism. T_3 resin uptake (T_3RU or RT_3U) measures the percentage of free T_4 (not bound to protein); it does not measure serum T_3 concentration; T_3RU and other tests that reflect thyroid hormone binding to plasma protein are also known as *thyroid hormone-binding ratios* (THBR).

T_4, FREE (Free thyroxine)

Normal range: 0.8 to 2.8 ng/dl

Elevated in:

Graves disease, toxic multinodular goiter, toxic adenoma, iatrogenic and factitious causes, transient hyperthyroidism

Serum-free T_4 directly measures unbound thyroxine. Free T_4 can be measured by equilibrium dialysis (gold standard of free T_4 assays) or by immunometric techniques (influenced by serum levels of lipids, proteins, and certain drugs). The FTI can also be easily calculated by multiplying T_4 times T_3RU and dividing the result by 100; the FTI corrects for any abnormal T_4 values secondary to protein binding: FTI = $T_4 \times T_3RU/100$.

Normal values equal 1.1 to 4.3.

T_4, SERUM T_4

Normal range: 0.8 to 2.8 ng/dl (10 to 36 pmol/L [CF: 12.87; SMI: 1 pmol/L])

Abnormal values: Serum thyroxine (T_4)

Elevated in:

Graves disease

Toxic multinodular goiter

Toxic adenoma

Iatrogenic and factitious

Transient hyperthyroidism

Subacute thyroiditis

TABLE 104 Findings in Thyroid Function Tests in Various Clinical Conditions

Condition	T_4	FT_4I	T_3	FT_3I	TSH	TSI	TRH Stimulation
Hyperthyroidism							
Graves disease	↑	↑	↑	↑	↓	+	↓
Toxic nodular goiter	↑	↑	↑	↑	↓	–	↓
Pituitary TSH-secreting tumors	↑	↑	↑	↑	↑	–	↓
T_3 thyrotoxicosis	N	N	↑	↑	↓	+, –	↓
T_4 thyrotoxicosis	↑	↑	N	N	↓	+, –	↓
Hypothyroidism							
Primary	↓	↓	↓	↓	↑	+, –	↑
Secondary	↓	↓	↓	↓	↓ N	–	↓
Tertiary	↓	↓	↓	↓	↓, N	–	N
Peripheral unresponsiveness	↑, N	↑, N	↑, N	↑	↑, N	–	N,↑

↑, Increased; ↓, decreased; +, – variable; *FTI,* Free thyroid index; *N,* normal; T_3, triiodothyronine; T_4, thyroxine; *TRH,* thyrotropin-releasing hormone; *TSH,* thyroid-stimulating hormone; *TSI,* thyroid stimulating immunoglobulin.
From Tilton RC, Barrows A: *Clinical laboratory medicine,* St Louis, 1992, Mosby.

Hashimoto thyroiditis
Silent thyroiditis

Rare causes: Hypersecretion of TSH (e.g., pituitary neoplasms), struma ovarii, ingestion of large amounts of iodine in a patient with preexisting thyroid hyperplasia or adenoma (Jod-Basedow phenomenon), hydatidiform mole, carcinoma of thyroid, amiodarone therapy of arrhythmias.

Serum thyroxine test measures both circulating thyroxine bound to protein (represents >99% of circulating T_4) and unbound (free) thyroxine. Values vary with protein binding; changes in the concentration of T_4 secondary to changes in thyroxine-binding globulin (TBG) can be caused by the following:

Increased TBG (↑T4)	Decreased TBG (↓T4)
Pregnancy	Androgens, glucocorticoids
Estrogens	Nephrotic syndrome, cirrhosis
Acute infectious hepatitis	Acromegaly
Oral contraceptives	Hypoproteinemia
Familial	Familial
Fluorouracil, clofibrate	Phenytoin, acetylsalicylic acid (ASA) and other NSAIDs, heroin, methadone, high-dose penicillin, asparaginase, chronic debilitating illness

To eliminate the suspected influence of protein binding on thyroxine values, two additional tests are available: T_3 resin uptake and serum free thyroxine. Table 105 summarizes the effects of pregnancy on thyroid physiology, and Table 106 describes changes in thyroid hormone levels during illness.

TEGRETOL

See CARBAMAZEPINE.

TESTOSTERONE (total testosterone)

Normal range: Variable with age and sex. Testosterone circulates in plasma mostly bound to plasma proteins and sex hormone-binding globulin (SHBG). Approximately 2% of testosterone circulates in free form (biologically active form). Low testosterone levels in obese patients may be due to reduced levels of SHBG; therefore, it is essential to measure free testosterone when evaluating androgen deficiency in obese patients.

Serum/plasma

Males: 280-1100 ng/dl Females: 15-70 ng/dl

Urine

Males: 50-135 μg/day Females: 2-12 μg/day

Elevated in: Testicular tumors, ovarian masculinizing tumors, testosterone replacement therapy

TABLE 105 Effects of Pregnancy on Thyroid Physiology

Physiologic Change	Thyroid-Related Consequences
↑ Serum thyroxine-binding globulin	↑ Total T_4 and T_3; ↑ T_4 production
↑ Plasma volume	↑ T_4 and T_3 pool size; ↑ T_4 production; ↑ cardiac output
D3 expression in placenta and (?) uterus	↑ T_4 production
First-trimester ↑ in hCG	↑ Free T_4; ↓ basal thyrotropin; ↑ T_4 production
↑ Renal I– clearance	↑ Iodine requirements
↑ T_4 production; fetal T_4 synthesis during second and third trimesters	
↑ Oxygen consumption by fetoplacental unit, gravid uterus, and mother	↑ Basal metabolic rate; ↑ cardiac output

D3, Type 3 iodothyronine deiodinase; *I–,* plasma iodide; *hCG,* human chorionic gonadotropin; T_3, triiodothyronine; T_4, thyroxine.
From Melmed S et al: *Williams textbook of endocrinology*, ed 12, Philadelphia, 2011, WB Saunders.

TABLE 106 Changes in Thyroid Hormone Levels during Illness

Severity of Illness	Free T_3	Free T_4	Reverse T_3	TSH	Probable Cause
Mild	↓	N	↑	N	↓ D2, D1
Moderate	↓↓	N, ↑↓	↑↑	N, ↓	↓↓ D2, D1,?↑ D3
Severe	↓↓↓	↓	↑	↓↓	↓↓ D2, D1, ↑D3
Recovery	↓	↓	↑	↑	?

D1 through *D3,* iodothyronine deiodinases; *N,* no change; T_3, triiodothyronine; T_4, thyroxine; *TSH,* thyroid-stimulating hormone.
From Melmed S et al: *Williams textbook of endocrinology*, ed 12, Philadelphia, 2011, WB Saunders.

Decreased in: Hypogonadism, obesity, insulin resistance, sleep apnea. Fig. 57 illustrates testosterone level changes with age. The diagnosis of androgen deficiency should be based on at least two morning testosterone measurements (collected on separate days) in a symptomatic patient.

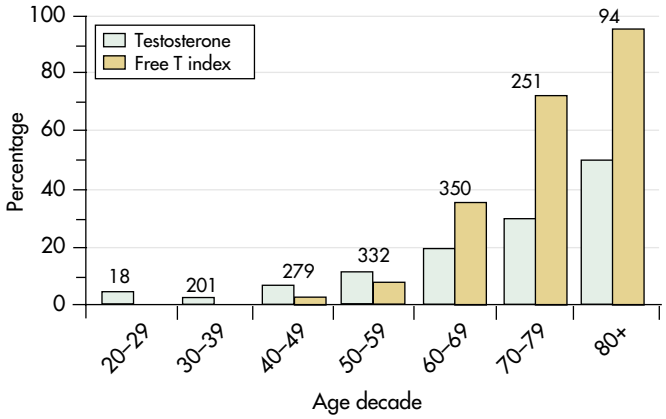

FIG. 57 Hypogonadism in aging men. Bar height indicates the percentage of men in each 10-year interval, from the third to the ninth decades, with at least one testosterone value in the hypogonadal range. The criteria used for these determinations are total testosterone less than 11.3 nmol/L (325 ng/dl) and testosterone and sex hormone-binding globulin (free T index) less than 0.153 nmol/nmol. The numbers above each pair of bars indicate the number of men studied in the corresponding decade. The fraction of men who are hypogonadal increases progressively after age 50 years by either criterion. More men are hypogonadal by free T index than by total testosterone after 50 years, and there seems to be a progressively greater difference with increasing age between the two criteria. (From Goldman L, Schafer AI: *Goldman's Cecil medicine*, ed 24, Philadelphia, 2012, WB Saunders.)

THEOPHYLLINE

Normal therapeutic range: 10 to 20 mcg/ml

THORACENTESIS FLUID

See PLEURAL FLUID

THROMBIN TIME (TT), Thrombin Clotting Time (TCT)

Normal range: 11.3 to 18.5 sec

Elevated in: Thrombolytic and heparin therapy, disseminated intravascular coagulation, hypofibrinogenemia, dysfibrinogenemia

See Table 107 for synthesizing results of PT, APTT, and TCT. Also see Fig. 58.

THYROGLOBULIN

Normal: 3 to 40 ng/ml. Thyroglobulin is a tumor marker for monitoring the status of patients with papillary or follicular thyroid cancer following resection.

Elevated in: Papillary or follicular thyroid cancer, Hashimoto thyroiditis, Graves disease, subacute thyroiditis

THYROID MICROSOMAL ANTIBODIES

Normal: Undetectable. Low titers may be present in 5% to 10% of normal individuals

Elevated in: Hashimoto disease, thyroid carcinoma, early hypothyroidism, pernicious anemia

THYROID-STIMULATING HORMONE (TSH)

See Fig. 59 for an algorithmic approach to thyroid testing.

Normal range: 2 to 11 μU/ml (2 to 11 mU/L [CF: 1; SMI: 1 mU/L])

CONDITIONS THAT INCREASE SERUM THYROID-STIMULATING HORMONE VALUES

Laboratory error
Primary hypothyroidism
Synthroid therapy with insufficient dose
Lithium or amiodarone; some patients
Hashimoto thyroiditis in later stage
Large doses of inorganic iodide (e.g., potassium iodide [SSKI])
Severe nonthyroid illness in recovery phase
Iodine deficiency (moderate or severe)

TABLE 107 Synthesizing Results of PT, APTT, and TCT

TEST			
PT	**APTT**	**TCT**	**Possible Diagnoses**
Normal	Normal	Normal	Normal hemostasis, disorder of platelet function, factor XIII deficiency, disorder of vascular hemostasis, mild coagulation protein deficiency, mild vWD, disorder of fibrinolysis (α_2-antiplasmin deficiency/defect, plasminogen activator inhibitor-1 deficiency/defect)
Prolonged	Normal	Normal	Factor VII deficiency; early oral anticoagulation; lupus anticoagulant; mild factor II, V, or X deficiency; specific factor inhibitor
Normal	Prolonged	Normal	Factor VIII, IX, XI, XI, prekallikrein, or HMWK deficiency; lupus anticoagulant; amyloid-adsorbed factor IX; specific factor inhibitor
Prolonged	Prolonged	Normal	Multiple factor deficiency (e.g., liver failure, vitamin K deficiency, oral anticoagulants); factor V, X, or II deficiency; amyloid-adsorbed factor X; specific factor inhibitor
Prolonged	Prolonged	Prolonged	Anticoagulants, DIC, dilutional coagulopathy, liver disease, fibrinogen deficiency/disorder, inhibition of fibrin polymerization, hyperfibrinolysis

APTT, Activated partial thromboplastin time; *DIC,* disseminated intravascular coagulation; *HMWK,* high-molecular-weight kininogen; *PT,* prothrombin time; *TCT,* thrombin clotting time; *vWD,* von Willebrand disease.
From Hoffman R: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

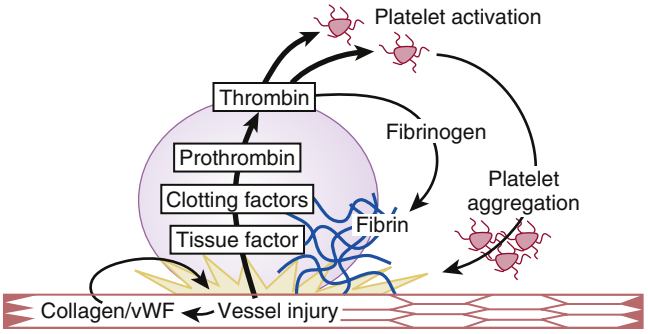

FIG. 58 Central role of thrombin in thrombogenesis. Vascular injury simultaneously triggers platelet adhesion and activation, as well as activation of the coagulation system. Platelet activation is initiated by exposure of subendothelial collagen and von Willebrand factor *(vWF),* to which platelets adhere. Adherent platelets become activated and release ADP and thromboxane A_2, platelet agonists that activate ambient platelets and recruit them to the site of injury. Coagulation, which is triggered by tissue factor exposed at the site of injury and enhanced by assembly of clotting factor complexes on the activated platelet surface, results in thrombin generation. Thrombin not only converts fibrinogen to fibrin but also serves as a potent platelet agonist. When platelets are activated, glycoprotein *(GP)* IIb/IIIa on their surfaces undergoes a conformational change that endows it with the capacity to ligate fibrinogen and mediate platelet aggregation. Fibrin strands then weave the platelet aggregates together to form a platelet/fibrin thrombus. (From Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine*, ed 11, Philadelphia, 2019, Elsevier.)

Thyroid-Stimulating Hormone

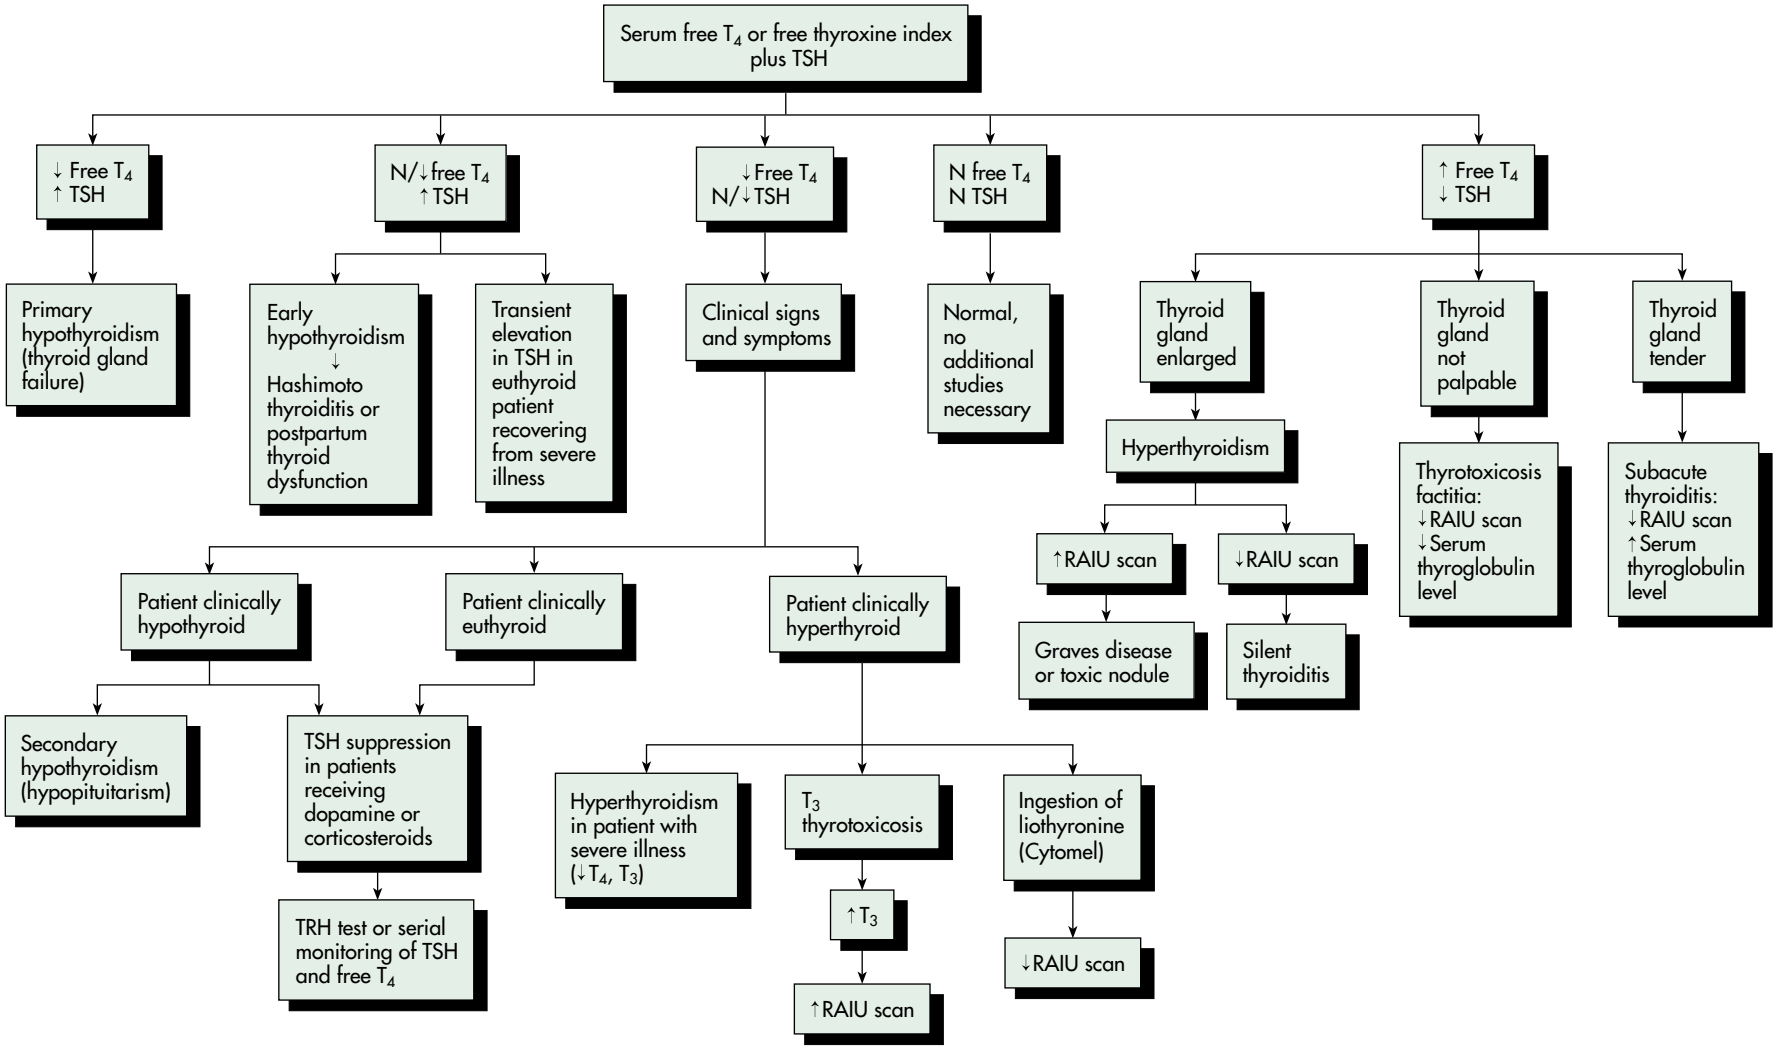

FIG. 59 Diagnostic approach to thyroid testing. *N,* Normal; *RAIU,* radioactive iodine uptake; T_3, triiodothyronine; T_4, thyroxine; *TRH,* thyrotropin-releasing hormone; *TSH,* thyroid-stimulating hormone. (From Ferri FF: *Practical guide to the care of the medical patient*, ed 8, St Louis, 2011, Mosby.)

Addison disease
TSH specimen drawn in evening (peak of diurnal variation)
Pituitary TSH-secreting tumor
Therapy of hypothyroidism (3 to 6 wk after beginning therapy [range, 1 to 8 wk]; sometimes longer when pretherapy TSH is over 100 μU/ml)
Acute psychiatric illness
Peripheral resistance to T_4 syndrome
Antibodies (e.g., human anti-mouse antibody [HAMA]) interfering with monoclonal sandwich method of TSH assay
Telepaque (iopanoic acid) and Oragrafin (ipodate) x-ray contrast media
Amphetamines
High altitudes
CONDITIONS THAT DECREASE SERUM THYROID-STIMULATING HORMONE VALUES
Laboratory error
T_4/T_3 toxicosis (diffuse or nodular etiology)
Excessive therapy for hypothyroidism
Active thyroiditis (subacute, painless, or early active Hashimoto disease)
Multinodular goiter containing areas of autonomy
Severe nonthyroid illness (especially acute trauma, dopamine, or glucocorticoid)
T_3 toxicosis
Pituitary insufficiency
Cushing syndrome (and some patients on high-dose glucocorticoid)
Jod-Basedow (iodine-induced) hyperthyroidism
Thyroid-stimulating hormone drawn 2 to 4 hr after levothyroxine dose
Postpartum transient toxicosis
Factitious hyperthyroidism
Struma ovarii
Radioimmunoassay, surgery, or antithyroid drug therapy for hyperthyroidism 4 to 6 wk (range, 2 wk to 2 yr) after the treatment
Interleukin-2 drugs (3% to 6% of cases) or α-interferon therapy (1% of cases)
Hyperemesis gravidarum
Amiodarone therapy.
See Table 106 for changes in thyroid hormone levels during illness.

THYROTROPIN (TSH) RECEPTOR ANTIBODIES

Normal: <130% of basal activity
Elevated in: Values between 1.3 and 2.0 are found in 10% of patients with thyroid disease other than Graves disease. Values >2.8 have been found only in patients with Graves disease.

THYROTROPIN-RELEASING HORMONE (TRH) STIMULATION TEST

Normal: Baseline TSH <11 microU/ml; Stimulated TSH: more than double the baseline.

In primary hypothyroidism the TSH increase is 2× to 3× the normal result. In secondary hypothyroidism no TSH response occurs. In tertiary hypothyroidism (hypothalamic failure) there is a delayed rise in the TSH level.

THYROXINE (T_4)

Normal range: 4 to 11 μg/dl (51 to 142 nmol/L [CF: 12.87; SMI: 1 nmol/L])
Elevated: Hyperthyroidism (see Fig. 59)

TIBC

See IRON-BINDING CAPACITY, TOTAL

TISSUE TRANSGLUTAMINASE ANTIBODY

Normal: Negative
Present in: Celiac disease (specificity; 94% to 97%, sensitivity, 90% to 98%), dermatitis herpetiformis

TRANSFERRIN

Normal range: 170 to 370 mg/dl (1.7 to 3.7 g/L [CF: 0.01; SMI: 0.01 g/L])
Elevated in: Iron deficiency anemia, oral contraceptive administration, viral hepatitis, late pregnancy

BOX 29 Causes of Serum Troponin T and I Elevations, Including Both Acute Coronary Syndromes, Noncoronary Cardiac Events, and Noncardiac Ailments

Acute coronary syndrome/acute myocardial infarction
Shock of any form (cardiogenic, obstructive, distributive)
Myocarditis and myopericarditis
Cardiomyopathies
Acute congestive heart failure (pulmonary edema)
Sepsis
Pulmonary embolism
Renal failure
Sympathomimetic ingestions
Polytrauma
Burns
Acute CNS event
Rhabdomyolysis
Cardiac neoplasm, inflammatory syndromes, and infiltrative diseases
Congenital coronary anomalies
Extreme physical exertion

From Vincent JL et al: *Textbook of critical care,* ed 6, Philadelphia, 2011, WB Saunders.

Decreased in: Nephrotic syndrome, liver disease, hereditary deficiency, protein malnutrition, neoplasms, chronic inflammatory states, chronic illness, thalassemia, hemochromatosis, hemolytic anemia

TRIGLYCERIDES

Normal range: <150 mg/dl (<1.80 mmol/L [CF: 0.01129; SMI: 0.02 mmol/L])
Elevated in: Hyperlipoproteinemias (types I, IIb, III, IV, V), hypothyroidism, pregnancy, estrogens, acute myocardial infarction, pancreatitis, alcohol intake, nephrotic syndrome, diabetes mellitus, glycogen storage disease
Decreased in: Malnutrition, congenital abetalipoproteinemias, drugs (e.g., gemfibrozil, fenofibrate, nicotinic acid, clofibrate)

TRIIODOTHYRONINE

See T_3

TROPONINS (serum)

See Box 29 for causes of troponin elevations.
Normal range: 0 to 0.4 ng/ml (negative). If there is clinical suspicion of evolving acute MI or ischemic episode, repeat testing in 5 to 6 hr is recommended.
Indeterminate: 0.05 to 0.49 ng/ml. Suggest further tests. In a patient with unstable angina and this troponin I level, there is an increased risk of a cardiac event in the near future.
Strong probability of acute MI: ≥0.05 ng/ml
Cardiac troponin T (cTnT) is a highly sensitive marker for myocardial injury for the first 48 hours after MI and for up to 5 to 7 days (see Fig. 20, under "Creatine Kinase Isoenzymes"). It may also be elevated in renal failure, chronic muscle disease, and trauma.
Cardiac troponin I (cTnI) is highly sensitive and specific for myocardial injury (≥CK-MB) in the initial 8 hr, peaks within 24 hr and lasts up to 7 days. With progressively higher levels of cTnI, the risk of mortality increases because the amount of necrosis increases.

TSH

See THYROID-STIMULATING HORMONE

TT

See THROMBIN TIME

TUBERCULIN TEST (PPD)

Abnormal results: See Box 30. Box 31 describes factors associated with false-negative tuberculin tests.

BOX 30 PPD Reaction Size Considered "Positive" (Intracutaneous 5 TU Mantoux Test at 48 hr)

5 mm or More
HIV infection or risk factors for HIV
Close recent contact with active TB case
Persons with chest x-ray consistent with healed TB

10 mm or More
Foreign-born persons from countries with high TB prevalence in Asia, Africa, and Latin America
IV drug users
Medically underserved low-income population groups (including Native Americans, Hispanics, and blacks)
Residents of long-term care facilities (nursing homes, mental institutions)
Medical conditions that increase risk for TB (silicosis, gastrectomy, undernourishment, diabetes mellitus, high-dose corticosteroids or immunosuppression Rx, leukemia or lymphoma, other malignancies)
Employees of long-term care facilities, schools, child care facilities, health care facilities

15 mm or More
All others not already listed

HIV, Human immunodeficiency virus; *IV,* intravenous; *PPD,* purified protein derivative; *Rx,* prescription; *TB,* tuberculosis; *TU,* tuberculin units.

BOX 31 Factors Associated with False-Negative Tuberculin Tests

Technical Errors
Improper administration
Inaccurate reading
Loss of potency of antigen

Patient-Related Factors (Anergy)
Age (elderly)
Nutritional status
Medications: Corticosteroids, immunosuppressive agents
Severe tuberculosis
Coexisting diseases
HIV infection
Viral illness or vaccination
Lymphoreticular malignancies
Sarcoidosis
Solid tumors
Lepromatous leprosy
Sjögren syndrome
Ataxia telangiectasia
Uremia
Primary biliary cirrhosis
Systemic lupus erythematosus
Severe systemic disease of any etiology

HIV, Human immunodeficiency virus.
From Stein JH (ed): *Internal medicine,* ed 4, St Louis, 1994, Mosby.

UNCONJUGATED BILIRUBIN

See BILIRUBIN, DIRECT

UREA NITROGEN, BLOOD (BUN)

Normal range: 8 to 18 mg/dl (3 to 6.5 mmol/L [CF: 0.357; SMI: 0.5 mmol/L])

Box 32 describes factors affecting BUN level independent of renal function.

Elevated in: Dehydration, drugs (aminoglycosides and other antibiotics, diuretics, lithium, corticosteroids), gastrointestinal bleeding, decreased renal blood flow (shock, congestive heart failure, myocardial infarction), renal disease (glomerulonephritis, pyelonephritis, diabetic nephropathy), urinary tract obstruction (prostatic hypertrophy)

BOX 32 Factors Affecting Blood Urea Nitrogen Level Independent of Renal Function

Disproportionate Increase in Blood Urea Nitrogen
Volume depletion ("prerenal azotemia")
Gastrointestinal hemorrhage
Corticosteroid or cytotoxic agents
High-protein diet
Obstructive uropathy
Sepsis
Catabolic states, tissue breakdown

Disproportionate Decrease in Blood Urea Nitrogen
Low-protein diet
Liver disease

From Andreoli TE (ed): *Cecil essentials of medicine,* ed 5, Philadelphia, 2001, WB Saunders.

Decreased in: Liver disease, malnutrition, third trimester of pregnancy, overhydration, acromegaly, celiac disease

URIC ACID (serum)

Normal range: 2 to 7 mg/dl

Elevated in: Renal failure, gout, excessive cell lysis (chemotherapeutic agents, radiation therapy, leukemia, lymphoma, hemolytic anemia), hereditary enzyme deficiency (hypoxanthine-guanine-phosphoribosyl transferase), acidosis, myeloproliferative disorders, diet high in purines or protein, drugs (diuretics, low doses of ASA, ethambutol, nicotinic acid), lead poisoning, hypothyroidism, Addison disease, nephrogenic diabetes insipidus, active psoriasis, polycystic kidneys

Decreased in: Drugs (allopurinol, febuxostat, high doses of ASA, probenecid, warfarin, corticosteroid), deficiency of xanthine oxidase, syndrome of inappropriate antidiuretic hormone secretion, renal tubular deficits (Fanconi syndrome), alcoholism, liver disease, diet deficient in protein or purines, Wilson disease, hemochromatosis

URINALYSIS

Normal range:
Color: Light straw
Appearance: Clear
Ketones: Absent
pH: 4.5 to 8 (average, 6)
Protein: Absent
Glucose: Absent
Specific gravity: 1.005 to 1.030
Occult blood absent
Microscopic examination:
Red blood cells: 0 to 5 (high-power field)
White blood cells: 0 to 5 (high-power field)
Bacteria (spun specimen): Absent
Casts: 0 to 4 hyaline (low-power field)
Abnormalities in the microscopic examination of urine are described in Table 108. Causes of abnormal appearance and color of urine are described in Table 109. Urine color changes with commonly used drugs are summarized in Table 110.

URINE AMYLASE

Normal range: 35 to 260 U Somogyi/hr (6.5 to 48.1 U/hr [CF: 0.185; SMI: 1 U/hr])

Elevated in: Pancreatitis, carcinoma of the pancreas

URINE BILE

Normal: Absent

Abnormal:
Urine bilirubin: Hepatitis (viral, toxic, drug-induced), biliary obstruction
Urine urobilinogen: Hepatitis (viral, toxic, drug-induced), hemolytic jaundice, liver cell dysfunction (cirrhosis, infection, metastases)

URINE CALCIUM

Normal range: <250 mg/24 hr (<6.2 mmol/dl [CF: 0.02495; SMI: 0.1 mmol/dl])

BOX 30 PPD Reaction Size Considered "Positive" (Intracutaneous 5 TU Mantoux Test at 48 hr)

5 mm or More
HIV infection or risk factors for HIV
Close recent contact with active TB case
Persons with chest x-ray consistent with healed TB

10 mm or More
Foreign-born persons from countries with high TB prevalence in Asia, Africa, and Latin America
IV drug users
Medically underserved low-income population groups (including Native Americans, Hispanics, and blacks)
Residents of long-term care facilities (nursing homes, mental institutions)
Medical conditions that increase risk for TB (silicosis, gastrectomy, undernourishment, diabetes mellitus, high-dose corticosteroids or immunosuppression Rx, leukemia or lymphoma, other malignancies)
Employees of long-term care facilities, schools, child care facilities, health care facilities

15 mm or More

TABLE 108 Microscopic Examination of the Urine

Finding	Associations
Casts	
Red blood cell	Glomerulonephritis, vasculitis
White blood cell	Interstitial nephritis, pyelonephritis
Epithelial cell	Acute tubular necrosis, interstitial nephritis, glomerulonephritis
Granular	Renal parenchymal disease (nonspecific)
Waxy, broad	Advanced renal failure
Hyaline	Normal finding in concentrated urine
Fatty	Heavy proteinuria
Cells	
Red blood cell	Urinary tract infection, urinary tract inflammation
White blood cell	Urinary tract infection, urinary tract inflammation
Eosinophil	Acute interstitial nephritis
(Squamous) epithelial cell	Contaminants
Crystals	
Uric acid	Acid urine, acute uric acid nephropathy, hyperuricosuria
Calcium phosphate	Alkaline urine
Calcium oxalate	Acid urine, hyperoxaluria, ethylene glycol poisoning
Cystine	Cystinuria
Sulfur	Sulfa-containing antibiotics

From Andreoli TE (ed): *Cecil essentials of medicine,* ed 5, Philadelphia, 2001, WB Saunders.

Elevated in: Primary hyperparathyroidism, hypervitaminosis D, bone metastases, multiple myeloma, increased calcium intake, steroids, prolonged immobilization, sarcoidosis, Paget disease, idiopathic hypercalciuria, renal tubular acidosis
Decreased in: Hypoparathyroidism, pseudohypoparathyroidism, vitamin D deficiency, vitamin D-resistant rickets, diet low in calcium, drugs (thiazide diuretics, oral contraceptives), familial hypocalciuric hypercalcemia, renal osteodystrophy, potassium citrate therapy

URINE CAMP

Elevated in: Hypercalciuria, familial hypocalciuric hypercalcemia, primary hyperparathyroidism, pseudohypoparathyroidism, rickets
Decreased in: Vitamin D intoxication, sarcoidosis

URINE CATECHOLAMINES

Normal range:
Norepinephrine: <100 μg/24 hr (<590 nmol/day [CF: 5.911; SMI: 10 nmol/day])
Epinephrine: <10 μg/24 hr (55 nmol/day [CF: 5.458; SMI: 5 nmol/day])
Elevated in: Pheochromocytoma, neuroblastoma, severe stress

URINE CHLORIDE

Normal range: 110 to 250 mEq/day (110 to 250 mmol/day [CF: 1; SMI: 1 mmol/day])
Elevated in: Corticosteroids, Bartter syndrome, diuretics, metabolic acidosis, severe hypokalemia
Decreased in: Chloride depletion (vomiting), colonic villous adenoma, chronic renal failure, renal tubular acidosis

URINE COPPER

Normal range: <40 μg/24 hr (<0.6 μmol/day [CF: 0.01574; SMI: 0.2 μmol/day])

URINE CORTISOL, FREE

Normal range: 10 to 110 μg/24 hr (30 to 300 nmol/day [CF: 2.759; SMI: 10 nmol/day])

TABLE 109 Appearance and Color of Urine

Appearance	Cause	Remarks
Colorless Cloudy	Very dilute urine	Polyuria, diabetes insipidus
	Phosphates, carbonates	Soluble in dilute acetic acid
	Urates, uric acid	Dissolve at 60° C (140° F) and in alkali
	Leukocytes	
	Red blood cells ("smoky")	Insoluble in dilute acetic acid
	Bacteria, yeasts	Lyse in dilute acetic acid
	Spermatozoa	Insoluble in dilute acetic acid
	Prostatic fluid	Insoluble in dilute acetic acid
	Mucin, mucous threads	May be flocculent
	Calculi, "gravel"	Phosphates, oxalates
	Clumps, pus, tissue	Rectovesical fistula
	Fecal contamination	In acid urine
	Radiographic dye	
Milky	Many neutrophils (pyuria)	Insoluble in dilute acetic acid
	Fat	Nephrosis, crush injury: soluble in ether
	Lipiduria, opalescent	
	Chyluria, milky	Lymphatic obstruction: soluble in ether
	Emulsified paraffin	Vaginal creams
Yellow	Acriflavine	Green fluorescence
Yellow-orange	Concentrated urine	Dehydration, fever
	Urobilin in excess	No yellow foam
	Bilirubin	Yellow foam if sufficient bilirubin
Yellow-green	Bilirubin-biliverdin	Yellow foam
Yellow-brown	Bilirubin-biliverdin	"Beer" brown, yellow foam
Red	Hemoglobin	Positive
	Erythrocytes	Positive } Reagent strip for blood
	Myoglobin	
	Porphyrin	Positive
	Fuscin, aniline dye	May be colorless
	Beets	Foods, candy
	Menstrual contamination	Yellow alkaline, genetic
		Clots, mucus
Red-purple	Porphyrins	May be colorless
Red-brown	Erythrocytes	Acid pH
	Hemoglobin on standing	Muscle injury
	Methemoglobin	Result of unstable hemoglobin
	Myoglobin	
	Bilifuscin (dipyrrole)	
Brown-black	Methemoglobin	Blood, acid pH
	Homogentisic acid	On standing, alkaline; alkaptonuria
	Melanin	On standing, rare
Blue-green	Indicans	Small intestine infections
	Pseudomonas infections	Mouth deodorants
	Chlorophyll	

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Elevated: See CORTISOL, PLASMA

URINE CREATININE (24 hr)

Normal range:
Male: 0.8 to 1.8 g/day (7 to 16 mmol/day [CF: 8.840; SMI: 0.1 mmol/day])
Female: 0.6 to 1.6 g/day (5.3 to 14 mmol/day)
NOTE: Useful test as an indicator of completeness of 24-hr urine collection.

URINE CRYSTALS

Uric acid: Acid urine, hyperuricosuria, uric acid nephropathy
Sulfur: Antibiotics containing sulfa
Calcium oxalate: Ethylene glycol poisoning, acid urine, hyperoxaluria
Calcium phosphate: Alkaline urine
Cystine: Cystinuria

TABLE 110 Urine Color Changes with Commonly Used Drugs*

Drug	Color
Alcohol, ethyl	Pale, diuresis
Anthraquinone laxatives (senna, cascara)	Reddish, alkaline; yellow-brown, acid
Chlorzoxazone (Paraflex) (muscle relaxant)	Red
Deferoxamine mesylate (Desferal) (chelates iron)	Red
Ethoxazene (Serenium) (urinary analgesic)	Orange, red
Fluorescein sodium (given IV)	Yellow
Furazolidone (Furoxone) (Tricofuron) (an antibacterial, antiprotozoal nitrofuran)	Brown
Indigo carmine dye (renal function, cystoscopy)	Blue
Iron sorbitol (Jectofer) (possibly other iron compounds forming iron sulfide in urine)	Brown on standing
Levodopa (L-dopa) (for parkinsonism)	Red then brown, alkaline
Mepacrine (Atabrine) (antimalarial) (intestinal worms, *Giardia)*	Yellow
Methocarbamol (Robaxin) (muscle relaxant)	Green-brown
Methyldopa (Aldomet) (antihypertensive)	Darkens; if oxidizing agents present, red to brown
Methylene blue (used to delineate fistulas)	Blue, blue-green
Metronidazole (Flagyl) (for *Trichomonas* infection, amebiasis, *Giardia*)	Darkening, reddish brown
Nitrofurantoin (Furadantin) (antibacterial)	Brown-yellow
Phenazopyridine (Pyridium) (urinary analgesic), also compounded with sulfonamides (e.g., Azo Gantrisin)	Orange-red, acid pH
Phenindione (Hedulin) (anticoagulant) (important to distinguish from hematuria)	Orange, alkaline; color disappears on acidifying
Phenol poisoning	Brown; oxidized to quinones (green)
Phenolphthalein (purgative)	Red-purple, alkaline pH
Phenolsulfonphthalein (also sulfobromophthalein)	Pink-red, alkaline pH
Rifampin (Rifadin, Rimactane) (tuberculosis therapy)	Bright orange-red
Riboflavin (multivitamins)	Bright yellow
Sulfasalazine (Azulfidine) (for ulcerative colitis)	Orange-yellow, alkaline pH

*Other commonly used drugs have been noted to produce color change once or occasionally: amitriptyline (Elavil)—blue-green; phenothiazines—red; triamterene (Dyrenium)—pale blue (blue fluorescence in acid urine).

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 111 Factors That Interfere with Determination of Urinary 5-HIAA

Foods	Drugs
Factors That Produce False-Positive Results	
Avocado	Acetaminophen
Banana	Acetanilid
Chocolate	Caffeine
Coffee	Fluorouracil
Eggplant	Guaifenesin
Pecan	L-Dopa
Pineapple	Melphalan
Plum	Mephenesin
Tea	Methamphetamine
Walnuts	Methocarbamol
	Methysergide maleate
	Phenmetrazine
	Reserpine
	Salicylates
Factors That Cause False-Negative Results	
None	Corticotropin
	p-Chlorophenylalanine
	Chlorpromazine
	Heparin
	Imipramine
	Isoniazid
	Methenamine mandelate
	Methyldopa
	Monoamine oxidase inhibitors
	Phenothiazine
	Promethazine

5-HIAA, 5-Hydroxyindoleacetic acid.

From Melmed S et al: *Williams textbook of endocrinology*, ed 12, Philadelphia, 2011, WB Saunders.

URINE EOSINOPHILS

Normal: Absent
Present in: Interstitial nephritis, acute tubular necrosis, urinary tract infection, kidney transplant rejection, hepatorenal syndrome

URINE GLUCOSE (qualitative)

Normal: Absent
Present in: Diabetes mellitus, renal glycosuria (decreased renal threshold for glucose), glucose intolerance

URINE HEMOGLOBIN, FREE

Normal: Absent
Present in: Hemolysis (with saturation of serum haptoglobin binding capacity and renal threshold for tubular absorption of hemoglobin)

URINE HEMOSIDERIN

Normal: Absent
Present in: Paroxysmal nocturnal hemoglobinuria, chronic hemolytic anemia, hemochromatosis, blood transfusion, thalassemias

URINE 5-HYDROXYINDOLE-ACETIC ACID (urine 5-HIAA)

Normal range: 2 to 8 mg/24 hr (10 to 40 μmol/day [CF: 5.23; SMI: 5 μmol/day])
Elevated in: Carcinoid tumors, after ingestion of certain foods (bananas, plums, tomatoes, avocados, pineapples, eggplant, walnuts), drugs (monoamine oxidase inhibitors, phenacetin, methyldopa, glycerol guaiacolate, acetaminophen, salicylates, phenothiazines, imipramine, methocarbamol, reserpine, methamphetamine). See Table 111.

URINE INDICAN

Normal: Absent
Present in: Malabsorption secondary to intestinal bacterial overgrowth

URINE KETONES (semiquantitative)

Normal: Absent
Present in: Diabetic ketoacidosis, alcoholic ketoacidosis, starvation, isopropanol ingestion

URINE METANEPHRINES

Normal range: 0 to 2.0 mg/24 hr (0 to 11.0 μmol/day [CF: 5.458; SMI: 0.5 μmol/day])
Elevated in: Pheochromocytoma, neuroblastoma, drugs (caffeine, phenothiazines, monoamine oxidase inhibitors), stress. Table 112 summarizes medications that may increase metanephrine levels.

URINE MYOGLOBIN

Normal: Absent

TABLE 112 Medications That May Increase Measured Levels of Fractionated Catecholamines and Metanephrines

Tricyclic antidepressants (including cyclobenzaprine)
Levodopa
Drugs containing adrenergic receptor agonists (e.g., decongestants)
Amphetamines
Buspirone and antipsychotic agents
Prochlorperazine
Reserpine
Withdrawal from clonidine and other drugs (e.g., illicit drugs)
Illicit drugs (e.g., cocaine, heroin)
Ethanol

From Melmed S et al: *Williams textbook of endocrinology*, ed 12, Philadelphia, 2011, WB Saunders.

TABLE 113 Differentiation of Hematuria, Hemoglobinuria, and Myoglobinuria

Condition	Plasma Findings	Urine Findings
Hematuria	Color—normal	Color—normal, smoky, pink, red, brown
		Erythrocytes—many
		Renal—red blood cell casts
		Protein—marked increase
		Lower urinary tract—no casts
		Protein—present or absent
Hemoglobinuria	Color—pink (early)	Color—pink, red, brown
	Haptoglobin—low	Erythrocytes—occasional
		Pigment casts—occasional
		Protein—present or absent
		Hemosiderin—late
Myoglobinuria	Color—normal	Color—red, brown
	Haptoglobin—normal	Erythrocytes—occasional
	Creatine kinase—marked increase	Dense brown casts—occasional
	Aldolase—increased	Protein—present or absent

From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

Present in: Severe trauma, hyperthermia, polymyositis/dermatomyositis, carbon monoxide poisoning, drugs (narcotic and amphetamine toxicity), hypothyroidism, muscle ischemia

Table 113 differentiates hematuria and hemoglobinuria from myoglobinuria.

URINE NITRITE

Normal: Absent
Present in: Urinary tract infections

URINE OCCULT BLOOD

Normal: Negative
Positive in: Trauma to urinary tract, renal disease (glomerulonephritis, pyelonephritis), renal or ureteral calculi, bladder lesions (carcinoma, cystitis), prostatitis, prostatic carcinoma, menstrual contamination, hematopoietic disorders (hemophilia, thrombocytopenia), anticoagulants, ASA

URINE OSMOLALITY

See OSMOLALITY, URINE

URINE PH

Normal range: 4.6 to 8 (average, 6)
Elevated in: Bacteriuria, vegetarian diet, renal failure with inability to form ammonia, drugs (antibiotics, sodium bicarbonate, acetazolamide)

BOX 33 Urine Potassium in Hypokalemia

Low 24-hour urinary potassium (<25 mEq/day) or low spot urine potassium (<15 mEq/L) or low potassium-to-creatinine ratio (<1.5 mEq/mmol)
GI losses: Vomiting, diarrhea, nasogastric tube
Sweat losses: Extreme heat, cystic fibrosis
Low intake
High 24-hour urinary potassium (>25 mEq/day) or high spot urine potassium (>40 mEq/L) or high potassium-to-creatinine ratio (>1.5 mEq/mmol)
Renal potassium wasting
Diuretics, amphotericin B
Increased mineralocorticoid activity
Excretion of bicarbonate (vomiting, RTA)
Excretion of other nonreabsorbable anion (hippurate, beta-hydroxybutyrate, penicillin derivative)
Transcellular shifts
Hypomagnesemia
Bartter, Gitelman, Liddle syndromes
High 24-hour urinary potassium (>25 mEq/day) and high potassium-to-creatinine ratio (>1.5 mEq/mmol) but low spot urine potassium (<15 mEq/L)
Established AKI (tubular dysfunction ± dilutional)
Primary polydipsia (dilutional)
Other polyuric states (osmotic and water diuresis)

AKI, Acute kidney injury; *GI,* gastrointestinal; *RTA,* renal tubular acidosis.
From Ronco C: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.

Decreased in: Acidosis (metabolic, respiratory), drugs (ammonium chloride, methenamine mandelate), diabetes mellitus, starvation, diarrhea

URINE PHOSPHATE

Normal range: 0.8 to 2.0 g/24 hr
Elevated in: Acute tubular necrosis (diuretic phase), chronic renal disease, uncontrolled diabetes mellitus, hyperparathyroidism, hypomagnesemia, metabolic acidosis, metabolic alkalosis, neurofibromatosis, adult-onset vitamin D-resistant hypophosphatemic osteomalacia
Decreased in: Acromegaly, acute renal failure, decreased dietary intake, hypoparathyroidism, respiratory acidosis

URINE POTASSIUM

Normal range: 25 to 100 mEq/24 hr (25 to 100 mmol/day [CF: 1; SMI: 1 mmol/day])
Elevated in:
Aldosteronism (primary, secondary), glucocorticoids, alkalosis, renal tubular acidosis, excessive dietary potassium intake
Decreased in:
Acute renal failure, potassium-sparing diuretics, diarrhea, hypokalemia

Box 33 describes urine potassium in hypokalemia.

URINE PROTEIN (quantitative)

Normal range: <150 mg/24 hr (<0.15 g/day [CF: 0.001; SMI: 0.01 g/day])
Elevated in:
Nephrotic syndrome as a result of primary renal diseases
Malignant hypertension
Malignancies: Multiple myeloma, leukemias, Hodgkin disease
Congestive heart failure
Diabetes mellitus
Systemic lupus erythematosus, rheumatoid arthritis
Sickle cell disease
Goodpasture syndrome
Malaria
Amyloidosis, sarcoidosis
Tubular lesions: Cystinosis
Functional (after heavy exercise)
Pyelonephritis
Pregnancy
Constrictive pericarditis
Renal vein thrombosis
Toxic nephropathies: Heavy metals, drugs

Radiation nephritis
Orthostatic (postural) proteinuria
Benign proteinuria: Fever, heat or cold exposure

URINE SEDIMENT

See Fig. 60 for visual evaluation of common abnormalities. Table 114 summarizes characteristics of amorphous and crystalline urinary sediments.

URINE SODIUM (quantitative)

See Table 115 for use of urine electrolytes in the differential diagnosis of hypokalemia. Table 116 describes urine sodium findings in acute kidney injury (AKI).

Normal range: 40 to 220 mEq/day (40 to 220 mmol/day [CF: 1; SMI: 1 mmol/day])

Elevated in: Diuretic administration, high sodium intake, salt-losing nephritis, acute tubular necrosis, vomiting, Addison disease, syndrome of inappropriate antidiuretic hormone secretion, hypothyroidism, congestive heart failure, hepatic failure, chronic renal failure, Bartter syndrome, glucocorticoid deficiency, interstitial nephritis caused by analgesic abuse, mannitol, dextran, or glycerol therapy, milk-alkali syndrome, decreased renin secretion, postobstructive diuresis

Decreased In: Increased aldosterone, glucocorticoid excess, hyponatremia, prerenal azotemia, decreased salt intake

URINE SPECIFIC GRAVITY

Normal range: 1.005 to 1.030

Elevated in: Dehydration, excessive fluid losses (vomiting, diarrhea, fever), x-ray contrast media, diabetes mellitus, congestive heart failure, syndrome of inappropriate antidiuretic hormone secretion, adrenal insufficiency, decreased fluid intake

Decreased in: Diabetes insipidus, renal disease (glomerulonephritis, pyelonephritis), excessive fluid intake or IV hydration

URINE VANILLYLMANDELIC ACID (VMA)

Normal range: <6.8 mg/24 hr (<35 μmol/day [CF: 5.046; SMI: 1 μmol/day])

Elevated in: Pheochromocytoma, neuroblastoma, ganglioblastoma, drugs (isoproterenol, methocarbamol, levodopa, sulfonamides, chlorpromazine), severe stress, after ingestion of bananas, chocolate, vanilla, tea, coffee

Decreased in: Drugs (monoamine oxidase inhibitors, reserpine, guanethidine, methyldopa)

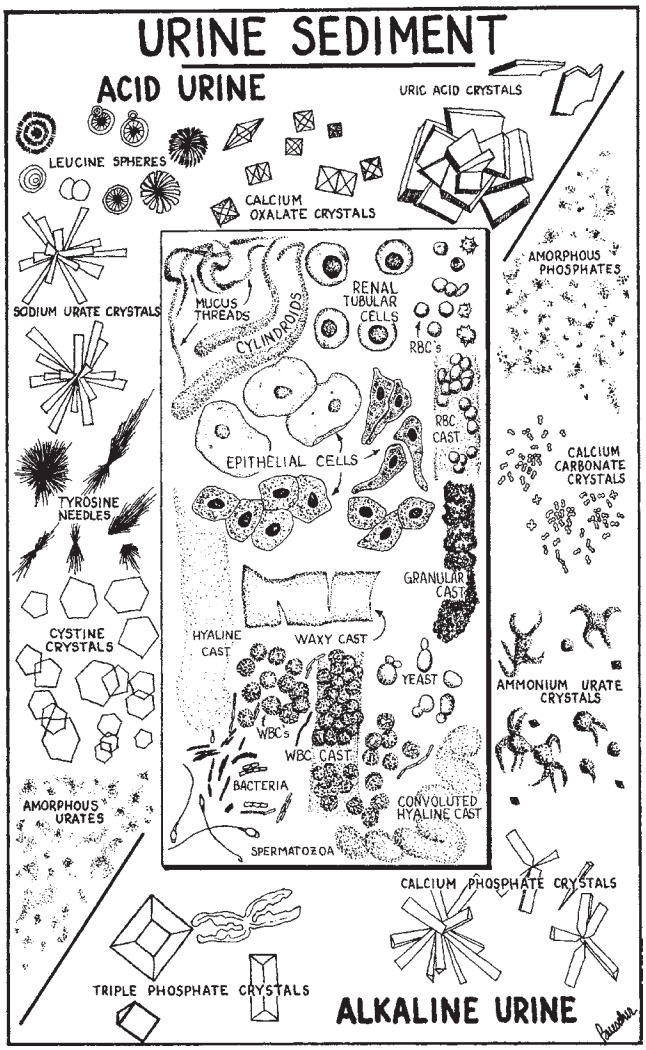

FIG. 60 Microscopic examination of urinary sediment. (From Grigorian Greene M: *The Harriet Lane handbook: a manual for pediatric house officers,* ed 17, St Louis, 2007, Mosby.)

TABLE 114 Characteristics of Amorphous and Crystalline Urinary Sediments

Substance	Description	URINE PH WHERE FOUND			Solubility Characteristics and Comments
		Acid	Neutral	Alkaline	
Ampicillin	Uncommon: from high dose; colorless; long prisms that form clusters, sheaves	+	–	–	
Bilirubin	Reddish brown; amorphous needles, rhombic plates, or cubes; may color uric acid crystals	+	–	–	Soluble in alkali, acid, acetone, and chloroform
Cholesterol	Rare; colorless; flat plate with corner notch; accompanies fatty casts and oval fat bodies	+	+	–	Very soluble in chloroform, ether, and hot alcohol
Calcium carbonate	Colorless; small granules in pairs, fours; spheres; rarely needles	–	+	+	Soluble in acetic acid with effervescence
Calcium oxalate	Dihydrate: common; colorless; small refractile octahedron Monohydrate: uncommon; dumbbell and ovoid rectangle	+	+	–	Soluble in dilute HCl
Cystine	Colorless; hexagonal plates, often laminated; rapidly destroyed by bacteria; may be confused with uric acid, but cystine is soluble in dilute hydrochloric acid	+	–	–	Soluble in alkali (especially ammonia) and dilute HCl; insoluble in boiling water, acetic acid, alcohol, ether; apply cyanide-nitroprusside reaction
Hematin	Small, biconvex "whetstone" seen with hemoglobinuria	+	–	–	

Continued

TABLE 114 Characteristics of Amorphous and Crystalline Urinary Sediments—cont'd

Substance	Description	URINE PH WHERE FOUND			Solubility Characteristics and Comments
		Acid	Neutral	Alkaline	
Hemosiderin	Golden brown; granules in clumps, in cells, casts	+	+	–	Blue with Prussian blue
Hippuric acid	Rare; colorless, needles, rhombic plates and four-sided prisms; distinguish from phosphates	+	+	+	Soluble with hot water and alkali; insoluble in acetic acid
Indigotin	Rare; blue; amorphous or small crystals; colors other crystals	+	+	+	Very soluble in chloroform; soluble in ether; insoluble in acetone
Phosphates					
Amorphous phosphate (magnesium, calcium)	Colorless; fine, granular precipitate	–	+	+	Insoluble with heat; soluble with acetic acid, dilute HCl
Calcium hydrogen phosphate	Less common; colorless, star-shaped or long, thin prisms or needles; form rosettes	sl	+	sl	Slightly soluble in dilute acetic acid, soluble in dilute HCl
Triple phosphate (ammonium, magnesium)	Common form: colorless; three- to six-sided prisms, "coffin lids" Less often: Flat, fern leaf form, sheets, flakes	–	+	+	Soluble in dilute acetic acid
Radiographic media (meglumine diatrizoate)	Intravenous: Colorless; thin, rhombic plates, some with notch, resemble cholesterol plates; elongated crystals Retrograde: Colorless; long, pointed crystals	+	–	–	Soluble in 10% NaOH: Insoluble in ether and chloroform; high specific gravity in urine: polarizes with interference colors
Sulfonamides					
Acetylsulfadiazine	Wheat sheaves with eccentric binding	+	–	–	
Acetylsulfamethoxazole	Brown; dense spheres or irregular divided spheres	+	–	–	
Sulfadiazine	Brown; dense globules	+	–	–	Soluble in acetone
Tyrosine	Rare; colorless or yellow, appears black with focusing; fine silky needles in sheaves or rosettes	+	–	–	Soluble in alkali, dilute mineral acid, relatively heat soluble; insoluble in alcohol, ether
Urates					
Amorphous (calcium, magnesium, sodium, potassium)	Common; colorless to yellow-brown; amorphous, granular precipitate	+	+	–	Soluble in dilute alkali; soluble at 60 °C (140 °F) or lower; change to uric acid crystal with concentrated HCl or acetic acid
Monosodium urate	Colorless; needles or amorphous precipitate	+	–	–	
Urates (sodium, potassium, ammonium)	Brown; small, spherical; clusters resemble biurates	sl	+	–	Soluble at 60 °C (140 °F); change to uric acid with glacial acetic acid
Ammonium biurate	Common in "old" urine; dark yellow or brown; spheres or "thorn apples" (spheres with horns)	–	+	+	Soluble at 60° C (140 °F) with acetic acid; soluble strong alkali; change to uric acid with concentrated hydrochloric or acetic acid
Uric acid	Common; yellow, red-brown, brown; large variety of shapes: rhombic, four-sided plates, rosettes, "whetstones" lemon shapes; rarely, colorless hexagonals	+	–	–	Soluble in alkali: Insoluble in alcohol and acids; polarizes with interference colors
Xanthine	Rare; colorless; small, rhombic plates	+	+	–	Soluble in alkali; soluble with heat; insoluble in acetic acid

HCl, Hydrochloride; *sl,* slight.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

TABLE 115 Urine Electrolytes* in the Differential Diagnosis of Hypokalemia

Condition	URINE ELECTROLYTE	
	Na^+	Cl^-
Vomiting		
Recent	High†	Low‡
Remote	Low	Low
Diuretics		
Recent	High	High
Remote	Low	Low
Diarrhea or Laxative Abuse	Low	High
Bartter or Gitelman Syndrome	High	High

*Do not use the urine electrolytes in this fashion during polyuric states.
†High = urine concentration >15 mmol/L.
‡Low = urine concentration <15 mmol/L.
From Vincent JL et al: *Textbook of critical care,* ed 6, Philadelphia, 2011, WB Saunders.

TABLE 116 Urinalysis Findings in Acute Kidney Injury (AKI)

Etiologic Disorder	Urine Chemistry	Urine Sediment
Prerenal	U_{Na}<20 mmol/L FE_{Na}<1% FE_{urea}<35%	Normal or nearly normal (hyaline casts and rare granular casts)
Acute tubular necrosis	U_{Na}>40 mmol/L FE_{Na}>2% FE_{urea}>60%	Renal tubular epithelial cells, epithelial cell casts, coarse pigmented (muddy brown) casts
Acute interstitial nephritis	Variable; U_{Na} may be >40 mmol/L, FE_{Na} may be >2%	Red blood cells, white blood cells, white blood cell casts, eosinophils
Acute glomerulonephritis	Variable; U_{Na} may be <20 mmol/L, FE_{Na} may be <1%	Red blood cells (dysmorphic), red blood cell casts
Acute vascular disease	Variable; U_{Na} may be <20 mmol/L, FE_{Na} may be <1%	Red blood cells, red blood cell casts in HUS/TTP, eosinophils in atheroembolic disease
Crystal-associated AKI	Variable	Crystalluria Uric acid crystals in tumor lysis syndrome Calcium oxalate crystals in ethylene glycol ingestion Drug crystals (acyclovir, methotrexate, indinavir, triamterene, sulfadiazine)
Obstructive	Variable; early U_{Na} may be <20 mmol/L, FE_{Na} may be <1%; late U_{Na} may be >40 mmol/L, FE_{Na} may be >2%	Normal or red blood cells, white blood cells and crystals

FE_{Na}, Fractional excretion of sodium; *FE_{urea},* fractional excretion of urea; *HUS,* hemolytic-uremic syndrome; *TTP,* thrombotic thrombocytopenic purpura; *U_{Na},* urine sodium concentration.
From Parrillo JE, Dellinger RP: *Critical care medicine, principles of diagnosis and management in the adult,* ed 4, Philadelphia, 2014, Elsevier.

VARICELLA-ZOSTER VIRUS (VZV) SEROLOGY

Test description: Test can be performed on whole blood, tissue, skin lesions, and CSF

VASOACTIVE INTESTINAL PEPTIDE (VIP)

Normal: <50 pg/ml
Elevated in: Pancreatic VIP-omas, neuroblastoma, pancreatic islet cell hyperplasia, liver disease, multiple endocrine neoplasia (MEN) I, ganglioneuroma, ganglioneuroblastoma

VDRL

Normal range: Negative
Positive test: Syphilis, other treponemal diseases (yaws, pinta, bejel)

NOTE: A false-positive test may be seen in patients with systemic lupus erythematosus and other autoimmune diseases, infectious mononucleosis, HIV, atypical pneumonia, malaria, leprosy, typhus fever, rat-bite fever, relapsing fever.

NOTE: See Table 117 for interpretation of serologic tests for syphilis.

VISCOSITY (serum)

Normal range: 1.4 to 1.8 relative to water (1.10-1.22 centipoise)

TABLE 117 Interpretation of Serologic Tests for Syphilis*

Nontreponemal Tests	Treponemal Tests	Interpretation of Finding: Is Syphilis Present?*
Nonreactive	Nonreactive	Early primary syphilis is not ruled out by negative serologic tests. Early syphilis is present in 13%-30% of patients who have a negative microhemagglutination *Treponema pallidum* test; in about 30% of patients who present with chancre but have a nonreactive reagin test; and in about 10% of patients who have a negative FTA-ABS test. Late syphilis is present in a very small fraction of patients. Adequately treated syphilis in remote past may produce these results, but treponemal tests usually remain reactive.
	Reactive	Observed in about 10% of patients with chancre. The treponemal tests may turn positive shortly before the reagin tests. Reagin tests repeated after several days are generally positive. In adequately treated early syphilis, the reagin test may return to nonreactive within 1-2 yr, whereas the treponemal tests generally do not. Late syphilis is not ruled out by a negative reagin test. The sensitivity of the reagin tests is lower than that of treponemal tests in untreated late syphilis. In secondary syphilis, rarely, a highly reactive serum appears negative when tested undiluted with a reagin test because flocculation is inhibited by relative antibody excess. Not reported to occur with treponemal tests. Quantitative reagin tests are positive. False-positive treponemal tests occur in 40% of patients with Lyme disease.
Reactive	Nonreactive borderline (FTA-ABS)	Finding is not diagnostic of syphilis but constitutes a classic biologic false-positive reaction. Not diagnostic of syphilis; most patients (90%) with this pattern do not develop clinical or serologic evidence of syphilis. Repeat test is indicated. Chronic borderline results are associated with a variety of conditions other than syphilis.
	Beaded (FTA-ABS)	Not diagnostic of syphilis. Seen with collagen vascular disease.
	Reactive	Findings diagnostic of syphilis or other treponemal disease. In adequately treated syphilis, one would expect (1) a sustained fourfold drop in titer of reagin test, although reagin test may remain positive after adequate therapy; (2) treponemal tests remain positive after adequate therapy. Concurrent false-positive results on both nontreponemal and treponemal tests could occur in rare instances. It may be impossible to rule out syphilis in an individual with this test profile.

FTA-ABS, Fluorescent treponemal antibody, absorbed.
*Serologic data must always be interpreted in the light of a total clinical evaluation. Diagnosis based on serologic criteria alone is fraught with error. Serologic tests apparently in conflict with clinical diagnosis should be confirmed by repetition or possibly referral to a reference laboratory.
From Stein JH (ed): *Internal medicine,* ed 4, St Louis, 1994, Mosby.

TABLE 116 Urinalysis Findings in Acute Kidney Injury (AKI)

Etiologic Disorder	Urine Chemistry	Urine Sediment
Prerenal	U_{Na}<20 mmol/L FE_{Na}<1% FE_{urea}<35%	Normal or nearly normal (hyaline casts and rare granular casts)
Acute tubular necrosis	U_{Na}>40 mmol/L FE_{Na}>2% FE_{urea}>60%	Renal tubular epithelial cells, epithelial cell casts, coarse pigmented (muddy brown) casts
Acute interstitial nephritis	Variable; U_{Na} may be >40 mmol/L, FE_{Na} may be >2%	Red blood cells, white blood cells, white blood cell casts, eosinophils
Acute glomerulonephritis	Variable; U_{Na} may be <20 mmol/L, FE_{Na} may be <1%	Red blood cells (dysmorphic), red blood cell casts
Acute vascular disease	Variable; U_{Na} may be <20 mmol/L, FE_{Na} may be <1%	Red blood cells, red blood cell casts in HUS/TTP, eosinophils in atheroembolic disease
Crystal-associated AKI	Variable	Crystalluria Uric acid crystals in tumor lysis syndrome Calcium oxalate crystals in ethylene glycol ingestion Drug crystals (acyclovir, methotrexate, indinavir, triamterene, sulfadiazine)
Obstructive	Variable; early U_{Na} may be <20 mmol/L, FE_{Na} may be <1%; late U_{Na} may be >40 mmol/L, FE_{Na} may be >2%	Normal or red blood cells, white blood cells and crystals

FE_{Na}, Fractional excretion of sodium; *FE_{urea},* fractional excretion of urea; *HUS,* hemolytic-uremic syndrome; *TTP,* thrombotic thrombocytopenic purpura; *U_{Na},* urine sodium concentration.

BOX 34 Etiopathophysiologic Classification of Cobalamin Deficiency

- Nutritional cobalamin deficiency (insufficient cobalamin intake): Vegetarians, poverty-imposed near-vegetarians, breastfed infants of mothers with pernicious anemia
- Abnormal intragastric events (inadequate proteolysis of food cobalamin): Atrophic gastritis, hypochlorhydria, proton pump inhibitors, H_2 blockers
- Loss/atrophy of gastric oxyntic mucosa (deficient intrinsic factor [IF] molecules): Total or partial gastrectomy, adult and juvenile pernicious anemia, caustic destruction (lye)
- Abnormal events in the small bowel lumen
  - Inadequate pancreatic protease (R factor-cobalamin not degraded, cobalamin not transferred to IF)
  - Insufficient pancreatic protease: Pancreatic insufficiency
  - Inactivation of pancreatic protease: Zollinger-Ellison syndrome
  - Usurping of luminal cobalamin (inadequate binding of cobalamin to IF)
  - By bacteria-stasis syndromes (blind loops, pouches of diverticulosis, strictures, fistulas, anastomosis), impaired bowel motility (scleroderma), hypogammaglobulinemia
  - By *Diphyllobothrium latum* (fish tapeworm)
- Disorders of ileal mucosa/IF-cobalamin receptors (IF-cobalamin not bound to IF-cobalamin receptors [cubam receptors])
  - Diminished or absent cubam receptors: Ileal bypass/resection/fistula
  - Abnormal mucosal architecture/function: Tropical/nontropical sprue, Crohn disease, tuberculous ileitis, amyloidosis
  - Cubam receptor defects: Imerslund-Gräsbeck syndrome
  - Drug-effects: Metformin, cholestyramine, colchicine, neomycin
- Disorders of plasma cobalamin transport (transcobalamin [TCII]-cobalamin not delivered to TCII receptors): Congenital TCII deficiency, defective binding of TCII-cobalamin to TCII receptors (rare)
  - Metabolic disorders (cobalamin not used by cell)
  - Inborn enzyme errors: cblA to cblG disorders
  - Acquired disorders (cobalamin inactivated by irreversible oxidation): Nitrous oxide

From Hoffman R: *Hematology: Basic principles and practice,* ed 6, Philadelphia, 2013, WB Saunders.

Elevated in: Monoclonal gammopathies (Waldenström macroglobulinemia, multiple myeloma), hyperfibrinogenemia, systemic lupus erythematosus, rheumatoid arthritis, polycythemia, leukemia

VITAMIN B_{12} (cobalamin)

See Box 34 for etiopathophysiologic classification of cobalamin deficiency. Causes of false-positive and false-negative serum cobalamin levels are summarized in Table 118. Table 119 describes causes of megaloblastosis not responding to therapy with cobalamin or folate. Table 120 summarizes indications for prophylaxis with cobalamin or folate.

Normal

190 to 900 ng/ml

Causes of vitamin B_{12} deficiency:

a. Pernicious anemia (antibodies against intrinsic factor and gastric parietal cells)
b. Dietary (strict lacto-ovo vegetarians, food faddists)
c. Malabsorption (achlorhydria, gastrectomy, ileal resection, pancreatic insufficiency, drugs [omeprazole, cholestyramine])

- Falsely low levels occur in patients with severe folate deficiency, in patients using high doses of ascorbic acid, and when cobalamin levels are measured after nuclear medicine studies (radioactivity interferes with cobalamin radioimmunoassay).
- Falsely high or normal levels in patients with cobalamin deficiency can occur in severe liver disease and chronic granulocytic leukemia.
- The absence of anemia or macrocytosis does not exclude the diagnosis of cobalamin deficiency.

TABLE 118 Serum Cobalamin: False-Positive and False-Negative Test Results

Falsely Low Serum Cobalamin in the Absence of True Cobalamin Deficiency
Folate deficiency (one third of patients)
Multiple myeloma
TCI deficiency
Megadose vitamin C therapy
Falsely Raised Cobalamin Levels in the Presence of True Deficiency*
Cobalamin binders (TCI and II) increased (e.g., myeloproliferative states, hepatomas, and fibrolamellar hepatic tumors)
TCII-producing macrophages are activated (e.g., autoimmune diseases, monoblastic leukemias and lymphomas)
Release of cobalamin from hepatocytes (e.g., active liver disease)
High serum anti-IF antibody titer

IF, Intrinsic factor; *TC,* transcobalamin.

*Although a low serum cobalamin level is not synonymous with cobalamin deficiency, 5% of patients with true cobalamin deficiency have low-normal cobalamin levels, a potentially serious problem because the patient's underlying cobalamin deficiency will progress if uncorrected.

From Hoffman R et al: *Hematology, basic principles and practice*, ed 6, Philadelphia, 2013, WB Saunders.

TABLE 119 Causes of Megaloblastosis Not Responding to Therapy with Cobalamin or Folate

Wrong Diagnosis
Combined folate and cobalamin deficiencies being treated with only one vitamin
Associated iron deficiency
Associated hemoglobinopathy (e.g., sickle cell disease, thalassemia)
Associated anemia of chronic disease
Associated hypothyroidism

From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 120 Indications for Prophylaxis with Cobalamin or Folate

Prophylaxis with Cobalamin
Infants on specialized diets[a]
Premature infants
Infants of mothers with pernicious anemia[a]
Infants and children of mothers with nutritional cobalamin deficiency
Vegetarianism and poverty-imposed near-vegetarianism[a]
Total gastrectomy[b]
Prophylaxis with Folic Acid[c]
All women contemplating pregnancy (at least 400μg/day)[d]
Pregnancy and lactation, premature infants
Mothers at risk for delivery of infants with neural tube defects[e,f]
Hemolytic anemias/hyperproliferative hematologic states
Patients with rheumatoid arthritis or psoriasis on therapy with methotrexate[g]
Patients on antiepileptic drugs
Patients with ulcerative colitis

[a]For vegetarians, prophylaxis with cobalamin (5- to 10-μg tablet/day) orally should suffice. In all other conditions involving any abnormality of cobalamin absorption, cobalamin tablets of 1000μg/day should be administered orally to ensure that cobalamin transport by passive diffusion across the intestine is sufficient to meet daily needs.

[b]Consider late development of cobalamin deficiency and iron malabsorption (prophylaxis with oral cobalamin and iron).

[c]Ensure that the patient does not have a cobalamin deficiency before initiating long-term folate prophylaxis.

[d]For prevention of first occurrence of neural tube defects

[e]Previous delivery of a child with neural tube defects (e.g., anencephaly, spina bifida, meningocele) imparts a 10-fold greater risk for subsequent delivery of infant with neural tube defects.

[f]Folic acid (4 mg/day) administered periconceptionally and throughout the first trimester

[g]To reduce toxicity of the antifolate

From Hoffman R: *Hematology, basic principles and practice*, ed 7, Philadelphia, 2018, Elsevier.

TABLE 121 Serum Calcium, Phosphate, and Vitamin D Levels in Various Disorders

Disorder	Calcium	25(OH)D	1,25(OH)D	Phosphate
25(OH)D intoxication	High	High	Low, normal	Normal, high
Primary hyperparathyroidism	High	Normal	Normal, high	Low
Secondary hyperparathyroidism	Low	Low, normal, high	Low, normal, high	Low, normal, high
Tertiary hyperparathyroidism	Normal, high*	Low, normal, high	Low, normal, high	Low, normal, high
Malignancy	High	Normal	Low, normal	Low
Vitamin D deficiency	Low	Low	Low, normal, high	Low
Renal failure	Low	Normal	Low	High
Hyperphosphatemia	Low	Normal	Low	High
Vitamin D rickets type I, II	Low	Normal, high	Low, normal, high	Low
Granulomatous diseases (sarcoid/TB)	High	Low, normal, high	High	Normal, high
Postmenopausal osteoporosis	Normal	Normal	Normal	Normal
Senile osteoporosis	Normal	Normal	Normal	Normal
Osteomalacia	Low, normal	Low, normal	Low	Low, normal, high

*Calcium may be normal in the setting of concurrent $1,25(OH)_2D_3$ deficiency.
TB, Tuberculosis.
From McPherson RA, Pincus MR: *Henry's clinical diagnosis and management by laboratory methods*, ed 23, St Louis, 2017, Elsevier.

VITAMIN D, 1,25 DIHYDROXY CALCIFEROL

Normal: 16 to 65 pg/ml
Elevated in: Tumor calcinosis, primary hyperparathyroidism, sarcoidosis, tuberculosis, idiopathic hypercalciuria
Decreased in: Nutritional deficiency, postmenopausal osteoporosis, chronic renal failure, hypoparathyroidism, tumor-induced osteomalacia, rickets, elevated blood lead levels. Table 121 compares vitamin D levels in various disorders. Fig. 61 illustrates vitamin D physiology.

VITAMIN K

Normal: 0.10 to 2.20 ng/ml
Decreased in: Primary biliary cirrhosis, anticoagulants, antibiotics, cholestyramine, GI disease, pancreatic disease, cystic fibrosis, obstructive jaundice, hypoprothrombinemia, hemorrhagic disease of the newborn

VON WILLEBRAND FACTOR

Normal: Levels vary according to blood type; blood type O: 50 to 150 U/dl; blood type non-O: 90 to 200 U/dl
Decreased in: von Willebrand disease (however, in type II von Willebrand disease the antigen may be normal but the function is impaired)

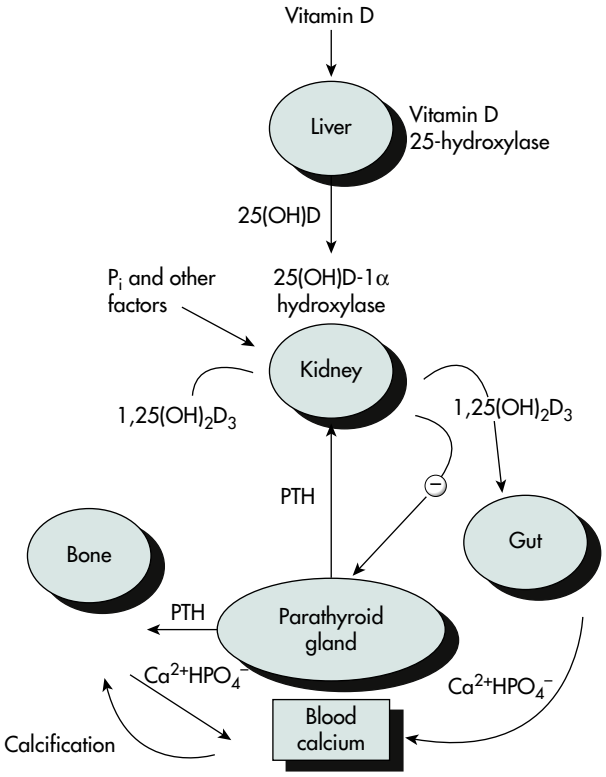

FIG. 61 Vitamin D physiology. P_i, Inorganic phosphate; *PTH,* parathyroid hormone. (From Ronco C: *Critical care nephrology*, ed 3, Philadelphia, 2019, Elsevier.)

IMMUNIZATIONS AND CHEMOPROPHYLAXIS

Childhood and Adolescent Immunizations

TABLE 1 Recommended Immunization Schedule for Children and Adolescents Aged 18 Years or Younger—United States, 2020. (For those who fall behind or start late, see the catch-up schedule [Table 2])

These recommendations must be read with the footnotes that follow. For those who fall behind or start late, provide catch-up vaccination at the earliest opportunity as indicated by the divided bars. To determine minimum intervals between doses, see the catch-up schedule (Table 2). School entry and adolescent vaccine age groups are shaded in gray.

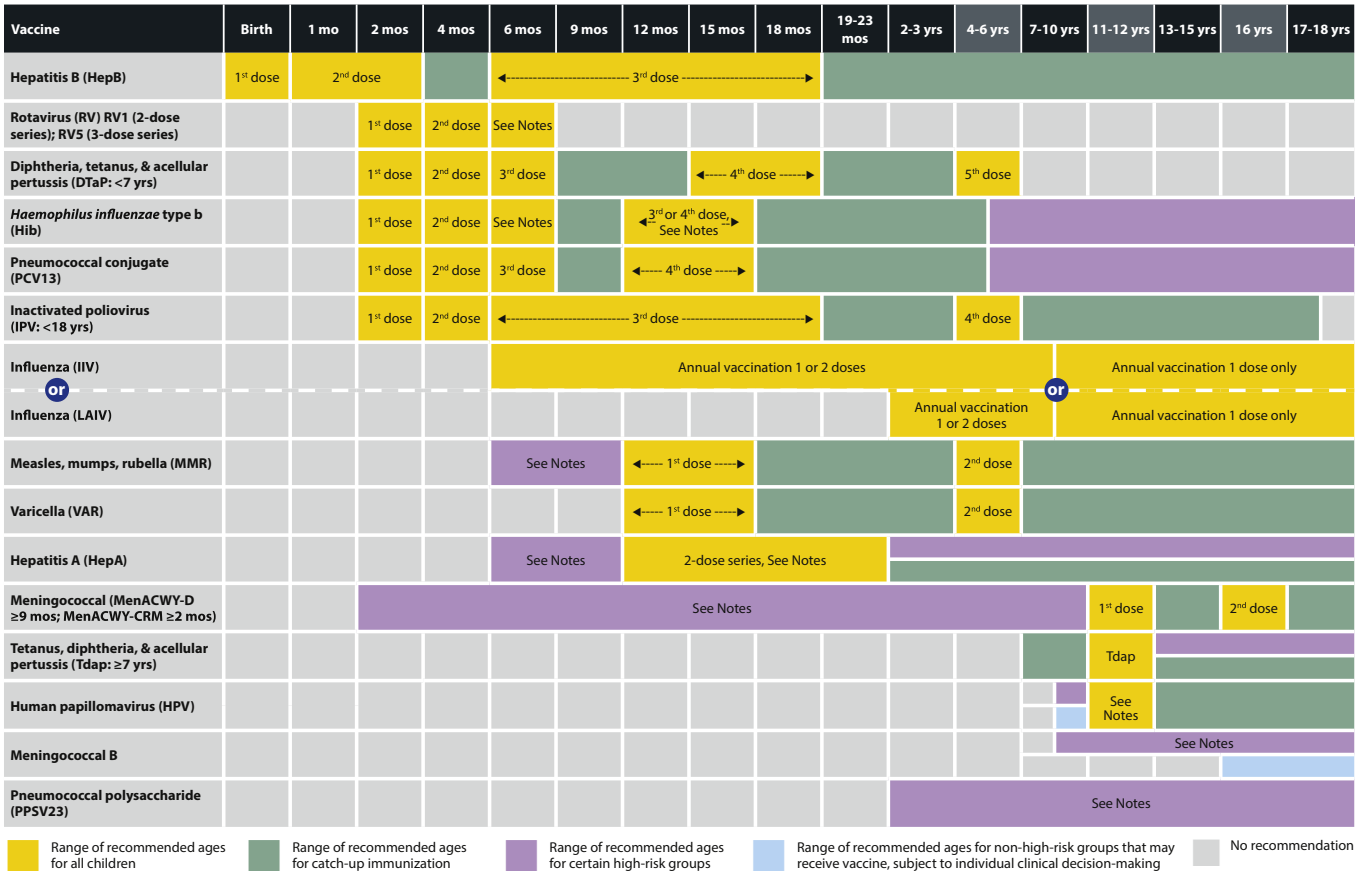

TABLE 2 Catch-up Immunization Schedule for Persons Aged 4 Months Through 18 Years Who Start Late or Who Are More Than 1 Month Behind—United States, 2020

The table below provides catch-up schedules and minimum intervals between doses for children whose vaccinations have been delayed. A vaccine series does not need to be restarted, regardless of the time that has elapsed between doses. Use the section appropriate for the child's age. Always use this table in conjunction with Table 1 and the footnotes that follow.

Vaccine	Minimum Age for Dose 1	Minimum Interval Between Doses			
		Dose 1 to Dose 2	Dose 2 to Dose 3	Dose 3 to Dose 4	Dose 4 to Dose 5
Children age 4 months through 6 years					
Hepatitis B	Birth	**4 weeks**	**8 weeks *and* at least 16 weeks after first dose.** Minimum age for the final dose is 24 weeks.		
Rotavirus	6 weeks Maximum age for first dose is 14 weeks, 6 days	**4 weeks**	**4 weeks** Maximum age for final dose is 8 months, 0 days.		
Diphtheria, tetanus, and acellular pertussis	6 weeks	**4 weeks**	**4 weeks**	**6 months**	**6 months**
Haemophilus influenzae type b	6 weeks	**No further doses needed** if first dose was administered at age 15 months or older. **4 weeks** if first dose was administered before the 1st birthday. **8 weeks (as final dose)** if first dose was administered at age 12 through 14 months.	**No further doses needed** if previous dose was administered at age 15 months or older. **4 weeks** if current age is younger than 12 months ***and*** first dose was administered at younger than age 7 months, ***and*** at least 1 previous dose was PRP-T (ActHib, Pentacel, Hiberix) or unknown. **8 weeks *and* age 12 through 59 months (as final dose)** if current age is younger than 12 months ***and*** first dose was administered at age 7 through 11 months; OR if current age is 12 through 59 months ***and*** first dose was administered before the 1st birthday, ***and*** second dose administered at younger than 15 months; OR if both doses were PRP-OMP (PedvaxHIB; Comvax) ***and*** were administered before the 1st birthday.	**8 weeks (as final dose)** This dose only necessary for children age 12 through 59 months who received 3 doses before the 1st birthday.	
Pneumococcal conjugate	6 weeks	**No further doses needed** for healthy children if first dose was administered at age 24 months or older. **4 weeks** if first dose administered before the 1st birthday. **8 weeks (as final dose for healthy children)** if first dose was administered at the 1st birthday or after.	**No further doses needed** for healthy children if previous dose administered at age 24 months or older. **4 weeks** if current age is younger than 12 months and previous dose given at <7 months old. **8 weeks (as final dose for healthy children)** if previous dose given between 7-11 months (wait until at least 12 months old); OR if current age is 12 months or older and at least 1 dose was given before age 12 months.	**8 weeks (as final dose)** This **dose** only necessary for children age 12 through 59 months who received 3 doses before age 12 months or for children at high risk who received 3 doses at any age.	
Inactivated poliovirus	6 weeks	**4 weeks**	4 weeks if current age is < 4 years. 6 months (as final dose) if current age is 4 years or older.	**6 months** (minimum age 4 years for final dose).	
Measles, mumps, rubella	12 months	**4 weeks**			
Varicella	12 months	**3 months**			
Hepatitis A	12 months	**6 months**			
Meningococcal	2 months MenACWY-CRM 9 months MenACWY-D	**8 weeks**	See Notes	See Notes	
Children and adolescents age 7 through 18 years					
Meningococcal	Not Applicable (N/A)	**8 weeks**			
Tetanus, diphtheria; tetanus, diphtheria, and acellular pertussis	7 years	**4 weeks**	**4 weeks** if first dose of DTaP/DT was administered before the 1st birthday. **6 months (as final dose)** if first dose of DTaP/DT or Tdap/Td was administered at or after the 1st birthday.	**6 months** if first dose of DTaP/DT was administered before the 1st birthday.	
Human papillomavirus	9 years	**Routine dosing intervals are recommended.**			
Hepatitis A	N/A	**6 months**			
Hepatitis B	N/A	**4 weeks**	**8 weeks *and*** at least 16 weeks after first dose.		
Inactivated poliovirus	N/A	**4 weeks**	**6 months** A fourth dose is not necessary if the third dose was administered at age 4 years or older and at least 6 months after the previous dose.	A fourth dose of IPV is indicated if all previous doses were administered at <4 years or if the third dose was administered <6 months after the second dose.	
Measles, mumps, rubella	N/A	**4 weeks**			
Varicella	N/A	**3 months** if younger than age 13 years. **4 weeks** if age 13 years or older.			

Footnotes — Recommended Child and Adolescent Immunization Schedule for ages 18 years or younger, United States, 2020

For vaccine recommendations for persons 19 years of age and older, see the Recommended Adult Immunization Schedule.

Additional information

- Consult relevant ACIP statements for detailed recommendations at www.cdc.gov/vaccines/hcp/acip-recs/index.html.
- For information on contraindications and precautions for the use of a vaccine, consult the General Best Practice Guidelines for Immunization and relevant ACIP statements at www.cdc.gov/vaccines/hcp/acip-recs/index.html.
- For calculating intervals between doses, 4 weeks = 28 days. Intervals of ≥4 months are determined by calendar months.
- Within a number range (e.g., 12–18), a dash (–) should be read as "through."
- Vaccine doses administered ≤4 days before the minimum age or interval are considered valid. Doses of any vaccine administered ≥5 days earlier than the minimum age or minimum interval should not be counted as valid and should be repeated as age-appropriate. The repeat dose should be spaced after the invalid dose by the recommended minimum interval. For further details, see Table 3-1, Recommended and minimum ages and intervals between vaccine doses, in General Best Practice Guidelines for Immunization at www.cdc.gov/vaccines/hcp/acip-recs/general-recs/timing.html.
- Information on travel vaccine requirements and recommendations is available at wwwnc.cdc.gov/travel/.
- For vaccination of persons with immunodeficiencies, see Table 8-1, Vaccination of persons with primary and secondary immunodeficiencies, in General Best Practice Guidelines for Immunization at www.cdc.gov/vaccines/hcp/acip-recs/general-recs/immunocompetence.html, and Immunization in Special Clinical Circumstances (In: Kimberlin DW, Brady MT, Jackson MA, Long SS, eds. R*ed Book: 2018 Report of the Committee on Infectious Diseases*. 31st ed. Itasca, IL: American Academy of Pediatrics; 2018:67–111).
- For information regarding vaccination in the setting of a vaccine-preventable disease outbreak, contact your state or local health department.
- The National Vaccine Injury Compensation Program (VICP) is a no-fault alternative to the traditional legal system for resolving vaccine injury claims. All routine child and adolescent vaccines are covered by VICP except for pneumococcal polysaccharide vaccine (PPSV23). For more information, see www.hrsa.gov/vaccinecompensation/index.html.

1. Diphtheria, tetanus, and pertussis (DTaP) vaccination (minimum age: 6 weeks [4 years for Kinrix or Quadracel])

Routine vaccination

- 5-dose series at 2, 4, 6, 15–18 months, 4–6 years
  - **Prospectively:** Dose 4 may be given as early as age 12 months if at least 6 months have elapsed since dose 3.
  - **Retrospectively:** A 4th dose that was inadvertently given as early as 12 months may be counted if at least 4 months have elapsed since dose 3.

Catch-up vaccination

- Dose 5 is not necessary if dose 4 was administered at age 4 years or older.
- For other catch-up guidance, see Table 2.

2. *Haemophilus influenzae* type b vaccination

(minimum age: 6 weeks)

Routine vaccination

- **ActHIB, Hiberix, or Pentacel:** 4-dose series at 2, 4, 6, 12–15 months
- **PedvaxHIB:** 3-dose series at 2, 4, 12–15 months

Catch-up vaccination

- **Dose 1 at 7–11 months:** Administer dose 2 at least 4 weeks later and dose 3 (final dose) at 12–15 months or 8 weeks after dose 2 (whichever is later).
- **Dose 1 at 12–14 months:** Administer dose 2 (final dose) at least 8 weeks after dose 1.
- **Dose 1 before 12 months and dose 2 before 15 months:** Administer dose 3 (final dose) 8 weeks after dose 2.
- **2 doses of PedvaxHIB before 12 months:** Administer dose 3 (final dose) at 12–59 months and at least 8 weeks after dose 2.
- **Unvaccinated at 15–59 months:** 1 dose
- For other catch-up guidance, see Table 2.

Special situations

- **Chemotherapy or radiation treatment:**
  12–59 months
  - Unvaccinated or only 1 dose before age 12 months: 2 doses, 8 weeks apart
  - 2 or more doses before age 12 months: 1 dose at least 8 weeks after previous dose

  Doses administered within 14 days of starting therapy or during therapy should be repeated at least 3 months after therapy completion.
- **Hematopoietic stem cell transplant (HSCT):**
  - 3-dose series 4 weeks apart starting 6 to 12 months after successful transplant regardless of Hib vaccination history
- **Anatomic or functional asplenia (including sickle cell disease):**
  12–59 months
  - Unvaccinated or only 1 dose before 12 months: 2 doses, 8 weeks apart
  - 2 or more doses before 12 months:1 dose at least 8 weeks after previous dose

  Unvaccinated persons age 5 years or older*
  - 1 dose
- **Elective splenectomy:**
  Unvaccinated persons age 15 months or older*
  - 1 dose (preferably at least 14 days before procedure)
- **HIV infection:**
  12–59 months
  - Unvaccinated or only 1 dose before age 12 months: 2 doses, 8 weeks apart
  - 2 or more doses before age 12 months: 1 dose at least 8 weeks after previous dose

  Unvaccinated persons age 5–18 years*
  - 1 dose
- **Immunoglobulin deficiency, early component complement deficiency:**
  12–59 months
  - Unvaccinated or only 1 dose before age 12 months: 2 doses, 8 weeks apart
  - 2 or more doses before age 12 months: 1 dose at least 8 weeks after previous dose

**Unvaccinated* = Less than routine series (through 14 months) OR no doses (14 months or older)

3. Hepatitis A vaccination

(minimum age: 12 months for routine vaccination)

Routine vaccination

- 2-dose series (**Havrix** 6–12 months apart or **Vaqta** 6–18 months apart, minimum interval 6 months); a series begun before the 2nd birthday should be completed even if the child turns 2 before the second dose is administered.

Catch-up vaccination

- Anyone 2 years of age or older may receive HepA vaccine if desired. Minimum interval between doses: 6 months
- Adolescents 18 years and older may receive the combined HepA and HepB vaccine, **Twinrix**, as a 3-dose series (0, 1, and 6 months) or 4-dose series (0, 7, and 21–30 days, followed by a dose at 12 months).

International travel

- Persons traveling to or working in countries with high or intermediate endemic hepatitis A (wwwnc.cdc.gov/travel/):
  - **Infants age 6–11 months:** 1 dose before departure; revaccinate with 2 doses, separated by 6–18 months, between 12 to 23 months of age.
  - **Unvaccinated age 12 months and older:** 1st dose as soon as travel considered

Special situations

At risk for hepatitis A infection: 2-dose series as above

- **Chronic liver disease**
- **Clotting factor disorders**
- **Men who have sex with men**
- **Injection or noninjection drug use**
- **Homelessness**
- **Work with hepatitis A virus** in research laboratory or nonhuman primates with hepatitis A infection

- **Travel** in countries with high or intermediate endemic hepatitis A
- **Close, personal contact with international adoptee** (e.g., household or regular babysitting) in first 60 days after arrival from country with high or intermediate endemic hepatitis A (administer dose 1 as soon as adoption is planned, at least 2 weeks before adoptee's arrival)

4. **Hepatitis B vaccination**
(minimum age: birth)

Birth dose (monovalent HepB vaccine only)
- **Mother is HBsAg-negative:** 1 dose within 24 hours of birth for **all** medically stable infants ≥2,000 grams. Infants <2,000 grams: administer 1 dose at chronological age 1 month or hospital discharge.
- **Mother is HBsAg-positive:**
  - Administer **HepB vaccine** and **0.5 mL of hepatitis B immune globulin (HBIG)** (at separate anatomic sites) within 12 hours of birth, regardless of birth weight. For infants <2,000 grams, administer 3 additional doses of vaccine (total of 4 doses) beginning at age 1 month.
  - Test for HBsAg and anti-HBs at age 9–12 months. If HepB series is delayed, test 1–2 months after final dose.
- **Mother's HBsAg status is unknown:**
  - Administer **HepB vaccine** within 12 hours of birth, regardless of birth weight.
  - For infants <2,000 grams, administer **0.5 mL of HBIG** in addition to HepB vaccine within 12 hours of birth. Administer 3 additional doses of vaccine (total of 4 doses) beginning at age 1 month.
  - Determine mother's HBsAg status as soon as possible. If mother is HBsAg-positive, administer **0.5 mL of HBIG** to infants ≥2,000 grams as soon as possible, but no later than 7 days of age.

Routine series
- 3-dose series at 0, 1–2, 6–18 months (use monovalent HepB vaccine for doses administered before age 6 weeks)
- Infants who did not receive a birth dose should begin the series as soon as feasible (see Table 2).
- Administration of **4 doses** is permitted when a combination vaccine containing HepB is used after the birth dose.
- **Minimum age** for the final (3rd or 4th) dose: 24 weeks
- **Minimum intervals:** dose 1 to dose 2: 4 weeks / dose 2 to dose 3: 8 weeks / dose 1 to dose 3: 16 weeks (when 4 doses are administered, substitute "dose 4" for "dose 3" in these calculations)

Catch-up vaccination
- Unvaccinated persons should complete a 3-dose series at 0, 1–2, 6 months.
- Adolescents age 11–15 years may use an alternative 2-dose schedule with at least 4 months between doses (adult formulation **Recombivax HB** only).
- Adolescents 18 years and older may receive a 2-dose series of HepB **(Heplisav-B)** at least 4 weeks apart.
- Adolescents 18 years and older may receive the combined HepA and HepB vaccine, **Twinrix**, as a 3-dose series (0, 1, and 6 months) or 4-dose series (0, 7, and 21–30 days, followed by a dose at 12 months).
- For other catch-up guidance, see Table 2.

5. **Human papillomavirus vaccination**
(minimum age: 9 years)

Routine and catch-up vaccination
- HPV vaccination routinely recommended for all adolescents **age 11–12 years (can start at age 9 years)** and through age 18 years if not previously adequately vaccinated
- 2- or 3-dose series depending on age at initial vaccination:
  - **Age 9 through 14 years at initial vaccination:** 2-dose series at 0, 6–12 months (minimum interval: 5 months; repeat dose if administered too soon)
  - **Age 15 years or older at initial vaccination:** 3-dose series at 0, 1–2 months, 6 months (minimum intervals: dose 1 to dose 2: 4 weeks / dose 2 to dose 3: 12 weeks / dose 1 to dose 3: 5 months; repeat dose if administered too soon)
- If completed valid vaccination series with any HPV vaccine, no additional doses needed

Special situations
- **Immunocompromising conditions, including HIV infection:** 3-dose series as above
- **History of sexual abuse or assault**: Start at age 9 years
- **Pregnancy:** HPV vaccination not recommended until after pregnancy; no intervention needed if vaccinated while pregnant; pregnancy testing not needed before vaccination

6. **Inactivated poliovirus vaccination**
(minimum age: 6 weeks)

Routine vaccination
- 4-dose series at ages 2, 4, 6–18 months, 4–6 years; administer the final dose on or after the 4th birthday and at least 6 months after the previous dose.
- 4 or more doses of IPV can be administered before the 4th birthday when a combination vaccine containing IPV is used. However, a dose is still recommended after the 4th birthday and at least 6 months after the previous dose.

Catch-up vaccination
- In the first 6 months of life, use minimum ages and intervals only for travel to a polio-endemic region or during an outbreak.
- IPV is not routinely recommended for U.S. residents 18 years and older.

Series containing oral polio vaccine (OPV), either mixed OPVIPV or OPV-only series:
- Total number of doses needed to complete the series is the same as that recommended for the U.S. IPV schedule. See www.cdc.gov/mmwr/volumes/66/wr/mm6601a6.htm?s_cid=mm6601a6_w.
- Only trivalent OPV (tOPV) counts toward the U.S. vaccination requirements. For guidance to assess doses documented as "OPV," see www.cdc.gov/mmwr/volumes/66/wr/mm6606a7.htm?s_cid=mm6606a7_w.
- For other catch-up guidance, see Table 2.

7. **Influenza vaccination**
(minimum age: 6 months [IIV], 2 years [LAIV], 18 years [RIV])

Routine vaccination
- 1 dose any influenza vaccine appropriate for age and health status annually (2 doses separated by at least 4 weeks for **children 6 months–8 years** who did not receive at least 2 doses of influenza vaccine before July 1, 2018)

Special situations
- **Egg allergy, hives only:** Any influenza vaccine appropriate for age and health status annually
- **Egg allergy more severe than hives** (e.g., angioedema, respiratory distress): Any influenza vaccine appropriate for age and health status annually in medical setting under supervision of health care provider who can recognize and manage severe allergic conditions
- **LAIV should not be used** for those with a history of severe allergic reaction to any component of the vaccine (excluding egg) or to a previous dose of any influenza vaccine, children and adolescents receiving concomitant aspirin or salicylate-containing medications, children age 2 through 4 years with a history of asthma or wheezing, those who are immunocompromised due to any cause (including immunosuppression caused by medications and HIV infection), anatomic and functional asplenia, cochlear implants, cerebrospinal fluid-oropharyngeal communication, close contacts and caregivers of severely immunosuppressed persons who require a protected environment, pregnancy, and persons who have received influenza antiviral medications within the previous 48 hours.

8. **Measles, mumps, and rubella vaccination**
(minimum age: 12 months for routine vaccination)

Routine vaccination
- 2-dose series at 12–15 months, 4–6 years
- Dose 2 may be administered as early as 4 weeks after dose 1.

Catch-up vaccination
- Unvaccinated children and adolescents: 2 doses at least 4 weeks apart
- The maximum age for use of *MMRV* is 12 years.

Continued

Special situations

International travel

- **Infants age 6–11 months:** 1 dose before departure; revaccinate with 2 doses at 12–15 months (12 months for children in high-risk areas) and dose 2 as early as 4 weeks later.
- **Unvaccinated children age 12 months and older:** 2-dose series at least 4 weeks apart before departure

9. Meningococcal serogroup A,C,W,Y vaccination
(minimum age: 2 months [MenACWY-CRM, Menveo], 9 months [MenACWY-D, Menactra])

Routine vaccination

- 2-dose series: 11–12 years, 16 years

Catch-up vaccination

- Age 13–15 years: 1 dose now and booster at age 16–18 years (minimum interval: 8 weeks)
- Age 16–18 years: 1 dose

Special situations

Anatomic or functional asplenia (including sickle cell disease), HIV infection, persistent complement component deficiency, eculizumab use:

- **Menveo**
  - Dose 1 at age 8 weeks: 4-dose series at 2, 4, 6, 12 months
  - Dose 1 at age 7–23 months: 2-dose series (dose 2 at least 12 weeks after dose 1 and after the 1st birthday)
  - Dose 1 at age 24 months or older: 2-dose series at least 8 weeks apart
- **Menactra**
  - **Persistent complement component deficiency:**
    - Age 9–23 months: 2 doses at least 12 weeks apart
    - Age 24 months or older: 2 doses at least 8 weeks apart
  - **Anatomic or functional asplenia, sickle cell disease, or HIV infection:**
    - **Age 9–23 months:** Not recommended
    - **24 months or older:** 2 doses at least 8 weeks apart
    - **Menactra** must be administered at least 4 weeks after completion of PCV13 series.

Travel in countries with hyperendemic or epidemic meningococcal disease, including countries in the African meningitis belt or during the Hajj (wwwnc.cdc.gov/travel/)**:**

- Children age less than 24 months:
  - **Menveo (age 2–23 months):**
    - Dose 1 at 8 weeks: 4-dose series at 2, 4, 6, 12 months
    - Dose 1 at 7–23 months: 2-dose series (dose 2 at least 12 weeks after dose 1 and after the 1st birthday)
  - **Menactra (age 9–23 months):**
    - 2-dose series (dose 2 at least 12 weeks after dose 1; dose 2 may be administered as early as 8 weeks after dose 1 in travelers)
- Children age 2 years or older: 1 dose **Menveo** or **Menactra**

First-year college students who live in residential housing (if not previously vaccinated at age 16 years or older) or military recruits:

- 1 dose **Menveo** or **Menactra**

Note: Menactra should be administered either before or at the same time as DTaP. For MenACWY booster dose recommendations for groups listed under "Special situations" above and additional meningococcal vaccination information, see meningococcal *MMWR* publications at www.cdc.gov/vaccines/hcp/acip-recs/vacc-specific/mening.html.

10. Meningococcal serogroup B vaccination
(minimum age: 10 years [MenB-4C, Bexsero; MenB-FHbp, Trumenba])

Clinical discretion

- MenB vaccine may be administered based on individual clinical decision to **adolescents not at increased risk** age 16–23 years (preferred age 16–18 years):
- **Bexsero:** 2-dose series at least 1 month apart
- **Trumenba:** 2-dose series at least 6 months apart; if dose 2 is administered earlier than 6 months, administer a 3rd dose at least 4 months after dose 2.

Special situations

Anatomic or functional asplenia (including sickle cell disease), persistent complement component deficiency, eculizumab use:

- **Bexsero:** 2-dose series at least 1 month apart
- **Trumenba:** 3-dose series at 0, 1–2, 6 months

Bexsero and **Trumenba** are not interchangeable; the same product should be used for all doses in a series. For additional meningococcal vaccination information, see meningococcal *MMWR* publications at www.cdc.gov/vaccines/hcp/acip-recs/vacc-specific/mening.html.

11. Pneumococcal vaccination
(minimum age: 6 weeks [PCV13], 2 years [PPSV23])

Routine vaccination with PCV13

- 4-dose series at 2, 4, 6, 12–15 months

Catch-up vaccination with PCV13

- 1 dose for healthy children age 24–59 months with any incomplete* PCV13 series
- For other catch-up guidance, see Table 2.

Special situations

High-risk conditions below: When both PCV13 and PPSV23 are indicated, administer PCV13 first. PCV13 and PPSV23 should not be administered during same visit.

Chronic heart disease (particularly cyanotic congenital heart disease and cardiac failure); chronic lung disease (including asthma treated with high-dose, oral corticosteroids); diabetes mellitus:

Age 2–5 years

- Any incomplete* series with:
  - 3 PCV13 doses: 1 dose PCV13 (at least 8 weeks after any prior PCV13 dose)
  - Less than 3 PCV13 doses: 2 doses PCV13 (8 weeks after the most recent dose and administered 8 weeks apart)
- No history of PPSV23: 1 dose PPSV23 (at least 8 weeks afterany prior PCV13 dose)

Age 6–18 years

- No history of PPSV23: 1 dose PPSV23 (at least 8 weeks after any prior PCV13 dose)

Cerebrospinal fluid leak, cochlear implant:

Age 2–5 years

- Any incomplete* series with:
  - 3 PCV13 doses: 1 dose PCV13 (at least 8 weeks after any prior PCV13 dose)
  - Less than 3 PCV13 doses: 2 doses PCV13, 8 weeks after the most recent dose and administered 8 weeks apart
- No history of PPSV23: 1 dose PPSV23 (at least 8 weeks after any prior PCV13 dose)

Age 6–18 years

- No history of either PCV13 or PPSV23: 1 dose PCV13, 1 dose PPSV23 at least 8 weeks later
- Any PCV13 but no PPSV23: 1 dose PPSV23 at least 8 weeks after the most recent dose of PCV13
- PPSV23 but no PCV13: 1 dose PCV13 at least 8 weeks after the most recent dose of PPSV23

Sickle cell disease and other hemoglobinopathies; anatomic or functional asplenia; congenital or acquired immunodeficiency; HIV infection; chronic renal failure; nephrotic syndrome; malignant neoplasms, leukemias, lymphomas, Hodgkin disease, and other diseases associated with treatment with immunosuppressive drugs or radiation therapy; solid organ transplantation; multiple myeloma:

Age 2–5 years

- Any incomplete* series with:
  - 3 PCV13 doses: 1 dose PCV13 (at least 8 weeks after any prior PCV13 dose)
  - Less than 3 PCV13 doses: 2 doses PCV13 (8 weeks after the most recent dose and administered 8 weeks apart)
- No history of PPSV23: 1 dose PPSV23 (at least 8 weeks after any prior PCV13 dose) and a 2nd dose of PPSV23 5 years later

Age 6–18 years
- No history of either PCV13 or PPSV23: 1 dose PCV13, 2 doses PPSV23 (dose 1 of PPSV23 administered 8 weeks after PCV13 and dose 2 of PPSV23 administered at least 5 years after dose 1 of PPSV23)
- Any PCV13 but no PPSV23: 2 doses PPSV23 (dose 1 of PPSV23 administered 8 weeks after the most recent dose of PCV13 and dose 2 of PPSV23 administered at least 5 years after dose 1 of PPSV23)
- PPSV23 but no PCV13: 1 dose PCV13 at least 8 weeks after the most recent PPSV23 dose and a 2nd dose of PPSV23 administered 5 years after dose 1 of PPSV23 and at least 8 weeks after a dose of PCV13

Chronic liver disease, alcoholism:
Age 6–18 years
- No history of PPSV23: 1 dose PPSV23 (at least 8 weeks after any prior PCV13 dose)

*An incomplete series is defined as not having received all doses in either the recommended series or an ageappropriate catch-up series. See Tables 8, 9, and 11 in the ACIP pneumococcal vaccine recommendations (www.cdc.gov/mmwr/pdf/rr/rr5911.pdf) for complete schedule details.

12. Rotavirus vaccination
(minimum age: 6 weeks)
Routine vaccination
- **Rotarix:** 2-dose series at 2 and 4 months.
- **RotaTeq:** 3-dose series at 2, 4, and 6 months.

If any dose in the series is either **RotaTeq** or unknown, default to 3-dose series.
Catch-up vaccination
- Do not start the series on or after age 15 weeks, 0 days.
- The maximum age for the final dose is 8 months, 0 days.
- For other catch-up guidance, see Figure 2.

13. Tetanus, diphtheria, and pertussis (Tdap) vaccination
(minimum age: 11 years for routine vaccination, 7 years for catch-up vaccination)
Routine vaccination
- **Adolescents age 11–12 years:** 1 dose Tdap
- **Pregnancy:** 1 dose Tdap during each pregnancy, preferably in early part of gestational weeks 27–36
- Tdap may be administered regardless of the interval since the last tetanus- and diphtheria-toxoid-containing vaccine

Catch-up vaccination
- **Adolescents age 13–18 years who have not received Tdap:** 1 dose Tdap, then Td booster every 10 years
- **Persons age 7–18 years not fully immunized with DTaP:** 1 dose Tdap as part of the catch-up series (preferably the first dose); if additional doses are needed, use Td.
- **Children age 7–10 years** who receive Tdap inadvertently or as part of the catch-up series should receive the routine Tdap dose at 11–12 years.
- **DTaP inadvertently given after the 7th birthday:**
  - **Child age 7–10 years:** DTaP may count as part of catch-up series. Routine Tdap dose at 11–12 should be administered.
  - **Adolescent age 11–18 years:** Count dose of DTaP as the adolescent Tdap booster.
- For other catch-up guidance, see Table 2.
- For information on use of Tdap or Td as tetanus prophylaxis in wound management, see www.cdc.gov/mmwr/volumes/67/rr/rr6702a1.htm.

14. Varicella vaccination
(minimum age: 12 months)
Routine vaccination
- 2-dose series: 12–15 months, 4–6 years
- Dose 2 may be administered as early as 3 months after dose 1 (a dose administered after a 4-week interval may be counted).

Catch-up vaccination
- Ensure persons age 7–18 years without evidence of immunity (see *MMWR* at www.cdc.gov/mmwr/pdf/rr/rr5604.pdf) have 2-dose series:
  - **Ages 7–12 years:** routine interval: 3 months (minimum interval: 4 weeks)
  - **Ages 13 years and older:** routine interval: 4–8 weeks (minimum interval: 4 weeks).
  - The maximum age for use of *MMRV* is 12 years.

General Recommendations on Immunization

TABLE 3 Recommended and Minimum Ages and Intervals between Vaccine Doses*†

Vaccine and Dose Number	Recommended Age for this Dose	Minimum Age for this Dose	Recommended Interval to Next Dose	Minimum Interval to Next Dose
HepB-1§	Birth	Birth	1-4 months	4 weeks
HepB-2	1-2 months	4 weeks	2-17 months	8 weeks
HepB-3¶	6-18 months	24 weeks	—	—
DTaP-1§	2 months	6 weeks	2 months	4 weeks
DTaP-2	4 months	10 weeks***	2 months	4 weeks
DTaP-3	6 months	14 weeks	6-12 months	6 months
DTaP-4	15-18 months	12 months	3 years	6 months
DTaP-5	4-6 years	4 years	—	—

Herpes zoster******	≥60 years	60 years	—	—
Pneumococcal vaccine‡‡‡‡‡‡	—	—	—	—

DTaP, Diphtheria and tetanus toxoids and acellular pertussis; *HepA,* hepatitis A; *HepB,* hepatitis B; *Hib, Haemophilus influenzae* type b; *HPV,* human papillomavirus; *IPV,* inactivated poliovirus; *LAIV,* live, attenuated influenza vaccine; *MCV4,* quadrivalent meningococcal conjugate vaccine; *MMR,* measles, mumps, and rubella; *MMRV,* measles, mumps, rubella, and varicella; *MPSV4,* quadrivalent meningococcal polysaccharide vaccine; *PCV,* pneumococcal conjugate vaccine; *PPSV,* pneumococcal polysaccharide vaccine; *PRP-OMB,* polyribosylribitol phosphate-meningococcal outer membrane protein conjugate; *Td,* tetanus and diphtheria toxoids; *Tdap,* tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis.

*Combination vaccines are available. Use of licensed combination vaccines is generally preferred to separate injections of their equivalent component vaccines. When administering combination vaccines, the minimum age for administration is the oldest age for any of the individual components; the minimum interval between doses is equal to the greatest interval of any of the individual components.

†Information on travel vaccines, including typhoid, Japanese encephalitis, and yellow fever, is available at www.cdc.gov/travel. Information on other vaccines that are licensed in the United States but not distributed, including anthrax and smallpox, is available at www.cdc.gov/vaccines/hcp/vis/current-vis.html.

§Combination vaccines containing the hepatitis B component are available. These vaccines should not be administered to infants aged <6 weeks because of the other components (i.e., Hib, DTaP, HepA, and IPV).

¶HepB-3 should be administered at least 8 weeks after HepB-2 and at least 16 weeks after HepB-1 and should not be administered before age 24 weeks.

**Calendar months.

††The minimum recommended interval between DTaP-3 and DTaP-4 is 6 months. However, DTaP-4 need not be repeated if administered at least 4 months after DTaP-3.

§§For Hib and PCV, children receiving the first dose of vaccine at age ≥7 months require fewer doses to complete the series.

¶¶If PRP-QMP (Pedvax-Hib, Merck Vaccine Division) was administered at ages 2 and 4 months, a dose at age 6 months is not necessary.

***A fourth dose is not needed if the third dose was administered at ≥4 years and at least 6 months after the previous dose.

†††Combination MMRV vaccine can be used for children aged 12 months to 12 years.

§§§The minimum interval from Varicella-1 to Varicella-2 for persons beginning the series at age ≥13 years is 4 weeks.

¶¶¶One dose of influenza vaccine per season is recommended for most persons. Children aged <9 years who are receiving influenza vaccine for the first time or who received only 1 dose the previous season (if it was their first vaccination season) should receive 2 doses this season.

****The minimum age for inactivated influenza vaccine varies by vaccine manufacturer. See package insert for vaccine-specific minimum ages.

††††Revaccination with meningococcal vaccine is recommended for previously vaccinated persons who remain at high risk for meningococcal disease. (Source: CDC. Updated recommendations from the Advisory Committee on Immunization Practices (ACIP) for revaccination of persons at prolonged increased risk for meningococcal disease. *MMWR* 2009;58:[1042-3]).

TABLE 3 Recommended and Minimum Ages and Intervals between Vaccine Doses*† —cont'd

§§§§Only 1 dose of Tdap is recommended. Subsequent doses should be given as Td. For one brand of Tdap, the minimum age is 11 years. For management of a tetanus-prone wound in persons who have received a primary series of tetanus–toxoid-containing vaccine, the minimum interval after a previous dose of any tetanus-containing vaccine is 5 years.
¶¶¶¶A second dose of PPSV 5 years after the first dose is recommended for persons aged ≤65 years at highest risk for serious pneumococcal infection and those who are likely to have a rapid decline in pneumococcal antibody concentration. (Source: CDC. Prevention of pneumococcal disease: recommendations of the Advisory Committee on Immunization Practices [ACIP]. *MMWR* 1997;46[No. RR-8].)
*****Bivalent HPV vaccine is approved for females aged 10-25 years. Quadrivalent HPV vaccine is approved for males and females aged 9-26 years.
†††††The minimum age for HPV-3 is based on the baseline minimum age for the first dose (i.e., 108 months) and the minimum interval of 24 weeks between the first and third dose. Dose 3 need not be repeated if it is administered at least 16 weeks after the first dose.
§§§§§The first dose of rotavirus must be administered at age 6 weeks through 14 weeks and 6 days. The vaccine series should not be started for infants aged ≥15 weeks, 0 days. Rotavirus should not be administered to children older than 8 months, 0 days of age regardless of the number of doses received between 6 weeks and 8 months, 0 days of age.
¶¶¶¶¶If 2 doses of Rotarix (GlaxoSmithKline) are administered as age appropriate, a third dose is not necessary.
******Herpes zoster vaccine is recommended as a single dose for persons aged ≥60 years.

TABLE 4 Guidelines for Spacing of Live and Inactivated Antigens

Antigen Combination	Recommended Minimum Interval between Doses
Two or more inactivated*	May be administered simultaneously or at any interval between doses
Inactivated and live	May be administered simultaneously or at any interval between doses
Two or more live intranasal or injectable†	28 days minimum interval, if not administered simultaneously

*Certain experts suggest a 28-day interval between tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis (Tdap) vaccine and tetravalent meningococcal conjugate vaccine if they are not administered simultaneously.
†Live oral vaccines (e.g., Ty21a typhoid vaccine and rotavirus vaccine) may be administered simultaneously or at any interval before or after inactivated or live injectable vaccines.
From Centers for Disease Control and Prevention: General recommendations on immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR* 60(2):38, 2011.

TABLE 5 Guidelines for Administering Antibody-Containing Products* and Vaccines

Type of Administration	Products Administered		Recommended Minimum Interval between Doses
Simultaneous (during the same office visit)	Antibody-containing products and inactivated antigen		Can be administered simultaneously at different anatomic sites or at any time interval between doses
	Antibody-containing products and live antigen		Should not be administered simultaneously.† If simultaneous administration of measles-containing vaccine or varicella vaccine is unavoidable, administer at different sites and revaccinate or test for seroconversion after the recommended interval
Nonsimultaneous	**Administered First**	**Administered Second**	
	Antibody-containing products	Inactivated antigen	No interval necessary
	Inactivated antigen	Antibody-containing products	No interval necessary
	Antibody-containing products	Live antigen	Dose related
	Live antigen	Antibody-containing products	2 weeks

*Blood products containing substantial amounts of immune globulin include intramuscular and intravenous immune globulin, specific hyperimmune globulin (e.g., hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, and rabies immune globulin), whole blood, packed red blood cells, plasma, and platelet products.
†Yellow fever vaccine; rotavirus vaccine; oral Ty21a typhoid vaccine; live, attenuated influenza vaccine; and zoster vaccine are exceptions to these recommendations. These live, attenuated vaccines can be administered at any time before or after or simultaneously with an antibody-containing product.
‡The duration of interference of antibody-containing products with the immune response to the measles component of measles-containing vaccine, and possibly varicella vaccine, is dose related.
From Centers for Disease Control and Prevention: General recommendations on immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR*60:(RR-2), 2011.

TABLE 6 Recommended Intervals between Administration of Antibody-Containing Products and Measles- or Varicella-Containing Vaccine, by Product and Indication for Vaccination

Product/Indication	Dose (mg IgG/kg) and Route*	Recommended Interval before Measles- or Varicella-Containing Vaccine† Administration (months)
Tetanus IG	250 units (10 mg IgG/kg) IM	3
Hepatitis A IG		
Contact prophylaxis	0.02 ml/kg (33 mg IgG/kg) IM	3
International travel	0.06 ml/kg (10 mg IgG/kg) IM	3
Hepatitis B IG	0.06 ml/kg (10 mg IgG/kg) IM	3
Rabies IG	20 IU/kg (22 mg IgG/kg) IM	4
Varicella IG	125 units/10 kg (60–200 mg IgG/kg) IM, maximum 625 units	5
Measles prophylaxis IG		
Standard (i.e., nonimmunocompromised) contact	0.25 ml/kg (40 mg IgG/kg) IM	5
Immunocompromised contact	0.50 ml/kg (80 mg IgG/kg) IM	6
Blood transfusion		
RBCs, washed	10 ml/kg negligible IgG/kg IV	None
RBCs, adenine-saline added	10 ml/kg (10 mg IgG/kg) IV	3
Packed RBCs (hematocrit 65%)§	10 ml/kg (60 mg IgG/kg) IV	6
Whole blood (hematocrit 35%-50%)§	10 ml/kg (80-100 mg IgG/kg) IV	6
Plasma/platelet products	10 ml/kg (160 mg IgG/kg) IV	7
Cytomegalovirus IGIV	150 mg/kg maximum	6
IGIV		
Replacement therapy for immune deficiencies¶	300-400 mg/kg IV¶	8
Immune thrombocytopenic purpura treatment	400 mg/kg IV	8
Postexposure varicella prophylaxis**	400 mg/kg IV	8
Immune thrombocytopenic purpura treatment	1000 mg/kg IV	10
Kawasaki disease	2 g/kg IV	11
Monoclonal antibody to respiratory syncytial virus F protein (Synagis [MedImmune])††	15 mg/kg IM	None

HIV, human immunodeficiency virus; *IG,* immune globulin; *IgG,* immune globulin G; *IGIV,* intravenous immune globulin; *mg IgG/kg,* milligrams of immune globulin G per kilogram of body weight; *IM,* intramuscular; *IV,* intravenous; *RBCs,* red blood cells.

*This table is not intended for determining the correct indications and dosages for using antibody-containing products. Unvaccinated persons might not be protected fully against measles during the entire recommended interval, and additional doses of IG or measles vaccine might be indicated after measles exposure. Concentrations of measles antibody in an IG preparation can vary by manufacturer's lot. Rates of antibody clearance after receipt of an IG preparation also might vary. Recommended intervals are extrapolated from an estimated half-life of 30 days for passively acquired antibody and an observed interference with the immune response to measles vaccine for 5 months after a dose of 80 mg IgG/kg.

†Does not include zoster vaccine. Zoster vaccine may be given with antibody-containing blood products.

§Assumes a serum IgG concentration of 16 mg/ml.

¶Measles and varicella vaccinations are recommended for children with asymptomatic or mildly symptomatic HIV infection but are contraindicated for persons with severe immunosuppression from HIV or any other immunosuppressive disorder.

**The investigational VariZIG, similar to licensed varicella-zoster IG (VZIG), is a purified human IG preparation made from plasma containing high levels of antivaricella antibodies (IgG). The interval between VariZIG and varicella vaccine (Var or MMRV) is 5 months.

††Contains antibody only to respiratory syncytial virus.

From Centers for Disease Control and Prevention: General recommendations on immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR*60:(RR-2), 2011.

TABLE 7 Contraindications and Precautions* to Commonly Used Vaccines

Vaccine	Contraindications	Precautions
DTaP	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component Encephalopathy (e.g., coma, decreased level of consciousness, or prolonged seizures), not attributable to another identifiable cause, within 7 days of administration of previous dose of DTP or DTaP	Progressive neurologic disorder, including infantile spasms, uncontrolled epilepsy, progressive encephalopathy; defer DTaP until neurologic status clarified and stabilized Temperature of ≥105° F (≥40° C) within 48 hours after vaccination with a previous dose of DTP or DTaP Collapse or shocklike state (i.e., hypotonic hyporesponsive episode) within 48 hours after receiving a previous dose of DTP/DTaP Seizure ≤3 days after receiving a previous dose of DTP/DTaP Persistent, inconsolable crying lasting ≥3 hours within 48 hours after receiving a previous dose of DTP/DTaP GBS <6 weeks after previous dose of tetanus toxoid containing vaccine History of Arthus-type hypersensitivity reactions after a previous dose of tetanus toxoid containing vaccine; defer vaccination until at least 10 years have elapsed since the last tetanus toxoid containing vaccine Moderate or severe acute illness with or without fever
DT, Td	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	GBS <6 weeks after previous dose of tetanus toxoid containing vaccine History of Arthus-type hypersensitivity reactions after a previous dose of tetanus toxoid containing vaccine; defer vaccination until at least 10 years have elapsed since the last tetanus toxoid containing vaccine Moderate or severe acute illness with or without fever
Tdap	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component Encephalopathy (e.g., coma, decreased level of consciousness, or prolonged seizures), not attributable to another identifiable cause, within 7 days of administration of previous dose of DTP, DTaP, or Tdap	GBS <6 weeks after a previous dose of tetanus toxoid containing vaccine Progressive or unstable neurologic disorder, uncontrolled seizures, or progressive encephalopathy until a treatment regimen has been established and the condition has stabilized History of Arthus-type hypersensitivity reactions after a previous dose of tetanus toxoid containing vaccine; defer vaccination until at least 10 years have elapsed since the last tetanus toxoid containing vaccine Moderate or severe acute illness with or without fever
IPV	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Pregnancy Moderate or severe acute illness with or without fever
MMR†§	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component Pregnancy: Known severe immunodeficiency (e.g., from hematologic and solid tumors, receipt of chemotherapy, congenital immunodeficiency, or long-term immunosuppressive therapy¶ or patients with HIV infection who are severely immunocompromised)§	Recent (≤11 months) receipt of antibody-containing blood product (specific interval depends on product) History of thrombocytopenia or thrombocytopenic purpura Need for tuberculin skin testing†† Moderate or severe acute illness with or without fever
Hib	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component Age <6 weeks	Moderate or severe acute illness with or without fever
Hepatitis B	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Infant weight <2000 g§§ Moderate or severe acute illness with or without fever
Hepatitis A	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Pregnancy: Moderate or severe acute illness with or without fever
Varicella	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component Known severe immunodeficiency (e.g., from hematologic and solid tumors, receipt of chemotherapy, congenital immunodeficiency, or long-term immunosuppressive therapy¶ or patients with HIV infection who are severely immunocompromised)§ Pregnancy	Recent (≤11 months) receipt of antibody-containing blood product (specific interval depends on product)¶¶ Moderate or severe acute illness with or without fever
PCV	Severe allergic reaction (e.g., anaphylaxis) after a previous dose (of PCV7, PCV13, or any diphtheria toxoid-containing vaccine) or to a component of a vaccine (PCV7, PCV13, or any diphtheria toxoid-containing vaccine)	Moderate or severe acute illness with or without fever
TIV	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to vaccine component, including egg protein	GBS <6 weeks after a previous dose of influenza vaccine Moderate or severe acute illness with or without fever
LAIV	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to vaccine component, including egg protein Pregnancy Immunosuppression Certain chronic medical conditions***	GBS <6 weeks after a previous dose of influenza vaccine Moderate or severe acute illness with or without fever
PPSV	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Moderate or severe acute illness with or without fever
MCV4	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Moderate or severe acute illness with or without fever
MPSV4	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Moderate or severe acute illness with or without fever

Continued

TABLE 7 Contraindications and Precautions* to Commonly Used Vaccines—cont'd

Vaccine	Contraindications	Precautions
HPV	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component	Pregnancy: Moderate or severe acute illness with or without fever
Rotavirus	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component SCID	Altered immunocompetence other than SCID: History of intussusception Chronic gastrointestinal disease††† Spina bifida or bladder exstrophy††† Moderate or severe acute illness with or without fever
Zoster	Severe allergic reaction (e.g., anaphylaxis) after a previous dose or to a vaccine component Substantial suppression of cellular immunity Pregnancy	Moderate or severe acute illness with or without fever

DT, Diphtheria and tetanus toxoids; *DTaP,* diphtheria and tetanus toxoids and acellular pertussis; *GBS,* Guillain-Barré syndrome; *HBsAg,* hepatitis B surface antigen; *Hib, Haemophilus influenzae* type b; *HIV,* human immunodeficiency virus; *HPV,* human papillomavirus; *IPV,* inactivated poliovirus; *LAIV,* live, attenuated influenza vaccine; *MCV4,* quadrivalent meningococcal conjugate vaccine; *MMRV* measles, mumps, rubella; *MPSV4,* quadrivalent meningococcal polysaccharide vaccine; *PCV,* pneumococcal conjugate vaccine; *PPSV,* pneumococcal polysaccharide vaccine; *SCID,* severe combined immunodeficiency; *Td,* tetanus and diphtheria toxoids; *Tdap,* tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis; *TIV,* trivalent inactivated influenza vaccine.

*Events or conditions listed as precautions should be reviewed carefully. Benefits of and risks for administering a specific vaccine to a person under these circumstances should be considered. If the risk from the vaccine is believed to outweigh the benefit, the vaccine should not be administered. If the benefit of vaccination is believed to outweigh the risk, the vaccine should be administered. Whether and when to administer DTaP to children with proven or suspected underlying neurologic disorders should be decided on a case-by-case basis.

†HIV-infected children may receive varicella and measles vaccine if $CD4^+$ T-lymphocyte count is <15%. (Source: Adapted from American Academy of Pediatrics. Passive immunization. In: Pickering LK, ed. *Red book: 2009 report of the committee on infectious diseases.* 28th ed. Elk Grove Village.IL: American Academy of Pediatrics: 2009.)

§MMR and varicella vaccines can be administered on the same day. If not administered on the same day, these vaccines should be separated by at least 28 days.

¶Substantially immunosuppressive steroid dose is considered to be ≥2 weeks of daily receipt of 20 mg or 2 mg/kg body weight of prednisone or equivalent.

††Measles vaccination might suppress tuberculin reactivity temporarily. Measles-containing vaccine can be administered on the same day as tuberculin skin testing. If testing cannot be performed until after the day of MMR vaccination, the test should be postponed for ≥4 weeks after the vaccination. If an urgent need exists to skin test, do so with the understanding that reactivity might be reduced by the vaccine.

§§Hepatitis B vaccination should be deferred for infants weighing <2000 g if the mother is documented to be HBsAg-negative at the time of the infant's birth. Vaccination can commence at chronological age 1 month or at hospital discharge. For infants born to HBsAg-positive women, hepatitis B immune globulin and hepatitis B vaccine should be administered within 12 hours after birth, regardless of weight.

¶¶Vaccine should be deferred for the appropriate interval if replacement immune globulin products are being administered.

TABLE 8 Conditions Commonly Misperceived as Contraindications to Vaccination

Vaccine	Conditions Commonly Misperceived as Contraindications (i.e., Vaccination May Be Administered under These Conditions)
General for all vaccines, including DTaP, pediatric DT, adult Td, adolescent-adult Tdap, IPV, MMR, Hib, hepatitis A, hepatitis B, varicella, rotavirus, PCV, TIV, LAIV, PPSV, MCV4, MPSV4, HPV, and herpes zoster	Mild acute illness with or without fever Mild-to-moderate local reaction (i.e., swelling, redness, soreness); low-grade or moderate fever after previous dose Lack of previous physical examination in well-appearing person Current antimicrobial therapy* Convalescent phase of illness Preterm birth (hepatitis B vaccine is an exception in certain circumstances)† Recent exposure to an infectious disease History of penicillin allergy, other nonvaccine allergies, relatives with allergies, or receiving allergen extract immunotherapy
DTaP	Fever of <105° F (<40° C), fussiness or mild drowsiness after a previous dose of DTP/DTaP Family history of seizures Family history of sudden infant death syndrome Family history of an adverse event after DTP or DTaP administration Stable neurologic conditions (e.g., cerebral palsy, well-controlled seizures, or developmental delay)
Tdap	Fever of ≥105° F (≥40° C) for <48 hours after vaccination with a previous dose of DTP or DTaP Collapse or shock-like state (i.e., hypotonic hyporesponsive episode) within 48 hours after receiving a previous dose of DTaP Seizure <3 days after receiving a previous dose of DTP/DTaP Persistent, inconsolable crying lasting <3 hours within 48 hours after receiving a previous dose of DTP/DTaP History of extensive limb swelling after DTP/DTaP/Td that is not an Arthus-type reaction Stable neurologic disorder History of brachial neuritis Latex allergy that is not anaphylactic Breastfeeding Immunosuppression
IPV	Previous receipt of ≥1 dose of oral polio vaccine
MMR§,¶	Positive tuberculin skin test Simultaneous tuberculin skin testing** Breastfeeding Pregnancy of recipient's mother or other close or household contact Recipient is female of childbearing age Immunodeficient family member or household contact Asymptomatic or mildly symptomatic HIV infection Allergy to eggs
Hepatitis B	Pregnancy Autoimmune disease (e.g., systemic lupus erythematosus or rheumatoid arthritis)
Varicella	Pregnancy of recipient's mother or other close or household contact Immunodeficient family member or household contact†† Asymptomatic or mildly symptomatic HIV infection Humoral immunodeficiency (e.g., agammaglobulinemia)
TIV	Nonsevere (e.g., contact) allergy to latex, thimerosal, or egg Concurrent administration of Coumadin or aminophylline
LAIV	Health care providers that see patients with chronic diseases or altered immunocompetence (an exception is providers for severely immunocompromised patients requiring care in a protected environment) Breastfeeding Contacts of persons with chronic disease or altered immunocompetence (an exception is contacts of severely immunocompromised patients requiring care in a protected environment)
PPSV	History of invasive pneumococcal disease or pneumonia
HPV	Immunosuppression Previous equivocal or abnormal Papanicolaou test Known HPV infection Breastfeeding History of genital warts
Rotavirus	Prematurity Immunosuppressed household contacts Pregnant household contacts
Zoster	Therapy with low-dose methotrexate (≤0.4 mg/kg/week), azathioprine (≤3.0 mg/kg/day), or 6-mercaptopurine (≤1.5 mg/kg/day) for treatment of rheumatoid arthritis, psoriasis, polymyositis, sarcoidosis, inflammatory bowel disease, or other conditions Health care providers of patients with chronic diseases or altered immunocompetence Contacts of patients with chronic diseases or altered immunocompetence Unknown or uncertain history of varicella in a U.S.-born person

Continued

TABLE 8 Conditions Commonly Misperceived as Contraindications to Vaccination—cont'd

DT, Diphtheria and tetanus toxoids; *DTP,* diphtheria toxoid, tetanus toxoid, and pertussis; *DTaP,* diphtheria and tetanus toxoids and acellular pertussis; *HBsAg,* hepatitis B surface antigen; *Hib, Haemophilus influenzae* type b; *HPV,* human papillomavirus; *IPV,* inactivated poliovirus; *LAIV,* live, attenuated influenza vaccine; *MCV4,* quadrivalent meningococcal conjugate vaccine; *MMR,* measles, mumps, and rubella; *MPSV4,* quadrivalent meningococcal polysaccharide vaccine; *PCV,* pneumococcal conjugate vaccine; *PPSV,* pneumococcal polysaccharide vaccine; *Td,* tetanus and diphtheria toxoids; *Tdap,* tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis; *TIV,* trivalent inactivated influenza vaccine.

*Antibacterial drugs might interfere with Ty21a oral typhoid vaccine, and certain antiviral drugs might interfere with varicella-containing vaccines and LAIV.

†Hepatitis B vaccination should be deferred for infants weighing <2000 g if the mother is documented to be HBsAg-negative at the time of the infant's birth. Vaccination can commence at chronologic age 1 month or at hospital discharge. For infants born to HBsAg-positive women, hepatitis B immune globulin and hepatitis B vaccine should be administered within 12 hours after birth, regardless of weight.

§MMR and varicella vaccines can be administered on the same day. If not administered on the same day, these vaccines should be separated by at least 28 days.

¶HIV-infected children should receive immune globulin after exposure to measles. HIV-infected children can receive varicella and measles vaccine if $CD4^+$ T-lymphocyte count is >15%. (Source: Adapted from American Academy of Pediatrics. Passive immunization. In: Pickering LK, ed. *Red book: 2009 report of the Committee on Infectious Diseases,* 28th ed. Elk Grove Village, IL: American Academy of Pediatrics; 2009.)

**Measles vaccination might suppress tuberculin reactivity temporarily. Measles-containing vaccine can be administered on the same day as tuberculin skin testing. If testing cannot be performed until after the day of MMR vaccination, the test should be postponed for at least 4 weeks after the vaccination. If an urgent need exists to skin test, do so with the understanding that reactivity might be reduced by the vaccine.

††If a vaccinee experiences a presumed vaccine-related rash 7-25 days after vaccination, the person should avoid direct contact with immunocompromised persons for the duration of the rash.

From Centers for Disease Control and Prevention: General recommendations on immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR*60:(RR-2), 2011.

VACCINE ADMINISTRATION*

INFECTION CONTROL AND STERILE TECHNIQUE

Persons administering vaccines should follow appropriate precautions to minimize risk for spread of disease. Hands should be cleansed with an alcohol-based, waterless antiseptic hand rub or washed with soap and water between each patient contact. Occupational Safety and Health Administration (OSHA) regulations do not require that gloves be worn when administering vaccinations unless persons administering vaccinations are likely to come into contact with potentially infectious body fluids or have open lesions on their hands. Needles used for injections must be sterile and disposable to minimize the risk for contamination. A separate needle and syringe should be used for each injection. Changing needles between drawing vaccine from a vial and injecting it into a recipient is not necessary. Different vaccines should never be mixed in the same syringe unless specifically licensed for such use, and no attempt should be made to transfer between syringes.

For all intramuscular injections, the needle should be long enough to reach the muscle mass and prevent vaccine from seeping into subcutaneous tissue, but not so long as to involve underlying nerves, blood vessels, or bone. Vaccinators should be familiar with the anatomy of the area where they are injecting vaccine. Intramuscular injections are administered at a 90-degree angle to the skin, preferably into the anterolateral aspect of the thigh or the deltoid muscle of the upper arm depending on the age of the patient.

Decision on needle size and site of injection must be made for each person on the basis of the size of the muscle, the thickness of adipose tissue at the injection site, the volume of the material to be administered, injection technique, and the depth below the muscle surface into which the material is to be injected (Fig. E1). Aspiration before injection of vaccines or toxoids (i.e., pulling back on the syringe plunger after needle insertion before injection) is not required because no large blood vessel exists at the recommended injection sites.

INFANTS (AGED <12 MONTHS)

For the majority of infants, the anterolateral aspect of the thigh is the recommended site for injection because it provides a large muscle mass (Fig. E2). The muscles of the buttock have not been used for administration of vaccines in infants and children because of concern about potential injury to the sciatic nerve, which is well documented after injection of antimicrobial agents into the buttock. If the gluteal muscle must be used, care should be taken to define the anatomic landmarks.† Injection technique is the most important parameter to ensure efficient intramuscular vaccine delivery. If the subcutaneous and muscle tissue are bunched to minimize the chance of striking bone, a 1-inch needle is required to ensure intramuscular administration in infants. For the majority of infants, a 1-inch, 22- to 25-gauge needle is sufficient to penetrate muscle in an infant's thigh. For newborn (first 28 days of life) and premature infants, a 5/8-inch-long needle usually is adequate if the skin is stretched flat between thumb and forefinger and the needle inserted at a 90-degree angle to the skin.

TODDLERS AND OLDER CHILDREN (AGED 12 MONTHS TO 10 YEARS)

The deltoid muscle should be used if the muscle mass is adequate. The needle size for deltoid site injections can range from 22 to 25 gauge and from 5/8 to 1 inch on the basis of the size of the muscle and the thickness of adipose tissue at the injection site (Fig. E3). A 5/8-inch needle is adequate only for the deltoid muscle and only if the skin is stretched flat between the thumb and forefinger and the needle inserted at a 90-degree angle to the skin. For toddlers, the anterolateral thigh can be used, but the needle should be at least 1 inch in length.

ADOLESCENTS AND ADULTS (AGED >11 YEARS)

For adults and adolescents, the deltoid muscle is recommended for routine intramuscular vaccinations. The anterolateral thigh also can be used. For men and women weighing <130 lb (<60 kg) a 5/8- to 1-inch needle is sufficient to ensure intramuscular injection. For women weighing 130 to 200 lb (60 to 90 kg) and men 130 to 260 lb (60 to 118 kg), a 1- to 1½-inch needle is needed. For women weighing >200 lb (>90 kg) or men weighing >260 lb (>118 kg), a 1½-inch needle is required.

SUBCUTANEOUS INJECTIONS

Subcutaneous injections are administered at a 45-degree angle, usually into the thigh for infants younger than 12 months and in the upper-outer triceps area of persons aged 12 months and older. Subcutaneous injections can be administered into the upper-outer triceps area of an infant if necessary. A 5/8-inch, 23- to 25-gauge needle should be inserted into the subcutaneous tissue.

TABLE 9 Treatment of Anaphylaxis in Children and Adults with Drugs Administered Intramuscularly or Orally

Drug	Dosage
Children	
Primary Regimen	
Epinephrine 1:1000 (aqueous) (1 mg/ml)*	0.01 mg/kg up to 0.5 mg (administer 0.01 ml/kg/dose up to 0.5 ml) IM repeated every 10-20 minutes up to 3 doses
Secondary Regimen	
Diphenhydramine	1-2 mg/kg oral, IM, or IV, every 4-6 hours (100 mg, maximum single dose)
Hydroxyzine	0.5-1 mg/kg oral, IM, every 4-6 hours (100 mg, maximum single dose)
Prednisone	1.5-2 mg/kg oral (60 mg, maximum single dose); use corticosteroids as long as needed
Adults	
Primary Regimen	
Epinephrine 1:1000 (aqueous)*	0.01 mg/kg up to 0.5 mg (administer 0.01 ml/kg/dose up to 0.5 ml) IM repeated every 10-20 minutes up to 3 doses
Secondary Regimen	
Diphenhydramine	1-2 mg/kg up to l00 mg IM or oral, every 4-6 hours

IM, Intramuscular; *IV,* intravenous.

*If the agent causing the anaphylactic reaction was administered by injection, epinephrine may be injected into the same site to slow absorption.

TABLE 10 Vaccination of Persons with Primary and Secondary Immune Deficiencies

PRIMARY

Category	Specific Immunodeficiency	Contraindicated Vaccines*	Risk-Specific Recommended Vaccines*	Effectiveness and Comments
B lymphocyte (humoral)	Severe antibody deficiencies (e.g., X-linked agammaglobulinemia and common variable immunodeficiency)	OPV[a] Smallpox[b] LAIV BCG Yellow fever virus (YFV) and live-bacteria vaccines[e] No data for rotavirus vaccines	Annual IIV is the only vaccine given to patients receiving IG therapy; routine inactivated vaccines can be given if not receiving IGIV.	The effectiveness of any vaccine will be uncertain if it depends only on the humoral response (e.g., PPSV23). IG therapy interferes with the immune response to live vaccines MMR and VAR.
	Less severe antibody deficiencies (e.g., selective IgA deficiency and IgG subclass deficiency)	OPV[a] BCG YFV vaccine Other live vaccines[d] appear to be safe.	Vaccines should be given as on the annual immunization schedule for immunocompetent people.[e] PPSV23 should be given beginning at 2 yr of age.[f]	All vaccines are probably effective. Immune response may be attenuated.
T lymphocyte (cell-mediated and humoral)	Complete defects (e.g., SCID, complete DiGeorge syndrome)	All live vaccines[c,d,g]	The only vaccine that should be given if the patient is receiving IG is annual IIV if there is some residual antibody protection.	All inactivated vaccines are probably ineffective.
	Partial defects (e.g., most patients with DiGeorge syndrome, hyper-IgM syndrome, Wiskott-Aldrich syndrome, ataxia-telangiectasia)	All live vaccines[c,d,g]	Routine inactivated vaccines should be given.[e] PPSV23 should be given beginning at 2 yr of age.[f]	Effectiveness of any vaccine depends on degree of immune suppression.
	Interferon (IFN)-γ–interleukin (IL)-12 axis deficiencies	All live vaccines for IL-12/IL-12R deficiencies, IFN-γ, IFN-α, or STAT1 deficiencies	None	None
Complement	Persistent complement, properdin, MBL, or factor B deficiency; secondary deficiency because taking eculizumab (Solaris)	None	PPSV23 should be given beginning at 2 yr of age.[f] MCV series beginning in infancy.[h] MenB series beginning at 10 yr of age	All routine vaccines are probably effective.
Phagocytic function	Chronic granulomatous disease	Live-bacteria vaccines[c]	None	All inactivated vaccines are safe and probably effective. Live-virus vaccines are probably safe and effective.
	Phagocytic deficiencies that are undefined or accompanied by defect in T-cell and NK-cell dysfunction (e.g., Chédiak-Higashi syndrome, leukocyte adhesion defects, myeloperoxidase deficiency)	MMR, MMRV, OPV,[a] smallpox, LAIV, YF, all bacteria vaccines	PPSV23 should be given beginning at 2 yr of age.[f] MCV series beginning in infancy.[h]	All inactivated vaccines are safe and probably effective.

SECONDARY

Specific Immunodeficiency	Contraindicated Vaccines*	Risk-Specific Recommended Vaccines*	Effectiveness and Comments
HIV/AIDS	OPV[a] Smallpox BCG Combined MMRV LAIV Withhold MMR, varicella, and zoster in severely immunocompromised persons. YF vaccine may have a contraindication or precaution depending on the indicators of immune function.[j]	PPSV23 should be given beginning at 2 yr of age.[f] MCV series beginning in infancy.[h] Consider Hib (if not administered in infancy).[l]	Rotavirus vaccine is recommended on standard schedule. MMR and VAR are recommended for HIV-infected children who are asymptomatic or only low-level immunocompromised.[k] All inactivated vaccines may be effective.
Generalized malignant neoplasm, transplantation, autoimmune disease, immunosuppressive or radiation therapy	Live-virus and live-bacteria vaccines, depending on immune status.[c,d,m]	PPSV23 should be given beginning at 2 yr of age.[f] Annual IIV (unless receiving intensive chemotherapy or anti-B cell antibodies). Hib vaccine may be indicated.[n]	Effectiveness of any vaccine depends on degree of immune suppression; inactivated standard vaccines are indicated if not highly immunosuppressed, but doses should be repeated after chemotherapy ends.

TABLE 10 Vaccination of Persons with Primary and Secondary Immune Deficiencies—cont'd

SECONDARY			
Specific Immunodeficiency	**Contraindicated Vaccines***	**Risk-Specific Recommended Vaccines***	**Effectiveness and Comments**
Asplenia (functional, congenital anatomic, surgical)	LAIV	PPSV23 should be given beginning at 2 yr of age.[f] MCV series beginning in infancy.[h] MenB series beginning at 10 yr of age. Hib (if not administered in infancy)[o]	All routine vaccines are probably effective.
Chronic renal disease	LAIV	PPSV23 should be given beginning at 2 yr of age.[f] HepB is indicated if not previously immunized.	All routine vaccines are probably effective.
CNS anatomic barrier defect (cochlear implant, congenital dysplasia of the inner ear, persistent CSF communication with naso-/oropharynx)	None	PPSV23 should be given beginning at 2 yr of age.[f]	All standard vaccines are indicated.

BCG, Bacille Calmette-Guérin vaccine; *CNS,* central nervous system; *Hib, Haemophilus influenzae* type b vaccine; *HIV/AIDS,* human immunodeficiency virus/acquired immunodeficiency syndrome; *IG,* immune globulin; *IIV,* inactivated influenza vaccine; *LAIV,* live-attenuated influenza vaccine; *MMR,* measles, mumps, rubella vaccine; *MMRV,* measles-mumps-rubella-varicella; *MCV,* quadrivalent meningococcal polysaccharide vaccine; *MenB,* serogroup B meningococcal vaccine; *OPV,* oral poliovirus vaccine (live); *PPSV23,* pneumococcal polysaccharide vaccine; *SCID,* severe combined immunodeficiency disease; *VAR,* varicella; *YF,* yellow fever.

*Other vaccines that are universally or routinely recommended should be given if not contraindicated.

[a]OPV is no longer available in the United States.

[b]This table refers to contraindications for nonemergency vaccination (i.e., ACIP recommendations)

[c]Live-bacteria vaccines: BCG and oral Ty21a *Salmonella typhi* vaccine.

[d]Live-virus vaccines: MMR, MMRV, VAR, OPV, LAIV, YF, zoster, rotavirus, and vaccinia (smallpox). Smallpox vaccine is not recommended for children or the general public.

[e]Children who are delayed or underimmunized should be immunized with routinely recommended vaccines, according to age and catch-up schedule.

[f]PPSV23 is begun at 2 yr or older. If PCV13 is required, PCV13 doses should be administered first, followed by PPSV23 at least 8 wk later; a 2nd dose of PPSV23 is given 5 yr after the 1st.

[g]Regarding T-lymphocyte immunodeficiency as a contraindication for rotavirus vaccine, data exist only for SCID.

[h]Age and schedule of doses depend on the product; repeated doses are required.

[i]Pneumococcal vaccine is not indicated for children with chronic granulomatous disease beyond age-based universal recommendations for PCV13. Children with chronic granulomatous disease are not at increased risk for pneumococcal disease.

[j]YF vaccine is contraindicated in HIV-infected children <6 yr old who are highly immunosuppressed. There is precaution for use of YF vaccine in asymptomatic HIV-infected children <6 yr with total lymphocyte percentage of 15%–24%, and >6 yr old with $CD4^+$ T-lymphocyte counts of 200-499 cells/mm^3.

[k]HIV-infected children should receive immune globulin after exposure to measles and may receive varicella vaccine if $CD4^+$ T-lymphocyte percentage is ≥15% for those <6 yr old, or $CD4^+$ T-lymphocyte count ≥200 cells/mm^3 for those ≥6 yr old. People with perinatal HIV infection who were vaccinated with measles, rubella, or mumps–containing vaccine before the establishment of combination antiretroviral therapy (cART) should be considered unvaccinated and should receive two appropriately spaced doses of MMR vaccine once effective cART has been established (at least 6 mo with $CD4^+$ T-lymphocytes ≥15% for children <6 yr old, or $CD4^+$ T-lymphocyte count ≥200 cells/mm^3 for children ≥6 yr old).

[l]For patients 5-18 yr old who have not received a Hib primary series and a booster dose or at least 1 Hib dose after age 14 mo.

[m]Withholding inactivated vaccines also is recommended with some forms of immunosuppressive therapy, such as anti-CD20 antibodies, induction or consolidation chemotherapy, or patients with major antibody deficiencies receiving immune globulins. Inactivated influenza vaccine is an exception, but consideration should be given to repeating doses of any inactivated vaccine administered during these therapies.

[n]For persons <60 mo old undergoing chemotherapy or radiation therapy who have not received a Hib primary series plus a booster dose or at least 1 Hib dose after age 14 mo.

[o]For persons >59 mo old who are asplenic and persons ≥15 mo who are undergoing elective splenectomy and who have not received a Hib primary series and a booster dose or at least 1 Hib dose after age 14 mo.

(Data from Centers for Disease Control and Prevention: Yellow fever vaccine: Recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 59[RR-07]; 1-27, 2010.)

In Kimberlin DW et al (eds): *Red Book 2018: Report of the Committee on Infectious Diseases,* ed 31, Elk Grove Village 2018, American Academy of Pediatrics.)

TABLE 11A Immunizations for Pediatric Oncology Patients

Vaccine	Indications and Comments
DTaP	Indicated for incompletely immunized children <7 yr, even during active chemotherapy
Td	Indicated 1 yr after completion of therapy in children 7 yr
Hib	Indicated for incompletely immunized children if <7 yr
HBV	Indicated for incompletely immunized children
23PS	Indicated for asplenic patients
PCV13	Indicated for incompletely immunized children <5 yr
Meningococcus	Consider in asplenic patients
IPV	Indicated for incompletely immunized children; also recommended for all household contacts requiring immunization to reduce the risk of vaccine-associated polio
MMR	Contraindicated until child is in remission and finished with all chemotherapy for 3-6 mo; may need to reimmunize after chemotherapy if titers have fallen below protective levels
Influenza	Defer in active chemotherapy; may give as early as 3-4 wk after remission and off chemotherapy if during influenza season; peripheral granulocyte and lymphocyte counts should be >1000/μL; should also be given to household contact of children with cancer
Varicella	Consider immunizing children who have remained in remission and have finished chemotherapy for >1 yr; with absolute lymphocyte count of >700/μL and platelet count of >100,000/μL within 24 hr of immunization; check titers of previously immunized children to verify protective levels of antibodies

DTaP, Diphtheria, tetanus, and pertussis; *HBV,* hepatitis B virus; *Hib, Haemophilus influenzae* type b; *IPV,* inactivated polio vaccine; *MMR,* measles, mumps, rubella; *PCV13,* pneumococcal conjugate vaccine; *Td,* tetanus, diphtheria; *23PS,* 23-valent pneumococcal polysaccharide vaccine.
From *MMWR* 49(RR-10):1-147, 2000.

TABLE 11B Vaccines Recommended for Children and Adolescents with Underlying Conditions or at High Risk

Vaccines	Special Situations
PCV13 (and PPSV23 in certain conditions)	Chronic heart disease (particularly cyanotic congenital heart disease and cardiac failure), chronic lung disease (including asthma if treated with high-dose oral corticosteroid therapy), chronic liver disease, chronic renal failure
	Diabetes mellitus
	Cerebrospinal fluid leak
	Cochlear implant
	Sickle cell disease and other hemoglobinopathies
	Anatomic or functional asplenia
	HIV infection
	Nephrotic syndrome
	Diseases associated with treatment with immunosuppressive drugs or radiation therapy, including malignant neoplasms, leukemias, lymphomas, and Hodgkin disease
	Generalized malignancy
	Solid organ transplantation
	Congenital or acquired immunodeficiencies
	Multiple myeloma
Hep A	Chronic liver disease
	Clotting factor disorders
	Men who have sex with men
	Injection or noninjection drug use
	Homelessness
	Work with hepatitis A virus
	Travel in countries with high or intermediate endemic hepatitis A
	Close, personal contact with international adoptee (e.g., household or regular babysitting)
Flu	Egg allergy more severe than hives
MCV4	Anatomic or functional asplenia (including sickle cell disease)
	Persistent complement component deficiency
	Residents of or travelers to countries in African meningitis belt or pilgrims on the Hajj
	During outbreaks caused by a vaccine serogroup
	HIV infection
MenB	Anatomic or functional asplenia (including sickle cell disease)
	Children with persistent complement component deficiency
	During serogroup B outbreaks
Hib	Persons at increased risk for Hib disease, including chemotherapy recipients and those with anatomic or functional asplenia (including sickle cell disease), human immunodeficiency virus (HIV) infection, immunoglobulin deficiency, or early component complement deficiency
	Recipients of hematopoietic stem cell transplant (HSCT)
	Elective splenectomy
Hep B	Infants born to HBsAg-positive mothers or mothers whose HBsAg status is unknown (administer vaccine within 12 hr of birth)
HPV	Immunocompromising conditions, including HIV infection
	History of sexual abuse or assault

From Centers for Disease Control and Prevention: Child and adolescent schedule. www.cdc.gov/vaccines/schedules/hcp/imz/child-adolescent.html. In Kliegman RM: *Nelson textbook of pediatrics,* ed 21, Philadelphia, 2020, Elsevier.

TABLE 12 Approaches to the Evaluation and Vaccination of Persons Vaccinated Outside the United States Who Have No (or Questionable) Vaccination Records

Vaccine	Recommended Approach	Alternative Approach*
MMR	Revaccination with MMR	Serologic testing for IgG antibodies to measles, mumps, and rubella
Hib	Age-appropriate revaccination	—
Hepatitis A	Age-appropriate revaccination	Serologic testing for IgG antibodies to hepatitis A
Hepatitis B	Age-appropriate revaccination and serologic testing for HBsAg†	—
Poliovirus	Revaccinate with inactivated poliovirus vaccine	Serologic testing for neutralizing antibody to poliovirus types 1, 2, and 3 (limited availability)
DTaP	Revaccination with DTaP, with serologic testing for specific IgG antibody to tetanus and diphtheria toxins in the event of a severe local reaction	Persons whose records indicate receipt of ≥3 doses: serologic testing for specific IgG antibody to diphtheria and tetanus toxins before administering additional doses, or administer a single booster dose of DTaP, followed by serologic testing after 1 month for specific IgG antibody to diphtheria and tetanus toxins with revaccination as appropriate
Tdap	Age-appropriate vaccination of persons who are candidates for Tdap vaccine on the basis of time since last diphtheria and tetanus toxoid containing vaccines.	—
Varicella	Age-appropriate vaccination of persons who lack evidence of varicella immunity	—
Pneumococcal conjugate	Age-appropriate vaccination	—
Rotavirus	Age-appropriate vaccination	—
HPV	Age-appropriate vaccination	—
Zoster	Age-appropriate vaccination	—

DTaP, Diphtheria and tetanus toxoids and acellular pertussis; *HBsAg,* hepatitis B surface antigen; *Hib, Haemophilus influenzae* type b; *HPV,* human papillomavirus; *IgG,* immune globulin G; *MMR,* measles, mumps, and rubella; *Tdap,* tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis.

*There is a recommended approach for all vaccines and an alternative approach for some vaccines.

†In rare instances, hepatitis B vaccine can give a false-positive HBsAg result up to 18 days after vaccination; therefore, blood should be drawn to test for HBsAg before vaccinating. (Source: CDC. A comprehensive immunization strategy to eliminate transmission of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices [ACIP]; Part I: Immunization in infants, children, and adolescents, *MMWR* 2005;54(No. RR-16.)

From Centers for Disease Control and Prevention: General recommendations on immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR*60:(RR-2), 2011.

Immunizations for Adults

RECOMMENDED IMMUNIZATION SCHEDULE FOR ADULTS AGED 19 YEARS OR OLDER, UNITED STATES, 2020

The *Recommended Immunization Schedule for Adults Aged 19 Years or Older, United States* became effective, as recommended by the Advisory Committee on Immunization Practices (ACIP) and approved by the Centers for Disease Control and Prevention (CDC). The adult immunization schedule was also reviewed and approved by the following professional medical organizations:

- American College of Physicians (www.acponline.org)
- American Academy of Family Physicians (www.aafp.org)
- American College of Obstetricians and Gynecologists (www.acog.org)
- American College of Nurse-Midwives (www.midwife.org)

CDC announced the availability of the 2020 adult immunization schedule at www.cdc.gov/vaccines/schedules/easy-to-read/adult.html.

The adult immunization schedule describes the age groups and medical conditions and other indications for which licensed vaccines are recommended. The 2020 adult immunization schedule consists of:

- Table 13. Recommended immunization schedule for adults by age group
- Table 14. Recommended immunization schedule for adults by medical condition and other indications
- Footnotes that accompany each vaccine containing important general information and considerations for special populations

Consider the following information when reviewing the adult immunization schedule:

- The tables in the adult immunization schedule should be read with the footnotes that contain important general information and information about vaccination of special populations.
- When indicated, administer recommended vaccines to adults whose vaccination history is incomplete or unknown.
- Increased interval between doses of a multi-dose vaccine does not diminish vaccine effectiveness; therefore, it is not necessary to restart the vaccine series or add doses to the series because of an extended interval between doses.
- Adults with immunocompromising conditions should generally avoid live vaccines, e.g., measles, mumps, and rubella vaccine. Inactivated vaccines, e.g., pneumococcal or inactivated influenza vaccines, are generally acceptable.
- Combination vaccines may be used when any component of the combination is indicated and when the other components of the combination vaccine are not contraindicated.
- The use of trade names in the adult immunization schedule is for identification purposes only and does not imply endorsement by the ACIP or CDC.

Details on vaccines recommended for adults and complete ACIP statements are available at www.cdc.gov/vaccines/hcp/acip-recs/index.html. Additional CDC resources include:

- A summary of information on vaccination recommendations, vaccination of persons with immunodeficiencies, preventing and managing adverse reactions, vaccination contraindications and precautions, and other information can be found in *General Recommendations on Immunization* at www.cdc.gov/mmwr/preview/mmwrhtml/rr6002a1.htm.
- Vaccine Information Statements that explain benefits and risks of vaccines are available at www.cdc.gov/vaccinesafety/Concerns/Index.html.
- Information and resources regarding vaccination of pregnant women are available at www.cdc.gov/vaccines/pregnancy/pregnant-women/index.html.
- Information on travel vaccine requirements and recommendations is available at www.cdc.gov/travel/destinations/list.
- *CDC Vaccine Schedules App* for clinicians and other immunization service providers to download is available at www.cdc.gov/vaccines/schedules/.
- *Recommended Immunization Schedule for Children and Adolescents Aged 18 Years or Younger* is available at www.cdc.gov/vaccines/schedules/hcp/child-adolescent.html#schedule.

Report suspected cases of reportable vaccine-preventable diseases to the local or state health department.

Report all clinically significant post-vaccination reactions to the Vaccine Adverse Event Reporting System at www.vaers.hhs.gov or by telephone, 800-822-7967. All vaccines included in the 2020 adult immunization schedule except herpes zoster and 23-valent pneumococcal polysaccharide vaccines are covered by the Vaccine Injury Compensation Program. Information on how to file a vaccine injury claim is available at www.hrsa.gov/vaccinecompensation or by telephone, 800-338-2382.

The following acronyms are used for vaccines recommended for adults:

HepA	hepatitis A vaccine
HepA-HepB	hepatitis A and hepatitis B vaccines
HepB	hepatitis B vaccine
Hib	*Haemophilus influenzae* type b conjugate vaccine
HPV vaccine	human papillomavirus vaccine
HZV	herpes zoster vaccine
IIV	inactivated influenza vaccine
LAIV	live attenuated influenza vaccine
MenACWY	serogroups A, C, W, and Y meningococcal conjugate vaccine
MenB	serogroup B meningococcal vaccine
MMR	measles, mumps, and rubella vaccine
MPSV4	serogroups A, C, W, and Y meningococcal polysaccharide vaccine
PCV13	13-valent pneumococcal conjugate vaccine
PPSV23	23-valent pneumococcal polysaccharide vaccine
RIV	recombinant influenza vaccine
Td	tetanus and diphtheria toxoids
Tdap	tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis vaccine
VAR	varicella vaccine

TABLE 13 Recommended Immunization Schedule for Adults Aged 19 Years or Older by Age Group, United States, 2020

These recommendations must be read with the footnotes that follow.

Vaccine	19–21 years	22–26 years	27–49 years	50–64 years	≥65 years
Influenza inactivated (IIV) or **Influenza recombinant** (RIV) or **Influenza live attenuated** (LAIV)	1 dose annually (or) 1 dose annually				
Tetanus, diphtheria, pertussis (Tdap or Td)	1 dose Tdap, then Td booster every 10 yrs				
Measles, mumps, rubella (MMR)	1 or 2 doses depending on indication (if born in 1957 or later)				
Varicella (VAR)	2 doses (if born in 1980 or later)				
Zoster recombinant (RZV) *(preferred)* or **Zoster live** (ZVL)				2 doses (or) 1 dose	
Human papillomavirus (HPV) **Female**	2 or 3 doses depending on age at initial vaccination				
Human papillomavirus (HPV) **Male**	2 or 3 doses depending on age at initial vaccination				
Pneumococcal conjugate (PCV13)	1 dose				
Pneumococcal polysaccharide (PPSV23)	1 or 2 doses depending on indication				1 dose
Hepatitis A (HepA)	2 or 3 doses depending on vaccine				
Hepatitis B (HepB)	2 or 3 doses depending on vaccine				
Meningococcal A, C, W, Y (MenACWY)	1 or 2 doses depending on indication, then booster every 5 yrs if risk remains				
Meningococcal B (MenB)	2 or 3 doses depending on vaccine and indication				
***Haemophilus influenzae* type b** (Hib)	1 or 3 doses depending on indication				

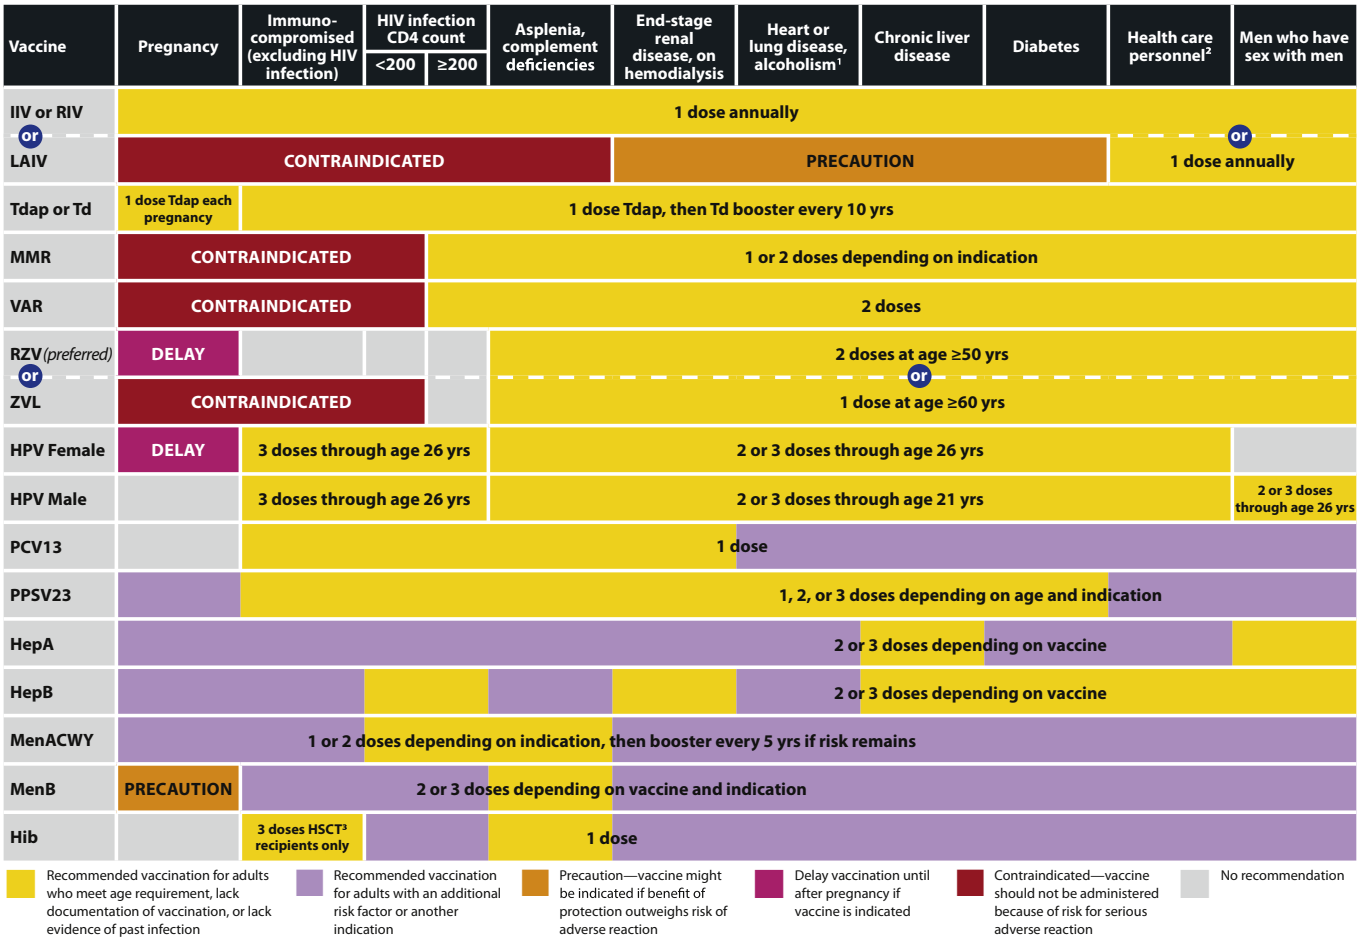
Recommended vaccination for adults who meet age requirement, lack documentation of vaccination, or lack evidence of past infection

Recommended vaccination for adults with an additional risk factor or another indication

No recommendation

TABLE 14 Recommended Immunization Schedule for Adults Aged 19 Years or Older by Medical Condition and Other Indications, United States, 2020

These recommendations must be read with the footnotes that follow.



1. Precaution for LAIV does not apply to alcoholism. **2.** See notes for influenza; hepatitis B; measles, mumps, and rubella; and varicella vaccinations. **3.** Hematopoietic stem cell transplant.

Footnotes. Recommended Adult Immunization Schedule United States, 2020

1. ***Haemophilus influenzae*** **type b vaccination**
   Special situations
   - **Anatomical or functional asplenia (including sickle cell disease):** 1 dose Hib if previously did not receive Hib; if elective splenectomy, 1 dose Hib, preferably at least 14 days before splenectomy
   - **Hematopoietic stem cell transplant** (HSCT): 3-dose series Hib 4 weeks apart starting 6–12 months after successful transplant, regardless of Hib vaccination history
2. **Hepatitis A vaccination**
   Routine vaccination
   - **Not at risk but want protection from hepatitis A** (identification of risk factor not required): 2-dose series HepA (Havrix 6–12 months apart or Vaqta 6–18 months apart [minimum interval: 6 months]) or 3-dose series HepA-HepB (Twinrix at 0, 1, 6 months [minimum intervals: 4 weeks between doses 1 and 2, 5 months between doses 2 and 3])

   Special situations
   - **At risk for hepatitis A virus infection:** 2-dose series HepA or 3-dose series HepA-HepB as above
     - **Chronic liver disease**
     - **Clotting factor disorders**
     - **Men who have sex with men**
     - **Injection or noninjection drug use**
     - **Homelessness**
     - **Work with hepatitis A virus** in research laboratory or nonhuman primates with hepatitis A virus infection
     - **Travel in countries with high or intermediate endemic hepatitis A**
     - **Close personal contact with international adoptee** (e.g., household, regular babysitting) in first 60 days after arrival from country with high or intermediate endemic hepatitis A (administer dose 1 as soon as adoption is planned, at least 2 weeks before adoptee's arrival)
3. **Hepatitis B vaccination**
   Routine vaccination
   - **Not at risk but want protection from hepatitis B** (identification of risk factor not required): 2- or 3-dose series HepB (2-dose series Heplisav-B at least 4 weeks apart [2-dose series HepB only applies when 2 doses of Heplisav-B are used at least 4 weeks apart] or 3-dose series Engerix-B or Recombivax HB at 0, 1, 6 months [minimum intervals: 4 weeks between doses 1 and 2, 8 weeks between doses 2 and 3, 16 weeks between doses 1 and 3]) or 3-dose series HepA-HepB (Twinrix at 0, 1, 6 months [minimum intervals: 4 weeks between doses 1 and 2, 5 months between doses 2 and 3])

   Special situations
   - **At risk for hepatitis B virus infection:** 2-dose (Heplisav-B) or 3-dose (Engerix-B, Recombivax HB) series HepB, or 3-dose series HepA-HepB as above
     - **Hepatitis C virus infection**
     - **Chronic liver disease** (e.g., cirrhosis, fatty liver disease, alcoholic liver disease, autoimmune hepatitis, alanine aminotransferase [ALT] or aspartate aminotransferase [AST] level greater than twice upper limit of normal)
     - **HIV infection**
     - **Sexual exposure risk** (e.g., sex partners of hepatitis B surface antigen (HBsAg)-positive persons; sexually active persons not in mutually monogamous relationships, persons seeking evaluation or treatment for a sexually transmitted infection, men who have sex with men)
     - **Current or recent injection drug use**
     - **Percutaneous or mucosal risk for exposure to blood** (e.g., household contacts of HBsAg-positive persons; residents and staff of facilities for developmentally disabled persons; health care and public safety personnel with reasonably anticipated risk for exposure

to blood or blood-contaminated body fluids; hemodialysis, peritoneal dialysis, home dialysis, and predialysis patients; persons with diabetes mellitus age younger than 60 years and, at discretion of treating clinician, those age 60 years or older)
  - **Incarcerated persons**
  - **Travel in countries with high or intermediate endemic hepatitis B**

4. **Human papillomavirus vaccination**
   Routine vaccination
   - **Females through age 26 years and males through age 21 years:** 2- or 3-dose series HPV vaccine depending on age at initial vaccination; males age 22 through 26 years may be vaccinated based on individual clinical decision (HPV vaccination routinely recommended at age 11–12 years)
   - **Age 15 years or older at initial vaccination:** 3-dose series HPV vaccine at 0, 1–2, 6 months (minimum intervals: 4 weeks between doses 1 and 2, 12 weeks between doses 2 and 3, 5 months between doses 1 and 3; repeat dose if administered too soon)
   - **Age 9 through 14 years at initial vaccination and received 1 dose, or 2 doses less than 5 months apart:** 1 dose HPV vaccine
   - **Age 9 through 14 years at initial vaccination and received 2 doses at least 5 months apart:** HPV vaccination complete, no additional dose needed
   - If completed valid vaccination series with any HPV vaccine, no additional doses needed

   Special situations
   - **Immunocompromising conditions (including HIV infection) through age 26 years:** 3-dose series HPV vaccine at 0, 1–2, 6 months as above
   - **Men who have sex with men and transgender persons through age 26 years:** 2- or 3-dose series HPV vaccine depending on age at initial vaccination as above
   - **Pregnancy through age 26 years:** HPV vaccination not recommended until after pregnancy; no intervention needed if vaccinated while pregnant; pregnancy testing not needed before vaccination

5. **Influenza vaccination**
   Routine vaccination
   - **Persons age 6 months or older:** 1 dose IIV, RIV, or LAIV appropriate for age and health status annually
     For additional guidance, see www.cdc.gov/flu/professionals/index.htm

   Special situations
   - **Egg allergy, hives only:** 1 dose IIV, RIV, or LAIV appropriate for age and health status annually
   - **Egg allergy more severe than hives** (e.g., angioedema, respiratory distress): 1 dose IIV, RIV, or LAIV appropriate for age and health status annually in medical setting under supervision of health care provider who can recognize and manage severe allergic conditions
   - **Immunocompromising conditions (including HIV infection), anatomical or functional asplenia, pregnant women, close contacts and caregivers of severely immunocompromised persons in protected environment, use of influenza antiviral medications in previous 48 hours, with cerebrospinal fluid leak or cochlear implant:** 1 dose IIV or RIV annually (LAIV not recommended)
   - **History of Guillain-Barré syndrome within 6 weeks of previous dose of influenza vaccine:** Generally should not be vaccinated

6. **Measles, mumps, and rubella vaccination**
   Routine vaccination
   - **No evidence of immunity to measles, mumps, or rubella:** 1 dose MMR
     - Evidence of immunity: Born before 1957 (except health care personnel [see below]), documentation of receipt of MMR, laboratory evidence of immunity or disease (diagnosis of disease without laboratory confirmation is not evidence of immunity)

   Special situations
   - **Pregnancy with no evidence of immunity to rubella:** MMR contraindicated during pregnancy; after pregnancy (before discharge from health care facility), 1 dose MMR
   - **Nonpregnant women of childbearing age with no evidence of immunity to rubella:** 1 dose MMR
   - **HIV infection with CD4 count ≥200 cells/μL for at least 6 months and no evidence of immunity to measles, mumps, or rubella:** 2-dose series MMR at least 4 weeks apart; MMR contraindicated in HIV infection with CD4 count <200 cells/μL
   - **Severe immunocompromising conditions:** MMR contraindicated
   - **Students in postsecondary educational institutions, international travelers, and household or close personal contacts of immunocompromised persons with no evidence of immunity to measles, mumps, or rubella:** 1 dose MMR if previously received 1 dose MMR, or 2-dose series MMR at least 4 weeks apart if previously did not receive any MMR
   - **Health care personnel born in 1957 or later with no evidence of immunity to measles, mumps, or rubella:** 2-dose series MMR at least 4 weeks apart for measles or mumps, or at least 1 dose MMR for rubella; if born before 1957, consider 2-dose series MMR at least 4 weeks apart for measles or mumps, or 1 dose MMR for rubella

7. **Meningococcal vaccination**
   Special situations for MenACWY
   - **Anatomical or functional asplenia (including sickle cell disease), HIV infection, persistent complement component deficiency, eculizumab use:** 2-dose series MenACWY (Menactra, Menveo) at least 8 weeks apart and revaccinate every 5 years if risk remains
   - **Travel in countries with hyperendemic or epidemic meningococcal disease, microbiologists routinely exposed to *Neisseria meningitidis*:** 1 dose MenACWY and revaccinate every 5 years if risk remains
   - **First-year college students who live in residential housing (if not previously vaccinated at age 16 years or older) and military recruits:** 1 dose MenACWY

   Special situations for MenB
   - **Anatomical or functional asplenia (including sickle cell disease), persistent complement component deficiency, eculizumab use, microbiologists routinely exposed to *Neisseria meningitidis*:** 2-dose series MenB-4C (Bexsero) at least 1 month apart, or 3-dose series MenB-FHbp (Trumenba) at 0, 1–2, 6 months (if dose 2 was administered at least 6 months after dose 1, dose 3 not needed); MenB-4C and MenBFHbp are not interchangeable (use same product for all doses in series)
   - **Pregnancy:** Delay MenB until after pregnancy unless at increased risk and vaccination benefit outweighs potential risks
   - **Healthy adolescents and young adults age 16 through 23 years (age 16 through 18 years preferred) not at increased risk for meningococcal disease:** Based on individual clinical decision, may receive 2-dose series MenB-4C at least 1 month apart, or 2-dose series MenB-FHbp at 0, 6 months (if dose 2 was administered less than 6 months after dose 1, administer dose 3 at least 4 months after dose 2); MenB-4C and MenB-FHbp are not interchangeable (use same product for all doses in series)

8. **Pneumococcal vaccination**
   Routine vaccination
   - **Age 65 years or older** (immunocompetent): 1 dose PCV13 if previously did not receive PCV13, followed by 1 dose PPSV23 at least 1 year after PCV13 and at least 5 years after last dose PPSV23
     - Previously received PPSV23 but not PCV13 at age 65 years or older: 1 dose PCV13 at least 1 year after PPSV23
     - When both PCV13 and PPSV23 are indicated, administer PCV13 first (PCV13 and PPSV23 should not be administered during same visit)

   Special situations
   - **Age 19 through 64 years with chronic medical conditions (chronic heart [excluding hypertension], lung, or liver disease; diabetes), alcoholism, or cigarette smoking:** 1 dose PPSV23
   - **Age 19 years or older with immunocompromising conditions (congenital or acquired immunodeficiency [including B- and T-lymphocyte deficiency, complement deficiencies, phagocytic disorders, HIV infection], chronic renal failure, nephrotic syndrome, leukemia, lymphoma, Hodgkin disease, generalized malignancy, iatrogenic immunosuppression [e.g., drug or radiation therapy], solid organ transplant, multiple myeloma) or anatomical or functional asplenia (including sickle cell disease and other hemoglobinopathies):** 1 dose PCV13 followed by 1 dose PPSV23 at least 8 weeks later, then another dose PPSV23 at least 5 years after previous PPSV23; at age 65 years or older, administer 1 dose PPSV23 at least 5 years after most recent PPSV23 (note: only 1 dose PPSV23 recommended at age 65 years or older)
   - **Age 19 years or older with cerebrospinal fluid leak or cochlear implant:** 1 dose PCV13 followed by 1 dose PPSV23 at least 8 weeks later; at age 65 years or older, administer another dose PPSV23 at least 5 years after PPSV23 (note: only 1 dose PPSV23 recommended at age 65 years or older)

Continued

9. **Tetanus, diphtheria, and pertussis vaccination**
   Routine vaccination
   - **Previously did not receive Tdap at or after age 11 years:** 1 dose Tdap, then Td booster every 10 years

   Special situations
   - **Previously did not receive primary vaccination series for tetanus, diphtheria, and pertussis:** 1 dose Tdap followed by 1 dose Td at least 4 weeks after Tdap, and another dose Td 6–12 months after last Td (Tdap can be substituted for any Td dose, but preferred as first dose); Td booster every 10 years thereafter
   - **Pregnancy:** 1 dose Tdap during each pregnancy, preferably in early part of gestational weeks 27–36
   - For information on use of Tdap or Td as tetanus prophylaxis in wound management, see www.cdc.gov/mmwr/volumes/67/rr/rr6702a1.htm

10. **Varicella vaccination**
    Routine vaccination
    - **No evidence of immunity to varicella:** 2-dose series VAR 4–8 weeks apart if previously did not receive varicella-containing vaccine (VAR or MMRV [measlesmumps-rubella-varicella vaccine] for children); if previously received 1 dose varicella-containing vaccine: 1 dose VAR at least 4 weeks after first dose
      - Evidence of immunity: U.S.-born before 1980 (except for pregnant women and health care personnel [see below]), documentation of 2 doses varicella-containing vaccine at least 4 weeks apart, diagnosis or verification of history of varicella or herpes zoster by a health care provider, laboratory evidence of immunity or disease

    Special situations
    - **Pregnancy with no evidence of immunity to varicella:** VAR contraindicated during pregnancy; after pregnancy (before discharge from health care facility), 1 dose VAR if previously received 1 dose varicellacontaining vaccine, or dose 1 of 2-dose series VAR (dose 2: 4–8 weeks later) if previously did not receive any varicella-containing vaccine, regardless of whether U.S.-born before 1980
    - **Health care personnel with no evidence of immunity to varicella:** 1 dose VAR if previously received 1 dose varicella-containing vaccine, or 2-dose series VAR 4–8 weeks apart if previously did not receive any varicella-containing vaccine, regardless of whether U.S.-born before 1980
    - **HIV infection with CD4 count ≥200 cells/μL with no evidence of immunity:** Consider 2-dose series VAR 3 months apart based on individual clinical decision; VAR contraindicated in HIV infection with CD4 count <200 cells/μL
    - **Severe immunocompromising conditions:** VAR contraindicated

11. **Zoster vaccination**
    Routine vaccination
    - **Age 50 years or older:** 2-dose series RZV 2–6 months apart (minimum interval: 4 weeks; repeat dose if administered too soon) regardless of previous herpes zoster or previously received ZVL (administer RZV at least 2 months after ZVL)
    - **Age 60 years or older:** 2-dose series RZV 2–6 months apart (minimum interval: 4 weeks; repeat dose if administered too soon) or 1 dose ZVL if not previously vaccinated (if previously received ZVL, administer RZV at least 2 months after ZVL); RZV preferred over ZVL

    Special situations
    - **Pregnancy:** ZVL contraindicated; consider delaying RZV until after pregnancy if RZV is otherwise indicated
    - **Severe immunocompromising conditions (including HIV infection with CD4 count <200 cells/μL):** ZVL contraindicated; recommended use of RZV under review

The Advisory Committee on Immunization Practices (ACIP) recommendations and package inserts for vaccines provide information on contraindications and precautions related to vaccines. Contraindications are conditions that increase chances of a serious adverse reaction in vaccine recipients and the vaccine should not be administered when a contraindication is present. Precautions should be reviewed for potential risks and benefits for vaccine recipient. For a person with a severe allergy to latex, e.g., anaphylaxis, vaccines supplied in vials or syringes that contain natural rubber latex should not be administered unless the benefit of vaccination clearly outweighs the risk for a potential allergic reaction. For latex allergies other than anaphylaxis, vaccines supplied in vials or syringes that contain dry, natural rubber or natural rubber latex may be administered.

TABLE 15 Immunization and Pregnancy

Vaccine	Before Pregnancy	During Pregnancy	After Pregnancy	Type of Vaccine	Route
Hepatitis A	If at high risk for disease	If at high risk for disease	If at high risk for disease	Inactivated	IM
Hepatitis B	Yes, if at risk	Yes, if at risk	Yes, if at risk	Inactivated	IM
Human papillomavirus (HPV)	Yes, if 9-26 years of age	No, under study	Yes, if 9-26 years of age	Inactivated	IM
Influenza TIV	Yes	Yes	Yes	Inactivated	IM
Influenza LAIV	Yes, if <50 years and healthy; avoid conception for 4 weeks	No	Yes, if <50 years and healthy; avoid conception for 4 weeks	Live	Nasal spray
MMR	Yes, avoid conception for 4 weeks	No	Yes, give immediately postpartum if susceptible to rubella	Live	SC
Meningococcal	If indicated	If indicated	If indicated		
Polysaccharide				Inactivated	SC
Conjugate				Inactivated	IM
Pneumococcal polysaccharide	If indicated	If indicated	If indicated	Inactivated	IM or SC
Tetanus/diphtheria Td	Yes, Tdap preferred	If indicated	Yes, Tdap preferred	Toxoid	IM
Tdap, one dose only	Yes, preferred	If high risk of pertussis; otherwise, Td preferred	Yes, preferred	Toxoid/ inactivated	IM
Varicella	Yes, avoid conception for 4 weeks	No	Yes, give immediately postpartum if susceptible	Live	SC

IM, Intramuscular; *LAIV,* live, attenuated influenza vaccine; *SC,* subcutaneous; *Tdap,* tetanus and diphtheria toxoids and acellular pertussis; *TIV,* trivalent inactivated influenza vaccine.

TABLE 16 Immunizing Agents and Immunization Schedules for Health Care Workers (HCWs)*

Generic Name	Primary Schedule and Booster(s)	Indications	Major Precautions and Contraindications	Special Considerations
Immunizing Agents Strongly Recommended for Health Care Workers				
Hepatitis B (HB) recombinant vaccine	Two doses IM 4 wk apart; third dose 5 mo after second; booster doses not necessary	**Preexposure:** HCWs at risk for exposure to blood or body fluids	Based on limited data no risk of adverse effects to developing fetuses is apparent. Pregnancy should *not* be considered a contraindication to vaccination of women. Previous anaphylactic reaction to common baker's yeast is a contraindication to vaccination.	The vaccine produces neither therapeutic nor adverse effects on HB-infected persons. Prevaccination serologic screening is not indicated for persons being vaccinated because of occupational risk. HCWs who have contact with patients or blood should be tested 1-2 mo after vaccination to determine serologic response.
Hepatitis B immune globulin (HBIG)	0.06 ml/kg IM as soon as possible after exposure. A second dose of HBIG should be administered 1 mo later if the HB vaccine series has not been started.	**Postexposure prophylaxis:** For persons exposed to blood or body fluids containing HBsAg and who are not immune to HBV infection—0.06 ml/kg IM as soon as possible (but no later than 7 days after exposure)		
Influenza vaccine (inactivated whole-virus and split-virus vaccines)	Annual vaccination with current vaccine Administered IM	HCWs who have contact with patients at high risk for influenza or its complications; HCWs who work in long-term care facilities; HCWs with high-risk medical conditions or who are aged ≥65 yr	History of anaphylactic hypersensitivity to egg ingestion	No evidence exists of risk to mother or fetus when the vaccine is administered to a pregnant woman with an underlying high-risk condition. Influenza vaccination is recommended during second and third trimesters of pregnancy because of increased risk for hospitalization.
Measles live-virus vaccine	One dose SC; second dose at least 1 mo later	HCWs† born during or after 1957 who do not have documentation of having received two doses of live vaccine on or after the first birthday **or** a history of physician-diagnosed measles or serologic evidence of immunity. Vaccination should be considered for all HCWs who lack proof of immunity, including those born before 1957.	Pregnancy; immunocompromised persons,‡ including HIV-infected persons who have evidence of severe immunosuppression; anaphylaxis after gelatin ingestion or administration of neomycin; recent administration of immune globulin	MMR is the vaccine of choice if recipients are likely to be susceptible to rubella and/or mumps as well as measles. Persons vaccinated between 1963 and 1967 with a killed measles vaccine alone, killed vaccine followed by live vaccine, or with a vaccine of unknown type should be revaccinated with two doses of live measles virus vaccine.
Mumps live-virus vaccine	One dose SC; second dose at least 1 mo later	HCWs† believed to be susceptible can be vaccinated. Adults born before 1957 can be considered immune.	Pregnancy; immunocompromised persons,‡ history of anaphylactic reaction after gelatin ingestion or administration of neomycin	MMR is the vaccine of choice if recipients are likely to be susceptible to measles and rubella, as well as mumps.
Hepatitis A virus (HAV) vaccine	Two doses of vaccine either 6-12 mo apart (HAVRIX), or 6 mo apart (VAQTA)	Not routinely indicated for HCWs in the United States. Persons who work with HAV-infected primates or with HAV in a research laboratory setting should be vaccinated.	History of anaphylactic hypersensitivity to alum or, for HAVRIX, the preservative 2-phenoxyethanol. The safety of the vaccine in pregnant women has not been determined; the risk associated with vaccination should be weighed against the risk for hepatitis A in women who may be at high risk for exposure to HAV.	

TABLE 16 Immunizing Agents and Immunization Schedules for Health Care Workers (HCWs)*—cont'd

Generic Name	Primary Schedule and Booster(s)	Indications	Major Precautions and Contraindications	Special Considerations
Meningococcal vaccine	One dose in volume and by route specified by manufacturer; single booster for adults 19-21 years of age if the first dose was given before age 16	Laboratory personnel and others with exposure risk.	The safety of the vaccine in pregnant women has not been evaluated; it should not be administered during pregnancy unless the risk for infection is high.	
Typhoid vaccine, IM, SC, and oral	IM vaccine: One 0.5-ml/dose, booster 0.5 ml every 2 yr SC vaccine: Two 0.5-ml doses, ≥4 wk apart, booster 0.5 ml SC or 0.1 ID every 3 yr if exposure continues Oral vaccine: Four doses on alternate days. The manufacturer recommends revaccination with the entire 4-dose series every 5 yr	Workers in microbiology laboratories who frequently work with *Salmonella typhi*	Severe local or systemic reaction to a previous dose. Ty21a (oral) vaccine should not be administered to immunocompromised persons† or to persons receiving antimicrobial agents.	Vaccination should not be considered an alternative to the use of proper procedures when handling specimens and cultures in the laboratory.
Vaccinia vaccine (smallpox)	One dose administered with a bifurcated needle; boosters administered every 10 yr	Laboratory workers who directly handle cultures with vaccinia, recombinant vaccinia viruses, or orthopox viruses that infect human beings	The vaccine is contraindicated in pregnancy, in persons with eczema or a history of eczema, and in immunocompromised persons† and their household contacts.	Vaccination may be considered for HCWs who have direct contact with contaminated dressings or other infectious material from volunteers in clinical studies involving recombinant vaccinia virus.
Other Vaccine-Preventable Diseases				
Tetanus and diphtheria and pertussis (Tdap)	Two IM doses 4 wk apart or tetanus and diphtheria toxoid for adults with uncertain or incomplete primary vaccination; third dose 6-12 mo after second dose; booster every 10 yr. Substitute a one-time dose of Tdap for one of the doses of Td, either in the primary series or for the routine booster, whichever comes first.	All adults	Except in the first trimester, pregnancy is not a precaution. History of a neurologic reaction or immediate hypersensitivity reaction after a previous dose. History of severe local (Arthus-type) reaction after a previous dose. Such persons should not receive further routine or emergency doses of Td for 10 yr.	Tetanus prophylaxis in wound management‡
Pneumococcal polysaccharide vaccine (23 valent)	One dose, 0.5 ml, IM or SC; revaccination recommended for those at highest risk ≥5 yr after the first dose	Adults who are at increased risk of pneumococcal disease and its complications because of underlying health conditions; older adults, especially those age ≥65 who are healthy	The safety of vaccine in pregnant women has not been evaluated; it should not be administered during pregnancy unless the risk for infection is high. Previous recipients of any type of pneumococcal polysaccharide vaccine who are at highest risk for fatal infection or antibody loss may be revaccinated ≥5 yr after the first dose.	

Continued

TABLE 16 Immunizing Agents and Immunization Schedules for Health Care Workers (HCWs)*—cont'd

Generic Name	Primary Schedule and Booster(s)	Indications	Major Precautions and Contraindications	Special Considerations
Rubella live-virus vaccine	One dose SC; second dose at least 1 mo later	Indicated for HCWs,† both men and women, who do not have documentation of having received live vaccine on or after their first birthday **or** laboratory evidence of immunity. Adults born before 1957, **except women who can become pregnant,** can be considered immune.	Pregnancy; immunocompromised persons†; history of anaphylactic reaction after administration of neomycin	The risk for rubella vaccine-associated malformations in the offspring of women pregnant when vaccinated or who become pregnant within 3 mo after vaccination is negligible. Such women should be counseled regarding the theoretic basis of concern for the fetus. MMR is the vaccine of choice if recipients are likely to be susceptible to measles or mumps as well as rubella.
Varicella-zoster live-virus vaccine	Two 0.5-ml doses SC 4-8 wk apart if ≥13 yr	Indicated for HCWs† who do not have either a reliable history of varicella or serologic evidence of immunity	Pregnancy, immunocompromised persons,‡ history of anaphylactic reaction after receipt of neomycin or gelatin. Avoid salicylate use for 6 wk after vaccination.	Vaccine is available from the manufacturer for certain patients with acute lymphocytic leukemia in remission. Because 71%-93% of persons without a history of varicella are immune, serologic testing before vaccination is likely to be cost effective.
Varicella-zoster immune globulin (VZIG)	Persons <50 kg: 125 μg/10 kg IM; persons ≥50 kg: 625 μg§	Persons known or likely to be susceptible (particularly those at high risk for complications, e.g., pregnant women) who have close and prolonged exposure to a contact case or to an infectious hospital staff worker or patient		Serologic testing may help in assessing whether to administer VZIG. If use of VZIG prevents varicella disease, patient should be vaccinated subsequently.
BCG Vaccination				
Bacille Calmette-Guérin (BCG) vaccine (TB)	One percutaneous dose of 0.3 ml; no booster dose recommended	Should be considered only for HCWs in areas where multidrug TB is prevalent, a strong likelihood of infection exists, and where comprehensive infection control precautions have failed to prevent TB transmission to HCWs	Should not be administered to immunocompromised persons,‡ pregnant women	In the United States TB-control efforts are directed toward early identification, treatment of cases, and preventive therapy with isoniazid.
Other Immunobiologics That Are or May Be Indicated for HCWs				
Immune globulin (hepatitis A)	**Postexposure**—One IM dose of 0.02 ml/kg administered ≤2 wk after exposure	Indicated for HCWs exposed to feces of infectious patients	Contraindicated in persons with IgA deficiency; do not administer within 2 wk after MMR vaccine or 3 wk after varicella vaccine. Delay administration of MMR vaccine for ≥3 mo and varicella vaccine ≥5 mo after administration of immune globulin	Administer in large muscle mass (deltoid, gluteal).

HBsAg, Hepatitis B surface antigen; *HBV,* hepatitis B virus; *HIV,* human immunodeficiency virus; *IM,* intramuscular; *MMR,* measles, mumps, rubella vaccine; *SC,* subcutaneous; *TB,* tuberculosis.

*Persons who provide health care to patients or work in institutions that provide patient care (e.g., physicians, nurses, emergency medical personnel, dental professionals and students, medical and nursing students, laboratory technicians, hospital volunteers, and administrative and support staff in health care institutions).

†All HCWs (i.e., medical or nonmedical, paid or volunteer, full time or part time, student or nonstudent, with or without patient-care responsibilities) who work in health care institutions (e.g., inpatient and outpatient, public and private) should be immune to measles, rubella, and varicella.

‡Persons immunocompromised because of immune deficiency diseases, HIV infection, leukemia, lymphoma or generalized malignancy, or immunosuppressed as a result of therapy with corticosteroids, alkylating drugs, antimetabolites, or radiation.

§Some experts recommend 125 μg/10 kg regardless of total body weight.

Modified from *MMWR* 46(RR-18), 1998.

TABLE 17 Recommendations for Persons with Medical Conditions Requiring Special Vaccination Considerations

Condition	Tdap	MMR	Varicell[a]	HBV	HAV	Pneumovax[a]	Influenza[b]	HbCV	Meningococcal	IPV	Other Live Vaccines[c]	Other Killed Vaccines[d]
HIV infection	Rou	Rou/Contr[e]	Contr[f]	Rou[g]	Rou	Rec	Rec	Cons	Rou	Rou	Contr	Rou
Severe immunocompromise[h]	Rou	Contr	Contr[f]	Rou[g]	Rou	Rec	Rec	Rou[i]	Rou	Rou	Contr	Rou
Renal failure	Rou	Rou	Rou	Rec[g]	Rou	Rec	Rec	Rou	Rou	Rou	Rou	Rou
Diabetes	Rou	Rou	Rou	Rou	Rou	Rec	Rec	Rou	Rou	Rou	Rou	Rou

Terminal complement deficiency	Rou	Rou	Rou	Rou	Rou	Rou	Rou	Rou	Rec	Rou	Rou	
Clotting factor disorders	Rou	Rou	Rou	Rec	Rec	Rou	Rou	Rou	Rou	Rou	Rou	Rou

Cons, Consider vaccination; *Contr,* contraindicated; *HAV,* hepatitis A virus; *HbCV, Haemophilus influenzae* conjugate vaccine; *HBV,* hepatitis B virus; *IPV,* inactivated poliomyelitis vaccine; *MMR,* measles-mumps-rubella; *Rec,* recommended; *Rou,* routine as outlined for all adults; *Tdap,* tetanus and diphtheria toxoids and acellular pertussis.

[a]Pneumovax should be repeated in 5 yr for patients in whom vaccine is recommended. Asthma without chronic obstructive pulmonary disease is not an indication for the vaccine.

[b]Influenza vaccine should also be given to caregivers and household members.

[c]Includes bacille Calmette-Guérin, vaccinia, oral typhoid, yellow fever (if exposure cannot be avoided, persons with HIV can be given yellow fever vaccine; see text).

[d]Includes rabies (check postvaccination titers in HIV or severely immunocompromised persons), Lyme disease, inactivated typhoid, cholera, plague, and anthrax.

[e]For asymptomatic, nonseverely immunocompromised persons with HIV, MMR can be used; it is contraindicated in severely immunocompromised persons. MMR can be considered in symptomatic HIV patients without severe immunocompromise.

[f]Varicella can be given to household members and caregivers, but if varicella-like rash develops after vaccination, contact should be avoided.

[g]Recommended for persons with severe chronic renal failure approaching or already receiving dialysis, and higher doses should be given. Antibody titers should be measured after vaccination in these patients and in those with HIV or severe immunocompromise (who may require higher doses) to ensure adequate response. Yearly titers should be measured in dialysis patients.

[h]Severe immunocompromise can result from congenital immunodeficiency, leukemia, lymphoma, malignancy, organ transplant, chemotherapy, radiation therapy, or high-dose corticosteroids.

[i]Only for persons with Hodgkin's disease.

[j]Give at least 2 wk in advance of elective splenectomy.

Modified and updated from *MMWR* 42(RR-4):16, 1993.

Vaccinations for International Travel

TABLE 18 Recommended Immunizations for Travelers to Developing Countries

Immunizations	LENGTH OF TRAVEL		
	Brief (<2 wk)	Intermediate (2 wk-3 mo)	Long-Term Residential (>3 mo)
Review and complete age-appropriate childhood schedule	+	+	+
DTaP, poliovirus, pneumococcal, and *Haemophilus influenzae* type B vaccines may be given at 4-week intervals if necessary to complete the recommended schedule before departure. Rotavirus vaccine has maximum ages for the first and last doses; consideration should be given to the timing of an infant's travel so that the infant will be able to receive the vaccine series.			
Measles: Infants 6-11mo of age should receive 1 dose of MMR vaccine before departure. Two additional doses are given if younger than 12 mo of age at first dose.			
Varicella			
Hepatitis A*			
Hepatitis B†			
Vaccines against the following diseases should be considered depending on the geographic area and circumstances of the visit:			
Japanese encephalitis‡	±	±	+
Meningococcal disease§	±	±	±
Rabies¶	±	+	+
Typhoid fever**	±	+	+
Yellow fever††	+	+	+

DTaP, Diphtheria-tetanus-acellular pertussis.
*Indicated for travelers to areas with intermediate or high endemic rates of hepatitis A virus infection.
†If insufficient time to complete 6-month primary series, an accelerated series can be given.
‡For regions with endemic infection. For high-risk activities in areas experiencing outbreaks, vaccine is recommended, even for brief travel.
§Recommended for regions of Africa with endemic infection and during local epidemics and required for travel to Saudi Arabia for the Hajj.
¶Indicated for persons at high risk for animal exposure (especially dogs) and for travelers to countries with endemic infection.
**Indicated for travelers who will consume food and liquids in areas of poor sanitation.
††For regions with endemic infection.

		2	2 mo	2	2 mo
		3	6–18 mo¶	3	4 mo
				4	6 mo¶

HBIG, Hepatitis B immune globulin; *HBsAg,* hepatitis B surface antigen.
*Mothers should have blood drawn and tested for HBsAg as soon as possible after admission for delivery; if the mother is found to be HBsAg positive, the infant should receive HBIG as soon as possible but no later than age 7 days.
†Pediarix should not be administered before age 6 weeks.
§HBIG should be administered at a separate anatomical site from vaccine.
¶The final dose in the vaccine series should not be administered before age 24 weeks (164 days).
From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

TABLE 21 Hepatitis B Vaccine Schedules for Children, Adolescents, and Adults

Age Group	**Schedule* (Interval Represents Time in Months from First Dose)**
Children (1-10 y)	0, 1, and 6 mo
	0, 1, 2, and 12 mo
Adolescents (11-19 y)	0, 1, and 6 mo
	0, 12, and 24 mo
	0 and 4-6 mo†
	0, 1, 2, and 12 mo
	0, 7 d, 21-30 d, 12 mo§
Adults (≥20 y)	0, 1, and 6 mo
	0, 1, 2, and 12 mo
	0, 1, 2, and 6 mo¶
	0, 7 d, 21-30 d, 12 mo§

*Refer to package inserts for further information. For all ages, when the HepB vaccine schedule is interrupted, the vaccine series does not need to be restarted. If the series is interrupted after the first dose, the second dose should be administered as soon as possible, and the second and third doses should be separated by an interval of at least 8 weeks. If only the third dose has been delayed, it should be administered as soon as possible. The final dose of vaccine must be administered at least 8 weeks after the second dose and should follow the first dose by at least 16 weeks; the minimum interval between the first and second doses is 4 weeks. Inadequate doses of hepatitis B vaccine or doses received after a shorter-than-recommended dosing interval should be readministered, using the correct dosage or schedule. Vaccine doses administered ≤4 days before the minimum interval or age are considered valid. Because of the unique accelerated schedule for Twinrix, the 4-day guideline does not apply to the first three doses of this vaccine when administered on a 0-day, 7-day, 21-30-day, and 12-month schedule (new recommendation).
†A 2-dose schedule of Recombivax adult formulation (10 μg) is licensed for adolescents aged 11-15 years. When scheduled to receive the second dose, adolescents aged >15 years should be switched to a 3-dose series, with doses 2 and 3 consisting of the pediatric formulation administered on an appropriate schedule.
§Twinrix is approved for use in persons aged ≥18 years and is available on an accelerated schedule with doses administered at 0, 7, and 21-30 days and 12 months.
¶A 4-dose schedule of Engerix administered in two 1 ml doses (40 μg) on a 0-, 1-, 2-, and 6-month schedule is recommended for adult hemodialysis patients.
From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

TABLE 23 Postexposure Management after Distinct Nonoccupational Percutaneous or Mucosal Exposure to Blood or Body Fluids

	MANAGEMENT	
Exposure*	**Unvaccinated Person**	**Previously Vaccinated Person**
HBsAg-positive source	HepB vaccine series and HBIG	HepB vaccine dose
HBsAg status unknown for source	Hep B vaccine series	No management

HBIG, Hepatitis B immune globulin; *HBsAg,* hepatitis B surface antigen; *HepB,* hepatitis B.
*Exposures include percutaneous (e.g., bite or needlestick) or mucosal exposure to blood or body fluids, sex or needle-sharing contact, or victim of sexual assault/abuse.
From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

BOX 1 Persons Recommended to Receive Hepatitis B Vaccination

- All infants
- Unvaccinated children aged <19 years
- Persons at risk for infection by sexual exposure
  - Sex partners of hepatitis B surface antigen (HBsAg)-positive persons
  - Sexually active persons who are not in a long-term, mutually monogamous relationship (e.g., persons with more than one sex partner during the previous 6 months)
  - Persons seeking evaluation or treatment for a sexually transmitted infection
  - Men who have sex with men
- Persons at risk for infection by percutaneous or mucosal exposure to blood
  - Current or recent injection-drug users
  - Household contacts of HBsAg-positive persons
  - Residents and staff of facilities for developmentally disabled persons
  - Health care and public safety personnel with reasonably anticipated risk for exposure to blood or blood-contaminated body fluids
  - Hemodialysis patients and predialysis, peritoneal dialysis, and home dialysis patients
  - Persons with diabetes aged 19-59 years; persons with diabetes aged ≥60 years at the discretion of the treating clinician
- Others
  - International travelers to countries with high or intermediate levels of endemic hepatitis B virus (HBV) infection (HBsAg prevalence of ≥2%)
  - Persons with hepatitis C virus infection
  - Persons with chronic liver disease (including persons with cirrhosis, fatty liver disease, alcoholic liver disease, autoimmune hepatitis, and an alanine aminotransferase [ALT] or aspartate aminotransferase [AST] level greater than twice the upper limit of normal)
  - Persons with HIV infection
  - Incarcerated persons
- All other persons seeking protection from HBV infection

From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

BOX 2 Testing Anti-HBs for Health Care Personnel (HCP) Vaccinated in the Past

The issue: An increasing number of HCP have received routine hepatitis B (HepB) vaccination during childhood. No postvaccination serologic testing is recommended after routine infant or adolescent HepB vaccination. Because vaccine-induced antibody to hepatitis B surface antigen (anti-HBs) wanes over time, testing HCP for anti-HBs years after vaccination might not distinguish vaccine nonresponders from responders.

Guidance for health care institutions: Health care institutions may measure anti-HBs upon hire or matriculation for HCP who have documentation of a complete HepB vaccine series in the past (e.g., as part of routine infant or adolescent vaccination). HCP with anti-HBs <10 mIU/mL should receive one or more additional doses of HepB vaccine and retesting (see Fig. 6). Institutions that decide to not measure anti-HBs upon hire or matriculation for HCP who have documentation of a complete HepB vaccine series in the past should ensure timely assessment and postexposure prophylaxis following an exposure (see Table 22).

Considerations: The risk for occupational HBV infection for vaccinated HCP might be low enough in certain settings so that assessment of anti-HBs status and appropriate follow-up should be done at the time of exposure to potentially infectious blood or body fluids. This approach relies on HCP recognizing and reporting blood and body fluid exposures and therefore may be applied on the basis of documented low risk, implementation, and cost considerations. Certain HCP occupations have lower risk for occupational blood and body fluid exposures (e.g., occupations involving counseling versus performing procedures), and nontrainees have lower risks for blood and body fluid exposures than trainees. Some settings also will have a lower prevalence of HBV infection in the patient population served than in other settings, which will influence the risk for HCP exposure to HBsAg-positive blood and body fluids.

From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

BOX 3 Persons Recommended to Receive Serologic Testing Before Vaccination*

- Household, sexual, or needle contacts of hepatitis B surface antigen (HBsAg)-positive persons†
- HIV-positive persons†
- Persons with elevated alanine aminotransferase/aspartate aminotransferase of unknown etiology†
- Hemodialysis patients†
- Men who have sex with men†
- Past or current persons who inject drugs†
- Persons born in countries of high and intermediate hepatitis B virus (HBV) endemicity (HBsAg prevalence ≥2%)
- U.S.-born persons not vaccinated as infants whose parents were born in countries with high HBV endemicity (≥8%)
- Persons needing immunosuppressive therapy, including chemotherapy, immunosuppression related to organ transplantation, and immunosuppression for rheumatologic or gastroenterologic disorders
- Donors of blood, plasma, organs, tissues, or semen

*Serologic testing comprises testing for hepatitis B surface antigen (HBsAg), antibody to HBsAg, and antibody to hepatitis B core antigen.
†Denotes persons also recommended for hepatitis B vaccination. Serologic testing should occur before vaccination. Serologic testing should not be a barrier to vaccination of susceptible persons. The first dose of vaccine should typically be administered immediately after collection of the blood for serologic testing.
From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

BOX 4 Persons Recommended to Receive Postvaccination Serologic Testing* after a Complete Series of Hepatitis B Vaccination

- Infants born to hepatitis B surface antigen (HBsAg)-positive mothers or mothers whose HBsAg status remains unknown (e.g., when a parent or person with lawful custody safely surrenders an infant confidentially shortly after birth)†
- Health care personnel and public safety workers
- Hemodialysis patients and others who might require outpatient hemodialysis (e.g., predialysis, peritoneal dialysis, and home dialysis)
- HIV-infected persons
- Other immunocompromised persons (e.g., hematopoietic stem-cell transplant recipients or persons receiving chemotherapy)
- Sex partners of HBsAg-positive persons

*Postvaccination serologic testing for persons other than infants born to HBsAg-positive (or HBsAg-unknown) mothers consists of anti-HBs.
†Postvaccination serologic testing for infants born to HBsAg-positive (or HBsAg-unknown) mothers consists of anti-HBs and HBsAg. Persons with anti-HBs <10 mIU/ml after the primary vaccine series should be revaccinated. Infants born to HBsAg-positive mothers or mothers with an unknown HBsAg status should be revaccinated with a single dose of HepB vaccine and receive postvaccination serologic testing 1-2 months later. Infants whose anti-HBs remains <10 mIU/ml after single dose revaccination should receive two additional doses of HepB vaccine, followed by postvaccination serologic testing 1-2 months after the final dose. Based on clinical circumstances or family preference, HBsAg-negative infants with anti-HBs <10 mIU/ml may instead be revaccinated with a second, complete 3-dose series, followed by postvaccination serologic testing performed 1-2 months after the final dose of vaccine. For others with anti-HBs <10 mIU/ml after the primary series, administration of 3 additional HepB vaccine doses on an appropriate schedule, followed by anti-HBs testing 1-2 months after the final dose, is usually more practical than serologic testing after ≥1 dose of vaccine.
From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67(No. RR-1):1-31, 2018.

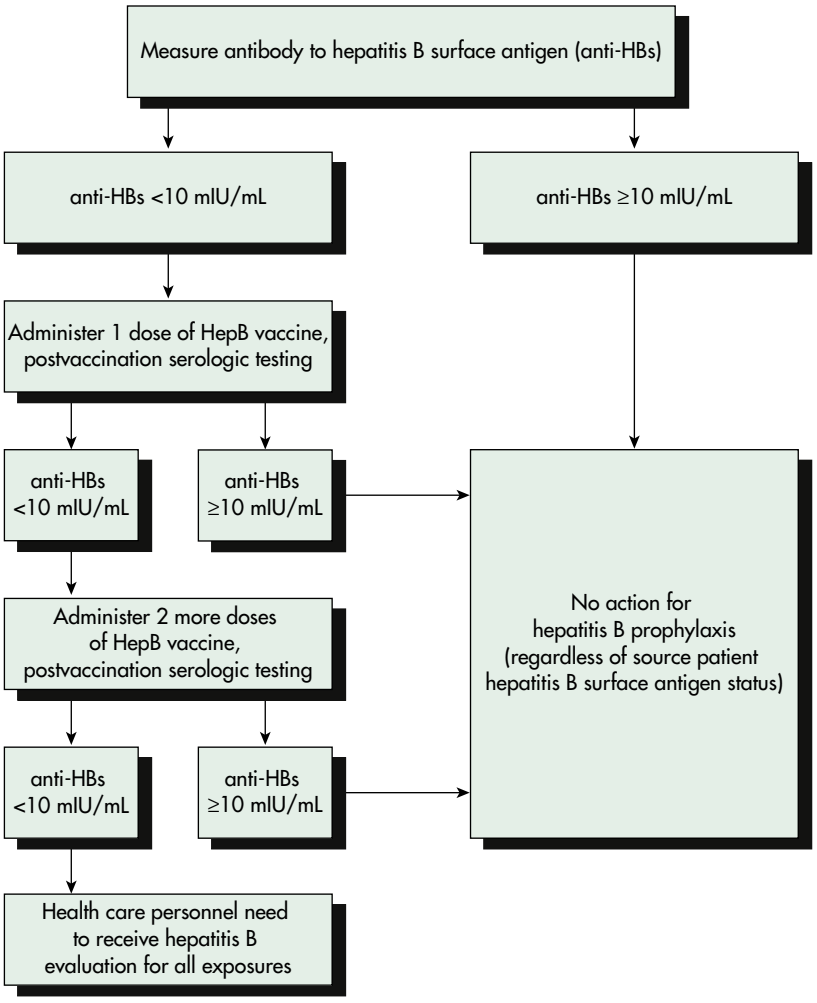

FIG. 6 Preexposure evaluation for health care personnel previously vaccinated with complete, ≥3-dose HepB vaccine series who have not had post-vaccination serologic testing.* Source: Adapted from CDC: a comprehensive immunization strategy to eliminate transmission of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices [ACIP]. Part II: immunization of adults. *MMWR* 55 (No.RR-16), 2006. *Should be performed 1-2 months after the last dose of vaccine using a quantitative method that allows detection of the protective concentration of anti-HBs (≥10 mIU/ml) (e.g., enzyme-linked immunosorbent assay [ELISA]). (From Schillie S et al: Prevention of hepatitis B virus infection in the United States: recommendations of the Advisory Committee on Immunization Practices, *MMWR Recomm Rep* 67[No. RR-1]:1-31, 2018.)

Hepatitis A Prophylaxis

TABLE 24 Recommended Dosages of Hepatitis A Immune Globulin

Setting	Duration of Coverage	Dose
Preexposure prophylaxis	Short term (<3 mo)	0.02 ml/kg
	Long term (3-5 mo)*	0.06 ml/kg
Postexposure prophylaxis	—	0.02 ml/kg

NOTE: Immune globulin should be administered intramuscularly into the deltoid or gluteal muscle in children younger than 24 mo; it may be administered in the anterolateral thigh muscle.
*Repeat every 5 mo if continued exposure to hepatitis A virus occurs.
Modified from Centers for Disease Control and Prevention: Prevention of hepatitis A through active or passive immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR* 55(RR-07):9, 2006.

TABLE 25 Licensed Dosages of Hepatitis A Vaccines

Vaccine	Patient's Age	Dose	Volume (ml)	Number of Doses	Schedule (mo)*
Hepatitis A vaccine, inactivated (Havrix)	12 mo to 18 yr	720 EL.U.	0.5	2	0, 6-12
	≥19 yr	1440 EL.U.	1.0	2	0, 6-12
Hepatitis A vaccine, inactivated (Vaqta)	12 mo to 18 yr	25 U	0.5	2	0, 6-18
	≥19 yr	50 U	1.0	2	0, 6-18
Combined hepatitis A and hepatitis B vaccine (Twinrix)	≥18 yr	720 EL.U. of hepatitis A antigen and 20 mcg of hepatitis B surface antigen protein	1.0	3	0, 1, and 6

*Zero represents the timing of the initial dose; subsequent numbers represent months after the initial dose.
Modified from Centers for Disease Control and Prevention: Prevention of hepatitis A through active or passive immunization: recommendations of the Advisory Committee on Immunization Practices (ACIP), *MMWR* 55(RR-07):10, 2006.

Influenza Treatment and Prophylaxis

BOX 5 Summary of Seasonal Influenza Vaccination Recommendations

Children

All children aged 6 months to 18 years should be vaccinated annually.
Children and adolescents at higher risk for influenza complications should continue to be a focus for vaccination efforts as providers and programs transition to routinely vaccinating all children and adolescents, including those who:

- are aged 6 months to 4 years (59 months)
- have chronic pulmonary (including asthma), cardiovascular (except hypertension), renal, hepatic, cognitive, neurologic/neuromuscular, hematologic, or metabolic disorders (including diabetes mellitus)
- are immunosuppressed (including immunosuppression caused by medications or by human immunodeficiency virus)
- are receiving long-term aspirin therapy and therefore might be at risk for experiencing Reye syndrome after influenza virus infection
- are residents of long-term care facilities
- will be pregnant during the influenza season

NOTE: Children aged <6 months cannot receive influenza vaccination. Household and other close contacts (e.g., day-care providers) of children aged <6 months, including older children and adolescents, should be vaccinated.

Adults

Annual vaccination against influenza is recommended for any adult who wants to reduce the risk of becoming ill with influenza or of transmitting it to others. Vaccination is recommended for all adults without contraindications in the following groups, because these persons either are at higher risk for influenza complications, or are close contacts of the persons at higher risk:

- persons aged ≥50 years
- women who will be pregnant during the influenza season
- persons who have chronic pulmonary (including asthma), cardiovascular (except hypertension), renal, hepatic, cognitive, neurologic/neuromuscular, hematologic, or metabolic disorders (including diabetes mellitus)
- persons who have immunosuppression (including immunosuppression caused by medications or by human immunodeficiency virus)
- residents of nursing homes and other long-term care facilities
- health care personnel
- household contacts and caregivers of children aged <5 years and adults aged ≥50 years, with particular emphasis on vaccinating contacts of children aged <6 months
- household contacts and caregivers of persons with medical conditions that put them at higher risk for severe complications from influenza

Modified from *MMWR*58:(RR-8), 2009.

TABLE 26 Live, Attenuated Influenza Vaccine (LAIV) Compared with Inactivated Influenza Vaccine (TIV) for Seasonal Influenza, U.S. Formulations

Factor	LAIV	TIV
Route of administration	Intranasal spray	Intramuscular injection
Type of vaccine	Live virus	Noninfectious virus (i.e., inactivated)
Number of included virus strains	3 (2 influenza A, 1 influenza B)	3 (2 influenza A, 1 influenza B)
Vaccine virus strains updated	Annually	Annually
Frequency of administration	Annually*	Annually*
Approved age	Persons aged 2-49 yr	Persons aged ≥6 mo
Interval between 2 doses recommended for children aged ≥6 mo to 8 yr who are receiving influenza vaccine for the first time	4 wk	4 wk
Can be administered to persons with medical risk factors for influenza-related complications†	No	Yes
Can be administered to children with asthma or children aged 2-4 yr with wheezing during the preceding year§	No	Yes
Can be administered to family members or close contacts of immunosuppressed persons not requiring a protected environment	Yes	Yes
Can be administered to family members or close contacts of immunosuppressed persons requiring a protected environment (e.g., hematopoietic stem cell transplant recipient)	No	Yes
Can be administered to family members or close contacts of persons at high risk but not severely immunosuppressed	Yes	Yes
Can be simultaneously administered with other vaccines	Yes¶	Yes**
If not simultaneously administered, can be administered within 4 wk of another live vaccine	Prudent to space 4 wk apart	Yes
If not simultaneously administered, can be administered within 4 wk of an inactivated vaccine	Yes	Yes

*Children aged 6 months to 8 years who have never received influenza vaccine before should receive 2 doses. Those who only receive 1 dose in their first year of vaccination should receive 2 doses in the following year, spaced 4 weeks apart.

†Persons at higher risk for complications of influenza infection because of underlying medical conditions should not receive LAIV. Persons at higher risk for complications of influenza infection because of underlying medical conditions include adults and children with chronic disorders of the pulmonary or cardiovascular systems; adults and children with chronic metabolic diseases (including diabetes mellitus), renal dysfunction, hemoglobinopathies, or immunosuppression; children and adolescents receiving long-term aspirin therapy (at risk for developing Reye syndrome after wild-type influenza infection); persons who have any condition (e.g., cognitive dysfunction, spinal cord injuries, seizure disorders, or other neuromuscular disorders) that can compromise respiratory function or the handling of respiratory secretions or that can increase the risk for aspiration; pregnant women; and residents of nursing homes and other chronic-care facilities that house persons with chronic medical conditions.

§Clinicians and immunization programs should screen for possible reactive airways diseases when considering use of LAIV for children aged 2-4 years and should avoid use of this vaccine in children with asthma or a recent wheezing episode. Health care providers should consult the medical record, when available, to identify children aged 2-4 years with asthma or recurrent wheezing that might indicate asthma. In addition, to identify children who might be at greater risk for asthma and possibly at increased risk for wheezing after receiving LAIV, parents or caregivers of children aged 2-4 years should be asked: "In the past 12 months, has a health care provider ever told you that your child had wheezing or asthma?" Children whose parents or caregivers answer "yes" to this question and children who have asthma or who had a wheezing episode noted in the medical record during the preceding 12 months should not receive LAIV.

¶LAIV coadministration has been evaluated systematically only among children aged 12-15 months who received measles, mumps, and rubella vaccine or varicella vaccine.

**TIV coadministration has been evaluated systematically only among adults who received pneumococcal polysaccharide or zoster vaccine.

Modified from *MMWR* 56(RR-6), 2007.

INDICATIONS FOR USE OF ANTIVIRALS

PERSONS FOR WHOM ANTIVIRAL TREATMENT SHOULD BE CONSIDERED

If possible, antiviral treatment should be started within 48 hours of influenza illness onset. The effectiveness of initiating antiviral treatment more than 48 hours after illness onset has not been established. Persons for whom antiviral treatment should be considered include:

- Persons hospitalized with laboratory-confirmed influenza (limited data suggest benefit even for persons whose antiviral treatment is initiated more than 48 hours after illness onset)
- Persons with laboratory-confirmed influenza pneumonia
- Persons with laboratory-confirmed influenza and bacterial coinfection
- Persons with laboratory-confirmed influenza infection who are at higher risk for influenza complications
- Persons presenting to medical care with laboratory-confirmed influenza within 48 hours of influenza illness onset who want to decrease the duration or severity of their symptoms and transmission of influenza to others at higher risk for complications

PERSONS FOR WHOM ANTIVIRAL CHEMOPROPHYLAXIS SHOULD BE CONSIDERED DURING PERIODS OF INCREASED INFLUENZA ACTIVITY IN THE COMMUNITY

- Persons at high risk during the 2 weeks after influenza vaccination (after the second dose for children younger than 9 years who have not previously been vaccinated) if influenza viruses are circulating in the community
- Persons at high risk for whom influenza vaccine is contraindicated
- Family members or health care providers who are unvaccinated and are likely to have ongoing, close exposure to persons at high risk or unvaccinated persons or infants younger than 6 months
- Persons and their family members and close contacts and health care workers when circulating strains of influenza virus in the community are not matched with vaccine strains
- Persons with immune deficiencies or those who might not respond to vaccination (e.g., persons infected with HIV or other immunosuppressed conditions or who are receiving immunosuppressive medications)
- Unvaccinated staff and persons during response to an outbreak in a closed institutional setting with residents at high risk (e.g., extended-care facilities)

Modified from *MMWR* 57(RR-7), 2008.

NOTE: Recommended antiviral medications (neuraminidase inhibitors) are not licensed for chemoprophylaxis of children younger than 1 year (oseltamivir) or younger than 5 years (zanamivir). Updates or supplements to these recommendations (e.g., expanded age or risk group indications for licensed vaccines) might be required. Health care providers should be alert to announcements of recommendation updates and should check the CDC influenza website periodically for additional information (www.cdc.gov/flu).

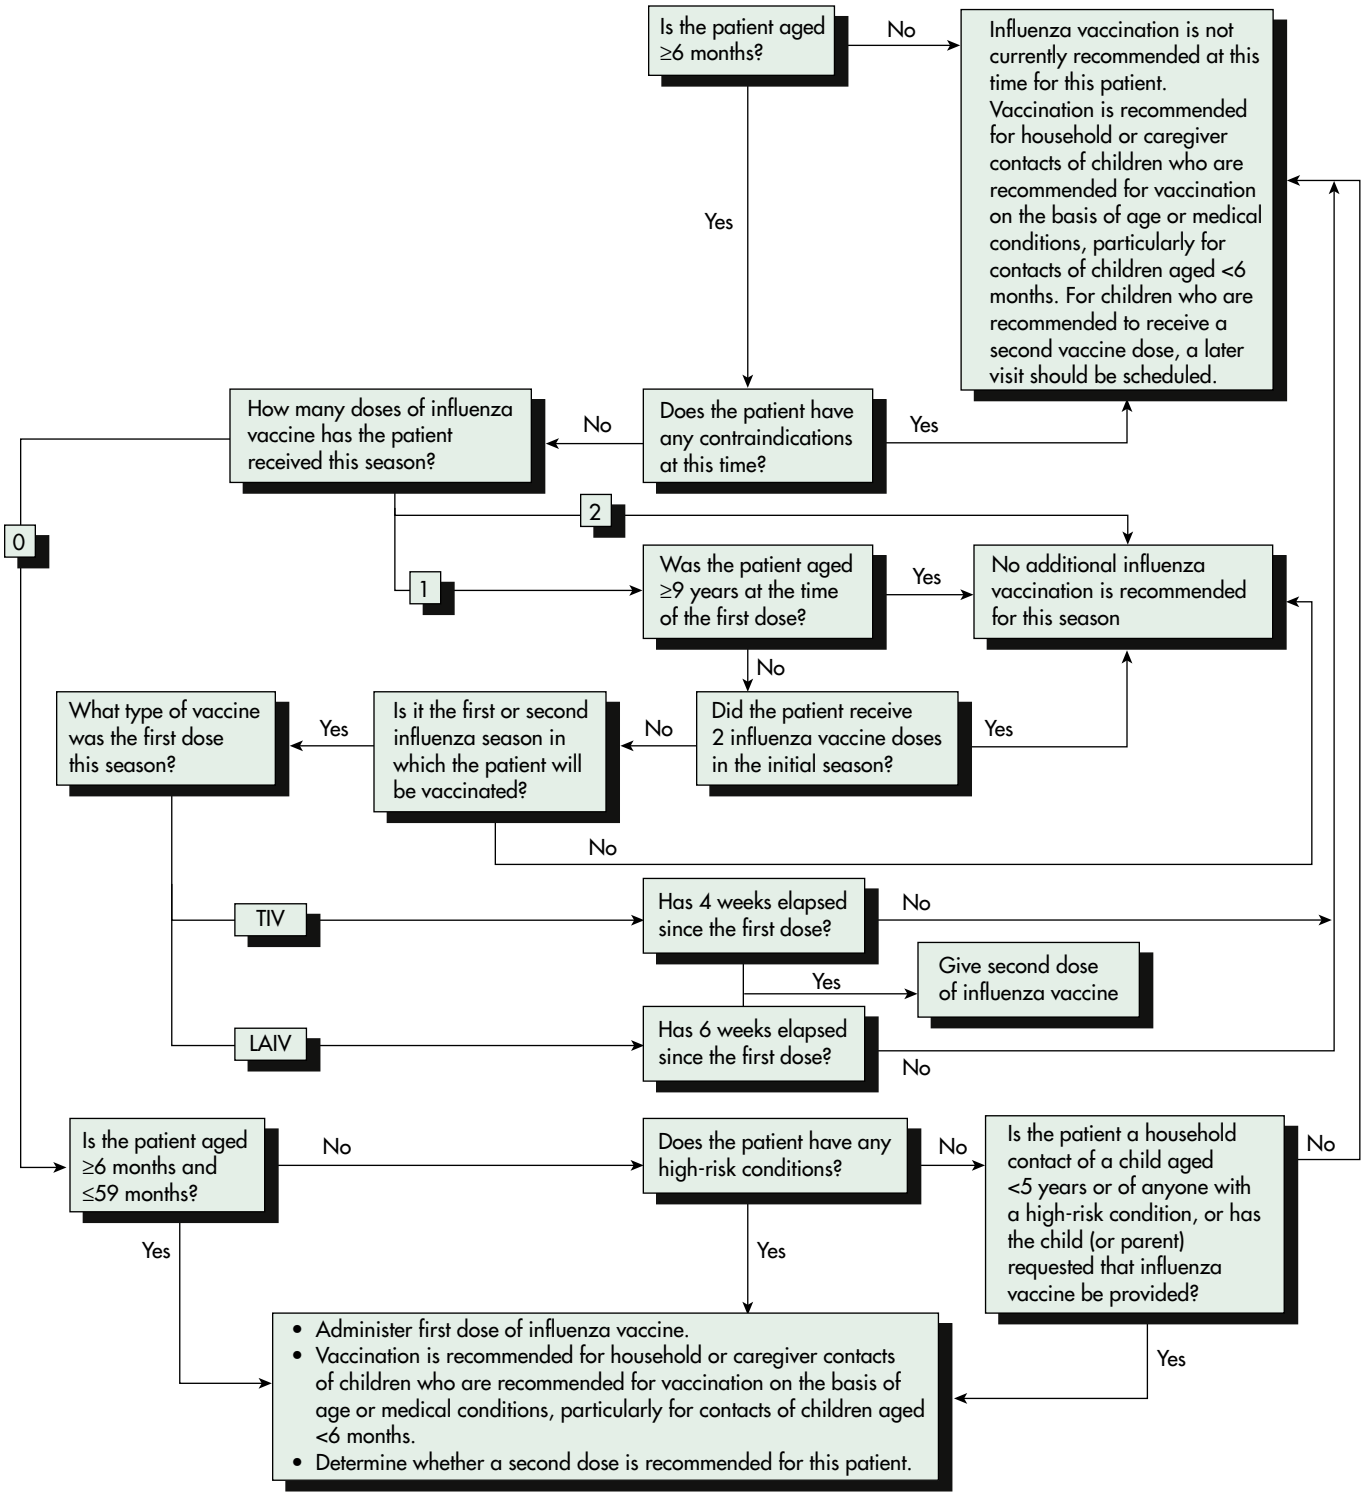

FIG. 7 Algorithm for determining recommended influenza immunization actions for children. *TIV,* Trivalent inactivated influenza vaccine; *LAIV,* live attenuated influenza vaccine. Modified with permission from the American Academy of Pediatrics' Committee on Infectious Diseases: Prevention of influenza: recommendations for influenza immunization of children, 2006-2007, *Pediatrics* 119:846-51, 2007.

HIV Testing and Postexposure Prophylaxis

RECOMMENDATIONS FOR HIV TESTING OF ADULTS, ADOLESCENTS, AND PREGNANT WOMEN

RECOMMENDATIONS FOR ADULTS AND ADOLESCENTS

The CDC recommends that diagnostic human immunodeficiency virus (HIV) testing and opt-out HIV screening be a part of routine clinical care in all health care settings while also preserving the patient's option to decline HIV testing and ensuring a provider-patient relationship conducive to optimal clinical and preventive care. The recommendations are intended for providers in all health care settings, including hospital emergency departments, urgent-care clinics, inpatient services, sexually transmitted disease (STD) clinics or other venues offering clinical STD services, tuberculosis (TB) clinics, substance abuse treatment clinics, other public health clinics, community clinics, correctional health care facilities, and primary care settings. The guidelines address HIV testing in health care settings only; they do not modify existing guidelines concerning HIV counseling, testing, and referral for persons at high risk for HIV who seek or receive HIV testing in nonclinical settings (e.g., community-based organizations, outreach settings, or mobile vans).[3]

SCREENING FOR HIV INFECTION

- In all health care settings, screening for HIV infection should be performed routinely for all patients aged 13 to 64 years. Health care providers should initiate screening unless prevalence of undiagnosed HIV infection in their patients has been documented to be less than 0.1%. In the absence of existing data for HIV prevalence, health care providers should initiate voluntary HIV screening until they establish that the diagnostic yield is less than 1 per 1000 patients screened, at which point such screening is no longer warranted.
- All patients initiating treatment for TB should be screened routinely for HIV infection.
- All patients seeking treatment for STDs, including all patients visiting STD clinics, should be screened routinely for HIV during each visit for a new complaint, regardless of whether the patient is known or suspected to have specific behavior risks for HIV infection.

REPEAT SCREENING

- Health care providers should subsequently test all persons likely to be at high risk for HIV at least annually. Persons likely to be at high risk include users of injection drugs and their sex partners, persons who exchange sex for money or drugs, sex partners of persons who are HIV infected, and men who have sex with men (MSM) or heterosexual persons who themselves or whose sex partners have had more than one sex partner since their most recent HIV test.
- Health care providers should encourage patients and their prospective sex partners to be tested before initiating a new sexual relationship.
- Repeat screening of persons not likely to be at high risk for HIV should be performed on the basis of clinical judgment.
- Unless recent HIV test results are immediately available, any person whose blood or body fluid is the source of an occupational exposure for a health care provider should be informed of the incident and tested for HIV infection at the time the exposure occurs.

CONSENT AND PRETEST INFORMATION

- Screening should be voluntary and undertaken only with the patient's knowledge and understanding that HIV testing is planned.
- Patients should be informed orally or in writing that HIV testing will be performed unless they decline (opt-out screening). Oral or written information should include an explanation of HIV infection and the meanings of positive and negative test results, and the patient should be offered an opportunity to ask questions and decline testing. With such notification, consent for HIV screening should be incorporated into the patient's general informed consent for medical care on the same basis as are other screening or diagnostic tests; a separate consent form for HIV testing is not recommended.
- Easily understood informational materials should be made available in the languages of the commonly encountered populations within the service area. The competence of interpreters and bilingual staff to provide language assistance to patients with limited English proficiency must be ensured.
- If a patient declines an HIV test, this decision should be documented in the medical record.

DIAGNOSTIC TESTING FOR HIV INFECTION

- All patients with signs or symptoms consistent with HIV infection or an opportunistic illness characteristic of acquired immunodeficiency syndrome (AIDS) should be tested for HIV.
- Clinicians should maintain a high level of suspicion for acute HIV infection in all patients who have a compatible clinical syndrome and who report recent high-risk behavior. When acute retroviral syndrome is a possibility, a plasma RNA test should be used in conjunction with an HIV antibody test to diagnose acute HIV infection.
- Patients or persons responsible for the patient's care should be notified orally that testing is planned, advised of the indication for testing and the implications of positive and negative test results, and offered an opportunity to ask questions and decline testing. With such notification, the patient's general consent for medical care is considered sufficient for diagnostic HIV testing.

HIV SCREENING FOR PREGNANT WOMEN AND THEIR INFANTS*

Universal Opt-Out Screening

- All pregnant women in the United States should be screened for HIV infection.
- Screening should occur after a woman is notified that HIV screening is recommended for all pregnant patients and that she will receive an HIV test as part of the routine panel of prenatal tests unless she declines (opt-out screening).
- HIV testing must be voluntary and free from coercion. No woman should be tested without her knowledge.
- Pregnant women should receive oral or written information that includes an explanation of HIV infection, a description of interventions that can reduce HIV transmission from mother to infant, and the meanings of positive and negative test results. They should be offered an opportunity to ask questions and decline testing.
- No additional process or written documentation of informed consent beyond what is required for other routine prenatal tests should be required for HIV testing.
- If a patient declines an HIV test, this decision should be documented in the medical record.

ADDRESSING REASONS FOR DECLINING TESTING

- Providers should discuss and address reasons for declining an HIV test (e.g., lack of perceived risk, fear of the disease, and concerns regarding partner violence or potential stigma or discrimination).
- Women who decline an HIV test because they have had a previous negative test result should be informed of the importance of retesting during each pregnancy.
- Logistical reasons for not testing (e.g., scheduling) should be resolved.
- Certain women who initially decline an HIV test might accept at a later date, especially if their concerns are discussed. Certain women will continue to decline testing, and their decisions should be respected and documented in the medical record.

Timing of HIV Testing

- To promote informed and timely therapeutic decisions, health care providers should test women for HIV as early as possible during each pregnancy. Women who decline the test early in prenatal care should be encouraged to be tested at a subsequent visit.
- A second HIV test during the third trimester, preferably less than 36 weeks of gestation, is cost effective even in areas of low HIV prevalence and may be considered for all pregnant women. A second HIV test during the third trimester is recommended for women who meet one or more of the following criteria:

[3] Data from *MMWR* 57(RR-10), 2008.

1. Women who receive health care in jurisdictions with elevated incidence of HIV or AIDS among women aged 15 to 45 years. In 2004, these jurisdictions included Alabama, Connecticut, Delaware, the District of Columbia, Florida, Georgia, Illinois, Louisiana, Maryland, Massachusetts, Mississippi, Nevada, New Jersey, New York, North Carolina, Pennsylvania, Puerto Rico, Rhode Island, South Carolina, Tennessee, Texas, and Virginia.[4]
2. Women who receive health care in facilities in which prenatal screening identifies at least one pregnant woman who is infected with HIV per 1000 women screened.
3. Women who are known to be at high risk for acquiring HIV (e.g., users of injection drugs and their sex partners, women who exchange sex for money or drugs, women who are sex partners of persons who are infected with HIV, and women who have had a new or more than one sex partner during this pregnancy).
4. Women who have signs or symptoms consistent with acute HIV infection. When acute retroviral syndrome is a possibility, a plasma RNA test should be used in conjunction with an HIV antibody test to diagnose acute HIV infection.

Rapid Testing During Labor

- Any woman with undocumented HIV status at the time of labor should be screened with a rapid HIV test unless she declines (opt-out screening).
- Reasons for declining a rapid test should be explored (see "Addressing Reasons for Declining Testing").
- Immediate initiation of appropriate antiretroviral prophylaxis should be recommended to women on the basis of a reactive rapid test result without waiting for the result of a confirmatory test.

Postpartum/Newborn Testing

- When a woman's HIV status is still unknown at the time of delivery, she should be screened immediately postpartum with a rapid HIV test unless she declines (opt-out screening).
- When the mother's HIV status is unknown postpartum, rapid testing of the newborn as soon as possible after birth is recommended so that antiretroviral prophylaxis can be offered to infants exposed to HIV. Women should be informed that identifying HIV antibodies in the newborn indicates that the mother is infected.
- For infants whose HIV exposure status is unknown and who are in foster care, the person legally authorized to provide consent should be informed that rapid HIV testing is recommended for infants whose biologic mothers have not been tested.
- The benefits of neonatal antiretroviral prophylaxis are best realized when it is initiated within 12 hours after birth.

Confirmatory Testing

- Whenever possible, uncertainties regarding laboratory test results indicating HIV infection status should be resolved before final decisions are made regarding reproductive options, antiretroviral therapy, cesarean delivery, or other interventions.
- If the confirmatory test result is not available before delivery, immediate initiation of appropriate antiretroviral prophylaxis should be recommended to any pregnant patient whose HIV screening test result is reactive to reduce the risk for perinatal transmission.

[4] A second HIV test in the third trimester is as cost effective as other common health interventions when HIV incidence among women of childbearing age is =17 HIV cases per 100,000 person-years. In 2004, in jurisdictions with available data on HIV case rates, a rate of 17 new HIV diagnoses per year per 100,000 women aged 15 to 45 years was associated with an AIDS case rate of at least nine AIDS diagnoses per year per 100,000 women aged 15 to 45 years (CDC, unpublished data, 2005). As of 2004, the jurisdictions listed above exceeded these thresholds. The list of specific jurisdictions where a second test in the third trimester is recommended will be updated periodically based on surveillance data.

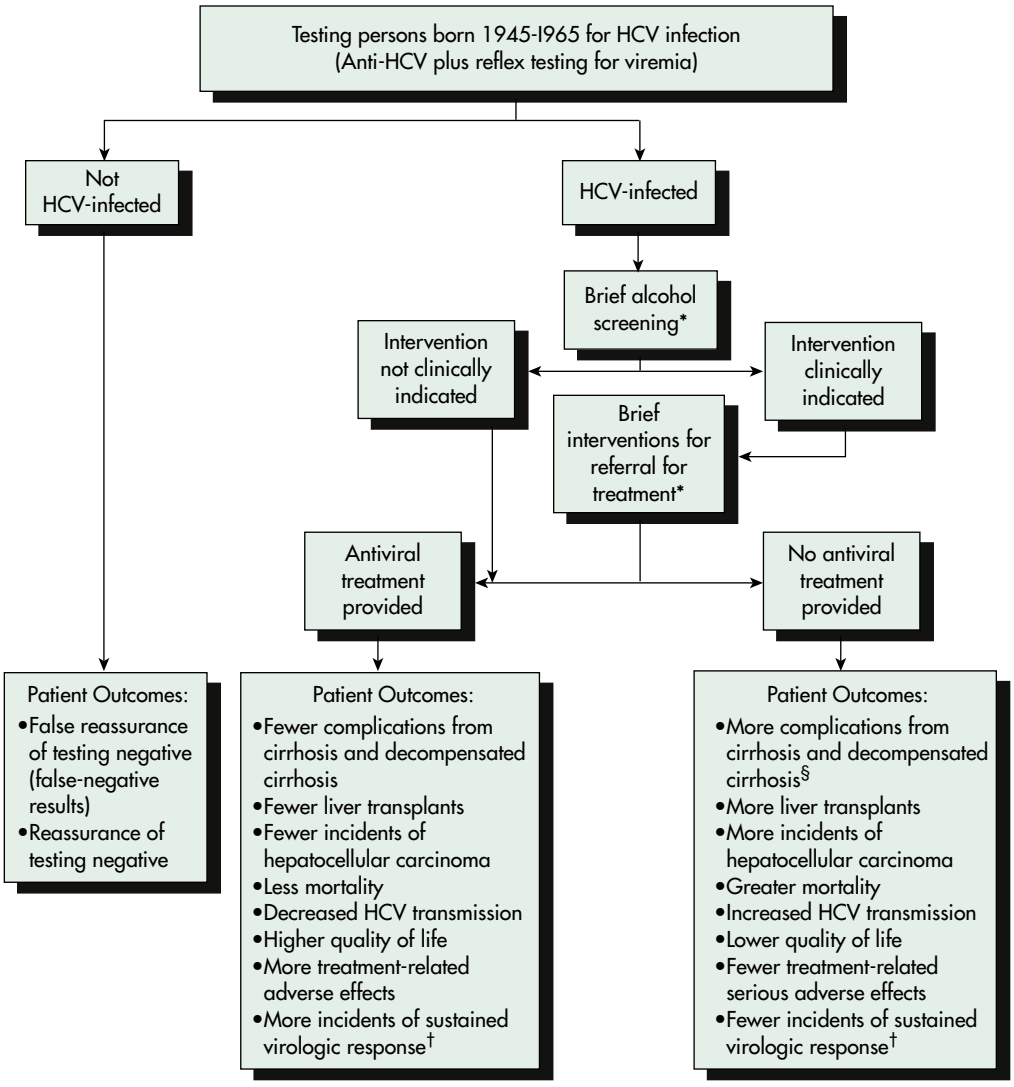

FIG. 8 Analytic framework for guiding hepatitis C virus (HCV) testing among persons born during 1945-1965. *Together, these interventions are known as alcohol screening and brief interventions (SBI) for referral for treatment. †Viral eradication after treatment completion. §Cirrhosis with the diagnosis of at least one of the following: ascites, variceal bleeding, encephalopathy, or impaired hepatitis synthetic function. From Centers for Disease Control and Prevention: Recommendations for the identification of chronic hepatitis C virus infection among persons born during 1945-1965. *MMWR* 2012:61(4).

TABLE 27 HIV Exposure, Estimated Per-Act Risk

Exposure Route	Risk per 10,000 Exposures to an Infected Source
Blood transfusion	9000
Needle-sharing injection drug use	67
Receptive anal intercourse	50
Percutaneous needle stick	30
Receptive penile-vaginal intercourse	10
Insertive anal intercourse	6.5
Insertive penile-vaginal intercourse	5
Receptive oral intercourse	1
Insertive oral intercourse	0.5

NOTE: Estimates of risk for transmission from sexual exposures assume no condom use. Source refers to oral intercourse performed on a man.

TABLE 28 Recommended Postexposure Prophylaxis (PEP) for All Occupational Exposures to Human Immunodeficiency Virus (HIV)

PREFERRED HIV PEP REGIMEN	
Raltegravir (Isentress) 400 mg PO (by mouth) twice daily *plus* tenofovir DF (Viread) 300 mg + emtricitabine (Emtriva) 200 mg; available as Truvada, PO once daily	
Alternative Regimens	
May combine one drug or drug pair from the left column with one pair of nucleoside/nucleotide reverse transcriptase inhibitors from the right column	
Dolutegravir (Tivicay)	Tenofovir DF (Viread) + emtricitabine (Emtriva); available as Truvada
Raltegravir (Isentress)	Tenofovir DF (Viread) + emtricitabine (Emtriva); available as Truvada
Darunavir (Prezista) + ritonavir (Norvir)	Tenofovir DF (Viread) + lamivudine (Epivir)
Etravirine (Intelence)	Zidovudine (Retrovir) + lamivudine (Epivir); available as Combivir
Rilpivirine (Edurant)	Zidovudine (Retrovir) + emtricitabine (Emtriva)
Atazanavir (Reyataz) + ritonavir (Norvir)	
Lopinavir/ritonavir (Kaletra)	
Stribild (elvitegravir, cobicistat, tenofovir DF, emtricitabine); a complete fixed-dose combination regimen with no additional antiretrovirals needed	
ALTERNATIVE ANTIRETROVIRAL AGENTS FOR USE AS PEP *ONLY* WITH EXPERT CONSULTATION	
Abacavir (Ziagen)	
Efavirenz (Sustiva)	
Enfuvirtide (Fuzeon)	
Fosamprenavir (Lexiva)	
Maraviroc (Selzentry)	
Saquinavir (Invirase)	
Stavudine (Zerit)	
ANTIRETROVIRAL AGENTS GENERALLY NOT RECOMMENDED FOR USE AS PEP	
Didanosine (Videx EC)	
Nelfinavir (Viracept)	
Tipranavir (Aptivus)	
ANTIRETROVIRAL AGENTS CONTRAINDICATED AS PEP	
Nevirapine (Viramune)	

Adapted from Kuhar DT et al: Updated U.S. Public Health Service guidelines for the management of occupational exposures to HIV and recommendations for postexposure prophylaxis, *Infect Control Hosp Epidemiol* 2013; 34:875-892. TABLE 29 Antiretroviral Therapy Medications, Adult Dosage, and Side Effects

Medication	Adult Dosage*	Side Effects and Toxicities
Combination Tablets		
Lopinavir/ritonavir (Kaletra)‡	3 tablets twice daily 400 mg lopinavir/100 mg ritonavir	Diarrhea, nausea, vomiting; asthenia; elevated transaminases; hyperglycemia; fat redistribution; lipid abnormalities; possible increased bleeding in persons with hemophilia; pancreatitis
Zidovudine/lamivudine (Combivir)	1 tablet twice daily 300 mg zidovudine/150 mg lamivudine	See following individual medications
Zidovudine/lamivudine/abacavir (Trizivir)	1 tablet twice daily 300 mg zidovudine/150 mg lamivudine/300 mg abacavir	See following individual medications
Lamivudine/abacavir (Epzicom)	1 tablet once daily 300 mg lamivudine/600 mg abacavir	See following individual medications
Emtricitabine/tenofovir (Truvada)	1 tablet once daily 200 mg emtricitabine/300 mg tenofovir	See following individual medications
Single Agents		
Nucleoside and nucleotide reverse transcriptase inhibitors (side effects as a class: lactic acidosis, severe hepatomegaly with steatosis, including some fatal cases)		
Abacavir (Ziagen, ABC)‡	300 mg twice daily or 600 mg once daily	Severe hypersensitivity reaction (can be fatal); nausea; vomiting
Didanosine (Videx, ddl)‡	>60 kg (132 lb) body weight: 200 mg twice daily or 400 mg daily; if with tenofovir, 250 mg/daily <60 kg (132 lb): 125 mg twice daily or 250 mg daily; if with tenofovir, dose not established Do not use with stavudine (d4T, Zerit) during pregnancy; avoid ddl/d4T combination in general because of increased risk for adverse events (e.g., neuropathy, pancreatitis, and hyperlactatemia)	Pancreatitis; nausea, diarrhea; peripheral neuropathy
Emtricitabine (Emtriva, FTC)	200 mg once daily	Minimal toxicity; lactic acidosis and hepatic steatosis a rare but possibly life-threatening event
Lamivudine (Epivir, 3TC)‡	150 mg twice daily or 300 mg once daily	Minimal toxicity; lactic acidosis and hepatic steatosis a rare but possibly life-threatening event
Stavudine (Zerit, d4T)‡	>60 kg (132 lb) body weight: 40 mg twice daily <60 kg (132 lb) body weight: 30 mg twice daily Do not use with didanosine (ddl, Videx) during pregnancy; avoid ddl/d4T combination in general because of increased risk of adverse events (e.g., neuropathy, pancreatitis, and hyperlactatemia)	Pancreatitis; peripheral neuropathy; rapidly progressive ascending neuromuscular weakness (rare)
Tenofovir (Viread)	300 mg daily	Nausea, vomiting, diarrhea; headache; asthenia; flatulence; renal impairment
Zidovudine (Retrovir, AZT)‡	200 mg three times daily or 300 mg twice daily	Bone marrow suppression (anemia, neutropenia); gastrointestinal intolerance; headache; insomnia; asthenia; and myopathy
Nonnucleoside reverse transcriptase inhibitors (side effects as a class: Stevens-Johnson syndrome)		
Efavirenz (Sustiva)	600 mg daily at bedtime	Rash; central nervous system symptoms (e.g., dizziness, impaired concentration, insomnia, and abnormal dreams); transaminase elevation; false-positive cannabinoid test
Protease inhibitors (side effects as a class: gastrointestinal intolerance, hyperlipidemia, hyperglycemia, diabetes, fat redistribution, and possible increased bleeding in hemophiliacs; do not use during known or possible pregnancy)		
Atazanavir (Reyataz)	400 mg once daily; if administered with tenofovir plus ritonavir, 300 mg once daily	Indirect hyperbilirubinemia; prolonged PR interval (use caution in patients with underlying cardiac conduction defects or on concomitant medications that can cause PR prolongation)
Fosamprenavir (Lexiva)‡	1400 mg twice daily	Gastrointestinal intolerance, nausea, vomiting, diarrhea; rash; elevated transaminases; headache
Indinavir (Crixivan)	800 mg q8h With ritonavir (might increase risk for renal adverse events): 800 mg indinavir and 100 mg ritonavir q12h or 800 mg indinavir and 200 mg ritonavir every q12h	Gastrointestinal intolerance, nausea; nephrolithiasis; headache; asthenia; blurred vision; metallic taste; thrombocytopenia; hemolytic anemia; indirect hyperbilirubinemia (inconsequential)
Nelfinavir (Viracept)‡	750 mg three times daily or one 250 mg twice daily	Diarrhea; elevated transaminases
Ritonavir (Norvir)‡	See doses used in combination with other specific protease inhibitors	Gastrointestinal intolerance; nausea, vomiting, diarrhea; paresthesias; hepatitis; pancreatitis; asthenia; taste perversion; many drug interactions
Saquinavir (hard-gel capsule) (Invirase)	With ritonavir: 400 mg saquinavir and 400 mg ritonavir twice daily or 1000 mg saquinavir and 100 mg ritonavir twice daily	Gastrointestinal intolerance; nausea, diarrhea; headache; elevated transaminases
Saquinavir (soft-gel capsule) (Fortovase)	With ritonavir: 400 mg saquinavir and 400 mg ritonavir twice daily or 1000 mg saquinavir and 100 mg ritonavir twice daily	Gastrointestinal intolerance; nausea, diarrhea; abdominal pain; dyspepsia; headache; elevated transaminases

TABLE 30 Laboratory Tests Generally Recommended for Persons after Exposure to HIV*

Test	RECOMMENDED DURING TREATMENT		RECOMMENDED AT FOLLOW-UP		
	Baseline	Symptom-Directed†	4-6 wk	12 wk	24 wk
ELISA for HIV antibodies	Yes	Yes	Yes	Yes	Yes
Creatinine, liver function, and complete blood count with differential count	Yes	Yes	No	No	No
HIV viral load	No	Yes	No	No	No
Anti-HBs antibodies	Yes‡	No	No	No	No
HBsAg	Yes‡§	No	No	No	No
HCV antibodies	Yes	No	Yes	Yes	Yes
HCV RNA‖	No	Yes	Yes	Yes	Yes
Screening, including rapid plasma reagin test, for other sexually transmitted infections¶	Yes	Yes	No	Yes	No

Anti-HBs antibodies, Hepatitis B virus surface antibodies; *ELISA,* enzyme-linked immunosorbent assay; *HBsAg,* hepatitis B surface antigen; *HCV,* hepatitis C virus.

*Patients who receive zidovudine plus lamivudine–based regimens should have a complete blood count and measurement of liver-enzyme levels at 2 weeks of treatment, irrespective of the presence or absence of clinical symptoms. Tenofovir plus emtricitabine–based regimens generally involve few side effects, and symptom-directed assessment of serum creatinine or liver-enzyme levels should be considered. The addition of a ritonavir-boosted protease inhibitor should be followed by symptom-directed assessment of liver-enzyme levels, serum glucose levels, or both.

†Symptom-directed tests are for signs or symptoms of toxic effects (rash, nausea, vomiting, or abdominal pain) or HIV seroconversion (fever, fatigue, lymphadenopathy, rash, or oral or genital ulcers).

‡If tests for anti-HBs antibodies and HBsAg are both negative, a vaccination series against HBV infection should be initiated and completed.

§If the patient is HBsAg-positive, he or she should have monthly follow-up of liver function tests after discontinuation of postexposure prophylactic regimens containing tenofovir, lamivudine, or emtricitabine; referral to a specialist in viral hepatitis should be considered.

‖HCV RNA testing may identify early HCV seroconversion; early detection and treatment during acute HCV infection may avert or ameliorate chronic disease. Data are from Dienstag and McHutchison.

¶Rapid plasma reagin testing and testing of urethral-swab and rectal-swab specimens for gonorrhea and chlamydia and of pharyngeal-swab specimens for gonorrhea should be performed as appropriate, according to the patient's sexual risk-taking behaviors and the type of exposure to HIV.

From Landovitz RJ, Currier JS: Postexposure prophylaxis for HIV infection, *N Engl J Med* 361:1768-1775, 2009.

BOX 6 Situations for Which Expert Consultation for HIV Postexposure Prophylaxis Is Advised[5]

- Delayed (i.e., later than 24-36 hours) exposure report
  1. The interval after which there is no benefit from postexposure prophylaxis (PEP) is undefined
- Unknown source (e.g., needle in sharps disposal container or laundry)
  1. Decide use of PEP on a case-by-case basis
  2. Consider the severity of the exposure and the epidemiologic likelihood of HIV exposure
  3. Do not test needles or other sharp instruments for HIV
- Known or suspected pregnancy in the exposed person
  1. Does not preclude the use of optimal PEP regimens
  2. Do not deny PEP solely on the basis of pregnancy
- Resistance of the source virus to antiretroviral agents
  1. Influence of drug resistance on transmission risk is unknown
  2. Selection of drugs to which the source person's virus is unlikely to be resistant is recommended if the source person's virus is known or suspected to be resistant to one or more of the drugs considered for the PEP regimen
  3. Resistance testing of the source person's virus at the time of the exposure is not recommended
- Toxicity of the initial PEP regimen
  1. Adverse symptoms such as nausea and diarrhea are common with PEP
  2. Symptoms often can be managed without changing the PEP regimen by prescribing antimotility and/or antiemetic agents
  3. Modification of dose intervals (i.e., administering a lower dose of drug more frequently throughout the day, as recommended by the manufacturer) in other situations might help alleviate symptoms

Hepatitis Hotline	Phone: 888-443-7232 Internet: www.cdc.gov/ncidod/diseases/hepatitis/index.htm
Reporting to CDC: Occupationally acquired HIV infections and failures of PEP	Phone: 800-893-0485
HIV Antiretroviral Pregnancy Registry	Phone: 800-258-4263 Fax: 800-800-1052 Address: 1410 Commonwealth Dr., Suite 215, Wilmington, NC 28405 Internet: www.apregistry.com/
Food and Drug Administration Report unusual or severe toxicity to antiretroviral agents	Phone: 800-332-1088 Address: MedWatch, HF-2, FDA, 5600 Fishers Lane, Rockville, MD 20857 Internet: www.fda.gov/medwatch
HIV/AIDS Treatment Information Service	Internet: www.hivatis.org

BOX 8 Management of Occupational Blood Exposures

Provide Immediate Care to the Exposure Site
- Wash wounds and skin with soap and water
- Flush mucous membranes with water

Determine Risk Associated with Exposure
- Type of fluid (e.g., blood, visibly bloody fluid, other potentially infectious fluid or tissue, and concentrated virus)
- Type of exposure (e.g., percutaneous injury, mucous membrane or nonintact skin exposure, and bites resulting in blood exposure)

Evaluate Exposure Source
- Assess the risk of infection using available information
- Test known sources for HBsAg, anti-HCV, and HIV antibodies (consider using rapid testing)
- For unknown sources, assess risk of exposure to HBV, HCV, or HIV infection
- Do not test discarded needles or syringes for virus contamination

Evaluate the Exposed Person
- Assess immune status for HBV infection (i.e., by history of hepatitis B vaccination and vaccine response)

Give PEP for Exposures Posing Risk of Infection Transmission
- HBV: See Table 5
- HCV: PEP not recommended
- HIV: See Tables 28, 29, and 30 and Fig. 8
  1. Initiate PEP as soon as possible, preferably within hours of exposure
  2. Offer pregnancy testing to all women of childbearing age not known to be pregnant
  3. Seek expert consultation if viral resistance is suspected
  4. Administer PEP for 4 weeks if tolerated

Perform Follow-up Testing and Provide Counseling
- Advise exposed persons to seek medical evaluation for any acute illness occurring during follow-up

HBV Exposures
- Perform follow-up anti-HBs testing in persons who receive hepatitis B vaccine
  1. Test for anti-HBs 1 to 2 months after last dose of vaccine
  2. Anti-HBs response to vaccine cannot be ascertained if HBIG was received in the previous 3 to 4 months

HCV Exposures
- Perform baseline and follow-up testing for anti-HCV and alanine aminotransferase 4 to 6 months after exposure
- Perform HCV RNA at 4 to 6 weeks if earlier diagnosis of HCV infection desired
- Confirm repeatedly reactive anti-HCV enzyme immunoassays with supplemental tests

HIV Exposures
- Perform HIV-antibody testing for at least 6 months after exposure (e.g., at baseline, 6 weeks, 3 months, and 6 months)
- Perform HIV-antibody testing if illness compatible with an acute retroviral syndrome occurs
- Advise exposed persons to use precautions to prevent secondary transmission during the follow-up period
- Evaluate exposed persons taking PEP within 72 hr after exposure and monitor for drug toxicity for at least 2 weeks

HBIG, Hepatitis B immune globulin; *HBsAg,* hepatitis B surface antigen; *HBV,* hepatitis B virus; *HCV,* hepatitis C virus; *HIV,* human immunodeficiency virus; *PEP,* postexposure prophylaxis; *RNA,* ribonucleic acid.

ENDOCARDITIS PROPHYLAXIS[6]

TABLE 31 Cardiac Conditions Associated with the Highest Risk of Adverse Outcome from Endocarditis for Which Prophylaxis with Dental Procedures Is Recommended

Prosthetic cardiac valve
Previous infective endocarditis
CHD*
Unrepaired cyanotic CHD, including palliative shunts and conduits
Completely repaired congenital heart defect with prosthetic material or device, whether placed by surgery or by catheter intervention, during the first 6 mo after the procedure†
Repaired CHD with residual defects at the site or adjacent to the site of a prosthetic patch or prosthetic device (that inhibit endothelialization)
Cardiac transplant recipients who develop cardiac valvulopathy

CHD, Congenital heart disease.
*Except for the conditions listed above, antibiotic prophylaxis is no longer recommended for any other form of CHD.
†Prophylaxis is recommended because endothelialization of prosthetic material occurs within 6 mo after the procedure.

TABLE 32 Dental Procedures for Which Endocarditis Prophylaxis Is Recommended for Patients in Table 31

All dental procedures that involve manipulation of gingival tissue or the periapical region of teeth or perforation of the oral mucosa*

*The following procedures and events do not need prophylaxis: routine anesthetic injections through noninfected tissue, taking dental radiographs, placement of removable prosthodontic or orthodontic appliances, adjustment of orthodontic appliances, placement of orthodontic brackets, shedding of deciduous teeth, and bleeding from trauma to the lips or oral mucosa.

TABLE 33 Regimens for a Dental Procedure

	REGIMEN: SINGLE DOSE 30-60 MIN BEFORE PROCEDURE		
Situation	**Agent**	**Adults**	**Children**
Oral	Amoxicillin	2 g	50 mg/kg
Unable to take oral medication	Ampicillin	2 g IM or IV	50 mg/kg IM or IV
	OR		
	Cefazolin or ceftriaxone*	1 g IM or IV	50 mg/kg IM or IV
Allergic to penicillins or ampicillin, oral	Cephalexin	2 g	50 mg/kg
	OR		
	Clindamycin	600 mg	20 mg/kg
	OR		
	Azithromycin or clarithromycin	500 mg	15 mg/kg
Allergic to penicillins or ampicillin and unable to take oral medicine	Cefazolin or ceftriaxone†	1 g IM or IV	50 mg/kg IM or IV
	OR		
	Clindamycin	600 mg IM or IV	20 mg/kg IM or IV

IM, Intramuscular; *IV,* intravenous.
*Or other first-generation or second-generation oral cephalosporin in equivalent adult or pediatric dosage.
†Cephalosporins should not be used in an individual with a history of anaphylaxis, angioedema, or urticaria with penicillins or ampicillin.

[6]From Prevention of infective endocarditis. A guideline from the American Heart Association Rheumatic Fever, Endocarditis, and Kawasaki Disease Committee, Council on Cardiovascular Disease in the Young, and the Council on Clinical Cardiology, Council on Cardiovascular Surgery and Anesthesia, and the Quality of Care and Outcomes Research Interdisciplinary Working Group. Circulation published online Apr 19, 2007, DOI: 10.1161/CIRCULATIONAHA.106.183095. Copyright © 2007 American Heart Association. All rights reserved. Print ISSN: 0009-7322. Online ISSN: 1524-4539.

TABLE 34 Summary of Major Changes in Updated Recommendations

We concluded that bacteremia resulting from daily activities is much more likely to cause IE than bacteremia associated with a dental procedure.
We concluded that only an extremely small number of cases of IE might be prevented by antibiotic prophylaxis even if prophylaxis is 100% effective.
Antibiotic prophylaxis is not recommended based solely on an increased lifetime risk of acquisition of IE.
Limit recommendations for IE prophylaxis only to those conditions listed in Table 31.
Antibiotic prophylaxis is no longer recommended for any other form of CHD, except for the conditions listed in Table 31.
Antibiotic prophylaxis is recommended for all dental procedures that involve manipulation of gingival tissues or periapical region of teeth or perforation of oral mucosa only for patients with underlying cardiac conditions associated with the highest risk of adverse outcome from IE (see Table 31).
Antibiotic prophylaxis is recommended for procedures on respiratory tract or infected skin, skin structures, or musculoskeletal tissue only for patients with underlying cardiac conditions associated with the highest risk of adverse outcome from IE (see Table 31).
Antibiotic prophylaxis solely to prevent IE is not recommended for GU or GI tract procedures.
The writing group reaffirms the procedures noted in the 1997 prophylaxis guidelines for which endocarditis prophylaxis is not recommended and extends this to other common procedures, including ear and body piercing, tattooing, and vaginal delivery and hysterectomy.

NOTE: A guide to the clinical preventive services described is available online at www.ahrq.gov/clinic/pocketgd07/. *CHD,* Congenital heart disease; *GI,* gastrointestinal; *GU,* genitourinary; *IE,* infective endocarditis.

Hepatitis C Testing (See Fig. 8)

BOX 9 Recommendations for Prevention and Control of Hepatitis C Virus (HCV) Infection and HCV-Related Chronic Diseases

Recommendations for the Identification of Chronic Hepatitis C Virus Infection among Persons Born During 1945-1965[7]
- Adults born during 1945-1965 should receive one-time testing for HCV without prior ascertainment of HCV risk.
- All persons with identified HCV infection should receive a brief alcohol screening and intervention as clinically indicated, followed by referral to appropriate care and treatment services for HCV infection and related conditions.

Guidelines for Prevention and Treatment of Opportunistic Infections in HIV-Infected Adults and Adolescents
- HIV-infected patients should be tested routinely for evidence of chronic HCV infection. Initial testing for HCV should be performed using the most sensitive immunoassays licensed for detection of antibody to HCV (anti-HCV) in blood.

Recommendations for Prevention and Control of Hepatitis C Virus (HCV) Infection and HCV-Related Chronic Disease
Routine HCV testing is recommended for
- Persons who ever injected illegal drugs, including those who injected once or a few times many years ago and do not consider themselves drug users.
- Persons with selected medical conditions, including:
  1. persons who received clotting factor concentrates produced before 1987;
  2. persons who were ever on chronic (long-term) hemodialysis;
  3. persons with persistently abnormal alanine aminotransferase levels.
- Prior recipients of transfusions or organ transplants, including:
  1. persons who were notified that they received blood from a donor who later tested positive for HCV infection;
  2. persons who received a transfusion of blood or blood components before July 1992; and
  3. persons who received an organ transplant before July 1992.

Routine HCV testing is recommended for persons with recognized exposures, including
- Health care, emergency medical, and public safety workers after needle sticks, sharps, or mucosal exposures to HCV-positive blood.
- Children born to HCV-positive women.

Recommendations for Meningococcal Vaccination

TABLE 35 Recommendations for Meningococcal Vaccination of Children at Increased Risk for Meningococcal Disease

Vaccine	Age of Primary Vaccination	Booster Doses	Indicated for Infants	Not Indicated for Infants
MenACWY-CRM (Menveo)	2, 4, 6, and 12 mo	1st booster 3 yr after primary series Additional boosters every 5 yr	Complement component deficiencies Functional or anatomic asplenia The risk groups for an outbreak for which vaccination is recommended Traveling to or residing in epidemic or hyperendemic regions	
MenACWY-D (Menactra)	9 and 12 mo	1st booster 3 yr after primary series Additional boosters every 5 yr	Complement component deficiencies The risk groups for an outbreak for which vaccination is recommended Traveling to or residing in epidemic or hyperendemic regions	Functional or anatomic asplenia
Hib-MenCY-TT (MenHibrix)	2, 4, 6, and 12-15 mo	1st booster (using MenACWY-CRM or MenACWY-D) 3 yr after primary series	1st booster 3 yr after primary series	Traveling to or residing in epidemic or hyperendemic regions
MenB-FHbp (Trumenba)	3-dose series, with 2nd and 3rd doses after 2 and 6 mo after 1st dose; 2nd dose 6 mo after 1st dose is an option	None	≥10 yr at increased risk for serogroup B disease (complement component deficiencies, functional or anatomic asplenia, the risk groups for an outbreak for which vaccination is recommended)	Children aged <10 yr Traveling to or residing in epidemic or hyperendemic regions
MenB-4C (Bexsero)	2-dose series, with doses at least 1 mo apart	None	≥10 yr at increased risk for serogroup B disease (complement component deficiencies, functional or anatomic asplenia, the risk groups for an outbreak for which vaccination is recommended)	Children aged <10 yr Traveling to or residing in epidemic or hyperendemic regions

Appendix Ia

Definitions of Complementary and Alternative Medicine Terms

Acupuncture Thin needles are inserted superficially on the skin at locations throughout the body. These points are located along "channels" of energy. Heat can be applied by burning (moxibustion), electric current (electroacupuncture), or pressure (acupressure). Healing is proposed by the restoration of a balance of energy flow called *Qi.* Another explanation suggests that, possibly, the stimulation activates endorphin receptors.

Alexander Technique A bodywork technique in which rebalancing of "postural sets" (i.e., physical alignment) is taught by mentally focusing on the way correct alignments should look and feel and through verbal and tactile guidance by the practitioner.

Applied Kinesiology A form of treatment that uses nutrition, physical manipulation, vitamins, diets, and exercise to restore and energize the body. Weak muscles are proposed as a source of dysfunctional health.

Aromatherapy A form of complementary medicine that uses various plant oils such as those from lavender. Route of administration can be through absorption in the skin or inhalation. The aromatic biochemical structures of certain plants are thought to act in areas of the brain related to past experiences and emotions (e.g., limbic system).

Ayurveda A major health system that originated in India and incorporates the body, mind, and spirit to prevent and treat disease. Includes special types of diets, herbs, and minerals.

Biofeedback A mind-body therapy procedure in which sensors are placed on the body to measure muscle tension, heart rate, and sweat responses or neural activity. Information is provided by visual, auditory, or body-muscle cell activation so as to teach either to increase or decrease physiologic activity, which, when reconstituted, is proposed to improve health problems (e.g., pain, anxiety, or high blood pressure). In some cases, relaxation exercises complement this procedure.

Chelation Therapy Involves the removal—through intravenous infusion of a chelating agent (synthetic amino acid ethylenediamine tetraacetic acid [EDTA])—of heavy metals, including lead, nickel, and cadmium, as a way to treat certain diseases. Ancillary treatments include the use of vitamins, changes in diet, and exercise.

Cognitive Therapy Psychological therapy in which the major focus is altering and changing irrational beliefs through a type of Socratic dialogue and self-evaluation of certain illogical thoughts. Conditioning and learning are important components of this therapy.

Craniosacral Therapy A form of gentle manual manipulation used for diagnosis and for making corrections in a system made up of cerebrospinal fluid, cranial and dural membranes, cranial bones, and sacrum. This system is proposed to be dynamic, with its own physiologic frequency. Through touch and pressure, tension is proposed to be reduced and cranial rhythms normalized, leading to improvement in health and disease.

Diathermy The use of high-frequency electrical currents as a form of physical therapy and in surgical procedures. The term *diathermy,* derived from the Greek words *dia* and *therma,* literally means "heating through." The three forms of diathermy used by physical therapists are short wave, ultrasound, and microwave.

Eye Movement Desensitization and Reprocessing (EMDR) A technique that proposes to remove painful memories by behavioral techniques. Rhythmic, multisaccadic eye movements are produced by allowing the patient to track and follow a moving object while imagining a stressful memory or event. By using deconditioning, including verbal interaction with the therapist, the painful memory is extinguished and health improved.

Feldenkrais Method A bodywork technique that integrates physics, judo, and yoga. The practitioner directs sequences of movement using verbal or hands-on techniques or teaches a system of self-directed exercise to treat physical impairments through the learning of new movement patterns.

Hatha Yoga The branch of yoga practice that involves physical exercise, breathing practices, and movement. These exercises are designed to have a salutary effect on posture, flexibility, and strength and are intended ultimately to prepare the body to remain still for long periods of meditation.

Hellerwork A bodywork technique that treats and improves proper body alignment through the development of a more complete awareness of the physical body. The goal is to realign fascia for improvement of standing, sitting, and breathing using "body energy," verbal feedback, and changing emotions and attitudes.

Homeopathy A form of treatment in which substances (minerals, plant extracts, chemicals, or disease-producing germs), which in sufficient doses would produce a set of illness symptoms in healthy individuals, are given in microdoses to produce a "cure" of those same symptoms. The *symptom* is not thought to be part of the illness but part of a curative process.

Hyperbaric Oxygen A therapy in which 100% oxygen is given at or above atmospheric pressure. An increase in oxygen in the tissue is proposed to increase blood circulation and improve healing and health and influence the course of disease.

Jin Shin Jyutsu An ancient bodywork technique to harmonize body, mind, and spirit by gentle touch that uses specific "healing points" at the body surface. The points are proposed to overlie flowing energy (Qi). The therapist's fingers are used to "redirect, balance, and provide a more efficient energy flow" to and throughout the body.

Light Therapy Natural light or light of specified wavelengths is used to treat disease. This may include ultraviolet light, colored light, or low-intensity laser light. Generally, the eye is the initial entry point for the light because of its direct connection to the brain.

Magnetic Therapy Magnets are placed directly on the skin, theoretically stimulating living cells and increasing blood flow by ionic currents that are created from polarities on the magnets.

Modified and updated from Spencer JW: *Complementary/alternative medicine: an evidence-based approach,* St Louis, 1999, Mosby.

Mediterranean Diet A diet that includes 50% to 60% carbohydrates, 30% fats, and 10% proteins. The diet is derived from the eating habits of people in the Mediterranean area, who were shown to have reduced rates of cardiovascular disease. Clinical trial evidence has indicated that it may reduce the risk of cardiovascular disease in people at high risk for CVD.

Mind-Body Therapies A group of therapies that emphasize using the mind or brain in conjunction with the body to assist healing. Mind-body therapies can involve varying degrees of levels of consciousness, including *hypnosis,* in which selective attention is used to induce a specific altered state (trance) for memory retrieval, relaxation, or suggestion; *visual imagery,* in which the focus is on a target visual stimulus; *yoga,* which involves integration of posture and controlled breathing, relaxation, and/or meditation; *relaxation,* which includes lighter levels of altered states of consciousness through indirect or direct focus; and *meditation,* in which there is an intentional use of posture, concentration, contemplation, and visualization.

Muscle Energy Technique A manual therapy in osteopathic medicine that includes both passive mobilization and muscle reeducation. Diagnosis of somatic dysfunction is performed by the practitioner, after which the patient is guided to provide corrective muscle contraction.

Music Therapy The use of music in an either active or passive mode. Used mainly to reduce stress, anxiety, and pain, especially in the palliative care setting.

Naturopathy A major health system that includes practices that emphasize diet, nutrition, homeopathy, acupuncture, herbal medicine, manipulation, and various mind-body therapies. Focal points include self-healing and treatment through changes in lifestyle and emphasis on health prevention.

Ornish Diet A life-choice program based on eating a vegetarian diet containing less than 10% fat. The diet is high in complex carbohydrates and fiber. Meat and fish are generally avoided.

Oslo Diet An eating plan that emphasizes increased intake of fish and reduced total fat intake. Diet is combined with regular endurance exercise.

Pilates An educational and exercise approach using the proper body mechanics, movements, truncal and pelvic stabilization, coordinated breathing, and muscle contractions to promote strengthening. Attention is paid to the entire musculoskeletal system.

Prayer The use of prayer(s) that are offered to "some higher being" or authority to heal and/or arrest disease. May be practiced by the individual patient, by groups, or by other(s) with or without the patient's knowledge (e.g., intercessory).

Pritikin Diet A weight management plan that is based on a vegetarian framework. Meals are low in fat, high in fiber, and high in complex carbohydrates.

Qi Gong A form of Chinese exercise-stimulation therapy that proposes to improve health by redirecting mental focus, breathing, coordination, and relaxation. The goal is to "rebalance" the body's own healing capacities by activating proposed electrical or energetic currents that flow along meridians located throughout the body. These meridians, however, do not follow conventional nerve or muscle pathways. In Chinese medical training and practice this therapy includes "external Qi," which is energy transmitted from one person to another so as to heal.

Raja Yoga Yoga practice that includes all of the other forms of yoga. The practitioner is instructed to follow moral directives, physical exercises, breathing exercises, meditation, devotion, and service to others to facilitate religious awakening.

Reflexology A bodywork technique that uses reflex points on the hands and feet. Pressure is applied at points that correspond to various body parts, to eliminate blockages thought to produce pain or disease.

Reiki Comes from the Japanese word meaning "universal life force energy." The practitioner serves as a conduit for healing energy directed into the body or energy field of the recipient without physical contact with the body.

Rolfing A bodywork technique that involves the myofascia. The body is realigned by using the hands to apply deep pressure and friction that allow more sufficient posture, movement, and the "release" of emotions from the body.

Shiatsu A Japanese bodywork technique involving finger pressure at specific points on the body mainly to balance "energy" in the body. The major focus is on prevention by keeping the body healthy. The therapy uses more than 600 points on the skin that are proposed to be connected to pathways through which energy flows.

T'ai Chi A technique that uses slow, purposeful motor-physical movements of the body to control and achieve a more balanced physiologic and psychological state.

Therapeutic Touch A body energy field technique in which hands are passed over the body without actually touching to recreate and change proposed "energy imbalances" for restoring innate healing forces. Verbal interaction between patient and therapist helps maximize effects.

Traditional Chinese Medicine An ancient form of medicine that focuses on prevention and secondarily treats disease with an emphasis on maintaining balance through the body by stimulating a constant, smooth-flowing Qi energy. Herbs, acupuncture, massage, diet, and exercise are also used.

Trager Psychophysical Integration A bodywork technique in which the practitioner enters a meditative state and guides the client through gentle, light, rhythmic, nonintrusive movements. "Mentastics" exercises using self-healing movements are taught to the clients.

Relaxation Techniques

Relaxation Techniques

Relaxation Technique	Summary	Further Resources
Breathing exercise	This is the foundation of most relaxation techniques. Have patients place one hand on the chest and the other on the abdomen. Instruct them to take a slow, deep breath, as if they were sucking in all the air in the room. While doing this, the hand on the abdomen should rise higher than the hand on the chest. This promotes diaphragmatic breathing that increases alveolar expansion in the bases of the lungs. Have them hold the breath for a count of 7 and then exhale. Exhalation should take twice as long as inhalation. Repeat this for a total of five breaths, and encourage patients to do this three times a day.	*Conscious Breathing* by Gay Hendricks is one of many good resources on using breathing for relaxation and health.
Meditation		
Transcendental/the relaxation response	To prevent distracting thoughts, the subject repeats a mantra (a word or sound) over and over again while sitting in a comfortable position. If a distracting thought comes to mind, it is accepted and let go, with the mind focusing again on the mantra.	*The Relaxation Response* by Herbert Benson; www.tm.org for information on transcendental meditation.
Mindful meditation	This represents the philosophy of living in the present or in the moment. The *body scan* is one technique where the subject uses breathing to obtain a relaxed state while lying or sitting. The mind progressively focuses on different parts of the body, where it feels any and all sensations intentionally but nonjudgmentally before moving on to another part of the body. A patient with back pain may focus on the quality and characteristics of the pain as if to better understand it and bring it under control.	*Full Catastrophe Living* by Jon Kabat-Zinn describes this technique in full and the program for stress reduction at the University of Massachusetts Medical Center.
Centering prayer	This is a form similar to transcendental meditation that has a more religious foundation. The subject repeats a "sacred word" similar to a mantra. As thoughts come to mind, they are accepted and let go, clearing the mind to become more centered on the spirit within, as if the mind's preoccupied thoughts are the layers of an onion that are peeled away, allowing better understanding of the spirit at the core.	www.centeringprayer.com; look under "method of centering prayer" for a nondenominational discussion.
Progressive muscle relaxation (PMR)	A form of relaxation in which the subject is attuned to the difference in feeling when the muscles are tensed and then relaxed. In a comfortable position, start by tensing the whole body from head to toe. While doing this, notice the feelings of tightness. Take a deep breath in and as you let it out, let the tension release and the muscles relax. This is then followed by progressive tension and relaxation throughout the body. One may start by clenching the fists and then tensing the arms, shoulders, chest, abdomen, hips, legs, and so on, with each step followed by relaxation.	*You Must Relax* is a book by the founder of this technique, Edmund Jacobson. Anxiety Canada: www.anxietycanada.com/adults/how-do-progressive-muscle-relaxation Mayo Clinic: www.mayoclinic.org/healthy-lifestyle/stress-management/in-depth/relaxation-technique/art-20045368 Oncology Nursing Society: www.ons.org/intervention/progressive-muscle-relaxation-pmr
Visualization/Self-hypnosis	The subject uses visualization to recruit images that create a relaxed state. For example, if a person is anxious, visualizing images of a place and a time that were peaceful and comforting would help induce relaxation. This is best used in conjunction with a breathing exercise.	There are many CDs, MP3s, and DVDs that can guide people through a visualization "script" that can result in relaxation. Emmett Miller is one well-known author.
Autogenic training	This induces a physiologic response by using simple phrases. For example, "My legs are heavy and warm" is meant to increase the blood flow to this area, resulting in relaxation. This is done progressively from head to toe with the use of deep breathing and repetition of the phrase. After completing this, focus attention on any body part that may still be tense, and then focus the breath and phrase to that area until the whole body is relaxed.	The British Autogenic Society at www.autogenic-therapy.org.uk/ is a good resource for more information.

Continued on following page

Relaxation Techniques—cont'd

Relaxation Technique	Summary	Further Resources
Exercise/Movement		
Aerobic	While performing an aerobic exercise, focus attention on a phrase, sound, word, or prayer and passively disregard other thoughts that may enter the mind. Some may focus on their breathing, saying to themselves, "In" with inhalation and "Out" with exhalation, or repeating "one-two, one-two" with each step they take with jogging. Doing this will help the mind focus, preventing other thoughts that may cause tension.	*Beyond the Relaxation Response* by Herbert Benson includes discussion of his research on inducing the relaxation response while exercising.
Yoga	This has been practiced for thousands of years in India. In America, it has been divided into three aspects: breathing (pranayama yoga), bodily postures or asanas (hatha yoga), and meditation to maintain balance and health. Regular practice induces relaxation.	For Yoga, t'ai chi, and qi gong therapies, it is best to encourage patients to take a class at a local community center or gym and to pick up an introductory book at a library or bookstore.
T'ai chi	An ancient Chinese martial art that uses slow, graceful movements combined with inner mindfulness and breathing techniques to help bring balance between the mind and body.	See above.
Qi gong	A traditional Chinese practice that uses movement, meditation, and controlled breathing to balance the body's vital energy force, Qi.	See above.

Updated from Rakel RE (ed): *Principles of family practice*, ed 6, Philadelphia, 2002, Saunders.

Appendix Ic

Overview of Selected Natural Products

This table includes a few of the common uses and side effects of selected natural products. The evidence supporting the uses and side effects of these products varies considerably and may be based on anecdotal information or theoretical concerns with the natural products.

Natural Products	Common Use(s)	Adverse Effects/Potential Concerns
African plum (Pygeum)	Benign prostatic hyperplasia	Nausea and abdominal pain have been reported, but pygeum is generally well tolerated. Pygeum does not decrease prostate size or influence PSA concentrations.
Black cohosh	Management of hot flashes in peri- and postmenopausal women	Dyspepsia, rash, weight gain, headache, and cramping have been reported. Concern exists that black cohosh causes liver toxicity, although the botanical was part of a multi-ingredient blend. The potential development of mild estrogen-like adverse effects, especially endometrial hyperplasia, is of concern.
Butterbur	Prevention of migraine headaches and supported by 2012 American Academy of Neurology; allergic rhinitis	Diarrhea, stomach upset, fatigue, belching, headache, and drowsiness may occur. Due to concern about hepatotoxicity, butterbur products should be free of pyrrolizidine alkaloids. Products should be standardized to 15% petasin and isopetasin.
Chamomile (German)	Motion sickness, anxiety, insomnia; gastrointestinal spasms; mucositis	Allergic reactions occur on rare occasion. Patients with a ragweed allergy should use chamomile with caution.
Chasteberry	Premenstrual dysphoric disorder, premenstrual syndrome, menopausal symptoms, female infertility, mastalgia	Gastrointestinal upset, headache, rash, acne, weight gain, and menstrual bleeding have been reported.
Chitosan	Weight loss, Crohn disease, hypercholesterolemia, anemia	Gastrointestinal upset, nausea, flatulence, and constipation have been reported. Patients with a shellfish allergy should avoid the use of chitosan.
Chondroitin sulfate	Osteoarthritis, osteoporosis, hyperlipidemia	Gastrointestinal upset, nausea, diarrhea, constipation, and alopecia. Concern exists that chondroitin may have anticoagulant activity due to its structural similarity to part of heparin.
Cinnamon	Type 2 diabetes mellitus, flatulence, gastrointestinal spasms, anorexia, menopausal symptoms, impotence	Cassia cinnamon is one of three types of cinnamon in commercial food products; this is the only type that may have minor effects to improve blood glucose concentrations.
Coenzyme Q10	Chronic heart failure, angina, dilated cardiomyopathy, statin-induced myopathy, Parkinson disease	Nausea, vomiting, diarrhea, anorexia, heartburn, and rash have been reported. Coenzyme Q10 is structurally similar to vitamin K; concern exists about potential interaction with warfarin.
Cranberry	Prevention and treatment of urinary tract infections; type 2 diabetes mellitus; chronic fatigue syndrome; pleurisy	Gastrointestinal upset and diarrhea have been reported with large doses of cranberry. Uric acid kidney stone formation is also possible with large doses of cranberry over prolonged periods of time.
Dehydroepiandrosterone (DHEA)	Slow or reverse aging, weight loss, metabolic syndrome, erectile dysfunction, immune stimulant, osteoporosis, systemic lupus erythematosus, multiple sclerosis, depression, schizophrenia	Acne and other androgenic effects commonly occur in women. Alopecia, insulin resistance, hepatic dysfunction, and hypertension have been reported. Ingested wild yam and soy cannot be converted into DHEA by humans.
Devil's claw	Osteoarthritis, atherosclerosis, gout, myalgias, fever, migraines	Diarrhea, nausea, and vomiting, as well as allergic reactions, have been reported.
Echinacea	Prevention and treatment of viral respiratory infections; urinary tract infections; chronic fatigue syndrome; attention deficit hyperactivity disorder	Nausea, vomiting, diarrhea, heartburn, headaches, dizziness, arthralgias, and allergic reactions have been reported with echinacea. Patients with a ragweed allergy should avoid use of echinacea.
Eleuthero (Siberian ginseng)	Maintenance of a normal blood pressure; atherosclerosis; Alzheimer disease; chronic fatigue syndrome; diabetes; herpes simplex infections	Drowsiness, anxiety, and irritability have been reported.

Continued on following page

Overview of Selected Natural Products

Natural Products	Common Use(s)	Adverse Effects/Potential Concerns
Evening primrose oil (EPO)	Premenstrual syndrome, mastalgia, osteoporosis, asthma, menopausal symptoms, eczema, chronic fatigue syndrome	EPO is well tolerated.
Fenugreek	Type 2 diabetes mellitus, anorexia, atherosclerosis; also used as galactogogue	Gastrointestinal upset, flatulence, and hypoglycemia are possible side effects. Patients with a peanut allergy (and an allergy to related plants) should use fenugreek with caution. Nursing mothers who use fenugreek may notice a "maple syrup" smell in their sweat and in the urine of their infants. This may be mistaken to be maple syrup urine disease in the infant.
Feverfew	Prevention of migraines; fever; menstrual-related problems; arthritis; infertility; asthma	Gastrointestinal side effects are the most common with feverfew. A "post-feverfew syndrome" has been reported in individuals who have taken feverfew for prolonged periods of time and then have abruptly stopped the herbal.
Fish oil	Hypertriglyceridemia, coronary heart disease, hypertension, asthma, depression, rheumatoid arthritis, osteoporosis, psoriasis	Heartburn, nausea, rash, and a "fishy" aftertaste can occur. Contamination with pesticides (as well as with mercury and other heavy metals) is a potential concern, although this is unlikely.
Garlic	Hyperlipidemia, hypertension, peripheral arterial disease, type 2 diabetes mellitus	Nausea, vomiting, heartburn, and body odor are most common. "Deodorized" garlic products may lack the active ingredient, allicin.
Ginger	Nausea and vomiting secondary to pregnancy, chemotherapy, motion sickness, surgery	Heartburn, belching, and dermatitis have been reported. In overdoses, ginger has been associated with central nervous system depression and arrhythmias. Efficacy for hyperemesis gravidarum is unknown, and use is not recommended.
Ginkgo	Alzheimer disease, vascular dementias, tinnitus, acute mountain sickness, intermittent claudication	Gastrointestinal side effects, headaches, dizziness, and allergic skin reactions. Seizures have been reported in several case reports. Products should contain 24% ginkgo flavone glycosides and 6% terpenoids.
Ginseng (Panax)	Increased resistance to stress and improved well-being; increased physical stamina; depression; diabetes; erectile dysfunction	Insomnia has been reported with ginseng. Vaginal bleeding, mastalgia, and amenorrhea have also been reported.
Glucosamine sulfate	Osteoarthritis	Nausea, heartburn, skin reactions, and headache have been reported. Increased glucose concentrations have been a concern but have not been documented. Patients with a shellfish allergy should use glucosamine with caution.
Green tea	Improve cognitive performance; prevention of breast, prostate, and colon cancer; hyperlipidemia; Parkinson disease; obesity; diabetes; cardiovascular disease	Nausea, vomiting, dyspepsia, dizziness, insomnia, and nervousness have been reported. Side effects may be a result of the large amount of caffeine in green tea products. Hepatotoxicity has been a potential concern with green tea.
Hawthorn	Mild heart failure, angina, arrhythmias, hypertension	Mild gastrointestinal effects, dizziness, rash, palpitations, and nervousness have been reported.
Hoodia	Obesity	Side effects have not been reported. Many products have been adulterated and lack the actual ingredient.
Horse chestnut	Chronic venous insufficiency, including varicose veins; benign prostate hyperplasia; diarrhea	Mild nausea, vomiting, dizziness, headache, and itching. Products are standardized to 16%–20% aescin.
Huperzine	Alzheimer disease, increased alertness and energy, myasthenia gravis, memory enhancement	Nausea, vomiting, diarrhea, sweating, and blurred vision as a result of the cholinergic effects of huperzine have been reported.
Kava	Anxiety, insomnia, restlessness, seizure disorders, depression, chronic fatigue syndrome	Gastrointestinal upset, headache, dizziness, "kava" dermopathy, and allergic skin reactions. Hepatotoxicity is the primary concern with kava; some countries have banned the use of kava.
Melatonin	Jet lag, insomnia, migraine, chronic fatigue syndrome, breast cancer, gastritis/PUD, osteoporosis; also used for insomnia in children with ADHD	Daytime drowsiness, headache, and dizziness have been reported. Vaginal bleeding has occurred in perimenopausal women. Melatonin from animal sources should be avoided.
Melissa	Cold sores (topically), anxiety, insomnia, Alzheimer disease, hypertension, dyspepsia	Nausea, vomiting, dizziness, and wheezing have occurred with oral melissa.
Methylsulfonylmethane (MSM)	Chronic pain, arthritis, diabetes, osteoporosis, allergies, obesity, premenstrual syndrome	Nausea, bloating, diarrhea, fatigue, and insomnia have been associated with MSM. This substance is used frequently in combination with glucosamine and chondroitin.
Milk thistle	Protective agent against liver damage due to alcohol, acetaminophen, and carbon tetrachloride; hepatitis C	Nausea, abdominal fullness, diarrhea, and allergic reactions. Patients with a ragweed allergy should use milk thistle with caution.
Peppermint	Irritable bowel syndrome, sinusitis, morning sickness, dysmenorrhea	Heartburn has been reported, as well as laryngeal and bronchial spasm in infants and children.
Policosanol	Hyperlipidemia, intermittent claudication, atherosclerosis	Migraines, insomnia, dizziness, skin rash, and bleeding have been reported with policosanol. The product has antiplatelet effects.
Probiotics	Treatment and prevention of diarrhea including antibiotic-associated diarrhea; irritable bowel syndrome; atopic dermatitis; Crohn disease	Theoretically, probiotic products may increase risk of infections in immunocompromised individuals.
Red clover phytoestrogens	Menopausal symptoms, premenstrual syndrome, asthma	Rash, myalgias, headaches, and vaginal bleeding have been reported. Theoretically, endometrial hyperplasia is an adverse effect from the use of these compounds.
Red yeast rice	Hyperlipidemia, indigestion, diarrhea, circulatory conditions	Gastrointestinal upset and dizziness may occur. Red yeast rice may contain lovastatin-like compounds and potentially cause rhabdomyolysis.

Natural Products	Common Use(s)	Adverse Effects/Potential Concerns
S-adenosylmethionine (SAM-e)	Depression, anxiety, dementia, osteoarthritis, heart disease	Nausea, vomiting, diarrhea, headache, and nervousness have been reported. Concern exists that SAM-e raises homocysteine levels.
St. John's wort	Depression, anxiety, chronic fatigue syndrome, HIV/AIDS	Anxiety, gastrointestinal upset, vaginal bleeding, neuropathy, and rash can occur. Hypomania has been induced by St. John's wort.
Tea tree oil	Topical use for acne, fungal infections, lice, scabies	Local inflammation and contact dermatitis may occur.
Valerian	Insomnia, depression, chronic fatigue syndrome, menstrual cramps	Headaches, gastrointestinal upset, and drowsiness can occur. Hepatotoxicity is a potential concern with valerian.

ADHD, Attention deficit hyperactivity disorder; *AIDS,* acquired immune deficiency syndrome; *HIV,* human immunodeficiency virus; *PUD,* peptic ulcer disease; *PSA,* prostate-specific antigen.

AUTHOR: **Anne L. Hume, PharmD**

Appendix Id

Natural Products and Drug Interactions

This table lists interactions between selected natural products and prescription and nonprescription drugs. Many of the listed interactions are theoretical in nature and have not been documented to occur in humans. However, interactions with St. John's wort are potentially life threatening in nature. Other interactions are based on small studies of healthy volunteers and use pharmaceutical-quality natural products that may or may not be commercially available.

Natural Products	Drugs	Interactions
Black cohosh	Hepatotoxic drugs	Concern exists that the risk of hepatotoxicity with black cohosh is increased in the presence of hepatotoxic drugs.
	Cisplatin	Animal studies suggest that the efficacy of cisplatin against breast cancer cells may be decreased by black cohosh.
	CYP2D6 substrates	Black cohosh may modestly inhibit CYP2D6 enzyme activity to result in higher drug concentrations.
Butterbur	CYP3A4 inducers (rifampin, carbamazepine, etc.)	Drugs that induce the activity of CYP3A4 increase the risk of the formation of hepatotoxic metabolites from pyrrolizidine alkaloids from some butterbur products.
Chamomile	CNS depressants	Chamomile may have additive CNS depressant effects.
	CYP1A2 substrates	Chamomile may inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
	CYP3A4 substrates	Chamomile may inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	Estrogens	Chamomile may compete for estrogen receptors.
	Tamoxifen	Chamomile may interfere with the effects of tamoxifen because of its estrogenic effects.
Chaste tree berry	Antipsychotic agents	Chaste tree berry may antagonize the effects of antipsychotic agents through its dopaminergic activity.
	Metoclopramide	Chaste tree berry may antagonize the effects of metoclopramide through its dopaminergic activity.
	Dopamine agonists	Chaste tree berry may possess additive effects to drugs such as levodopa through its dopaminergic activity.
	Oral contraceptives/estrogens	Chaste tree berry may possess additive hormonal effects.
Chondroitin	Warfarin	High-dose chondroitin has structural similarity to a heparinoid and may possess weak anticoagulant effects.
Cinnamon	Hypoglycemic agents	Cinnamon may possess additive effects on blood glucose to those of hypoglycemic agents.
Coenzyme Q10	Antihypertensive agents	Coenzyme Q10 may possess additive effects on blood pressure to those of antihypertensive agents.
	Warfarin	Coenzyme Q10 may lessen the anticoagulant effects of warfarin because of its structural similarity to vitamin K.
	Chemotherapy	The antioxidant effects of coenzyme Q10 may blunt the efficacy of chemotherapeutic agents that depend on the formation of free radicals.
Cranberry	CYP2C9 substrates (warfarin)	Cranberry may inhibit CYP2C9 enzyme activity to result in higher drug concentrations, although evidence with warfarin is contradictory.
Dehydroepiandrosterone (DHEA)	Tamoxifen and aromatase inhibitors such as anastrozole	DHEA may interfere with the antiestrogenic effects of these drugs.
	CYP3A4 substrates	DHEA may slightly inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
Devil's claw	Antihypertensive agents	Devil's claw may possess additive effects on blood pressure to those of antihypertensive agents.
	Hypoglycemic agents	Devil's claw may possess additive effects on blood glucose to those of hypoglycemic agents.
	H_2 antagonists and PPIs	Devil's claw may raise gastric pH and blunt the efficacy of H_2 antagonists and PPIs.
	CYP3A4 substrates	Devil's claw may inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	CYP2C9 substrates	Devil's claw may inhibit CYP2C9 enzyme activity to result in higher drug concentrations.
	CYP2C19 substrates	Devil's claw may inhibit CYP2C19 enzyme activity to result in higher drug concentrations.
	Warfarin	Devil's claw may inhibit CYP2C9 enzyme activity to result in higher concentrations of warfarin; purpura has been reported.

Natural Products	Drugs	Interactions
Echinacea	Immune suppressants	Echinacea may stimulate immune function, potentially decreasing the effectiveness of drugs such as cyclosporine and prednisone.
	CYP3A4 substrates	Echinacea may modestly induce hepatic CYP3A4 enzyme activity to result in lower drug concentrations.
	CYP1A2 substrates	Echinacea may inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
Eleuthero (Siberian ginseng)	CNS depressants	Eleuthero may have additive CNS depressant effects.
	Antiplatelet and anticoagulant agents	Eleuthero may have antiplatelet activity, potentially increasing the risk of bleeding.
	CYP3A4 substrates	Eleuthero may inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	CYP1A2 substrates	Eleuthero may modestly inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
	CYP2C9 substrates	Eleuthero may modestly inhibit CYP2C9 enzyme activity to result in higher drug concentrations.
	CYP2D6 substrates	Eleuthero may inhibit CYP2D6 enzyme activity to result in higher drug concentrations.
	Digoxin	Concentration of digoxin has been reported to increase but without evidence of toxicity.
Evening primrose oil (EPO)	Antiplatelet and anticoagulant agents	EPO may have anticoagulant activity, potentially increasing the risk of bleeding.
Fenugreek	Antiplatelet and anticoagulant agents	Fenugreek may have antiplatelet activity, potentially increasing the risk of bleeding.
	Hypoglycemic agents	Fenugreek may potentially lower blood glucose concentrations and have additive effects with hypoglycemic agents.
Feverfew	Antiplatelet and anticoagulant agents	Feverfew may have antiplatelet activity, potentially increasing the risk of bleeding.
	CYP3A4 substrates	Feverfew may inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	CYP1A2 substrates	Feverfew may inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
	CYP2C9 substrates	Feverfew may inhibit CYP2C9 enzyme activity to result in higher drug concentrations.
	CYP2C19 substrates	Feverfew may inhibit CYP2C19 enzyme activity to result in higher drug concentrations.
Fish oils (omega-3 fatty acids)	Antiplatelet and anticoagulant agents	Fish oils may have antiplatelet activity, potentially increasing the risk of bleeding, although this has not been documented in humans.
	Antihypertensive agents	Fish oils may possess additive effects on blood pressure to those of antihypertensive agents.
	Oral contraceptives	Oral contraceptives may potentially interfere with the triglyceride-lowering effects of fish oil.
Garlic	Antiplatelet and anticoagulant agents	Garlic may have antiplatelet activity, potentially increasing the risk of bleeding.
	CYP3A4 substrates	Garlic may potentially induce CYP3A4 enzyme activity to result in lower drug concentrations; evidence is contradictory.
	CYP2E1 substrates	Garlic may modestly inhibit CYP2E1 enzyme activity to result in higher drug concentrations.
Ginger	Antiplatelet and anticoagulant agents	Ginger may have antiplatelet activity, potentially increasing the risk of bleeding.
	Hypoglycemic agents	Ginger may potentially lower blood glucose concentrations and have additive effects with hypoglycemic agents.
Ginkgo	Antiplatelet and anticoagulant agents	Ginkgo may have antiplatelet activity, potentially increasing the risk of bleeding.
	CYP2C19 substrates	Ginkgo may induce CYP2C19 enzyme activity to result in lower drug concentrations.
	CYP1A2 substrates	Ginkgo may modestly inhibit CYP1A2 enzyme activity to result in higher drug levels.
	CYP2C9 substrates	Ginkgo may modestly inhibit CYP2C9 enzyme activity to result in higher drug concentrations.
	CYP2D6 substrates	Ginkgo may inhibit CYP2D6 enzyme activity to result in higher drug concentrations.
Ginseng (Panax)	Antiplatelet and anticoagulant agents	Panax ginseng may have antiplatelet properties; American ginseng may decrease the effectiveness (international normalized ratio [INR]) of warfarin.
	CYP2D6 substrates	Panax ginseng may modestly inhibit CYP2D6 enzyme activity to result in higher drug concentrations.
	Immune suppressants	Panax ginseng may stimulate immune function, potentially decreasing the effectiveness of drugs such as cyclosporine and prednisone.
	Hypoglycemic agents	Panax ginseng may potentially lower blood glucose levels and have additive effects with hypoglycemic agents.
Glucosamine	Warfarin	High-dose glucosamine (along with high-dose chondroitin) may have additive effects to those of warfarin because of structural similarity to heparin. Evidence is lacking.
Green tea extract	Antiplatelet agents	Green tea possesses compounds that may have antiplatelet activity, potentially increasing the risk of bleeding.
	Amphetamines	Caffeine in green tea may increase the risk of CNS toxicity.
	Cocaine	Caffeine in green tea may increase the risk of CNS toxicity.
	Oral contraceptives	Oral contraceptives may decrease the clearance of caffeine in green tea.
	Warfarin	Small amounts of vitamin K have been reported to be present in green tea, potentially decreasing the effectiveness of warfarin.
	Theophylline	Caffeine potentially decreases theophylline clearance.
	Verapamil	Verapamil decreases caffeine clearance, resulting in increased concentrations.
	Quinolone antibiotics	Some quinolone antibiotics decrease the clearance of caffeine.
	Hepatotoxic drugs	Concern exists that the risk of hepatotoxicity with green tea is increased in the presence of hepatotoxic drugs.
Hawthorn	β-Blockers	Hawthorn and β-blockers may have additive effects on blood pressure and heart rate.
	CCBs, nitrates	Hawthorn and CCBs (or nitrates) may have additive effects due to coronary vasodilation.
	Digoxin	Hawthorn may have additive effects to those of digoxin.
	Phosphodiesterase inhibitors	Hawthorn may have additive vasodilatory and hypotensive effects with these drugs.
Horse chestnut seed extract (HCSE)	Antiplatelet and anticoagulant agents	HCSE may have antiplatelet activity, potentially increasing the risk of bleeding.
	Hypoglycemic agents	HCSE may potentially lower blood glucose concentrations and have additive effects with hypoglycemic agents.
Huperzine	AChE inhibitors (donepezil, etc.)	Huperzine may have additive effects when combined with AChE inhibitors.
	Anticholinergic drugs	The effectiveness of huperzine and/or the anticholinergic drug may be decreased by their concomitant administration.
	Cholinergic drugs (bethanechol, etc.)	Huperzine may have additive effects when combined with cholinergic drugs.

Continued on following page

Natural Products	Drugs	Interactions
Kava	CYP3A4 substrates	Kava may inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	CYP1A2 substrates	Kava may inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
	CYP2C9 substrates, CYP2C19 substrates	Kava may inhibit CYP2C9 and CYP2C19 enzyme activity to result in higher drug concentrations.
	CYP2D6 substrates	Kava may inhibit CYP2D6 enzyme activity to result in higher drug concentrations.
	P-glycoprotein substrates (digoxin; itraconazole; diltiazem, verapamil; and many other drugs)	Kava may inhibit P-glycoprotein transporter systems.
	Hepatotoxic drugs	Concern exists that the risk of hepatotoxicity from kava is increased in the presence of hepatotoxic drugs.
Melatonin	Antiplatelet and anticoagulant agents	Melatonin may potentiate the effects of antiplatelets and anticoagulants, although the mechanism is unknown.
	CNS depressants	Melatonin may have additive CNS depressant effects.
	Fluvoxamine	Fluvoxamine may increase levels of melatonin.
	Immune suppressants	Melatonin may stimulate immune function, potentially decreasing the effectiveness of drugs such as cyclosporine and prednisone.
	Hypoglycemic agents	Melatonin may impair glucose utilization and may decrease the efficacy of hypoglycemic agents.
Milk thistle	Estrogens (and other drugs that undergo glucuronidation)	Silymarin may increase the clearance of estrogens.
	CYP2C9 substrates	Milk thistle may modestly inhibit CYP2C9 enzyme activity to result in higher drug concentrations.
Peppermint oil	H_2 antagonists and proton pump inhibitors	Peppermint oil may raise gastric pH and blunt efficacy of H_2 antagonists and PPIs.
	CYP3A4 substrates	Peppermint oil may modestly inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	CYP1A2 substrates	Peppermint oil may modestly inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
	CYP2C9 substrates, CYP2C19 substrates	Peppermint oil may modestly inhibit CYP2C9 and CYP2C19 enzyme activity to result in higher drug concentrations.
Policosanol	Antiplatelet and anticoagulant agents	Policosanol may have antiplatelet activity, potentially increasing the risk of bleeding.
Probiotics	Antibiotics	Antibiotics may kill the live organisms in different probiotic preparations.
	Immune suppressants	Theoretically, probiotics may cause bacterial or fungal infections in patients who are taking immune suppressants chronically.
Red clover phytoestrogens	Antiplatelet and anticoagulant agents	Theoretically, red clover may possess coumarins, which increase the risk of bleeding with antiplatelet and anticoagulants. Evidence is lacking.
	CYP3A4 substrates	Red clover may inhibit CYP3A4 enzyme activity to result in higher drug concentrations.
	CYP2C9 substrates, CYP2C19 substrates	Red clover may inhibit CYP2C9 and CYP2C19 enzyme activity to result in higher drug concentrations.
	CYP1A2 substrates	Red clover may inhibit CYP1A2 enzyme activity to result in higher drug concentrations.
Red yeast rice	CYP3A4 inhibitors	Drugs that inhibit CYP3A4 may decrease the metabolism of lovastatin in red yeast rice.
	Statins	Red yeast rice contains lovastatin and increases the risk of myopathy.
	Fibrates and niacin	Fibrates and niacin may increase concentrations of lovastatin in red yeast rice.
S-adenosylmethionine (SAM-e)	Antidepressants (including MAOIs)	Additive effects are possible, and there is potential for toxicity.
	Serotonergic drugs (triptans, SSRIs, tramadol, dextromethorphan, etc.)	SAM-e may increase the risk of development of serotonin syndrome when used concomitantly.
Soy phytoestrogens	Estrogens	Soy potentially may inhibit the effects of estrogen.
	Tamoxifen/aromatase inhibitors	Soy's estrogenic effects may antagonize the antitumor effects of tamoxifen/aromatase inhibitors.
	MAOIs	Fermented soy products may contain tyramine.
St. John's wort	CYP3A4 substrates	St. John's wort strongly induces CYP3A4 enzyme activity to result in lower drug concentrations.
	CYP1A2 substrates	St. John's wort modestly induces CYP1A2 enzyme activity to result in lower drug levels.
	CYP2C9 substrates	St. John's wort induces CYP2C9 enzyme activity to result in lower drug concentrations.
	P-glycoprotein substrates (digoxin; itraconazole; diltiazem, verapamil; and many other drugs)	St. John's wort induces P-glycoprotein transporter systems.
	Serotonergic drugs (triptans, SSRIs, tramadol, dextromethorphan, etc.)	St. John's wort may increase the risk of development of serotonin syndrome when used concomitantly.
Valerian	CNS depressants	Valerian may increase the sedative effects of CNS depressants.
	CYP3A4 substrates	Valerian may modestly inhibit the CYP3A4 enzyme activity.

AChE, Acetylcholinesterase; *CCBs,* calcium channel blockers; *CNS,* central nervous system; *MAOIs,* monoamine oxidase inhibitor; *PPIs,* proton pump inhibitors; *SSRIs,* selective serotonin reuptake inhibitors.

EXAMPLES OF DRUGS METABOLIZED BY CYP ENZYMES

The following are examples of drugs that are metabolized through the different cytochrome P450 isoenzymes:

CYP1A2 substrates: Theophylline, imipramine, clozapine, naproxen

CYP2C9 substrates: Warfarin, tamoxifen, irbesartan, ibuprofen, glipizide

CYP2C19 substrates: Omeprazole and other proton pump inhibitors, phenytoin, phenobarbital, cyclophosphamide

CYP2D6 substrates: S-metoprolol, propafenone, paroxetine, risperidone, tramadol

CYP2E1 substrates: Acetaminophen, alcohol

CYP3A4 substrates: Most statins, indinavir, amlodipine, verapamil, alprazolam, buspirone

Appendix Ie

Commonly Ingested Plants with Significant Toxic Potential

Plant	Symptoms	Management
Autumn crocus (*Colchicum autumnale*)	Vomiting Diarrhea Initial leukocytosis followed by bone marrow failure Multisystem organ failure	Activated charcoal decontamination Aggressive fluid resuscitation and supportive care
Belladonna alkaloids: Jimson weed (*Datura stramonium*) Belladonna ("deadly nightshade;" *Atropa belladonna*)	Anticholinergic toxidrome Seizures	Supportive care, benzodiazepines Consider physostigmine if patient is a threat to self or others; only use if no conduction delays on ECG
Cardiac glycoside-containing plants (foxglove, lily of the valley, oleander, yellow oleander, etc.)	Nausea Vomiting Bradycardia Dysrhythmias (AV block, ventricular ectopy) Hyperkalemia	Digoxin-specific Fab fragments
Jequirity bean and other abrin-containing species (e.g., rosary pea, precatory bean)	Oral pain Vomiting Diarrhea Shock Hemolysis Renal failure	Supportive care, including aggressive volume resuscitation and correction of electrolyte abnormalities
Monkshood (*Aconitum* species)	Numbness and tingling of lips/tongue Vomiting Bradycardia	Atropine for bradycardia Supportive care
Oxalate-containing plants: *Philodendron, Dieffenbachia, Colocasia* ("elephant ear")	Local tissue injury Oral pain Vomiting	Supportive care, pain control
Poison hemlock *(Conium maculatum)*	Vomiting Agitation followed by CNS depression Paralysis Respiratory failure	Supportive care
Pokeweed	Hemorrhagic gastroenteritis Burning of mouth and throat	Supportive care
Rhododendron	Vomiting Diarrhea Bradycardia	Atropine for symptomatic bradycardia Supportive care
Tobacco	Vomiting Agitation Diaphoresis Fasciculations Seizures	Supportive care
Water hemlock (*Cicuta* species)	Abdominal pain Vomiting Delirium Seizures	Supportive care, including benzodiazepines for seizures
Yew (*Taxus* species)	GI symptoms QRS widening Hypotension CV collapse	Supportive care Atropine for bradycardia Sodium bicarbonate does not appear to be effective

AV, Atrioventricular; *CNS,* central nervous system; *CV,* cardiovascular; *ECG,* electrocardiogram; *Fab,* fragment, antigen binding; *GI,* gastrointestinal.

Appendix If

Herbs Associated with Toxicity

TABLE 1 Clinical Toxicity of Selected Herbs

Common Name	Botanical Name	Therapeutic Uses	Potential Toxicity
Aconite (monkshood, wolfsbane)	*Aconitum* spp.	Sedative, analgesic, antihypertensive	Cardiac arrhythmias
Aloe	*Aloe* spp.	Burns, skin diseases	Nephritis, GI upset
Betel nut	*Areca catechu*	Mood elevation	Bronchoconstriction, oral cancers
Bloodroot	*Sanguinaria canadensis*	Emetic, cathartic, eczema	GI upset, vertigo, visual disturbances
Chaparral (greasewood)	*Larrea tridentata*	Aging, free radical scavenging	Hepatitis
Compound Q	*Trichosanthes kirilowii*	Anthelmintic, cathartic	Diarrhea, hypoglycemia, CNS toxicity
Dandelion	*Taraxacum officinale*	Diuretic, heartburn remedy	Anaphylaxis
Figwort (xuan shen)	*Scrophularia* spp.	Antiinflammatory, antibacterial	Cardiac stimulation
Ginseng	*Panax quinquefolium*	Antihypertensive, aphrodisiac, stimulant, mood elevation, digestive aid	Ginseng abuse syndrome
Goldenseal	*Hydrastis canadensis*	Digestive aid, mucolytic, anti-infective	Uterine, cardiac stimulation; GI upset, leukopenia
Hellebore	*Veratrum* spp.	Antihypertensive	Vomiting, bradycardia, hypotension
Hyssop	*Hyssopus officinalis*	Asthma, mucolytic	Seizures
Juniper	*Juniperus communis*	Hallucinogen	GI upset, seizures, renal injury, hypotension, bradycardia
Kava kava	*Piper methysticum*	Sedative	Inebriation
Kombucha		Stimulant	Metabolic acidosis, hepatotoxicity, death
Licorice	*Glycyrrhiza* spp.	Indigestion	Mineralocorticoid effects
Lily of the valley	*Convallaria* spp.	Cardiotonic	GI (nausea, vomiting), cardiac arrhythmias
Linn (willow)	*Salix caprea*	Purgative	Hemolysis with glucose-6-phosphate dehydrogenase deficiency
Lobelia (Indian tobacco)	*Lobelia* spp.	Stimulant	Nicotine intoxication
Ma Huang	*Ephedra sinica*	Stimulant	Sympathetic crisis, especially with monoamine oxidase inhibitors
Mandrake	*Mandragora officinarum*	Hallucinogen	Anticholinergic syndrome
Mormon tea	*Ephedra nevadensis*	Stimulant, asthma, antipyretic	Hypertension, sympathomimetic
Nutmeg	*Myristica fragrans*	Hallucinogen, abortifacient	Hallucinations, GI upset
Oleander	*Nerium oleander*	Cardiac stimulant	Cardiac arrhythmias
Passionflower	*Passiflora caeruliea*	Hallucinogen	Hallucinations, seizures, hypotension
Periwinkle	*Vinca* spp.	Antiinflammatory, diabetes	Alopecia, seizures, hepatotoxicity
Pokeweed	*Phytolacca* spp.	Arthritis, chronic pain	GI upset, seizures, death
Sabah	*Sauropus androgynus*	Weight loss, vision	Pulmonary injury
Sage	*Salvia* spp.	CNS stimulant	Seizures
Snakeroot	*Rauwolfia serpentina*	Sedative, antihypertensive	Bradycardia, coma
Squill	*Urginea maritima*	Arthritis, cardiac stimulant	Seizures, arrhythmias, death
Thorn apple (jimsonweed)	*Datura stramonium*	Hallucinations	Anticholinergic
Tonka bean	*Dipteryx odorata*	Anticoagulant	Bleeding diathesis
Valerian root	*Valeriana* spp.	Sedative	Sedation, obtundation
Wild (squirting) cucumber	*Ecballium elaterium*	Constipation, antiinflammatory, rheumatic disease	Airway obstruction
Wormwood (mugwort)	*Artemisia* spp.	Stimulant, hallucinogen	Hallucinations, seizures, uterine stimulation
Yohimbine	*Corynanthe yohimbe*	Aphrodisiac, stimulant	Hypertension, sympathetic crisis

CNS, Central nervous system; *GI,* gastrointestinal.
From Kingston RL, Foley C: Herbal, traditional, and alternative medicines. In *Haddad and Winchester's clinical management of poisoning and drug overdose,* ed 4, Philadelphia, 2007, Saunders/Elsevier, p 1081.

TABLE 2 Common Herbal Dietary Supplements (HDS)–Drug Interactions

HDS	Drugs	Potential Consequences/Reactions
Aloe vera	Glibenclamide (glyburide)	↑ Oral aloe vera gel can cause additive glycemic-lowering effects when taken concurrently with a hypoglycemic agent.
Bitter orange	Phenelzine	↑ Risk of hypertensive crisis
Garlic	Ritonavir	↓ Effect of ritonavir
	Saquinavir	↓ Effect of saquinavir
Licorice	Warfarin	↑ Risk of bleeding
Grapefruit	Calcium channel blockers	Grapefruit juice has been found to increase bioavailability of certain drugs by inhibition of cytochrome P450 (CYP) 3A4 isozyme in liver and gut wall.
Melatonin	Zolpidem	↑ Sedative effects
Valerian	Alprazolam, phenobarbital	↑ Central nervous system depression
Goldenseal	Inhibition of CYP2D6 and CYP3A4	May affect approximately 50% of common pharmaceutical agents
St. John's wort	Cyclosporine, tacrolimus, warfarin, protease inhibitors, digoxin, theophylline, venlafaxine, oral contraceptives	May decrease drug effectiveness

↓, Decreasing; ↑, increasing.

Common Herbs in Integrated Medicine

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses[b]	Drug Interactions[c]
Aloe *(Aloe vera, Aloe barbadensis)*	Burns and wound healing Constipation Gastritis Ulcers Psoriasis	Antiinflammatory Antiseptic	Dermatitis GI upset (PO) Diarrhea Avoid in children and pregnancy Avoid latex with inflammatory intestinal disease	Liberal application of gel topically No more than 1 qt of juice per day	Cardiac glycoside containing herbs and drugs Licorice Stimulant laxatives
Bilberry *(Vaccinium myrtillus)*	Eye disorder Antidiarrheal Circulatory disorders Diabetes	Antioxidant Collagen stabilizer Vasoprotective Astringent ↓ Platelet aggregation	May alter insulin requirements	Anthocyanosides (calculated as anthocyanidin): 20-40 mg tid *V. myrtillus* (25% extract): 80-160 mg tid Fresh berries: 55-115 g tid	Warfarin (at high doses of bilberry)
Black cohosh *(Cimicifuga racemosa)*	Menopause symptoms Menstrual problems Rattlesnake bites	Probable SSRI-like effects Possible estrogenic activity Possible luteinizing hormone suppression	GI upset ↑ BP Avoid in pregnancy and lactation Vertigo Rash Liver disease	27-Deoxyacteine: 2 mg bid Powdered rhizome: 1-2 g Tincture (1:5): 4-6 ml Fluid extract (1:1): 3-4 ml (1 tsp) Solid (dry powder) extract (4:1):	Hepatotoxic herbs and drugs
Cat's claw *(Uncaria tomentosa)*	Arthritis Cancer HIV Diverticulitis Herpes simplex and zoster	Immune stimulant Antiinflammatory Antimutagenic	Avoid in pregnancy and lactation, autoimmune illness, MS, TB, and leukemia (awaiting bone marrow transplant) Avoid in children <3 years old Headaches Dizziness Vomiting	Tea (1 g/250 ml): 1 cup tid Tincture: 1-2 ml tid Standardized dry extract: 20-60 mg qd	Avoid combining with hormone drugs, insulin, vaccines, iron, NSAIDs, and salicylates Antihypertensives Cytochrome P450 substrates Chemotherapy Hyperimmune globulin IV thymic preparations
Cayenne *(Capsicum annum)*	Arthritis Muscle pain Neuralgia Postmastectomy pain Psoriasis Diabetes Antiflatulent Diarrhea	Blocks substance P (pain peptide) ↓ Lipids ↓ Platelet aggregation	Eye irritation Burning, local and mucous membranes Gastritis Diarrhea (with internal use) Avoid in children <2 years old	Cream (0.025% or 0.075% capsaicin) topically qid	Warfarin: ↓ platelet aggregation with internal use MAOIs ACE inhibitors Aspirin Cocaine Antacids H_2 blockers Theophylline

Continued on following page

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses[b]	Drug Interactions[c]
Chamomile *(Matricaria recutita, Matricaria chamomilla)*	GI complaints Skin and mucous membrane problems Stress and anxiety Wound healing	Antispasmodic effect Sedative effect Antiinflammatory Carminative	Avoid if allergy to member of daisy family (Asteraceae; e.g., ragweed, asters, chrysanthemums) Contact dermatitis Urticaria	Tea: 3-4 cups per day Capsules: 300-500 mg tid-qid Tincture: 4-6 ml tid Apply topically to affected area	Caution if using with tranquilizers or CNS depressants (?) WarfarinChemotherapy Cytochrome P450 substrates
Chaste tree *(Vitex agnus-castus)*	Menstrual problems Hyperprolactinemia Acne Infertility	Hormonal modulator	Rash Headache GI upset Avoid in pregnancy and lactation	Solution (9 g in 100 ml): 40 gtts qAM Dried extract: 4.2 mg qd Must take consistently for several months to see effect	Metoclopramide (Reglan) Contraceptive agents Avoid with dopamine agonists
Cranberry *(Vaccinium macrocarpon)*	Urinary tract infections	↓ Bacterial adherence to bladder endothelium	Diarrhea May increase risk of kidney stones	Prophylaxis: 90 ml qd Treatment: 360-960 ml qd Tincture 0.5-1 tsp tid	Lansoprazole, omeprazole Warfarin Cytochrome P450 substrates
Dong quai *(Angelica sinensis)*	Dysmenorrhea Other menstrual disorders Menopause symptoms Allergies	Phytoestrogen Antimicrobial effects Smooth muscle relaxant IgE inhibition	Photodermatitis Uterine stimulant Carcinogenic constituents Hypersensitivity Excess bleeding and fever Avoid with hormone-sensitive tumors	Dried root or rhizome: 1-2 g PO or IV tid Tincture (1:5): 3-5 ml tid Fluid extract (1:1): 0.5-2 ml tid	Warfarin Heparin Ticlopidine
Echinacea (*Echinacea* spp)	Colds and flu Immunity Upper respiratory infections Urinary tract infections Wound healing (topical) Recurrent candidal vaginitis	Immunostimulant ↑ Macrophage phagocytosis Stimulates lymphocyte activity Antiinflammatory Antimicrobial properties	Avoid in HIV/AIDS, autoimmune disease, collagen vascular disease, MS, and TB Avoid if allergy to sunflower seeds or member of daisy family (Asteraceae) such as ragweed (?) Avoid during pregnancy	Dried root (or as tea): 0.5-1 g Freeze-dried plant: 325-650 mg Juice of aerial portion of *E. purpurea* stabilized in 22% ethanol: 2-3 ml (0.5-0.75 tsp) Tincture (1:5): 2-4 ml (1-2 tsp) Solid (dry powdered) extract (6.5:1 or 3.5% echinacoside): 150-300 mg	Chemotherapy agents Cytochrome P450 substrates Immunosuppressants
Eleuthero *(Eleutherococcus senticosus)*	Herpes type II Fatigue Athletic performance Influenza complications	↑ Lymphocyte count Tonifying Immunomodulator Adaptogen	Diarrhea Sleep disturbance Anxiety Alters diabetes control Caution with cardiovascular disorders Avoid during antibiotic treatment of dysentery	Dried root: 2-4 g Tincture (1:5): 10-20 ml Fluid extract (1:1): 2-4 ml Solid (dry powdered) extract (20:1): 100-200 mg	Caution with antipsychotics, barbiturates, and sedatives Anticoagulants Chemotherapy agents Digoxin Hypoglycemics Kanamycin
Ephedra *(Ephedra sinensis, ma huang)*	Asthma Bronchitis Cough Decongestant Energy Weight loss Diuretic	Sympathomimetic activating α and β_1/β_2 receptors CNS stimulant Stimulates uterine contractions	↑ BP, root ↓ BP, plant above ground Anxiety, restlessness Headaches Irritability Nausea, vomiting Urinary obstruction with BPH Addictive potential Dysrhythmias Alters diabetes control Kidney stones Glaucoma Caution in heart disease, hypertension, diabetes, or thyroid disease	Based on alkaloid content 1%-3% 12.5-25 mg bid-tid Crude herb 500-1000 mg tid	Cardiac glycosides Halothane Guanethidine MAOIs Oxytocin Diabetic medication Dexamethasone Ergot derivatives Methylxanthines Reserpine Must be protected from the light

Continued on following page

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses[b]	Drug Interactions[c]
Evening primrose oil *(Oenothera biennis)*	Fibrocystic breast Eczema Diabetic neuropathy Psoriasis Breast pain Lactation	Source of gamma-linoleic acid (GLA)	Headache GI symptoms Insomnia May exacerbate temporal lobe epilepsy and schizophrenia	Based on 8% GLA content 500-2000 mg tid-qid	Phenothiazines Tamoxifen Anesthetics Anticoagulants
Feverfew *(Tanacetum parthenium)*	Migraine prophylaxis and treatment Dizziness Tinnitus Dysmenorrhea	↓ Platelet aggregation Smooth muscle relaxant ↓ Prostaglandin synthesis and serotonin release from platelets and WBCs Antinociceptive Inhibits serotonin release	Stop 2 weeks before major surgery Oral ulcers GI upset Rash Rebound migraine Nervousness Avoid in pregnancy and lactation, or if allergy to sunflower seeds or member of daisy family (Asteraceae) such as ragweed	Depends on adequate level of parthenolide (0.4%-0.66%) Freeze-dried, pulverized leaves: 25-50 mg bid	Warfarin: ↓ platelet aggregation NSAIDs
Flax seed *(Linumus itatissimum)*	Hyperlipidemia Constipation Cardiovascular risk reduction Systemic lupus erythematosus Breast cancer risk reduction Irritable bowel; inflammatory bowel disease	↓ Platelet aggregation Antiinflammatory	Diarrhea Allergic reaction Caution with hormone-sensitive cancers Contraindicated with bowel obstruction	Capsule (1 g): 3-6 capsules qd Oil: 1-2 tbsp qd	Mucilage may affect absorption of oral drugs Anticoagulants Antidiabetic drugs
Garlic *(Allium sativum)*	Hyperlipidemia Hypertension Cancer prevention Antimicrobial Atherosclerosis	Inhibits platelet aggregation ↑ Fibrinolysis Antioxidant ↓ Systolic and diastolic blood pressure	Stop 2 weeks before major surgery Heartburn GI upset Flatulence Body/breath odor ↓ Blood glucose	10 mg allicin or 4 g fresh garlic; equivalent to 1-2 cloves/day	May potentiate antithrombotic effect of antiinflammatories, warfarin, and aspirin Saquinavir Cyclosporin Chlorzoxazone Dipyridamole Ticlopidine Cytochrome P450 substrates
Ginger *(Zingiber officinale)*	Antiemetic Nausea Motion sickness Morning sickness Arthritis Antiinflammatory Rheumatological	Stimulates intestinal tone and peristalsis Cholagogue Antiinflammatory Antioxidant Positive inotrope Inhibits platelet aggregation	Stop 2 weeks before major surgery GI upset Caution if patient has gallstones	Dry powder ginger root: 1 g Extract (20% gingerol and shogaol): 100-200 mg tid	Warfarin: ↓ platelet aggregation Chemotherapy agents General anesthetics Heparin Antacids Antidiabetic drugs Antihypertensives Barbiturates H_2 blockers Proton pump inhibitors
Ginkgo biloba *(Ginkgo biloba)*	Cerebrovascular insufficiency Peripheral vascular disease Vascular dementia Alzheimer disease Memory Vertigo Tinnitus Macular degeneration Depression PMS Diabetic neuropathy Raynaud syndrome Retinopathy Glaucoma Sexual dysfunction associated with SSRIs	Membrane stabilizer Antiplatelet activating factor (PAF) Free radical scavenger Antioxidant ↑ Alpha brain waves ↓ Theta brain waves	Stop 2 weeks before major surgery GI upset Allergies (whole plant) Spontaneous bleeding problems Headaches Skin rashes Dizziness Palpitations Seizures Avoid in pregnancy	Based on standard extract 25% ginkgo heterosides 40 mg tid up to 80 mg bid-tid Use consistently for at least 12 weeks to determine effectiveness	Warfarin Aspirin (↓ platelet aggregation) MAOIs (↑ effect) Fluoxetine Glyburide Insulin Haloperidol Heparin Metformin Thiazide diuretics Ticlopidine Trazodone Buspirone Cytochrome P450 substrates

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses[b]	Drug Interactions[c]
Ginseng *(Panax ginseng) (Ginseng radix) (Eleutherococcus senticosus)*	Fatigue Weakness Energy Immunity Mentation Diabetes Respiratory illnesses Libido Stress-induced GI ulcers Postoperative stress	Immune enhancement Prevention of platelet aggregation Tonic effect	Stop 2 weeks before major surgery Agitation Insomnia (PM doses) BP Edema Hypertonia Caution with cardiac problems, diabetes, psychosis, and agitation	Based on ginsenoside content 4.5-6 g daily Root powder (5% ginsenoside): 100 mg qd-tid May use cyclically for 15-20 days, followed by 2-week interval without ginseng	Warfarin (↓ platelet aggregation) Corticosteroids (↑ side effects) Digoxin (↑ serum levels) MAOIs, hypoglycemics (↑ effects) Opioids, diuretics (↓ effect) Stimulants Antidiabetic drugs
Goldenseal *(Hidrastis canadensis)*	Cold Immunity Diarrhea Sore throat Ocular trachoma infections	Antimicrobial (often combined with echinacea) Immune stimulant Activates phagocytes	Avoid in pregnancy, lactation, and diabetes (may lower glucose) Mouth irritation Digestive disorders Avoid in infants	Dried root or as infusion (tea): 2-4 g Tincture (1:5): 6-12 ml (1.5-3 tsp) Fluid extract (1:1): 2-4 ml (0.5-1 tsp) Solid (powdered dry) extract (4:1 or 8%-12% alkaloid content): 250-500 mg	Antihypertensives Cytochrome P450 substrates Antacids CNS depressants Heparin H_2 blockers Proton pump inhibitors
Grape seed extract *(Vitis vinifera)*	Atherosclerosis Retinopathy Venous insufficiency Hepatic protective Dental caries	Proanthocyanidins: powerful antioxidants Vascular renewal and stability Collagen support	None known	25-250 mg bid	Tetracycline, doxycycline Warfarin
Hawthorn *(Crataegus laeviagata)*	Congestive heart failure Hypertension Angina Cardiac function	Cardioactive glycosides Positive inotropic ACE inhibition Mild diuretic Collagen stabilizer Dilates coronary vessels ↓ Peripheral resistance ↓ Oxygen consumption	Hypotension GI distress Rash Arrhythmia Avoid in pregnancy	Berries or flowers (dried): 3-5 g or as infusion Tincture (1:5): 4-5 ml (alcohol may elicit pressor response in some individuals) Fluid extract (1:1): 1-2 ml Freeze-dried berries: 1-1.5 g Flower extract (standardized to contain 1.8% vitexin-4)	May potentiate effects of digitalis drugs Calcium channel blockers CNS depressants Nitrates
Horse chestnut *(Aesculus hippocastanum)*	Venous insufficiency Varicose veins Nocturnal leg cramps Pruritus and swelling of legs Topically for hemorrhoids, skin ulcers, varicose veins, sport injuries, trauma	Aescin component reduces lysosomal activity, improves venous tone, and inhibits capillary protein permeability Diuretic	GI irritation ↓ gastric emptying Pruritus Nausea Standardized seed extracts are safe, but whole herb may be fatal Avoid in pregnancy and lactation, liver disease, renal disease May cross-react with latex allergy	Based on aescin 90-150 mg initially, followed by 35-70 mg qd	Anticoagulants Antidiabetic drugs
Kava *(Piper methysticum)*	Anxiety Restlessness Insomnia Anticonvulsant Oral anesthetic Depression Attention-deficit/hyperactivity disorder	GABA receptor–like actions Limbic system modulation Inhibits voltage-dependent sodium channels in brain Skeletal muscle relaxant	Dermatitis Sedation May impair reflexes and judgment for driving Avoid in pregnancy and lactation, depression, and Parkinson disease. Contraindicated in endogenous depression Hepatotoxicity *Note:* kava is nonaddictive	Anxiolytic dose: 45-70 mg kavalactones tid Sedative dose: 180-210 mg 1 hour before bedtime	Alcohol Benzodiazepines Barbiturates Anti-Parkinson drugs Other psychopharmacological agents, general anesthetics Cytochrome P450 substrates

Continued on following page

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses[b]	Drug Interactions[c]
Licorice (*Glycyrrhiza* spp)	Upper respiratory infection Oral and gastric ulcers Infection	Antiinflammatory Expectorant Antioxidant Demulcent Adrenocorticotropin	Avoid in pregnancy Contraindicated in cholestatic liver disease, cirrhosis, hypertension, hypokalemia, and renal insufficiency	Powdered root: 1-2 g Fluid extract (1:1): 2-4 ml Solid (dry powdered) extract (4:1): 250-500 mg	Furosemide Estrogens Chlorothiazide, metolazone Isoniazid Antihypertensives Insulin Risperidone Ibuprofen Digitalis glycosides Corticosteroids Cytochrome P450 substrates
Milk thistle *(Silybum marianum)*	Cirrhosis Alcoholic and viral hepatitis Mushroom poisoning *(Amanita)* Other hepatotoxins	Cell membrane stabilizer Stimulates ribosomal protein synthesis Free radical scavenger Antioxidant Contraindicated in liver disease Inhibits leukotriene formation Choleretic and lipotropic	GI upset Laxative effect Alcohol-based extracts Contraindicated in liver disease	Based on silymarin content 70-210 mg tid Silybin bound to phosphatidylcholine: 120-240 mg bid	Acetaminophen Butyrophenones Phenothiazines Indinavir Metronidazole Nitrous oxide Chemotherapy Clofibrate General anesthetics Haloperidol Cytochrome P450 substrates
Peppermint *(Mentha piperita)*	Dyspepsia Irritable bowel syndrome Biliary dyskinesia Digestive aid Myalgia Neuralgia Nasal decongestant Tension headache (topically)	Antispasmodic Cholagogue Menthol is active ingredient Antibacterial Antiviral Stimulates gastric secretion Coolant ↓ Lower esophageal sphincter tone Carminative	Nonenteric dosage may worsen heartburn in esophageal reflux and hiatal hernia Caution in pregnancy and in small children (choking from menthol) Allergic reactions Bradycardia Muscle tremor Dermatitis, skin rash Contraindicated in gallstones, achlorhydria, and liver damage	Infusion: 1-2 tsp dried leaves per 8 oz water Enteric-coated capsule (0.2 ml oil/capsule): 1-2 capsules tid Menthol 1.26%-16% applied topically up to qid	Antacids Cisapride
Saw palmetto *(Serenoa repens)*	Benign prostatic hyperplasia (stages I and II) Prostatitis	Antiandrogenic (5α-reductase) Bladder muscle spasmolytic Antiinflammatory	GI side effects Diarrhea Avoid in pregnancy Potential risk of aggravation of estrogen-sensitive tumors Rule out advanced prostatic hypertrophy and prostate cancer	Crude berries: 10 g bid Liposterolic extract (standardized at 85%-95% fatty acids and sterols): 160 mg bid	Anticoagulants Contraceptives Estrogens
St. John's wort *(Hypericum perforatum)*	Depression: mild to moderate Anxiety Insomnia Contusions First-degree burns Wound healing Antiinflammatory (topically) Myalgias Eczema	Affects neurotransmitters serotonin, dopamine, catecholamines, and possibly MAOIs; reduction of interleukin-6 Antiviral Antibacterial	Avoid in pregnancy (? uterotonic) GI side effects Photodermatitis Allergy Fatigue Insomnia Headache Restlessness Avoid in bipolar disorder	Dried flowers: 2-4 g tid Tincture (1:5): 3-6 ml tid Fluid extract (1:1): 1-2 ml tid Standardized fluid extract (0.14% hypericin: 1 mg hypericin/3 ml): 0.5-0.9 ml tid Standardized solid (dry powdered) extract (0.14% hypericin): 600 mg tid Standardized solid (dry powdered) extract (0.3% hypericin): 300 mg tid	Potential interaction with SSRIs, general anesthetics, and benzodiazepines Chemotherapy Cyclosporine Digoxin Indinavir Oral contraceptives Theophylline Trazadone *No longer contraindicated:* use with MAOIs, tyramine-containing compounds, 5-L-dopa, hydroxytryptophan

Common Herbs in Integrated Medicine

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses[b]	Drug Interactions[c]
Tea tree oil *(Melaleuca alternifolia)*	Skin infections Acne Mucosal and vaginal lesions Fungal infections (skin/nails)	Antibacterial Antiviral Antifungal	Contact dermatitis Allergic reaction Orally may cause significant toxicity; confusion and ataxia	Apply topically to affected area	None known
Valerian *(Valeriana officinalis)*	Insomnia Anxiety	GABA domain effects Improves latency and quality of sleep Improves slow-wave sleep	Overdose with temporary GI, chest, and CNS symptoms (?) Use in pregnancy and lactation Caution in children <12 years old Odor Cardiac disturbances *Note:* Valerian is not habit forming	Dried root (or as tea): 1-2 g Tincture (1:5): 4-6 ml (1-1.5 tsp) Fluid extract (1:1): 1-2 ml (0.5-1 tsp) Solid (dry powdered) extract (4:1): 250-500 mg Valerian extract (1%-1.5% valtrate or 0.5% valerenic acid): 150-300 mg	Avoid with benzodiazepines, barbiturates, general anesthetics, and alcohol Cytochrome P450 substrates

↑, Increased; ↓, decreased; *ACE,* angiotensin-converting enzyme; *AIDS,* acquired immunodeficiency syndrome; *bid,* twice daily; *BP,* blood pressure; *BPH,* benign prostatic hypertrophy; *CNS,* central nervous system; *g,* gram(s); *GABA,* gamma-aminobutyric acid; *GI,* gastrointestinal; *HIV,* human immunodeficiency virus; *IgE,* immunoglobulin E; *IV,* intravenous; *MAOIs,* monoamine oxidase inhibitors; *MS,* multiple sclerosis; *NSAIDs,* nonsteroidal antiinflammatory drugs; *PMS,* premenstrual syndrome; *PO,* oral; *qAM,* every morning; *qd,* every day; *qid,* four times daily; *SSRI,* selective serotonin reuptake inhibitor; *TB,* tuberculosis; *tid,* three times daily; *WBCs,* white blood cells.

[a]The most frequent indications are shown in boldface type.

[b]Dosages vary by preparation. Consult sources listed or expert practitioner.

[c]Drug–herb interactions: Many interactions as cited are theoretical, based on mechanism of action, pharmacokinetics, or other preclinical data and have not been observed in patients. Although this type of data suggests caution, it may not contraindicate combined use. For in-depth detail on interactions, consult the Natural Medicine Comprehensive Database, other sources listed, or an expert botanical medicine practitioner.

Appendix Ii

Herbal Activities Against Pain and Chronic Diseases

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses	Drug Interactions
Aloe vera—*Aloe vera*	Orally—constipation, ulcerative colitis, gastroesophageal reflux, gastritis, peptic ulcer disease Topically—psoriasis, minor cuts and burns	Orally the anthraquinone has powerful cathartic properties Also has antibacterial, antifungal, and antioxidant properties	General pain, abdominal pain and cramps, reduces inflammation Long-term use or abuse can cause diarrhea, weight loss, albuminuria, hematuria, and potassium depletion	Orally 100-200 mg aloe or 50 mg aloe extract daily Topically 0.5% aloe extract cream applied to area tid	Caution in patients on digoxins; prolonged use can lead to hypokalemia
Bilberry—*Vaccinium myrtillus*	Diabetic and hypertensive retinopathy	Flavonoid complex (anthocyanoside)		160 mg bid for retinopathy	—
Black cohosh—*Cimicifuga racemosa*	Menopausal symptoms (hot flashes) and mood disturbances	Estrogen-like effects without estrogenic activity	GI upset, rash, headache, dizziness Avoid in patients with hepatitis, breast cancer	Remifemin 20 mg tablet bid	No well-known drug interactions
Cranberry—*Vaccinium macrocarpon*	UTI prevention, urinary deodorizer	Proanthocyanidins seem to interfere with bacterial adherence to urinary tract epithelial cells Mild antiinflammatory, antiplatelet, and antitumor effects	Excessive use (greater than 1 L/day) over a prolonged period of time could lead to uric acid kidney stone formation	One 8-ounce glass per day	Daily ingestion of 250 ml cranberry juice can increase serum and urine salicylate level
Echinacea—*Echinacea angustifolia*	Decreases symptoms of common cold, diminishes recurrence of vaginal yeast infections	Immune stimulant	Nausea, abdominal pain, diarrhea, and vomiting Caution in patients with autoimmune disorders	A tablet of 300 mg of Echinacea dosed as 1-2 tablets given 3× daily	Theoretically can interfere with immunosuppressant medications
Elderberry—*Sambucus nigra*	Influenza	Antioxidant, antiinflammatory, and immunomodulating effects	—	Adult 15 ml qid for 3-5 days, child's dose is 15 ml (1 tablespoon) twice daily	—
Evening primrose oil—*Oenothera biennis*	Mastalgia, osteoporosis, atopic dermatitis, neuropathy	Gamma-linoleic acid (GLA)—antiinflammatory properties, possible antiestrogenic effects	Avoid in patients taking phenothiazines	3-4 g daily	Can potentiate effects of antiplatelet/anticoagulant drugs

Continued on following page

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses	Drug Interactions
Garlic—*Allium sativum*	Hypertension, atherosclerosis, prevention of stomach and colon cancer Topical treatment of dermal fungal infections (tinea corporis, tinea cruris, and tinea pedis)	Pharmacological effects attributed to allicin, ajoene, and other organosulfur constituents such as S-allyl-L-cysteine	Orally: breath and body odor, mouth and GI burning or irritation, heartburn, flatulence, nausea, vomiting, and diarrhea Topically: dermatitis, eczema, blisters, and scarring	Fresh garlic (1-2 cloves) per day, garlic extract (200-400 mg) 2 to 3× per day, topical garlic constituent ajoene at 0.4% cream, 0.6% gel, and 1.0% gel for the treatment of tinea	May potentiate effects of antiplatelet/anticoagulant drugs May decrease concentrations of HIV medications
Ginger—*Zingiber officinale*	Morning sickness, motion sickness, nausea/vomiting, arthritis	Antiemetic, antiinflammatory, antihypertensive, antiplatelet, antipyretic, and antitussive properties	Rare—abdominal discomfort, heartburn, diarrhea, and a pepper-like irritant effect in the mouth and throat	250 mg qid prn for morning sickness, 500-1000 mg 30 min before travel for motion sickness, 500-1000 mg 2 to 3× a day for arthritis	Theoretically ginger can potentiate the effects of antiplatelet and anticoagulant drugs
Ginkgo—*Ginkgo biloba*	Age-related memory impairment, improving cognitive function, dementia, diabetic retinopathy, glaucoma, intermittent claudication, PMS, Raynaud syndrome, vertigo, tinnitus, sexual dysfunction related to SSRIs	Antiinflammatory, reduces pain, antioxidant, free radical scavenger, inhibits platelet aggregation, protects cell membranes, erythrocytes, neurons, and retinal tissue	Mild GI upset, headache, dizziness, palpitations, constipation, and allergic skin reactions Rare cases of spontaneous bleeding and seizures	120-240 mg divided tid	Can potentiate effects of antiplatelet/anticoagulant drugs
Ginseng—*Panax ginseng*	Adaptogen, improving cognition, nourishing stimulant, aphrodisiac, treatment of diabetes, treatment of erectile dysfunction and premature ejaculation	Ginsenosides or panaxosides	Adverse effects and contraindications—generally well tolerated, most common adverse effect is insomnia	200-500 mg daily For erectile dysfunction: 900 mg tid	None known to exist, but there are several potential theoretical drug interactions
Grape seed—*Vitis vinifera*	Venous insufficiency, ocular stress, atherosclerosis, hypertension	Antioxidant, vasodilating, antilipoperoxidant, and antiplatelet effects	—	360-720 mg/day	Induces cytochrome P450 and may decrease plasma levels of common prescription drugs such as warfarin, clopidogrel, and propranolol
Kava kava—*Piper methysticum*	Anxiety, social anxiety disorder, cancer	Attributed to the kavalactones, which have anxiolytic, sedative, anticonvulsant, spasmolytic, antiinflammatory, and analgesic properties	Concern about potential hepatotoxicity has caused it to be banned from several countries, including Germany	100 mg tid (100 mg—standardized to contain 70% kavalactones)	Caution should to taken to avoid use with CNS depressants, such as benzodiazepines, alcohol, and barbiturates
Milk thistle—*Silybum marianum*	Type 2 diabetes, alcohol-induced liver damage and hepatitis B or C infection	Silymarin—antioxidant, free-radical scavenger, inhibitor of lipid peroxidation, TNF inhibitor, decreases insulin resistance	—	Silymarin 200 mg tid	Might inhibit cytochrome P450
Olive leaf—*Olea europaea*	Hyperlipidemia, hypertension, prevention of CAD, osteoarthritis, rheumatoid arthritis	Antiinflammatory, antiplatelet, antioxidant effects	—	2-3 tablespoons per day added to diet	—

Herb	Common Uses	Activity	Adverse Effects and Contraindications	Doses	Drug Interactions
Red clover—*Trifolium pretense*	Hot flashes, menopausal symptoms, hyperlipidemia	Contains isoflavones, acts as an alterative	Myalgia, headache, nausea, vaginal spotting	40-160 mg/day of standardized extract, 1-2 tsp dried flowers to make a cup of tea, or 2-4 ml of tincture 3 times a day	Theoretical interactions with birth control pills, estrogen replacement hormonal products, tamoxifen, blood thinners, and diabetes medications
Saw palmetto—*Serenoa repens*	BPH, alopecia	Antiandrogenic, antiproliferative, and antiinflammatory	Dizziness, headache, nausea, vomiting, constipation One case report of excessive bleeding during surgery (? antiplatelet effect)	160 mg twice daily or 320 mg once daily for BPH	Theoretically can potentiate effects of antiplatelet/anticoagulant drugs
Soy—*Glycine max*	Hyperlipidemia, menopausal symptoms, osteoporosis, cardiovascular disease	Contains phytoestrogens, known as isoflavones and lignans Rich in calcium, iron, potassium, amino acids, vitamins, and fiber	May cause endometrial hyperplasia	20-100 g/day of soy protein 50-120 mg/day of concentrated soy isoflavones	Tofu and soy sauce contain tyramine—avoid with MAO inhibitors Can interfere with absorption of oral thyroid hormone replacement
St. John's wort—*Hypericum perforatum*	Depression, somatization disorder, menstrual symptoms	Inhibits reuptake of serotonin, dopamine, and norepinephrine	Insomnia, vivid dreams, restlessness, anxiety, agitation, irritability, and mild GI complaints	300 mg tid	Multiple drug interactions, probably due to it being a potent inducer of cytochrome P450 Can decrease levels of common important drugs (digoxin, oral contraceptive pills, phenobarbital, phenytoin, and cyclosporine) Can also potentiate serotonin effects when taken with other SSRIs, Demerol, tramadol
Valerian—*Valeriana officinalis*	Insomnia, anxiety	GABA agonist	—	400-900 mg taken up to 2 hours before bedtime	Can theoretically potentiate effects of other CNS depressants such as benzodiazepines, alcohol, and opiates
Yohimbe—*Pausinystalia yohimbe*	Erectile dysfunction, sexual dysfunction	MAO inhibiting, calcium channel blocking, and peripheral serotonin receptor blocking effects	Excitation, tremor, insomnia, anxiety, hypertension, tachycardia, dizziness, gastric intolerance, salivation, sinusitis, irritability, headache, urinary frequency, fluid retention, rash, nausea, and vomiting Avoid in patients with CAD, hypertension, BPH, anxiety	15-30 mg daily	Can potentiate MAO inhibitors, TCAs, phenothiazines, and stimulant drugs Also antagonizing effects with antihypertensive drugs

bid, Twice daily; *BPH,* benign prostatic hypertrophy; *CAD,* coronary artery disease; *CNS,* central nervous system; *GABA,* gamma-aminobutyric acid; *GI,* gastrointestinal; *GLA,* gamma-linoleic acid; *MAO,* monoamine oxidase; *PMS,* premenstrual syndrome; *qid,* four times daily; *tid,* three times daily; *SSRI,* selective serotonin reuptake inhibitor; *TCA,* tricyclic antidepressant; *TNF,* tumor necrosis factor; *UTI,* urinary tract infection.

Appendix IIa

Dietary Supplements: What Every Primary Care Provider Should Know

Primary care providers must be knowledgeable regarding the safety, efficacy, and drug interactions associated with common dietary supplements because of the following:

- An estimated 33.2% of adults ages 18 years and older reported the use of at least one form of complementary health approach, according to the National Health Interview Survey in 2012.
- 18% of adults specifically reported the use of dietary supplements, with fish oil, glucosamine, chondroitin, melatonin, and pre/probiotics the most frequently used nonvitamin, nonmineral supplement.
- In a 2010 AARP telephone survey of older adults, almost one-third reported the use of herbal and other supplements, and almost half of those individuals using supplements did not tell their health care provider. https://nccih.nih.gov/research/statistics/2010

COMMON TERMINOLOGY

- A *dietary supplement* is defined as an oral product containing vitamins, minerals, herbs, or other botanicals; amino acids; dietary substances used to supplement the diet by increasing the total dietary intake; or a concentrate, metabolite, constituent, extract, or combination.
- *CAM* refers to the broad domain of healing practices that include diverse health systems, modalities, and practices and their accompanying theories and beliefs (see glossary of terms in Appendix Ia).
- *Complementary therapies* are those that are used *in addition to* conventional therapies, whereas *alternative therapies* are those that are used *instead of* conventional therapies. Integrative therapy is generally defined as the use of complementary medicine with conventional Western medicine in a coordinated manner. https://nccih.nih.gov/health/integrative-health#integrative

LEGISLATION

The U.S. Food and Drug Administration (FDA) is frequently criticized for not closely regulating dietary supplements and monitoring their safety. However, although the agency regulates prescription drugs and over-the-counter (OTC) products, the FDA has limited regulatory authority over dietary supplements. This is because the Dietary Supplement and Health Education Act (DSHEA) of 1994 and its resulting regulations limit the FDA's authority. As a result of DSHEA, the FDA is able to act only when a dietary supplement has been documented to contain a prescription drug, such as sildenafil and related compounds in supplements for erectile dysfunction or sibutramine in a weight-loss preparation. In addition, the FDA can act when safety issues related to a product have been clearly documented, although these cases are frequently challenged in the courts.

HEALTH CLAIMS

Dietary supplements generally are marketed under three types of health claims. The first category is the "nutrient content" claim, in which the product is identified as an excellent source of, typically, a mineral such as calcium, based on recommended daily values. The second type is the "significant scientific agreement" claim; these claims are used when some evidence of the product's efficacy exists (e.g., fish oil supplements). The third and most common type of health claim is called a "structure/function" claim; these claims state that the product has some effect on health—for example, "helps to maintain a healthy heart." However, dietary supplements are not permitted to carry claims stating that they are effective in preventing, treating, or curing diseases.

INFORMATION RESOURCES

Appendix Ic provides a brief overview of common dietary supplements. In the past, few evidence-based resources on dietary supplements were available. Clinical studies and systematic reviews on dietary supplements are now widely available through PubMed, EMBASE, and the Cochrane Database of Systematic Reviews. Although more information is available, references on specific products vary in their interpretation of the available evidence and may exhibit an unintentional bias, either pro or con, regarding the safety and efficacy of dietary supplements.

"Gold standard" evidence-based databases on dietary supplements (subscription required) include the following:

- Natural Medicines Professional Database (https://naturalmedicines.therapeuticresearch.com/) contains multiple databases including one listing many dietary supplements. Monographs include the different common and scientific names; uses and likely effectiveness for different uses; chemical constituents; interactions with drugs, diseases, foods, and laboratory tests; adverse effects; and cautions. The information is extensively referenced and is updated on a daily basis.
- ConsumerLab has a subscription-based database containing common popular dietary supplements as well as almost daily updates related to supplements in the news on its website (www.consumerlab.com). This organization is not affiliated with Consumer Reports and primarily conducts independent tests of the content of commercially available supplements.

Evidence-based free websites on dietary supplements include the following:

- National Center for Complementary and Integrative Health (NCCIH) https://nccih.nih.gov/health/providers
- Memorial Sloan-Kettering Cancer Center www.mskcc.org/cancer-care/diagnosis-treatment/symptom-management/integrative-medicine/herbs

DRUG INTERACTIONS

Clinically significant interactions have been documented between dietary supplements and prescription or OTC drugs. The challenge for primary care providers is to identify real, clinically relevant interactions versus potential or theoretical interactions. Data on interactions with dietary supplements are usually based on isolated case reports or on studies

enrolling healthy volunteers. As with drug-drug interactions, the likelihood of an interaction and its severity are influenced especially by concomitant medical conditions, such as heart failure and presence or absence of impaired kidney and liver function. Data also has suggested that the individual's genetic profile may influence the potential for drug-botanical supplement interactions.

Appendix Id lists interactions between selected dietary supplements and prescription and nonprescription drugs. The following two broad interactions are particularly important in primary care practice:

- St. John's wort, commonly used for depression, is a potent inducer of cytochrome P450 3A4 isoenzymes and has been documented to increase the clearance of many drugs that are metabolized through this and other pathways. In addition, St. John's wort may induce P-glycoprotein transporter systems that are important for digoxin and some chemotherapeutic agents. St. John's wort has also been associated with the development of serotonin syndrome when used with drugs that have significant serotonergic activity.
- Dietary supplements such as garlic, ginkgo, and feverfew, as well as many others, have been purported to either have antiplatelet activity or have effects on the clotting cascade. This may be important for adults also taking aspirin and other platelet-active agents, as well as warfarin and the direct-acting oral anticoagulants (DOACs).

COUNSELING POINTS

The single most important counseling point related to dietary supplements is to ask patients about their use of these products and to do so in an open, nonjudgmental manner. The approach should emphasize that many consumers have been interested in vitamins, minerals, herbs, teas, and so on, to maintain their health or to treat illness. If the clinician is unaware of the safety, efficacy, and interactions of a specific product, several websites are available to quickly scan for information. Also, access to drug information centers at colleges of pharmacy is frequently available, and some hospitals now offer programs in integrative medicine.

Patients should be asked about their goals in using the product, as well as how long they have taken it and in what dosage. Allergies to plants should be documented because cross-allergies are common. Clinicians should appreciate that individuals who use dietary supplements may be interested in making lifestyle changes and potentially decreasing their use of prescription drugs. In addition, if an individual is also consulting an alternative medicine practitioner, clinicians should recognize that some alternative health systems discourage the use of established therapies such as vaccines.

Although problems with safety and efficacy have been identified, many dietary supplements are benign except for their cost. Some patients are at higher risk for adverse outcomes from the use of dietary supplements (e.g., those with chronic kidney and liver disease). Patients should be counseled specifically to avoid purchasing dietary supplements over the Internet.

RESEARCH ISSUES

Many clinical and observational studies of dietary supplements have been published. In the past, clinicians frequently stated either that published studies of dietary supplements did not exist or that only a few were available. The reason for this finding was that in the past the National Library of Medicine did not abstract from the peer-reviewed alternative medicine literature. As with all research, the more rigorous the study methodology, the less likely the dietary supplement is to demonstrate clinical benefit.

In evaluating published studies of dietary supplements, the following should be considered:

- Has the correct plant and part of the plant (root, stem, leaf) been used? This critical information may not be known to many clinicians. Consulting a resource such as the National Medicines database can usually provide the needed information to judge this component of the study.
- Has the content of active ingredients been verified throughout the study? In a review of 81 major randomized controlled trials of herbal products, only 12 (15%) reported performing tests to quantify actual contents, and 3 (4%) provided adequate data to compare actual with expected content values of at least one chemical constituent.
- Is the severity of the disease appropriate for study? Negative studies with dietary supplements sometimes inappropriately enroll participants who have moderate-to-severe disease (e.g., those with depression or benign prostatic hyperplasia) when only mild disease would be appropriate.
- Is the duration of the study appropriate? Early studies comparing glucosamine and nonsteroidal antiinflammatory agents (NSAIAs) demonstrated greater efficacy with the NSAIAs because of an inadequate study duration for glucosamine to show any benefit.
- Is a placebo group included? Recent studies with dietary supplements for menopausal symptoms and osteoarthritis have demonstrated placebo responses over 40% to 50%.
- Was the blinding maintained throughout the study? Some dietary supplements, such as saw palmetto, have distinctive odors and tastes that are not easily masked.
- Is the preparation commercially available? Most important, when a study with dietary supplements does show benefit, it frequently is difficult to use the product in practice because the specific formulation studied is not commercially available.

Appendix IIb

Vitamins and Their Functions

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Fat-Soluble Vitamins				
Vitamin A	A family of the retinoid compounds, each member having biologic activity qualitatively similar to retinol. Carotenoids are structurally related to retinoids. Some carotenoids, most notably β-carotene, are metabolized into compounds with vitamin A activity and are therefore considered to be provitamin A compounds. Vitamin A is an integral component of rhodopsin and iodopsins, light-sensitive proteins in rod and cone cells in the retina. *Additional functions:* induction and maintenance of cellular differentiation in certain tissues; signal for appropriate morphogenesis in the developing embryo; maintenance of cell-mediated immunity. 1 μg of retinol = 3.33 IU of vitamin A.	Follicular hyperkeratosis and night blindness are early indicators. Conjunctival xerosis, degeneration of the cornea (keratomalacia), and dedifferentiation of rapidly proliferating epithelia are later indications of deficiency. *Bitot spots* (focal areas of the conjunctiva or cornea with foamy appearance) are an indication of xerosis. Blindness, due to corneal destruction and retinal dysfunction, ensues if left uncorrected. Increased susceptibility to infection is also a consequence. [F: 700 μg; M: 900 μg]	In adults, >150,000 μg may cause *acute* toxicity: fatal intracranial hypertension, skin exfoliation, and hepatocellular necrosis. *Chronic* toxicity may occur with habitual daily intake of >10,000 μg: alopecia, ataxia, bone and muscle pain, dermatitis, cheilitis, conjunctivitis, pseudotumor cerebri, hepatocellular necrosis, hyperlipidemia, and hyperostosis are common. Single, large doses of vitamin A (30,000 μg) or habitual intake of >4500 μg/day in early pregnancy can be teratogenic. Excessive intake of carotenoids causes a benign condition characterized by yellowish discoloration of the skin. Habitually large doses of canthaxanthin, a carotenoid, have the additional capability of inducing a retinopathy. [3000 μg]	Retinol concentration in the plasma and vitamin A concentrations in the milk and tears are reasonably accurate measures of adequate status. Toxicity is best assessed by elevated levels of retinyl esters in plasma. A quantitative measure of dark adaptation for night vision and electroretinography are useful functional tests.
Vitamin D	A group of sterol compounds whose parent structure is cholecalciferol (vitamin D_3). Cholecalciferol is formed in the skin from 7-dehydrocholesterol (provitamin D_3) by exposure to UVB radiation. A plant sterol, ergocalciferol (provitamin D_2), can be similarly converted into vitamin D_2 and has similar vitamin D activity. The vitamin undergoes sequential hydroxylations in the liver and kidney at the 25 and 1 positions, respectively, producing the most bioactive form of the vitamin, 1,25-dihydroxy vitamin D. Vitamin D maintains intracellular and extracellular concentrations of calcium and phosphate by enhancing intestinal absorption of the two ions and, in conjunction with PTH, promoting their mobilization from bone mineral. It retards proliferation and promotes differentiation in certain epithelia. Purported actions of vitamin D as an anti-diabetes, antiinflammatory, and cancer preventive agent remain controversial and are under investigation. 1 μg = 40 IU.	Deficiency results in decreased mineralization of newly formed bone called *rickets* in childhood and *osteomalacia* in adults. Expansion of the epiphyseal growth plates and replacement of normal bone with unmineralized bone matrix are the cardinal features of rickets; the latter feature also characterizes osteomalacia. Deformity of bone and pathologic fractures occur. Decreased serum concentrations of calcium and phosphate may occur. [15 μg, ages 19-70 yr; 20 μg, age >70 yr]	Excess amounts result in abnormally high concentrations of calcium and phosphate in the serum; metastatic calcifications, renal damage, and altered mentation may occur. [100 μg for ages ≥9 yr]	The serum concentration of the major circulating metabolite, 25-hydroxyvitamin D, is the best indicator of systemic status except in advanced kidney disease (stages 4 and 5), in which the impairment of renal 1-hydroxylation results in disassociation of the mono- and dihydroxyvitamin concentrations. Measurement of the serum concentration of 1,25-dihydroxyvitamin D is then necessary.

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Vitamin E	A group of at least 8 naturally occurring compounds, some of which are tocopherols and some of which are tocotrienols. At present, the only dietary form that is thought to be biologically active in humans is α-tocopherol. Vitamin E acts as an antioxidant and free radical scavenger in lipophilic environments, most notably in cell membranes. It acts in conjunction with other antioxidants, such as selenium.	Deficiency due to dietary inadequacy is rare. It is usually seen in premature infants, individuals with fat malabsorption, and individuals with abetalipoproteinemia. Red blood cell fragility occurs and can produce a hemolytic anemia. Neuronal degeneration produces peripheral neuropathies, ophthalmoplegia, and destruction of posterior columns of spinal cord. Neurologic disease is frequently irreversible if deficiency is not corrected early enough. May contribute to the hemolytic anemia and retrolental fibroplasia seen in premature infants. Reported to suppress cell-mediated immunity. [15 mg]	Depressed levels of vitamin K–dependent procoagulants and potentiation of oral anticoagulants have been reported, as has impaired WBC function. Doses of 800 mg/day have been reported to increase slightly the incidence of hemorrhagic stroke. [1000 mg]	Plasma or serum concentration of α-tocopherol is most commonly used. Additional accuracy is obtained by expressing this value per milligram of total plasma lipid. RBC peroxide hemolysis test is not entirely specific but is a useful functional measure of the antioxidant potential of cell membranes.
Vitamin K	A family of naphthoquinone compounds with similar biologic activity. Phylloquinone (vitamin K_1) is derived from plants; a variety of menaquinones (vitamin K_2) are derived from bacterial and animal sources. Vitamin K serves as an essential cofactor in the post-translational γ-carboxylation of glutamic acid residues in many proteins. These proteins include several circulating procoagulants and anticoagulants as well as proteins in a variety of tissues.	Deficiency syndrome is uncommon except in breast-fed newborns, in whom it may cause "hemorrhagic disease of the newborn"; in adults with fat malabsorption or who are taking drugs that interfere with vitamin K metabolism (e.g., coumarin, phenytoin, broad-spectrum antibiotics); and in individuals taking large doses of vitamin E and anticoagulant drugs. Excessive hemorrhage is the usual manifestation. [F: 90 μg; M: 120 μg]	Rapid intravenous infusion of K_1 has been rarely associated with dyspnea, flushing, and cardiovascular collapse; this is likely related to the dispersing agents in the solution. Supplementation may interfere with coumarin-based anticoagulation. Pregnant women taking large amounts of the provitamin menadione may deliver infants with hemolytic anemia, hyperbilirubinemia, and kernicterus. [no TUL established]	Prothrombin time is typically used as a measure of functional K status; it is neither sensitive nor specific for vitamin K deficiency. Determination of fasting plasma vitamin K is an accurate indicator of status. Undercarboxylated plasma prothrombin is also an accurate metric, but only for detecting the deficient state, and is less widely available than plasma vitamin K.
Water-Soluble Vitamins				
Thiamin (vitamin B_1)	A water-soluble compound containing substituted pyrimidine and thiazole rings and a hydroxyethyl side chain. The coenzyme form is thiamin pyrophosphate (TPP). Thiamin serves as a coenzyme in many α-ketoacid decarboxylation and transketolation reactions. Inadequate thiamin availability leads to impairments of these reactions, resulting in inadequate adenosine triphosphate synthesis and abnormal carbohydrate metabolism, respectively. It may have an additional role in neuronal conduction independent of the aforementioned actions.	Classic deficiency syndrome (beriberi) is described in Asian populations consuming a polished rice diet. Alcoholism, chronic renal dialysis, and persistent nausea and vomiting after bariatric surgery are also common precipitants. High carbohydrate intake increases need for B_1. *Mild deficiency*: irritability, fatigue, and headaches *More severe deficiency*: combinations of peripheral neuropathy, cardiovascular dysfunction, and cerebral dysfunction. Cardiovascular involvement (wet beriberi): congestive heart failure and low peripheral vascular resistance. Cerebral disease: nystagmus, ophthalmoplegia, and ataxia (Wernicke encephalopathy); hallucinations, impaired short-term memory, and confabulation (Korsakoff psychosis). Deficiency syndrome responds within 24 hr to parenteral thiamin but is partially or wholly irreversible after a certain stage. [F: 1.1 mg; M: 1.2 mg]	Excess intake is largely excreted in the urine, although parenteral doses of >400 mg/day are reported to cause lethargy, ataxia, and reduced tone of the gastrointestinal tract. [TUL not established]	The most effective measure of B_1 status is the erythrocyte transketolase activity coefficient, which measures enzyme activity before and after addition of exogenous TPP; RBCs from a deficient individual express a substantial increase in enzyme activity with addition of TPP. Thiamin concentrations in blood or urine are also used.
Riboflavin (vitamin B_2)	Consists of a substituted isoalloxazine ring with a ribitol side chain. Riboflavin serves as a coenzyme for a diverse array of biochemical reactions. The primary coenzymatic forms are flavin mononucleotide and flavin adenine dinucleotide. Riboflavin holoenzymes participate in oxidation-reduction reactions in myriad metabolic pathways.	Deficiency is usually seen in conjunction with deficiencies of other B vitamins. Isolated deficiency of riboflavin produces hyperemia and edema of nasopharyngeal mucosa, cheilosis, angular stomatitis, glossitis, seborrheic dermatitis, and a normochromic, normocytic anemia. [F: 1.1; M: 1.3]	Toxicity is not reported in humans. [TUL not established]	The most common method of assessment is to determine the activity coefficient of glutathione reductase in RBCs (the test is invalid for individuals with glucose-6-phosphate dehydrogenase deficiency). Measurements of blood and urine concentrations are less desirable methods.

Continued on following page

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Niacin (vitamin B_3)	Refers to nicotinic acid and the corresponding amide, nicotinamide The active coenzymatic forms are composed of nicotinamide affixed to adenine dinucleotide, forming NAD or NADP. More than 200 apoenzymes use these compounds as electron acceptors or hydrogen donors, either as a coenzyme or as a co-substrate. The essential amino acid tryptophan is a precursor of niacin; 60 mg of dietary tryptophan yields approximately 1 mg of niacin. Dietary requirements thus depend partly on tryptophan intake. Requirement is often determined on basis of calorie intake (i.e., niacin equivalents/1000 kcal). Large doses of nicotinic acid (1.5-3 g/day) effectively lower low-density lipoprotein cholesterol and elevate high-density lipoprotein cholesterol.	*Pellagra* is the classic deficiency syndrome and is often seen in populations in which corn is the major source of energy; it is still endemic in parts of China, Africa, and India. Diarrhea, dementia (or associated symptoms of anxiety or insomnia), and a pigmented dermatitis that develops in sun-exposed areas are typical features. Glossitis, stomatitis, vaginitis, vertigo, and burning dysesthesias are early signs. It is reported occasionally to occur in carcinoid syndrome because tryptophan is diverted to other synthetic pathways. [F: 14 mg; M: 16 mg]	Human toxicity is known largely through studies examining hypolipidemic effects. Includes vasomotor phenomenon (flushing), hyperglycemia, parenchymal liver damage, and hyperuricemia. [35 mg]	Assessment of status is problematic; blood levels of the vitamin are not reliable. Measurement of urinary excretion of the niacin metabolites *N*-methylnicotinamide and 2-pyridone is thought to be the most effective means of assessment at present.
Vitamin B_6	Refers to several derivatives of pyridine, including pyridoxine, pyridoxal, and pyridoxamine, which are interconvertible in the body. The coenzymatic forms are pyridoxal-5-phosphate (PLP) and pyridoxamine-5-phosphate. As a coenzyme, B_6 is involved in many transamination reactions (and thereby in gluconeogenesis), in the synthesis of niacin from tryptophan, in the synthesis of several neurotransmitters, and in the synthesis of δ-aminolevulinic acid (and therefore in heme synthesis). It also has functions unrelated to coenzymatic activity: pyridoxal and PLP bind to hemoglobin and alter oxygen affinity; PLP also binds to steroid receptors, inhibiting receptor affinity to DNA and thereby modulating steroid activity.	Deficiency is usually seen in conjunction with other water-soluble vitamin deficiencies. Stomatitis, angular cheilosis, glossitis, irritability, depression, and confusion occur in moderate to severe depletion; normochromic, normocytic anemia has been reported in severe deficiency. Abnormalities on electroencephalography and, in infants, convulsions have also been observed. Some sideroblastic anemias respond to B_6 administration. Isoniazid, cycloserine, penicillamine, ethanol, and theophylline can inhibit B_6 metabolism. [Ages 19-50 yr: 1.3 mg; >50 yr: 1.5 mg for women, 1.7 mg for men]	Long-term use with doses exceeding 200 mg/day (in adults) may cause peripheral neuropathies and photosensitivity. [100 mg]	Many useful laboratory methods of assessment exist. The plasma or erythrocyte PLP levels are most common. Urinary excretion of xanthurenic acid after an oral tryptophan load and activity indices of RBC alanine or aspartate transaminase are functional measures of B_6-dependent enzyme activity.
Folate	A group of related pterin compounds. More than 35 forms of the vitamin are found naturally. The fully oxidized form, folic acid, is not found in nature but is the pharmacologic form of the vitamin. All folate functions relate to its ability to transfer one-carbon groups. It is essential in the de novo synthesis of nucleotides and in the metabolism of several amino acids; it is an integral component for the regeneration of the "universal" methyl donor, *S*-adenosylmethionine. Inhibition of bacterial and cancer cell folate metabolism is the basis for the sulfonamide antibiotics and chemotherapeutic agents, such as methotrexate and 5-fluorouracil, respectively.	Women of childbearing age are most likely to be deficient. *Classic deficiency syndrome*: megaloblastic anemia, diarrhea. The hematopoietic cells in bone marrow become enlarged and have immature nuclei, reflecting ineffective DNA synthesis. The peripheral blood smear demonstrates macro-ovalocytes and polymorphonuclear leukocytes with an average of more than 3.5 nuclear lobes. Megaloblastic changes also occur in other epithelia that proliferate rapidly (e.g., oral mucosa and gastrointestinal tract, producing glossitis and diarrhea, respectively). Sulfasalazine and diphenytoin inhibit absorption and predispose to deficiency. [400 μg of dietary folate equivalents (DFE); 1 DFE = 1 μg food folate = 0.6 μg folic acid]	Doses >1000 μg/day may partially correct the anemia of B_{12} deficiency and may therefore mask (and perhaps exacerbate) the associated neuropathy. Large doses are also reported to lower seizure threshold in individuals prone to seizures. Parenteral administration is rarely reported to cause allergic phenomena, which is probably due to dispersion agents. [1000 μg]	Serum folate measures short-term folate balance, whereas RBC folate is a better reflection of tissue status. Serum homocysteine rises early in deficiency but is nonspecific because B_{12} or B_6 deficiency, renal insufficiency, and older age may also cause elevations.

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Vitamin C (ascorbic and dehydroascorbic acid)	Ascorbic acid readily oxidizes to dehydroascorbic acid in aqueous solution. Dehydroascorbic acid can be reduced in vivo, so it possesses vitamin C activity. Total vitamin C is therefore the sum of ascorbic and dehydroascorbic acid content. Vitamin C serves primarily as a biologic antioxidant in aqueous environments. Biosyntheses of collagen, carnitine, bile acids, and norepinephrine as well as proper functioning of the hepatic mixed-function oxygenase system depend on this property. Vitamin C in foodstuffs increases the intestinal absorption of nonheme iron.	Overt deficiency is uncommon in developed countries. The classic deficiency syndrome is *scurvy:* fatigue, depression, and widespread abnormalities in connective tissues, such as inflamed gingivae, petechiae, perifollicular hemorrhages, impaired wound healing, coiled hairs, hyperkeratosis, and bleeding into body cavities. In infants, defects in ossification and bone growth may occur. Tobacco smoking lowers plasma and leukocyte vitamin C levels. [F: 75 mg; M: 90 mg; increase requirement for cigarette smokers by 35 mg/day]	≥500 mg/day (in adults) may cause nausea and diarrhea. >1 g/day modestly increases risk for oxalate kidney stones. Supplementation may interfere with laboratory tests based on redox potential (e.g., fecal occult blood testing, serum cholesterol, and glucose). Withdrawal from chronic ingestion of high doses of vitamin C supplements should be done gradually because accommodation appears to occur, raising a concern of "rebound scurvy." [2 g]	Plasma ascorbic acid concentration reflects recent dietary intake, whereas WBC levels more closely reflect tissue stores. Women's plasma levels are approximately 20% higher than men's for any given dietary intake.
Vitamin B_{12}	A group of closely related cobalamin compounds composed of a corrin ring (with a cobalt atom in its center) connected to a ribonucleotide through an aminopropanol bridge. Microorganisms are the ultimate source of all naturally occurring B_{12}. The two active coenzyme forms are deoxyadenosylcobalamin and methylcobalamin. These coenzymes are needed for the synthesis of succinyl CoA, which is essential in lipid and carbohydrate metabolism, and for the synthesis of methionine. The synthesis of methionine is essential for amino acid metabolism, for purine and pyrimidine synthesis, for many methylation reactions, and for the intracellular retention of folates.	Dietary inadequacy is a rare cause of deficiency except in strict vegetarians. Most deficiencies arise from loss of intestinal absorption, which may occur with pernicious anemia, pancreatic insufficiency, atrophic gastritis, small bowel bacterial overgrowth, or ileal disease. Megaloblastic anemia and megaloblastic changes in other epithelia (see Folate) are the result of sustained depletion. Demyelination of peripheral nerves, posterior and lateral columns of spinal cord, and nerves within the brain may occur. Altered mentation, depression, and psychoses occur. Hematologic and neurologic complications may occur independently. Folate supplementation, in doses of 1000 μg/day, may partly correct the anemia, thereby masking (or perhaps exacerbating) the neuropathic complication. [2.4 μg]	A few allergic reactions have been reported to crystalline B_{12} preparations and are probably due to impurities, not the vitamin. [TUL not established]	Serum or plasma concentrations are generally accurate. Subtle deficiency with neurologic complications, as described in the Deficiency column, can best be established by concurrently measuring the concentration of plasma B_{12} and serum methylmalonic acid, which is a sensitive indicator of cellular deficiency.
Biotin	A bi-cyclic compound consisting of a ureido ring fused to a substituted tetrahydrothiophene ring. Endogenous synthesis by intestinal flora may contribute significantly to biotin nutriture. Most dietary biotin is linked to lysine, a compound called biotinyl lysine, or biocytin. The lysine must be hydrolyzed by an intestinal enzyme called biotinidase before intestinal absorption occurs. Biotin acts primarily as a coenzyme for several carboxylases; each holoenzyme catalyzes an adenosine triphosphate–dependent carbon dioxide transfer. The carboxylases are critical enzymes in carbohydrate and lipid metabolism.	Isolated deficiency is rare. Deficiency in humans has been produced by prolonged total parenteral nutrition lacking the vitamin and by ingestion of large quantities of raw egg white, which contains avidin, a protein that binds biotin with such high affinity that it renders it biounavailable. Alterations in mental status, myalgias, hyperesthesias, and anorexia occur. Later, a seborrheic dermatitis and alopecia develop. Deficiency is usually accompanied by lactic acidosis and organic aciduria. [30 μg]	Toxicity has not been reported in humans with doses as high as 60 mg/day in children. [TUL not established]	Plasma and urine concentrations of biotin are diminished in the deficient state. Elevated urine concentrations of methyl citrate, 3-methylcrotonylglycine, and 3-hydroxyisovalerate are also observed in deficiency.

Vitamins and Their Functions

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Pantothenic acid	Consists of pantoic acid linked to β-alanine through an amide bond Pantothenic acid is an essential component of CoA and phosphopantetheine, which are essential for synthesis and β-oxidation of fatty acids as well as for synthesis of cholesterol, steroid hormones, vitamins A and D, and other isoprenoid derivatives. CoA is also involved in the synthesis of several amino acids and δ-aminolevulinic acid, a precursor for the corrin ring of vitamin B_{12}, the porphyrin ring of heme, and of cytochromes. CoA is also necessary for the acetylation and fatty acid acylation of a variety of proteins.	Deficiency is rare; it has been reported only as a result of feeding of semisynthetic diets or an antagonist to the vitamin. Experimental, isolated deficiency in humans produces fatigue, abdominal pain, vomiting, insomnia, and paresthesias of the extremities. [5 mg]	In doses of 10 g/day, diarrhea is reported to occur. [TUL not established]	Whole blood and urine concentrations of pantothenate are indicators of status; serum levels are not thought to be accurate.

CoA, Coenzyme A; *NAD,* nicotinamide adenine dinucleotide; *NADP,* nicotinamide adenine dinucleotide phosphate; *PTH,* parathyroid hormone; *RBC,* red blood cell; *UVB,* ultraviolet B; *WBC,* white blood cell.

*Recommended daily allowance (RDA) established for female (F) and male (M) adults by the U.S. Food and Nutrition Board, 1999-2001. In some instances, insufficient data exist to establish an RDA, in which case the adequate intake (AI) established by the board is listed.

†Tolerable upper limit (TUL) established for adults by the U.S. Food and Nutrition Board, 1999-2001.

Appendix IIc

Nutritional Trace Elements and Their Clinical Implications

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Chromium	Dietary chromium consists of both inorganic and organic forms. Its primary function in humans is to potentiate insulin action. It accomplishes this function as a circulating complex called *glucose tolerance factor*, thereby affecting carbohydrate, fat, and protein metabolism.	Deficiency in humans has been described only in long-term total parenteral nutrition (TPN) patients receiving insufficient chromium. Hyperglycemia or impaired glucose tolerance occurs. Elevated plasma free fatty acid concentrations, neuropathy, encephalopathy, and abnormalities in nitrogen metabolism are also reported. Whether supplemental chromium may improve glucose tolerance in glucose-intolerant individuals remains controversial. [F: 25 µg; M: 35 µg]	Toxicity after oral ingestion is uncommon and seems confined to gastric irritation. Airborne exposure may cause contact dermatitis, eczema, skin ulcers, and bronchogenic carcinoma. [TUL not established]	Plasma or serum concentration of chromium is a crude indicator of chromium status; it appears to be meaningful when the value is markedly above or below the normal range.
Copper	Copper is absorbed by a specific intestinal transport mechanism. It is carried to the liver, where it is bound to ceruloplasmin, which circulates systemically and delivers copper to target tissues in the body. Excretion of copper is largely through bile and then into the feces. Absorptive and excretory processes vary with the levels of dietary copper, providing a means of copper homeostasis. Copper serves as a component of many enzymes, including amine oxidases, ferroxidases, cytochrome *c* oxidase, dopamine β-hydroxylase, superoxide dismutase, and tyrosinase.	Dietary deficiency is rare; it has been observed in premature and low-birthweight infants fed exclusively a cow's milk diet and in individuals on long-term TPN lacking copper. It has also been described after gastric bypass surgery and with chronic zinc supplementation. Clinical manifestations include depigmentation of skin and hair, myelopathy and other neurologic lesions, leukopenia, anemia, and skeletal abnormalities. Anemia arises from impaired utilization of iron and therefore often is manifested as a sideroblastic anemia. The peripheral smear and bone marrow may mimic myelodysplasia. A deficiency syndrome is also observed in Menkes disease, a rare inherited condition associated with impaired copper utilization. [900 µg]	Acute copper toxicity has been described after excessive oral intake and with absorption of copper salts applied to burned skin. Milder manifestations include nausea, vomiting, epigastric pain, and diarrhea; coma and hepatic necrosis may ensue in severe cases. Toxicity may be seen with doses as low as 70 µg/kg/day. Chronic toxicity is also described. Wilson disease is a rare, inherited disease associated with abnormally low ceruloplasmin levels and accumulation of copper in the liver and brain, eventually leading to damage to these two organs. [10 mg]	Practical methods to detect marginal deficiency are not available. Marked deficiency is reliably detected by diminished serum copper and ceruloplasmin concentrations as well as by low red blood cell superoxide dismutase activity.
Fluorine	Known more commonly by its ionic form, fluoride. Fluorine is incorporated into the crystalline structure of bone, thereby altering its physical characteristics.	Intake of <0.1 mg/day in infants and <0.5 mg/day in children is associated with an increased incidence of dental caries. Optimal intake in adults is between 1.5 and 4 mg/day. [F: 3 mg; M: 4 mg]	Acute ingestion of >30 mg/kg body weight is likely to cause death. Excessive chronic intake (0.1 mg/kg/day) leads to mottling of teeth (dental fluorosis), calcification of tendons and ligaments, and exostoses and may increase the brittleness of bones. [10 mg]	Estimates of intake and clinical assessment are used because no good laboratory test exists.

Continued on following page

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Iodine	Iodine is readily absorbed from the diet, concentrated in the thyroid, and integrated into the thyroid hormones thyroxine and triiodothyronine. These hormones circulate largely bound to thyroxine-binding globulin. They modulate resting energy expenditure and, in the developing human, growth and development.	In the absence of supplementation, populations relying primarily on food from soils with low iodine content have endemic iodine deficiency. Maternal iodine deficiency leads to fetal deficiency, which produces spontaneous abortions, stillbirths, hypothyroidism, cretinism, and dwarfism. Permanent cognitive deficits may result from iodine deficiency during the first 2 years of life. In the adult, compensatory hypertrophy of the thyroid (goiter) occurs along with varying degrees of hypothyroidism. [150 µg]	Large doses (>2 mg/day in adults) may induce hypothyroidism by blocking thyroid hormone synthesis. Supplementation with >100 mg/day to an individual who was formerly deficient occasionally induces hyperthyroidism. [1.1 mg]	Iodine status of a population can be estimated by the prevalence of goiter. Urinary excretion of iodine is an effective laboratory means of assessment. Thyroid-stimulating hormone blood level is an indirect and therefore not entirely specific means of assessment.
Iron	Conveys the capacity to participate in redox reactions to a number of metalloproteins, such as hemoglobin, myoglobin, cytochrome enzymes, and many oxidases and oxygenases. The primary storage form of iron is ferritin and, to a lesser degree, hemosiderin. Intestinal absorption is 15%-20% for "heme" iron and 1%-8% for iron contained in vegetables. Absorption of the latter form is enhanced by the ascorbic acid in foodstuffs; by poultry, fish, or beef; and by an iron-deficient state. It is decreased by phytate and tannins.	Iron deficiency is the most common micronutrient deficiency in the world. Women of childbearing age are the group at highest risk because of menstrual blood losses, pregnancy, and lactation. The classic deficiency syndrome is hypochromic, microcytic anemia. Glossitis and koilonychia ("spoon" nails) are also observed. Easy fatigability often is an early symptom, before anemia appears. In children, mild deficiency of insufficient severity to cause anemia is associated with behavioral disturbances and poor school performance. [postmenopausal F and M: 8 mg; premenopausal F: 18 mg]	Iron overload typically occurs when habitual dietary intake is extremely high, intestinal absorption is excessive, repeated parenteral administration occurs, or a combination of these factors exists. Excessive iron stores usually accumulate in the reticuloendothelial tissues and cause little damage (hemosiderosis). If overload continues, iron eventually begins to accumulate in tissues such as the hepatic parenchyma, pancreas, heart, and synovium, causing hemochromatosis. Hereditary hemochromatosis results from homozygosity of a common recessive trait. Excessive intestinal absorption of iron is seen in homozygotes. [45 mg]	Negative iron balance initially leads to depletion of iron stores in the bone marrow; a bone marrow biopsy and the concentration of serum ferritin are accurate indicators of early depletion. As the severity of deficiency proceeds, serum iron (SI) decreases and total iron-binding capacity (TIBC) increases; an iron saturation (SI/TIBC) of <16% suggests iron deficiency. Microcytosis, hypochromia, and anemia ensue. Elevated levels of serum ferritin or an iron saturation of >60% suggests iron overload, although systemic inflammation elevates serum ferritin regardless of iron status.
Manganese	A component of several metalloenzymes. Most manganese is in mitochondria, where it is a component of manganese superoxide dismutase.	Manganese deficiency in the human has not been conclusively demonstrated. It is said to cause hypocholesterolemia, weight loss, hair and nail changes, dermatitis, and impaired synthesis of vitamin K–dependent proteins. [F: 1.8 mg; M: 2.3 mg]	Toxicity by oral ingestion is unknown in humans. Toxic inhalation causes hallucinations, other alterations in mentation, and extrapyramidal movement disorders. [11 mg]	Until the deficiency syndrome is better defined, an appropriate measure of status will be difficult to develop.
Molybdenum	A cofactor in several enzymes, most prominently xanthine oxidase and sulfite oxidase	A probable case of human deficiency is described as being secondary to parenteral administration of sulfite and resulted in hyperoxypurinemia, hypouricemia, and low sulfate excretion. [45 µg]	Toxicity not well described in humans, although it may interfere with copper metabolism at high doses. [2 mg]	Laboratory means of assessment are not meaningful until the deficiency syndrome is better described.
Selenium	Most dietary selenium is in the form of an amino acid complex. Nearly complete absorption of such forms occurs. Homeostasis is largely performed by the kidney, which regulates urinary excretion as a function of selenium status. Selenium is a component of several enzymes, most notably glutathione peroxidase and superoxide dismutase. These enzymes protect against oxidative and free radical damage of various cell structures. The antioxidant protection conveyed by selenium apparently operates in conjunction with vitamin E because deficiency of one seems to potentiate damage induced by a deficiency of the other. Selenium also participates in the enzymatic conversion of thyroxine to its more active metabolite, triiodothyronine.	Deficiency is rare in North America but has been observed in individuals on long-term TPN lacking selenium. Such individuals have myalgias or cardiomyopathies. Populations in some regions of the world, most notably some parts of China, have marginal intake of selenium. In these regions *Keshan disease*, a condition characterized by cardiomyopathy, is endemic; it can be prevented (but not treated) by selenium supplementation. [55 µg]	Toxicity is associated with nausea, diarrhea, alterations in mental status, peripheral neuropathy, and loss of hair and nails; such symptoms were observed in adults who inadvertently consumed 27-2400 mg. [400 µg]	Erythrocyte glutathione peroxidase activity and plasma or whole blood selenium concentrations are the most commonly used methods of assessment. They are moderately accurate indicators of status.

	Biochemistry and Physiology	Deficiency [RDA*]	Toxicity [TUL†]	Assessment of Status
Zinc	Intestinal absorption occurs by a specific process that is enhanced by pregnancy and corticosteroids and diminished by coingestion of phytates, phosphates, iron, copper, lead, or calcium. Diminished intake of zinc leads to an increased efficiency of absorption and decreased fecal excretion, providing a means of zinc homeostasis. Zinc is a component of more than 100 enzymes, among which are DNA polymerase, RNA polymerase, and transfer RNA synthetase.	Zinc deficiency has its most profound effect on rapidly proliferating tissues. *Mild deficiency:* growth retardation in children. *More severe deficiency:* growth arrest, teratogenicity, hypogonadism and infertility, dysgeusia, poor wound healing, diarrhea, dermatitis on the extremities and around orifices, glossitis, alopecia, corneal clouding, loss of dark adaptation, and behavioral changes. Impaired cellular immunity is observed. Excessive loss of gastrointestinal secretions through chronic diarrhea and fistulas may precipitate deficiency. *Acrodermatitis enteropathica* is a rare, recessively inherited disease in which intestinal absorption of zinc is impaired. [F: 8 mg; M: 11 mg]	Acute zinc toxicity can usually be induced by ingestion of >200 mg of zinc in a single day (in adults). It is manifested by epigastric pain, nausea, vomiting, and diarrhea. Hyperpnea, diaphoresis, and weakness may follow inhalation of zinc fumes. Copper and zinc compete for intestinal absorption: long-term ingestion of >25 mg/day of zinc may lead to copper deficiency. Long-term ingestion of >150 mg/day has been reported to cause gastric erosions, low high-density lipoprotein cholesterol levels, and impaired cellular immunity. [40 mg]	No accurate indicators of zinc status exist for routine clinical use. Plasma, red blood cell, and hair zinc concentrations are often misleading. Acute illness, in particular, is known to diminish plasma zinc levels, in part by inducing a shift of zinc out of the plasma compartment and into the liver. Functional tests that determine dark adaptation, taste acuity, and rate of wound healing lack specificity.

*Recommended daily allowance (RDA) established for female (F) and male (M) adults by the U.S. Food and Nutrition Board, 1999–2001. In some instances, insufficient data exist to establish an RDA, in which case the adequate intake (AI) established by the board is listed.

†Tolerable upper limit (TUL) established for adults by the U.S. Food and Nutrition Board, 1999–2001.

Appendix IId

Summary of Vitamin and Mineral Deficiencies

Vitamin and Mineral Deficiencies	Neurologic Syndrome or Syndromes	Supporting Tests	Treatment	Causes (Other Than Malnutrition)
A (retinol)	Blindness from retinal or corneal damage	Visual fields, visual acuity Serum level <30-65 μg/dl	30,000 IU vitamin A daily ×1 wk	Hypothyroidism, diabetes, renal or liver failure
B_1 (thiamine)	Wernicke encephalopathy: ataxia, nystagmus, ophthalmoparesis, confusion, delirium Korsakoff syndrome: amnesia, confabulation Beriberi: axonal neuropathy	MRI: symmetric lesions of midbrain (periaqueductal area), pons, hypothalamus, thalamus, cerebellum MRI: necrosis of mammillary bodies, dorsomedial and anterior thalamus Nerve conduction tests: decreased amplitude Serum thiamine level <20 ng/dl Erythrocyte transketolase	Prevent by 100 mg PO daily before and 1 year after bariatric surgery, 100 mg IV before glucose administration or refeeding Treat Wernicke encephalopathy with 5 days of thiamine, 100-500 mg IV or IM daily, then PO 100 mg daily Antioxidants (*N*-acetylcysteine)	Alcoholism, bariatric or other major GI surgery, prolonged vomiting, hemodialysis, diuretic treatment of heart failure, cachexia, 5-fluorouracil, other blockers of thiamine phosphate production
B_3 (niacin)	Pellagra: confusion, dementia, weakness, ataxia, spasticity, myoclonus, glossitis, dermatitis, photosensitivity	Erythrocyte NAD, plasma niacin, urinary N_1-methylnicotinamide	Nicotinic acid, 50 mg PO tid or 25 mg IV tid; nicotinamide, 50-100 mg IM or PO tid	Alcoholism, corn- or cereal-based diet, Hartnup syndrome, carcinoid syndrome
B_5 (pantothenic acid)	Dysesthesias, foot paresthesias	Deficient coenzyme A	5 mg PO daily	Severe malnutrition
B_6 (pyridoxine)	Neuropathy, sensory ataxia, depression Infantile pyridoxine-deficient epilepsy	Plasma PLP <27 nmol/L; urinary 4-pyridoxic acid, <3 nmol ↑ Homocysteine after methionine loading challenge ↑ α-AASA in urine, plasma, CSF	50-100 mg PO daily for neuropathy (preventive use if taking B_6 antagonist) 100-200 mg daily for adult epilepsy	Diverticulosis, isoniazid, cycloserine, other antagonists Genetic defects in antiquitin (aldehyde dehydrogenase), pyridoxal synthesis
B_{12} (cobalamin)	Myelopathy with spastic paraparesis and sensory ataxia, peripheral neuropathy, optic neuropathy, memory loss, dementia; indirect contributor to stroke	Blood level <200 pg/ml↑ Methylmalonic acid >145 nmol/L Intrinsic factor antibodies Schilling test, megaloblastic anemia Delayed somatosensory evoked potentials ↑ Homocysteine, total >12.5 μmol/L	IM B_{12}, 1000 μg daily for 1 week, then weekly for 1 month, then monthly or oral B_{12}, 1000 μg daily, or nasal B_{12}, 500 μg weekly for lifetime if abnormal absorption, 50-100 μg daily if normal absorption	Achlorhydria, gastric or ileal resection, blind loop syndrome, sprue, HIV infection, nitrous oxide anesthesia (especially abuse), fish tapeworm, vegan diet
D (calciferol)	Proximal myopathy, often painful; cognitive impairment Secondary compression of spinal cord, plexus, or peripheral nerves from rickets or osteomalacia	25-(OH) vitamin D_3 level <10 ng/ml in urine Serum calcium ↑ PTH >54 pg/ml Osteopenia/porosis on bone densitometry	Daily supplementation with 400 IU, >50,000 IU 3 times per wk if malabsorption; use blood level or urine calcium excretion to guide (should be >100 mg/day)	Lack of exposure to sunlight, including sunblock protection; chronic antiepileptic drug use

Vitamin and Mineral Deficiencies	Neurologic Syndrome or Syndromes	Supporting Tests	Treatment	Causes (Other Than Malnutrition)
E (tocopherol)	Spinal and cerebellar ataxia, Babinski sign, ophthalmoplegia, peripheral neuropathy, retinitis pigmentosa	Vitamin E level <2.5 mg/L (normal, 6-15 with normal lipid level) ↑ A-β-lipoprotein levels, antigliadin antibodies Genetic analysis to rule out other spinocerebellar ataxias such as Friedreich ataxia	Supplement with 6-800 IU, 5-10 mg/kg twice daily, for ataxia of genetic causes, water-soluble 200 mg/kg/day or IM α-tocopherol for malabsorption	Biliary atresia, celiac sprue, genetic: ↓ α-tocopherol transport protein (8q13), microsomal triglyceride transfer protein
Folate	Dementia, B_{12} deficiency, stroke	↑ Homocysteine, plasma level <2.5 μg/L	1 mg 3 times per day until normal level, then maintenance of 1 mg/day Pregnancy: additional 0.4 mg/day if taking a folate antagonist	Malabsorption or use of antagonist (methotrexate) or antiepileptic medication
K (phytonadione)	Intracranial hemorrhage	INR or PT elevation	IM phytonadione at birth, maternal vitamin K for last month of pregnancy	Medication use that increases metabolism, such as phenytoin
Copper	Myelopathy, neuropathy	Serum Cu <75 μg/dl, ↓ urinary Cu, ceruloplasmin <23 mg/dl MRI: ↑ T_2 signal in cervical cord, dorsal column Mutation in ATP7A gene (Menkes disease)	Elemental Cu, 8 mg/day PO week 1, 6 mg/day week 2, 4 mg/day week 3, 2 mg/day ongoing malabsorption Menkes disease: 250 mg SC bid	Wilson disease, Menkes disease, alcoholism, malabsorption, gastric bypass, zinc toxicity
Magnesium	Seizures, encephalopathy	Serum magnesium <1.5 mg/ dl, correct for low albumin	Magnesium sulfate IV or POAvoid magnesium-wasting drugs	Alcoholism, especially beer
Potassium	Muscle weakness, chronic, acute	Serum potassium <3.5 mEq/L, ECG	IV or PO KCl until normalized	Diuretic use, bulimia

AASA, Aminoadipic semialdehyde; *CSF,* cerebrospinal fluid; *ECG,* electrocardiography; *GI,* gastrointestinal; *HIV,* human immunodeficiency virus; *IM,* intramuscularly; *INR,* international normalized ratio; *IU,* international units; *IV,* intravenously; *MRI,* magnetic resonance imaging; *NAD,* nicotinamide adenine dinucleotide; *PLP,* pyridoxal-5-phosphate (active coenzyme of pyridoxine); *PO,* by mouth; *PT,* prothrombin time; *PTH,* parathyroid hormone; *tid,* three times a day.

From Goldman L, Schafer AI: *Goldman's Cecil medicine,* ed 24, Philadelphia, 2012, Saunders.

Appendix IIIa

Selected Historical and Physical Findings in Poisoning

Sign	Toxin
Odor	
Bitter almonds	Cyanide
Acetone	Isopropyl alcohol, methanol, paraldehyde, salicylates
Rotten eggs	Hydrogen sulfide, sulfur dioxide, methyl mercaptans (additive to natural gas)
Wintergreen	Methyl salicylate
Garlic	Arsenic, thallium, organophosphates, selenium
Ocular Signs	
Miosis	Opioids (except propoxyphene, meperidine, and pentazocine), organophosphates and other cholinergics, clonidine, phenothiazines, sedative-hypnotics, olanzapine
Mydriasis	Anticholinergics (e.g., antihistamines, TCAs, atropine), sympathomimetics (cocaine, amphetamines, PCP), post-anoxic encephalopathy, opiate withdrawal, cathinones, MDMA
Nystagmus	Anticonvulsants, sedative-hypnotics, alcohols, PCP, ketamine, dextromethorphan
Lacrimation	Organophosphates, irritant gas or vapors
Retinal hyperemia	Methanol
Cutaneous Signs	
Diaphoresis	Cholinergics (organophosphates), sympathomimetics, withdrawal syndromes
Alopecia	Thallium, arsenic
Erythema	Boric acid, elemental mercury, cyanide, carbon monoxide, disulfiram, scombroid, anticholinergics, vancomycin
Cyanosis (unresponsive to oxygen)	Methemoglobinemia (e.g., benzocaine, dapsone, nitrites, phenazopyridine), amiodarone, silver
Oral Signs	
Salivation	Organophosphates, salicylates, corrosives, ketamine, PCP, strychnine
Oral burns	Corrosives, oxalate-containing plants
Gum lines	Lead, mercury, arsenic, bismuth
Gastrointestinal Signs	
Diarrhea	Antimicrobials, arsenic, iron, boric acid, cholinergics, colchicine, opioid withdrawal
Hematemesis	Arsenic, iron, caustics, NSAIDs, salicylates
Constipation	Lead
Cardiac Signs	
Tachycardia	Sympathomimetics, anticholinergics, antidepressants, antipsychotics, methylxanthines (theophylline, caffeine), salicylates, cellular asphyxiants (cyanide, carbon monoxide, hydrogen sulfide), withdrawal (ethanol, sedatives, clonidine, opioids), serotonin syndrome, neuroleptic malignant syndrome, MDMA, cathinones
Bradycardia	β-blockers, calcium channel blockers, digoxin, clonidine, organophosphates, opioids, sedative-hypnotics
Hypertension	Sympathomimetics, anticholinergics, monoamine oxidase inhibitors, serotonin syndrome, neuroleptic malignant syndrome, clonidine withdrawal
Hypotension	β-blockers, calcium channel blockers, cyclic antidepressants, iron, antipsychotics, barbiturates, clonidine, opioids, arsenic, amatoxin mushrooms, cellular asphyxiants (cyanide, carbon monoxide, hydrogen sulfide), snake envenomation
Respiratory Signs	
Depressed respirations	Opioids, sedative-hypnotics, alcohol, clonidine, barbiturates
Tachypnea	Salicylates, sympathomimetics, caffeine, metabolic acidosis, carbon monoxide, hydrocarbon aspiration

Sign	Toxin
Central Nervous System Signs	
Ataxia	Alcohols, anticonvulsants, sedative-hypnotics, lithium, dextromethorphan, carbon monoxide, inhalants
Coma	Opioids, sedative-hypnotics, anticonvulsants, antidepressants, antipsychotics, ethanol, anticholinergics, clonidine, GHB, alcohols, salicylates, barbiturates
Seizures	Sympathomimetics, anticholinergics, antidepressants (especially TCAs, bupropion, venlafaxine), cholinergics (organophosphates), isoniazid, camphor, lindane, salicylates, lead, nicotine, tramadol, water hemlock, withdrawal
Delirium/psychosis	Sympathomimetics, anticholinergics, LSD, PCP, hallucinogens, lithium, dextromethorphan, steroids, withdrawal, MDMA, cathinones
Peripheral neuropathy	Lead, arsenic, mercury, organophosphates, nicotine

GHB, γ-hydroxybutyrate; *LSD,* lysergic acid diethylamide; *MDMA,* 3,4-methylenedioxymethamphetamine (Ecstasy); *NSAIDs,* nonsteroidal anti-inflammatory drugs; *PCP,* phencyclidine; *TCAs,* tricyclic antidepressants.

From Kliegman RM: *Nelson textbook of pediatrics,* ed 21, Philadelphia, 2020, Elsevier.

Appendix IIIb

Toxidromes

TABLE 1 Recognizable Poison Syndromes

	Signs						
Toxidrome	**Vital Signs**	**Mental Status**	**Pupils**	**Skin**	**Bowel Sounds**	**Other**	**Possible Toxins**
Sympathomimetic	Hypertension, tachycardia, hyperthermia	Agitation, psychosis, delirium, violence	Dilated	Diaphoretic	Normal to increased		Amphetamines, cocaine, PCP, bath salts (cathinones), ADHD medication
Anticholinergic	Hypertension, tachycardia, hyperthermia	Agitation, delirium, coma, seizures	Dilated	Dry, hot	Diminished	Ileus urinary retention	Antihistamines, TCAs, atropine, jimsonweed
Cholinergic	Bradycardia, BP and temp typically normal	Confusion, coma, fasciculations	Small	Diaphoretic	Hyperactive	Diarrhea, urination, bronchorrhea, bronchospasm, emesis, lacrimation, salivation	Organophosphates (insecticides, nerve agents), carbamates (physostigmine, neostigmine, pyridostigmine) Alzheimer medications, myasthenia treatments
Opioids	Respiratory depression, bradycardia, hypotension, hypothermia	Depression, coma, euphoria	Pinpoint	Normal	Normal to decreased		Methadone, buprenorphine, morphine, oxycodone, heroin, etc.
Sedative-hypnotics	Respiratory depression, HR normal to decreased, BP normal to decreased, temp normal to decreased	Somnolence, coma	Small or normal	Normal	Normal		Barbiturates, benzodiazepines, ethanol
Serotonin syndrome (similar findings with neuroleptic malignant syndrome)	Hyperthermia, tachycardia, hypertension or hypotension (autonomic instability)	Agitation, confusion, coma	Dilated	Diaphoretic	Increased	Neuromuscular hyperexcitability: clonus, hyperreflexia (lower > upper extremities)	SSRIs, lithium, MAOIs, linezolid, tramadol, meperidine, dextromethorphan
Salicylates	Tachypnea, hyperpnea, tachycardia, hyperthermia	Agitation, confusion, coma	Normal	Diaphoretic	Normal	Nausea, vomiting, tinnitus, ABGs with primary respiratory alkalosis and primary metabolic acidosis; tinnitus or difficulty hearing	Aspirin and aspirin-containing products, methyl salicylate
Withdrawal (sedative-hypnotic)	Tachycardia, tachypnea, hyperthermia	Agitation, tremor, seizure, hallucinosis, delirium tremens	Dilated	Diaphoretic	Increased		Lack of access to ethanol, benzodiazepines, barbiturates, GHB, or excessive use of flumazenil
Withdrawal (opioid)	Tachycardia	Restlessness, anxiety	Dilated	Diaphoretic	Hyperactive	Nausea, vomiting, diarrhea	Lack of access to opioids or excessive use of naloxone

ABGs, Arterial blood gases; *ADHD,* attention-deficit/hyperactivity disorder; *BP,* blood pressure; *GHB,* γ-hydroxybutyrate; *HR,* heart rate; *MAOIs,* monoamine oxidase inhibitors; *PCP,* phencyclidine; *SSRIs,* selective serotonin reuptake inhibitors; *temp,* temperature; *TCAs,* tricyclic antidepressants.

From Kliegman RM: *Nelson textbook of pediatrics,* ed 21, Philadelphia, 2020, Elsevier.

TABLE 2 Laboratory Clues in Toxicologic Diagnosis

Anion Gap Metabolic Acidosis (Mnemonic = Mudpiles Cat)

Methanol, metformin
Uremia
Diabetic ketoacidosis
Propylene glycol
Isoniazid, iron, massive ibuprofen
Lactic acidosis
Ethylene glycol
Salicylates
Cellular asphyxiants (cyanide, carbon monoxide, hydrogen sulfide)
Alcoholic ketoacidosis
Tylenol (clinical significance depends upon presence or absence of liver injury)

Elevated Osmolar Gap

Alcohols: Ethanol, isopropyl, methanol, ethylene glycol

Hypoglycemia (Mnemonic = Hobbies)

Hypoglycemics, oral: Sulfonylureas, meglitinides
Other: Quinine, unripe ackee fruit
Beta-blockers
Insulin
Ethanol
Salicylates (late)

Hyperglycemia

15Salicylates (early)
Calcium channel blockers
Caffeine

Hypocalcemia

Ethylene glycol
Fluoride

Rhabdomyolysis

Neuroleptic malignant syndrome, serotonin syndrome
Statins
Mushrooms (*Tricholoma equestre*)
Any toxin causing prolonged immobilization (e.g., opioids, antipsychotics), excessive muscle activity or seizures (e.g., sympathomimetics)

Radiopaque Substance on KUB (Mnemonic = Chipped)

Chloral hydrate, calcium carbonate
Heavy metals (lead, zinc, barium, arsenic, lithium, bismuth)
Iron
Phenothiazines
Play-Doh, potassium chloride
Enteric-coated pills
Dental amalgam, drug packets

KUB, Kidney-ureter-bladder radiograph.
From Kliegman RM: *Nelson textbook of pediatrics,* ed 21, Philadelphia, 2020, Elsevier.

TABLE 3 Substances Poorly Adsorbed by Activated Charcoal

Alcohols
Caustics: Alkalis and acids
Cyanide
Heavy metals (e.g., lead)
Hydrocarbons
Iron
Lithium

From Kliegman RM: *Nelson textbook of pediatrics,* ed 21, Philadelphia, 2020, Elsevier.

Appendix IIIc

Antidotes and Indications for Use

Antidote	Indication for Use	Dose*	Treatment End Point	Comments
Antivenom, *Crotalidae* (Fab)†	Crotaline snake (e.g., rattlesnakes, copperhead)	4-6 vials; repeat for persistent or worsening clinical condition; repeated doses of 2 vials at 6, 12, and 18 hr after initial antivenom dose are recommended	Halt in progression of circumferential and proximal swelling Resolving systemic effects	Better safety profile than historical equine-derived antivenom Repetitive dosing indicated for recurrent soft tissue swelling Less effective at correcting hematologic (i.e., coagulation and platelet) disorders
Antivenom, *Latrodectus* (equine)†	Black widow spider (*Latrodectus* sp)	1 vial diluted in 50-100 ml NS, infused during 1 hr; can repeat	Resolution of symptoms, vital signs normal	Dilution and slow infusion rate are *critical* to avoid anaphylactoid reaction Indications include severe pain unresponsive to opioids and severe hypertension Serum sickness can occur IV calcium is ineffective
Atropine	Carbamates Nerve agents Organophosphorus compounds	2 mg IV; double the dose every 5 min to achieve atropinization and hemodynamic stability; then start continuous infusion of 10-20% of total stabilizing dose per hour	Cessation of excessive oral and pulmonary secretions, >80 beats/min, systolic blood pressure >80 mm Hg	Doubling of the dose every 5 min (e.g., 2, 4, 8, and 16 mg) estimated to achieve atropinization within 30 min Stop infusion when patient develops concerning signs or symptoms of anticholinergic toxidrome; restart infusion at lower rate when signs or symptoms abate
Calcium salt‡	Calcium-channel antagonists	Calcium chloride 10%, 10 ml (1 g) during 10 min; can be given in 1 min if critically ill Calcium gluconate 10%, 30 ml (3 g) during 10 min; can be given in 1 min if critically ill	Reversal of hypotension; may not reverse bradycardia	*All indications:* Monitor ionized calcium levels IV extravasation causes tissue necrosis, especially with calcium chloride Can administer at faster than stated rates for immediate life-threatening conditions (i.e., in 1 min) Calcium chloride contains three times more elemental calcium than calcium gluconate does
	Hydrofluoric acid	Systemic toxicity: calcium gluconate 10%, 1-3 g (10-30 ml) per dose IV during 10-min period; repeat as needed every 5-10 min	Reversal of life-threatening manifestations of hypocalcemia and hyperkalemia	Can dilute and give intra-arterially or IV with a Bier block for extremity exposures and burns
	Hyperkalemia (except cardiac glycosides)	Calcium gluconate 10%, 1 g (10 ml) per dose IV during 10-min period; repeat as needed every 5-10 min	Reversal of myocardial depression and conduction delays	May precipitate ventricular arrhythmias
	Hypermagnesemia	Calcium gluconate 10%, 1-2 g (10-20 ml) per dose IV during 10-min period; repeat as needed every 5-10 min	Reversal of respiratory depression, hypotension, and cardiac conduction blocks	Simultaneous therapies to increase magnesium elimination should be instituted
	Hypocalcemia (e.g., ethylene glycol)	Calcium gluconate 10%, 0.5-1.0 g (5-10 ml) per dose during 10-min period; repeat as needed every 10 min	Reversal of tetany	Correct symptomatic hypocalcemia; avoid excessive administration that may increase production of calcium oxalate crystals in ethylene glycol poisoning
L-Carnitine	Valproate-induced hyperammonemia or hepatotoxicity	100 mg/kg (maximum 6 g) IV during 30 min, then 15 mg/kg IV during 30-min period q4h (maximum 6 g/day)	Treat until clinical improvement occurs	Levocarnitine is active form Adjust dose for end-stage renal disease

Antidote	Indication for Use	Dose*	Treatment End Point	Comments
Cyanide antidote kit Amyl nitrite Sodium nitrite Sodium thiosulfate [Hydroxocobalamin is preferred if available, see below]	Cyanide	Amyl nitrite: 0.3-ml pearls, crush and inhale during 30-sec period Sodium nitrite 3%: 10 ml IV during 10-min period Sodium thiosulfate 25%: 50 ml (12.5 g) IV during 10-min period	Resolution of lactic acidosis and moderate to severe clinical signs and symptoms: seizures, coma, dyspnea, apnea, hypotension, bradycardia	Coordinate amyl nitrite with continued oxygenation and give only until sodium nitrite infusion is begun; nitrites may produce hypotension and excess methemoglobinemia Sodium nitrite dose must be adjusted if patient has hemoglobin <12 g/dl Sodium thiosulfate dosing can be repeated
Deferoxamine	Iron	Initiate at 5 mg/kg/hr, titrate to 15 mg/kg/hr IV (maximum 8 g/day) Mild to moderate: administer for 6-12 hr Severe toxicity: administer 24 hr	Resolution of clinical signs and symptoms Do not use urine color, which is an unreliable marker for iron clearance Laboratory testing is unreliable while antidote is being received	Indications: symptomatic patients with lethargy, severe abdominal pain, hypovolemia, acidosis, shock; any symptomatic patient with peak serum iron level >350 g/dl Prolonged therapy can cause pulmonary toxicity
Digoxin-specific antibody fragments (Fab)	Digoxin Digitalis and related plants (e.g., oleander, lily of the valley) Other cardiac glycosides (e.g., bufadienolides [Bufo toads])	Unknown digoxin dose or serum level, or for plant or toad source: acute toxicity—10-20 vials; chronic toxicity—3-6 vials Digoxin dose known: number of vials = (mg ingested × 0.8) ÷ 0.5 Digoxin serum level known: number of vials = [serum level (ng/ml) × weight (kg)] ÷ 100 Infuse dose during 30 min	Resolution of hyperkalemia, symptomatic bradydysrhythmias, ventricular arrhythmias, Mobitz II or third-degree heart block	Each vial binds 0.5 mg of digoxin or digitoxin Monitor ECG and potassium levels Digoxin serum levels unreliable after antidote administered unless test is specific for free serum digoxin
Dimercaprol (BAL)	Arsenic Lead Mercury, elemental and inorganic salts	Arsenic: 3-5 mg/kg IM q4h Lead: 75 mg/m^2 (4 mg/kg) IM q4h for 5 days Inorganic mercury: 5 mg/kg IM, then 2.5 mg/kg IM q12h for 10 days or until patient is clinically improved	Arsenic: 24-hr urinary arsenic <50 μg/L Lead: encephalopathy resolved, blood lead level <100 μg/dl, and succimer therapy can be started Mercury, elemental and inorganic: 24-hr urinary mercury <20 μg/L	Formulated in peanut oil; painful IM injection and caution with allergy Maximum adult dose is 3 g/day BAL started 4 hr before initiation of concomitant $CaNa_2$ EDTA for lead encephalopathy Dosing not well established for arsenic and elemental or inorganic mercury toxicity; not used for organic mercury poisoning Adverse effects: painful injections, fever, diaphoresis, agitation, headache, salivation, nausea and vomiting, hemolysis in G6PD-deficient patients, chelation of essential metals Check essential metal levels if chelation is prolonged Succimer is replacing BAL for many indications except lead encephalopathy Treatment end points for arsenic and mercury include improving clinical condition
Edetate calcium disodium ($CaNa_2$ EDTA)	Lead	1500 mg/m^2/24 hr (maximum 3 g) by continuous infusion	Treat for 5 days, followed by 2-day hiatus; repeat until encephalopathy resolved, lead level <100 μg/dl, and succimer therapy can be started	Use in patients with lead encephalopathy or lead level >100 g/dl Administer BAL 4 hr before initiating $CaNa_2$ EDTA Hydrate patient and establish good urinary output before starting therapy Avoid thrombophlebitis by diluting in NS or D_5W to a concentration ≤0.5% Substitution of Na_2 EDTA can cause fatal hypocalcemia
Flumazenil	Benzodiazepines	0.1 mg/min IV to a total dose of 1 mg	Reversal of coma	Limit use to reversal of inadequate ventilation in benzodiazepine-toxic patients Acute benzodiazepine withdrawal may occur in patients dependent on benzodiazepines Increases intracranial pressure and risk for seizures in presence of underlying seizure disorder or ingestion of seizure-producing toxicants Monitor for resedation up to 2 hr after last dose

Continued on following page

Antidotes and Indications for Use

Antidote	Indication for Use	Dose*	Treatment End Point	Comments
Folinic acid (tetrahydrofolic acid [leucovorin])	Methanol Methotrexate	Methanol: 50 mg IV q4h Methotrexate: 100 mg/m^2 IV during 15-30 min q3-6h; dosing lower when used as "rescue" in chemotherapy	Methanol: methanol undetectable, metabolic acidosis cleared Methotrexate: serum level $<1 \times 10^{-8}$ mol/L	Essential therapy for both toxicants Little concern with excessive dosing when used for methotrexate overdose Methotrexate: large overdoses may require increased dose Glucarpidase administered 2-4 hr before or after folinic acid
Fomepizole	Ethylene glycol Methanol	Dose 1: 15 mg/kg IV Doses during next 48 hr: 10 mg/kg IV All subsequent doses: 15 mg/kg IV Administer q12h, except when HD performed: HD initiation: next dose if >6 hr since last dose HD ongoing: q4h End of HD (based on time of last dose): <1 hr, no dose; 1-3 hr, next dose; >3 hr, next dose	For both: serum level <25 mg/dl and metabolic acidosis resolved	Start immediately if toxic alcohol suspected, without waiting for confirmatory levels Dose amount is not affected by interval timing of doses
Glucagon	β-Adrenergic receptor antagonists Calcium-channel antagonists	Bolus of 3-5 mg IV; can repeat to achieve clinical effect, then infusion of 2-10 mg/hr	Reversal of hypotension and bradycardia; taper infusion	Can precipitate vomiting; be prepared to protect airway Mild hyperglycemia occurs Maximum dosing amounts unknown; bolus doses up to 30 mg reported Duration of effect is 15 min; thus infusion must be started immediately
Hydroxocobalamin	Cyanide	Initial: 5 g IV during 15-min period Second dose: 5 g IV during 15 min to 2 hr; maximum total dose is 10 g Follow each hydroxocobalamin dose with sodium thiosulfate 25%: 50 ml (12.5 g) IV during 10-min period	Resolution of lactic acidosis and moderate to severe clinical signs and symptoms: seizures, coma, dyspnea, apnea, hypotension, bradycardia	Can be administered IV push if patient is in cardiac arrest Do not give hydroxocobalamin and sodium thiosulfate through the same IV line Adverse effects: red discoloration of plasma, urine, mucous membranes, skin; transient hypertension Interference with laboratory colorimetric assays: Levels increased: bilirubin; creatinine; glucose; hemoglobin; magnesium; co-oximetry total Hb, COHb%, MetHb% Levels decreased: AST, ALT, creatinine, co-oximetry O_2 Hb%
Hyperbaric oxygen (HBO)	Carbon monoxide Experimental: carbon tetrachloride, cyanide, hydrogen sulfide	3.0 atm pressure for 60 min (25 min O_2, 5 min air, 25 min O_2, 5 min air), then 2.0 atm for 65 min (30 min O_2, 5 min air, 30 min O_2), then "surface" to 1.0 atm	One treatment Repeated treatment controversial	Carbon monoxide: treatment protocols may vary HBO indicated for loss of consciousness; seizures; cerebellar dysfunction; impaired cognition; headache, nausea/vomiting persisting after 4 hr of O_2 therapy regardless of carboxyhemoglobin level
Insulin-glucose	Calcium-channel antagonists β-Adrenergic receptor antagonists	Regular insulin, 1 U/kg bolus, followed by 0.5-1 U/kg/hr Titrate 50% dextrose IV to avoid hypoglycemia	Reversal of myocardial depression	Initiate early to reverse myocardial depression Monitor glucose and potassium; hypoglycemia can occur during and after therapy Hyperglycemia results from calcium-channel antagonist–induced insulin resistance, and initial dextrose requirements may be less than anticipated Recovery may be heralded by normalization of glucose levels, with increased dextrose required to avoid hypoglycemia
Lipid emulsion	Cardiac toxicity from local anesthetics (e.g., bupivacaine, ropivacaine) Experimental: verapamil, diltiazem, tricyclic antidepressants, bupropion, propranolol, and other lipophilic toxicants	Use 20% formulation Initial bolus: 1.5 ml/kg IV during 1 min, followed immediately by infusion of 0.25 ml/kg/min for 30-60 min Can repeat bolus for asystole	Return of hemodynamic stability	Use for other than bupivacaine based on animal experiments and human case reports; numerous dosing regimens have been used Use if advanced life support measures fail; continue CPR as needed during drug administration

Antidote	Indication for Use	Dose*	Treatment End Point	Comments
Methylene blue	Methemoglobin-producing agents	1-2 mg/kg body weight (0.1-0.2 ml/kg of 1%) methylene blue during 5-min period; repeat dose for persistent or recurrent symptoms or signs	Resolution of dyspnea and altered mental status	Use if patient is symptomatic (i.e., dyspneic, altered mental status) Maximum dose should not exceed 7 mg/kg (0.7 ml/kg) Contraindicated in G6PD-deficient patients; may cause hemolysis Some toxicants (e.g., dapsone) may require prolonged therapy
N-Acetylcysteine (NAC) [7]	Acetaminophen Experimental: carbon tetrachloride, chloroform, pennyroyal oil	Oral (total 72 hr) Load: 140 mg/kg Maintenance (starting 4 hr after load): 70 mg/kg q4h × 17 doses IV (total 21 hr) Load: 150 mg/kg during 1-hr period Maintenance infusion: 12.5 mg/kg/hr during 4-hr period, then 6.25 mg/kg/hr over 16 hr as continuous infusion	At the end of therapy, repeat AST and APAP levels: if AST normal and APAP not detected, treatment complete; if AST normal and APAP detected, continue NAC; if AST elevated, continue NAC After patient has received full course of NAC therapy, if INR ≥2.0 or severe hepatotoxicity present (AST >1000 U/L), continue NAC until INR <2.0 and aminotransferases normalize	Most effective if initiated within 8 hr after ingestion; may be started any time after ingestion and is beneficial in severe hepatotoxic states Longer duration of treatment may be required in patients with hepatotoxicity Treatment end points simplified for ease of use INR result not valid indicator if FFP recently administered
Naloxone	Opioids	Opioid dependence possible: 40-50 μg (0.04-0.05 mg) IV titrated upward to reversal, while avoiding withdrawal if concerns for opioid dependence Opioid dependence not likely: 0.4 mg by any route and titrate up to 10 mg Continuous infusion: establish bolus dose required to reverse respiratory depression; begin infusing two thirds of reversal dose every hour and titrate to maintain adequate respirations; repeated bolus with half of reversal dose 15 min after reversal of respiratory depression	Initial: reversal of respiratory depression with resolution of hypoxia and hypercapnia Final: resolution of CNS and respiratory depression	Pre-ventilate patients with respiratory depression by bag-valve-mask or intubation before administration Use smaller doses in opioid-dependent patients Some opioids (e.g., buprenorphine) may require larger doses of naloxone Use continuous infusion for recurrent symptoms and prolonged action of some formulations (e.g., sustained-release morphine, methadone) Re-sedation can occur Do not use naltrexone to reverse acute toxicity
Octreotide	Sulfonylurea-induced hypoglycemia	50 mg SC q6h	Resolution of hypoglycemia and dextrose not required	Maintain dextrose infusion as needed Not for insulin-induced hypoglycemia
Physostigmine	Anticholinergic agents (e.g., diphenhydramine, jimsonweed [*Datura* sp], scopolamine)	1-2 mg IV during 5-min period; can repeat in 5 min if no effect and cholinergic effects do not occur	Reversal of anticholinergic effects	Duration of effect is 60-90 min Benzodiazepine used for subsequent treatment of agitation and seizures; additional physostigmine used rarely (e.g., refractory seizures or agitation) Adverse effects include seizures, excessive oral secretions, bradyarrhythmias; contraindicated in cyclic antidepressant toxicity
Pralidoxime chloride	Organophosphorus compounds Nerve agents: sarin, VX	30 mg/kg IV bolus (maximum 2 g) during 30 min, followed by continuous infusion of 8-10 mg/kg/hr (maximum 650 mg/hr)	Resolution of signs and symptoms, atropine no longer required	Can give initial dose during 2-min period for life-threatening clinical effects Administer early when diagnosis known or strongly suspected Efficacy variable, depending on the organophosphate Fat-soluble organophosphates may require prolonged treatment
Pyridoxine	Ethylene glycol Isoniazid Monomethylhydrazine (*Gyromitra esculenta* mushrooms)	100 mg IV 5 g IV, repeat for refractory seizures	One dose Resolution of seizures	Efficacy theoretical for ethylene glycol to enhance elimination of toxic metabolites Pyridoxine may be required even with benzodiazepines to stop seizures, but patient can remain comatose (isoniazid, *Gyromitra* mushrooms) Excessive dosing can cause neuropathy

Antidotes and Indications for Use

Antidote	Indication for Use	Dose*	Treatment End Point	Comments
Sodium bicarbonate ($NaHCO_3$)	Reversal of myocardial sodium-channel blockers (e.g., cyclic antidepressants, cocaine, sodium-channel–blocking antiarrhythmics with $\tau_{recovery}$ >1 sec, piperidine phenothiazines (thioridazine, mesoridazine)	1-2 mEq $NaHCO_3$/kg by intermittent bolus; repeat as needed	Narrowing of prolonged QRS, resolution of ventricular arrhythmias, reversal of hypotension	Monitor blood pH (optimal pH approximately 7.50); avoid pH >7.55
	Altered tissue distribution or enhanced elimination of salicylates; may be used for chlorophenoxy herbicides, formic acid, methotrexate, phenobarbital	1-2 mEq $NaHCO_3$/kg, followed by 3 ampules (150 ml) $NaHCO_3$ (44 mEq per 50 ml) in 850 ml of D_5W, infused at 2-3 times normal maintenance fluid rate	Serum salicylate <30 mg/dl and patient clinically stable	Target blood pH: 7.50-7.55 Monitor urinary pH hourly; adjust infusion to maintain urine pH of 7.5-8.0 (avoid blood pH >7.55) Monitor ABGs Maintain normokalemia
Succimer (DMSA)	Arsenic Lead Mercury, all forms	10 mg/kg/dose q8h for 5 days, followed by q12h for 14 days Drug holiday for 2 weeks; repeat if treatment end point not reached	Arsenic: 24-hr urinary arsenic <50 μg/L Lead: resolution of encephalopathy, gastrointestinal symptoms, neuropathy, nephropathy, arthralgias, myalgias, and blood lead level <70 μg/dl Mercury, elemental and inorganic: 24-hr urinary mercury <20 μg/L Mercury, organic: end point not well established	Oral chelator; adverse effects include rash, transient AST and alkaline phosphatase elevations, and gastrointestinal distress; minimal chelation of essential metals occurs Dosing for arsenic and mercury not well established Therapeutic end point for organic mercury not established; neurotoxicity not responsive to chelation therapy; suggest chelation until blood mercury level within normal-value range for reference laboratory
Vitamin K	Vitamin K antagonist anticoagulants (e.g., warfarin, long-acting anticoagulant rodenticides [LAARs]) [note that this is not for normalizing a supratherapeutic INR in patients prescribed warfarin]	Subcutaneous: AquaMEPHYTON (K_1), 10-25 mg, repeat every 6-12 hr until oral vitamin K_1 started Oral: 25-50 mg q6h; larger doses may be required	INR is normal 48-72 hr after stopping vitamin K_1 therapy Can also monitor factor VII activity	Anaphylactoid reaction can occur with rapid IV administration Severe bleeding may also require FFP, prothrombin protein concentrate (off label), or factor concentrates Base decision to treat on finding of elevated INR; do not administer prophylactic vitamin K_1 Oral therapy may be required for months with LAAR poisoning because of lipophilicity of toxicant, with slow body clearance

ABGs, Arterial blood gases; *ALT,* alanine aminotransferase; *APAP,* acetyl-*p*-aminophenol (acetaminophen); *AST,* aspartate aminotransferase; *BAL,* British antilewisite; *CNS,* central nervous system; *COHb%,* percentage carboxyhemoglobin; *CPR,* cardiopulmonary resuscitation; *D_5W,* 5% dextrose in water; *DMSA,* 2,3-dimercaptosuccinic acid; *ECG,* electrocardiogram; *FFP,* fresh-frozen plasma; *G6PD,* glucose-6-phosphate dehydrogenase; *Hb,* hemoglobin; *HD,* hemodialysis; *INR,* international normalized ratio; *MetHb%,* percentage methemoglobinemia; *NS,* normal saline; *O_2 Hb%,* percentage oxyhemoglobin; $\tau_{recovery}$, drug blockade recovery rate.

*Dose concentrations and infusion times are not given. Drug dosages may require adjustment in patients with renal or hepatic failure.

†Administer antivenom in a monitored setting; antivenom must be reconstituted and then diluted; initially infuse at a rate of 2-5 ml/hr, and double the infusion rate every 5 min as tolerated to administer antivenom during a 1-hr period.

‡Ten percent calcium chloride solution = 100 mg/ml (27.2 mg/ml elemental calcium); 10% calcium gluconate solution = 100 mg/ml (9 mg/ml elemental calcium).

Appendix IIIe

Pathophysiology, Clinical Effects, and Management of Specific Drugs and Toxicants

Drug or Toxicant	Pathophysiology	Clinical Effects	Laboratory	Specific Therapy
Acetaminophen	NAPQI (toxic metabolite) binds hepatic and renal tubular cells; acetaminophen itself induces transient decrease in functional factor VII	• Initial: Nausea, vomiting, coma, lactic acidosis in severe cases • Days 1-3: Elevated INR, aminotransferase, and bilirubin levels; RUQ tenderness; increased creatinine level in severe cases • Days 4-14: Gradual recovery or continued increase in INR and creatinine, lactic acidosis, coma, cerebral edema, death	• Potentially toxic level ≥150 µg/ml 4 hr after ingestion* • INR may be transiently elevated in first 24 hr because of decrease in functional factor VII; further increases indicate hepatic necrosis; elevated aminotransferase and bilirubin levels not predictive of hepatic failure • Creatinine elevated in severe cases	NAC can increase INR but not aPTT†
Amphetamines	• Increased release of presynaptic norepinephrine and dopamine • Increased serotonin release (especially MDMA, PMA, DOB, other synthetic amphetamines)	• Mild: Euphoria, decreased appetite, repetitive behavior • Moderate: Vomiting, agitation, hypertension, tachycardia, mydriasis, bruxism, diaphoresis • Severe: Hypertension or hypotension, arrhythmias, hyperthermia, seizures, coma, hepatotoxicity, rhabdomyolysis, DIC, hyponatremia (SIADH), renal failure, cerebral infarction or hemorrhage	Not helpful; many false-positives and false-negatives on screening tests	• IV crystalloid • External cooling • Benzodiazepines or barbiturates to control agitation or seizure • Benzodiazepines or nitroprusside for hypertension • See SSRIs/SRIs for features and treatment of serotonin syndrome
β-Adrenergic receptor antagonists	Blocks catecholamines from β-adrenergic receptors • α- and β-adrenergic receptor antagonism: Carvedilol, labetalol • Delayed rectifier potassium-channel blockade: Sotalol	Bradyarrhythmias, decreased myocardial contractility, hypotension, respiratory depression, decreased consciousness with seizures or coma (lipophilic agents, e.g., propranolol), prolonged QT interval (sotalol)	• ECG • No specific tests	• IV glucagon, 3.5-5 mg over 2-min period; if no increase in BP or HR, can repeat up to 10 mg; if effective, immediately start continuous infusion at 2-10 mg/hr; if still unstable, options include (1) regular insulin, 1 U/kg by IV bolus, followed by 1 U/kg/hr, plus dextrose to maintain euglycemia; (2) norepinephrine or dobutamine infusion titrated to desirable BP and HR; (3) IV milrinone, 50 µg/kg over 10-min period, then 0.375-0.75 µg/kg/min based on hemodynamic status‡ • Electrical pacing and IABP in refractory cases

Drug or Toxicant	Pathophysiology	Clinical Effects	Laboratory	Specific Therapy
L-type calcium-channel antagonists	• Blocks L-type voltage-sensitive calcium channels, thereby decreasing calcium entry into myocardial and vascular smooth muscle cells • Decreases pancreatic insulin release and increases insulin resistance	Bradyarrhythmias (verapamil, diltiazem), hypotension, hyperglycemia	• ECG • No specific tests	• IV 10% calcium chloride, 10-20 mg/kg (0.1-0.2 ml/kg); can repeat once; if BP improves, continuous infusion at 0.2-0.5 ml/kg/hr (20-50 mg/kg/hr) • Ionized Ca2+ levels should not exceed 2× normal (severe cases will be refractory to calcium therapy) • Glucagon, high-dose insulin and dextrose, catecholamines, and milrinone (as for β-adrenergic antagonists)
Cardiac glycosides, including digoxin, bufadienolides (toxic toad venom), or cardenolides (e.g., oleander, lily of the valley, dogbane)	• Inhibits Na+, K+-ATPase • Decreased CNS sympathetic output • Decreased baroreceptor sensitivity • Increased vagal acetylcholine discharge	• Bradyarrhythmias, including second- and third-degree AV block and asystole • Ventricular ectopy, tachycardia, fibrillation • Junctional tachycardia, paroxysmal atrial tachycardia with block • Weakness, visual disturbances, nausea, vomiting	• Serum digoxin level • Serum potassium (hyperkalemia occurs in acute poisoning; hypokalemia may be present in chronic poisoning), magnesium, and creatinine levels	• Correct hypokalemia and hypomagnesemia; do not give calcium • Digoxin-specific antibody fragments (Fab) indicated if patient has hemodynamically significant arrhythmias, serum potassium ≥5 mg/L, Mobitz II or third-degree AV block, ingestion of bufadienolide- or cardenolide-containing agents, or renal insufficiency • Empirical dose • Chronic: 2-5 vial • Acute: 10-20 vial • Calculated dose • Chronic: Number of vials = 2 × serum digoxin level (ng/ml) × 5.6 × weight (kg)/1000 • Acute: Number of vials = 2 × oral digoxin dose (mg) × 0.8
Cyclic antidepressants	Myocardial sodium- and potassium-channel blockade Blockade of α-adrenergic and cholinergic muscarinic receptor Inhibition of norepinephrine reuptake	• Decreased level of consciousness (can develop rapidly), myoclonus, seizures, coma • Anticholinergic toxidrome • Sinus tachycardia, ventricular conduction delays, ventricular arrhythmias, asystole • Hypotension	Serum levels not helpful in management	• Intermittent IV boluses of NaHCO3 (1 mEq/kg) to maintain arterial pH at 7.5 because acidemia can worsen cardiovascular complications • Intubation and neuroparalytic drugs may be useful to ameliorate acidemia from muscular hyperactivity while seizures are being treated • Contraindicated drugs: Types IA and IC antiarrhythmic agents; physostigmine, flumazenil
Ethylene glycol, methanol (e.g., antifreeze, window cleaners, camping stove fuels)	• Ethylene glycol: Toxic metabolites produce cytotoxicity in CNS, kidneys, lungs, heart, liver, muscles; metabolic acidosis is due to glycolate accumulation; oxalate complexes with calcium, so hypocalcemia can develop • Methanol: Metabolized to formic acid, which is responsible for metabolic acidosis and inhibition of cytochrome aa3; target organs include retina, optic nerve, CNS	• Ethylene glycol: CNS depression, cerebral edema, seizures, anion gap metabolic acidosis, renal failure with acute tubular necrosis, pulmonary edema, myositis • Methanol: Nausea, vomiting; cerebral edema, hemorrhage, infarcts; necrosis of thalamus and putamen; anion gap metabolic acidosis; visual disturbances, papilledema, hyperemic optic disc, nonreactive pupils	• Serum ethylene glycol and methanol levels; levels may be low or undetectable if significant metabolism has occurred • Ethylene glycol: Serum calcium, creatinine, BUN levels; examine urine for calcium oxalate crystals; false hyperlactatemia occurs with certain analyzers using l-lactate oxidase, which cross-reacts with glycolic and glyoxylic acids	• For both: Fomepizole (which inhibits alcohol dehydrogenase and blocks formation of toxic metabolites), 15 mg/kg IV loading dose, then 10 mg/kg IV for 4 doses during the next 48 hr, then 15 mg/kg for subsequent doses; interval dosing is q12h (q4h during hemodialysis, with dosing interval adjustments at start and finish); continue until ethylene glycol or methanol is no longer detectable • Use of ethanol is no longer recommended • Hemodialysis: Initiate if level is ≥50 mg/dl or metabolic acidosis with end-organ toxicity; continue until acidosis resolves and serum level of ethylene glycol or methanol is undetectable • Monitor for cerebral edema with possible herniation • Ethylene glycol: IV calcium for symptomatic hypocalcemia • Methanol: Folinic acid, 50 mg IV q4h until methanol not detectable and acidosis cleared

Continued on following page

Drug or Toxicant	Pathophysiology	Clinical Effects	Laboratory	Specific Therapy
γ-Hydroxybutyrate (GHB) and its precursors (γ-butyrolactone and 1,4-butanediol [1,4-BD])	Agonist effect on CNS GHB receptors; indirect action with opioid receptors (may increase proenkephalins); metabolized to GABA, interacts with $GABA_B$ receptors; decreases dopamine release	• CNS: Rapid loss of consciousness, with recovery typical within 2-4 hr; myoclonus (possible seizures) • Respiratory depression; bradycardia; nausea, vomiting	No specific tests	• Supportive care, including respiratory support as needed • Withdrawal resembles sedative-hypnotic withdrawal and can be treated with benzodiazepines or pentobarbital
Lithium	Decreases brain inositol; alters CNS serotonin, dopamine, and norepinephrine; inhibits adenylate cyclases, including those that mediate vasopressin-induced renal concentration and thyroid function	• Chronic toxicity usually more severe than acute toxicity: Tremor, hyperreflexia, drowsiness, incoordination, clonus, confusion, ataxia; in severe cases, seizures, coma, death; recovery may take weeks, and CNS deficits may persist • Sinus node dysfunction, QT prolongation, T wave abnormalities, U waves • Nephrogenic diabetes insipidus, hypothyroidism, hyperthyroidism, hypercalcemia, pseudotumor cerebri • Acute toxicity: Nausea, vomiting, diarrhea, and milder neurologic findings	• Peak serum levels: • Normal dose 2-3 hr; up to 5 hr for sustained-release lithium • Acute overdose: Peak may be delayed ≥4-12 hr	• Replenish intravascular volume, maintain urinary output at 1-2 ml/kg/hr • Consider GI decontamination with oral polyethylene glycol electrolyte solution within 1-2 hr after acute overdose of sustained-release drug • Hemodialysis[§] in patients with altered mental status, ataxia, seizures, or coma or in patients with mild symptoms in the setting of acute overdose or renal insufficiency • Ineffective or contraindicated therapies include oral activated charcoal, diuretics, and aminophylline
Opioids (e.g., heroin, morphine, oxycodone, fentanyl)	Agonist effect at CNS μ, κ, and δ opioid receptors; result is cell hyperpolarization and decreased neurotransmitter release	• CNS depression, respiratory depression, miosis • Dextromethorphan increases CNS serotonin and inhibits NMDA receptors, which causes hallucinations • Propoxyphene and its metabolite norpropoxyphene block sodium channels and can cause seizures and wide-complex arrhythmias similar to cyclic antidepressants; NaHCO3 treats arrhythmias • Seizure risk with tramadol, meperidine, propoxyphene • Rapid, powerful heroin-like effect when sustained-release oxycodone is crushed before ingestion, snorting, or smoking • QTc prolongation and torsades de pointes with methadone	Rapid urine drug screens detect morphine and codeine but may not detect semisynthetic and synthetic opioids; some interferents/irrelevants	• IV naloxone, 0.4-2 mg; can repeat up to 10 mg if no response • Continuous infusion for recurrent symptoms or sustained-release opioid ingestion; give 50% of dose that produces desired effect 15 min after initial effect is obtained, then infuse two thirds of this dose every hr; infusion rate can be increased or decreased to maintain normal respiration and avoid withdrawal symptoms • Contraindicated therapies: Nalmefene and naltrexone should not be used for acute opioid reversal
Organophosphorus compounds and carbamates (e.g., diazinon, mevinphos, fenthion, aldicarb)	Inhibits acetylcholinesterase, resulting in excessive acetylcholine stimulation of nicotinic and muscarinic receptors in autonomic and somatic motor nervous systems and CNS	• Nicotinic-mediated effects: Tachycardia, mydriasis, hypertension, delirium, coma, seizures, muscle weakness, fasciculations • Muscarinic-mediated effects: Salivation, lacrimation, urination, vomiting, defecation, miosis, bronchorrhea, bronchospasm, bradycardia	• Serum (butyrylcholinesterase) or RBC (acetylcholinesterase) activity <50% of normal • Clinical recovery occurs before serum cholinesterase levels normalize	• Atropine, 1-2 mg by initial IV bolus; double the dose every 5 min (2 mg, 4 mg, 8 mg, 16 mg, etc.) until drying of bronchial secretions, adequate oxygenation, pulse >80 bpm, systolic blood pressure >80 mm Hg achieved; continuous infusion at 10%-20% of total stabilizing dose per hr; stop infusion if patient develops any signs or symptoms of anticholinergic toxidrome; restart infusion at lower rate when signs or symptoms abate • Pralidoxime[‖] chloride 30 mg/kg (maximum 2 g) IV bolus over 30 min, then 8-10 mg/kg/hr (maximum 650 mg/hr) continuous infusion; administer as soon as possible after poisoning; continue 12-24 hr after atropine no longer required and symptoms resolve

Drug or Toxicant	Pathophysiology	Clinical Effects	Laboratory	Specific Therapy
Salicylates	Inhibits cyclooxygenase; decreases formation of prostaglandins and thromboxane A_2; stimulates CNS medullary respiratory receptor and chemoreceptor trigger zone; impairs platelet function; disrupts carbohydrate metabolism; uncouples oxidative phosphorylation; increases vascular permeability	• Acute toxicity • Mild: Nausea, vomiting, diaphoresis, tinnitus, decreased hearing, hyperpnea, tachypnea • Moderate–severe: Confusion, delirium, coma, seizures, hyperthermia, ALI; death can occur within hours of overdose • Chronic toxicity: Same as acute, but may not have diaphoresis or vomiting • Consider diagnosis in patients with new-onset confusion, anion gap metabolic acidosis, or ALI	• Serum salicylate level: Toxic ≥30 mg/dl; level ≥100 mg/dl indicates life-threatening toxicity with possible sudden, rapid clinical deterioration; in chronic toxicity, levels may be minimally elevated (>30 mg/dl), and clinical evaluation is more reliable for gauging degree of toxicity • Arterial blood gases: Respiratory alkalosis with metabolic acidosis • Anion gap metabolic acidosis • Prolonged PT and PTT, ketonuria, ketonemia	Multidose activated charcoal q2-3h in acute overdose with progressive symptoms or rising salicylate level
SSRIs/SRIs	• Inhibits reuptake of serotonin • SRIs have additional effects (e.g., duloxetine inhibits norepinephrine reuptake, nefazodone inhibits serotonergic 5-HT2 receptors, trazodone inhibits peripheral α-adrenergic receptors, venlafaxine inhibits norepinephrine and dopamine reuptake)	• Vomiting, blurred vision, CNS depression, tachycardia • Seizures and coma rare • Torsades de pointes reported with citalopram • Serotonin syndrome: Clonus, agitation, tremor, diaphoresis, hyperreflexia; hyperthermia and hypertonicity in severe cases	• No specific tests • If serotonin syndrome suspected: Electrolytes, BUN, glucose, liver enzymes, coagulation panel, blood gases, chest radiograph	• Respiratory support as needed • Benzodiazepines for agitation or seizures • Serotonin syndrome: Consider cyproheptadine, 12 mg PO initial dose then 2 mg PO q2h (to a maximum of 32 mg/day) until symptoms resolve • Critical care therapies for hyperthermia, rhabdomyolysis, DIC, ARDS, renal and hepatic dysfunction, torsades de pointes

ALI, Acute lung injury; *aPTT,* activated partial thromboplastin time; *ARDS,* acute respiratory distress syndrome; *AV,* atrioventricular; *BP,* blood pressure; *bpm,* beats per minute; *BUN,* blood urea nitrogen; *CNS,* central nervous system; *DIC,* disseminated intravascular coagulation; *DOB,* 4-bromo-2,5-dimethoxyamphetamine; *ECG,* electrocardiogram; *GABA,* α-aminobutyric acid; *GI,* gastrointestinal; *HR,* heart rate; *IABP,* intra-aortic balloon counterpulsation; *INR,* international normalized ratio; *IV,* intravenous; *MDMA,* 3,4-methylenedioxymethamphetamine; *Na^1,K^1-ATPase,* sodium, potassium adenosine triphosphatase; *NAC,* N-acetylcysteine; *NAPQI,* N-acetyl-p-benzoquinone imine; *NMDA,* N-methyl-D-aspartate; *PMA,* paramethoxyamphetamine; *PT,* prothrombin time; *PTT,* partial thromboplastin time; *RBC,* red blood cell; *RUQ,* upper right quadrant (abdomen); *SIADH,* syndrome of inappropriate antidiuretic secretion; *SRI,* serotonin reuptake inhibitor; *SSRI,* selective serotonin reuptake inhibitor.

[I]A double-blind, randomized, placebo-controlled trial of pralidoxime in acute organophosphorus poisoning found no significant difference in mortality rates or need for intubation.

*A nomogram to evaluate the potential toxicity of levels drawn more than 4 hours after ingestion is provided in Fig. 7, from Rumack BH, Matthew H: Acetaminophen poisoning and toxicity, *Pediatrics* 1975(55):871-876. The nomogram is valid only for levels drawn after a single acute ingestion.

[†]NAC can be discontinued in patients with uncomplicated disease after a loading dose plus six maintenance doses if hepatic aminotransferase levels are normal and acetaminophen is not detected; otherwise, the full regimen should be administered.

[‡]Adjust infusion for reduced renal function.

[§]Continue hemodialysis until the serum lithium level is less than 1 mEq/L. Recheck the level 8 hr after dialysis, and restart hemodialysis if the level is higher than 1 mEq/L. Repeat this cycle until the serum lithium level remains lower than 1 mEq/L.

Appendix IV

Impairment and Disability Issues

Impairment describes harm to anatomy and physiology, whereas *disability* denotes the difficulty a person has performing a function. Reporting disability for different sectors of society has its own nuances. Proper evaluation of impairment/disability starts with knowing who is asking for what. It is an area of practice in which an understanding of some basic concepts can make it rewarding rather than distressing.

- Ultimately, disability is a measure of function. Functional outcomes are becoming increasingly important in medicine, mirroring the shift toward patient-centeredness. All practitioners should have some facility with documenting the effects of an intervention on a patient's physical, psychological, and social functioning. For example, the continuation of an opioid analgesic should be predicated on meeting functional goals negotiated between the patient and physician before initiation of treatment. Even a brief comment on walking distance or work tolerance is better than nothing.
- Some concepts apply to all venues of disability. Primary care providers should rarely be in the position to determine whether a patient can be on or off a specific job. Rather, their task is to give general parameters about which physical exertions are medically dangerous. Try to be specific and use objective criteria where appropriate, but don't be intimidated by a form. Ballpark estimates can often suffice. For example, many chronic low back pain patients may conservatively and safely be described as able to lift/carry up 10 lbs, push/pull 25 lbs, and change positions as needed to keep comfortable. Have thorough medical records and be consistent; lawyers may focus on contradictions in your documentation to help their clients.
- Rehabilitation centers across the country are required to monitor function using a standardized set of criteria called the "Functional Independence Measure (FIM)," which categorizes activities of daily living into divisions such as mobility, transfers, feeding, grooming/hygiene, dressing, bathing, and toileting. In therapy notes, you may come across scores in these categories rating patients on a seven-point scale from totally dependent to moderate-assistance (mod A; patient can perform 50% of task) to modified-independent (patient requires an assistive device) to independent.
- Psychosocial contributing factors such as medicolegal issues can profoundly influence patients' presentations through somatization from secondary gain. However, it is important to differentiate this from malingering, Munchausen syndrome, or "gaming the system," which are remarkably less prevalent.
- The number of stakeholders expands in the disability system to include the employer, the government, the legal system, and the payer. Each sector has its own regulations. You may be required to fill out disability questionnaires as a condition of accepting payment for clinical services from a payer, such as in the workers' compensation system. Much more commonly, you will be seeing patients for clinical services paid for by an evaluation and management code. In these cases, you are not obligated to provide free medicolegal assessments. Settling payment issues in advance can avoid misunderstanding. Again, before assessing disability, understand who is asking and why.

GOVERNMENT-ADMINISTERED DISABILITY

State Temporary Disability Insurance (TDI) programs, the Family Medical Leave Act of 1993 (FMLA), the Social Security Administration (SSA), and the Department of Veterans Affairs offer disability benefits through the state and federal government.

- State TDI forms must be filled out for the patient to receive any income. They are generally very basic and just engage the social support network for a patient. This may not be the best venue to stipulate partial disability.
- The FMLA provides unpaid leave for qualified medical and family reasons. Because it is a federal program, the forms involved are standard across states and employers. They can be intimidating at first but are reasonably easy to complete once the basic definitions used are understood. It is recommended that you familiarize yourself with this paperwork the first few times it is encountered. Completing the form for subsequent patients should not be overly burdensome.
- The SSA and the Department of Veterans Affairs have their own internal mechanisms for quantifying disability, but they may subpoena your records or request a summary narrative as part of their processes. If you've kept good clinical notes, your existing documentation should satisfy their requirements. Many patients choose to apply for Social Security Disability Insurance (SSDI) and/or Supplemental Security Income (SSI) through a legal representative. These lawyers may send you a lengthy questionnaire to prepare their case. There are physicians whose practices perform these services and who can be hired by attorneys to facilitate patients' applications. If this nonclinical work appeals to you, consider affiliating with the SSA or contracting your time to lawyers under separate indenture. If not, you may want to recommend the law office contact a suitable practice.

WORKERS' COMPENSATION

In workers' compensation, the payer and employer join the provider in trying to rehabilitate the injured worker. Confidentiality issues are handled differently because these stakeholders may have a right to protected health information.

- Each state has their own laws regarding reporting requirements, and the U.S. Department of Labor governs injured federal employees. If you plan on accepting workers' compensation patients, you must familiarize yourself with the necessary paperwork. Typically, this is a standard, short form that includes measures of function. It may make sense to copy your state's parameters and create a "work note" to be used uniformly in your practice for cases both inside and outside of the workers' compensation system. Functional limitations should pertain to any task, not just to the employee's vocation. In general, employees should not be labeled "on" or "off."
- A notification that an employee has reached "maximal medical improvement" should be made once an employee's condition is expected to change over months/years rather than days/weeks. At this juncture they will transition from temporary disability benefits to permanent disability benefits, possibly including vocational rehabilitation. If ongoing sequelae exist, a permanent impairment rating may be needed to resolve an employee's claim and allow them to progress to the next stage of their life. These are more sophisticated determinations, usually directed by the American Medical Association's (AMA) *Guides to the Evaluation of Permanent Impairment*, now in its sixth edition. Analysis of permanent impairment, causation, and apportionment generally fall outside of workers' compensation reporting requirements. Someone with

appropriate training may be best suited to complete this task. Consider providing these more detailed services under a separate indenture, such as a consultation arrangement with the employee's attorney. Your state workers' compensation board may have specific guidelines governing these reports. In any case, the work should be done under a clear written agreement, not based on a verbal request by the employee. Very complex cases may also require a formal functional capacity evaluation through an appropriate rehabilitation resource.

PERSONAL INJURY

Patients hurt in car accidents or other personal injuries often are involved in legal cases covering medical care, personal damages, and pain and suffering. Most commonly, you will be helping these patients with their clinical issues under their regular medical insurance, although some providers agree to provide services under a legal lien on the claim. Regardless of your role in a personal injury case, it is helpful to document objective details about the injury and functional parameters. If you are asked to keep someone out of work, try to delineate functional limitations as you would in a workers' compensation employee.

- Similar to the workers' compensation system, it is helpful to state when a patient has reached maximal medical improvement. Personal injury claims can take longer to resolve than in the workers' compensation system, as the employer and insurance company are strongly incentivized to reach a resolution in those cases. In general, an ongoing legal case may hinder a patient from achieving a healthful balance of wellness. It is in the patient's best interest to move the claim toward completion.
- Quantifying permanent disability is a key component of resolving these cases. If a clinician is providing services under a legal lien, there may be a conflict of interest in having that provider quantify the permanent impairment. There may be financial implications to the degree of disability awarded, and this may influence whether or not the clinician will receive payment on their lien. These cases are almost always contentious and may be best handled by providers with special training, such as an independent medical examiner. Again, the determination typically follows the AMA's *Guides to the Evaluation of Permanent Impairment.* A clinician's role is to manage the patient's injuries, not to negotiate medicolegal issues. If you are not appropriately trained, consider deferring questions regarding disability to someone who is.

PRIVATE DISABILITY

Some patients purchase private insurance plans to provide income in addition to that offered through the government in the case of long-term disability. These forms vary by insurance carrier and change over time. They may need to be filled out periodically to maintain benefits. Many providers opt to charge a separate fee for the completion of this type of paperwork.

CONCLUSION

In summary, impairment and disability are measures of function and should be followed by all good doctors as part of patient-centered care. Providers can be most effective interacting with the various disability systems if they know when they are acting as clinicians and when they are acting as legal consultants. Understanding the principles involved with the different sectors will help you avoid confusion between obligations and opportunities when doing this work.

Appendix V

Protection of Travelers

TABLE 1 Structured Approach to the Pretravel Office Visit with a Traveler to the Developing World

Perform Risk Assessment

The following must always be ascertained to determine appropriate preventive medical recommendations. Preprinted medical record forms may be used to record these.
Exact itinerary, including regions within each country to be visited
Dates of travel to assess risk of seasonal diseases
Age
Past vaccination history
Underlying illness(es)
Current medications
Pregnancy status
Allergies
Purpose of trip
Risk exposures—blood, body fluids, adventure or extensive outdoor exposures
Urban versus rural travel
Type of accommodations
Level of aversion to risk
Financial limitations that may necessitate prioritization of interventions

Administer Immunizations

Administer routine vaccinations that are not up-to-date.
Administer indicated travel vaccines.
Provide to patient legally mandated Vaccine Information Statements from the Centers for Disease Control and Prevention (www.cdc.gov/vaccines/hcp/vis/index.html).
Provide printed checklist to patient, listing vaccines administered.
Record in the clinic record vaccines administered, lot number, and date.
Document vaccines offered to but declined by patient, as well as nonrecommended vaccines administered at the patient's request.

Provide Malaria Prevention (If Indicated)

Determine whether malaria risk exists for the destination country. If yes:
Does the patient's itinerary within that country put him or her at risk? If yes:
Recommend malaria chemoprophylaxis. Several equally effective drugs of choice may be indicated. Ascertain which is best suited to the individual patient and itinerary.
Educate on personal protection against arthropods.

Educate on Traveler's Diarrhea

Recommend food and water precautions.
Prescribe and educate on standby therapy with a quinolone antibiotic or azithromycin and advise on use of loperamide and oral hydration if needed.

Teach Essential Preventive Behaviors

Most travel-related health problems, including vaccine-preventable diseases, can be avoided through simple behaviors initiated by the traveler.
Educate on appropriate strategies in the following categories (some topics are not applicable to all destinations): blood-borne and sexually transmitted diseases, safety and crime avoidance, injury prevention, swimming safety, rabies, skin/wound care, tuberculosis, packing for healthy travel, obtaining health care abroad.

Discuss Other Applicable Heath Issues

Advise and prescribe for altitude illness, motion sickness, or jet lag.
Discuss prevention of specific travel-related infections that are of some risk to the traveler and have a possible preventive strategy not included in the strategies above.
Discuss any minimal-risk conditions (e.g., hemorrhagic fevers) that are a frequent cause of patient anxiety.

Updated from Bennett JE, Dolin R, Blaser MJ: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases,* ed 8, Philadelphia, 2015, Elsevier.

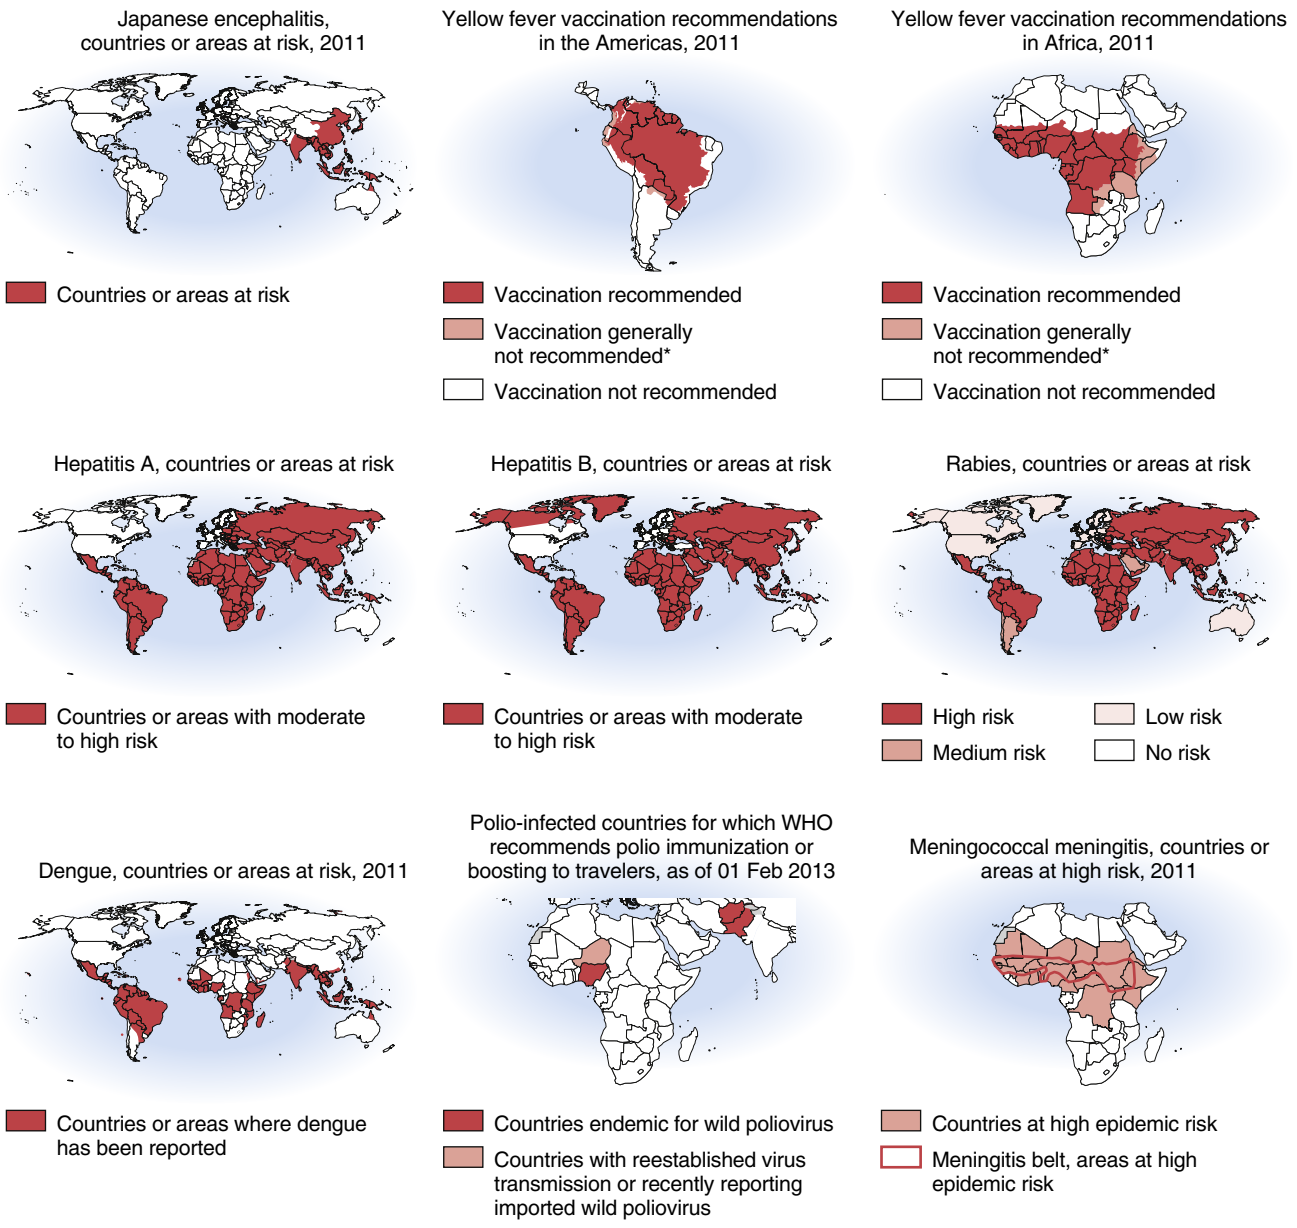

FIG. 1 Worldwide distribution of important travel-related diseases. *Yellow Fever (YF) vaccination is generally not recommended in areas where there is low-potential YF virus exposure. However, vaccination might be considered for a small subset of travelers to these areas who are at increased risk for exposure to YF virus because of prolonged travel, heavy exposure to mosquitoes, or inability to avoid mosquito bites. Consideration for vaccination of any traveler must take into account the traveler's risk of being infected with YF virus, country entry requirements, and individual risk factors for serious vaccine-associated adverse events (e.g., age, immune status). (From World Health Organization. International Travel and Health. Available at www.who.int/ith. In Bennett JE, Dolin R, Blaser MJ: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases,* ed 8, Philadelphia, 2015, Elsevier.)

TABLE 3 Travel-Related Vaccines of Adults

DISEASE	VACCINE	PRIMARY COURSE	ROUTE	FURTHER BOOSTERS
Vaccines to Consider for All Destinations				
Hepatitis A	Killed virus	0, 6-18 mo[a]	IM	None
Hepatitis B	Recombinant viral antigen	0, 1, 6 mo	IM	None
		A: 0, 1, 2, and 12 mo	IM	None
		A: 0, 1, 3 wk and 12 mo[b]	IM	
Hepatitis A/B	Combination of monovalent preparations	0, 1, 6 mo	IM	None
		A: 0, 1, 3 wk and 12 mo	IM	None
Typhoid	Capsular Vi polysaccharide	Single dose	IM	2-3 yr
	Live-attenuated Ty21a bacteria	0, 2, 4, 6 days	Oral	5 yr
Influenza	Inactivated viral	Single dose	IM	Annual
	Live-attenuated virus	Single dose	Nasal	Annual
Varicella	Live-attenuated virus	0, 4-8 wk	SC	None
Vaccines for Selected Destinations				
Yellow fever	Live-attenuated 17D virus	Single dose	SC	Lifetime protection[c]
Meningococcus	Quadrivalent conjugated polysaccharide (A, C, Y, W135)	Single dose	IM	5 yr
Rabies	Inactivated cell culture viral	0, 7, 21-28 days	IM[d]	None routinely but two doses after each exposure
Japanese encephalitis (Vero cell)	Inactivated viral	0, 28 days	IM	1 yr if at continued risk; no data on subsequent doses
Polio[e]	Inactivated viral	Single dose if adequate childhood series	SC; IM acceptable	None
Cholera	Killed bacteria + recombinant B toxin subunit	0, 1 wk	Oral	2 yr for cholera; 3 mo for ETEC
Tick-borne encephalitis[h]	Inactivated viral[f,g]	0, 1-3 mo, 9-12 mo	IM	3 yr

A, Accelerated regimen to be used for imminent departures; *ETEC,* enterotoxigenic *E. coli; IM,* intramuscular; *SC,* subcutaneous.
[a]Second dose may be delayed up to 8 years without diminished efficacy.
[b]Regimen not approved by the U.S. Food and Drug Administration for monovalent hepatitis B vaccine but approved for combination hepatitis A/B vaccine containing the same quantity of hepatitis B antigen.
[c]Until 2016, some countries that have mandatory entry requirements may require vaccination every 10 years.
[d]Intradermal rabies preexposure vaccine is no longer produced, and the intramuscular 1.0-mL vials are not licensed for intradermal use in a 0.1-mL dose.
[e]Oral polio vaccine is no longer produced in the United States.
[f]Not available in the United States but available in Canada and most European countries. No cholera vaccine of any kind is currently available in the United States.
[g]Also licensed in some countries for traveler's diarrhea because of enterotoxigenic *Escherichia coli.*
[h]Not available in United States but available in endemic areas and in Canada and the United Kingdom by special release.
From Bennett JE, Dolin R, Blaser MJ: *Mandell, Douglas, and Bennett's principles and practice of infectious diseases,* ed 8, Philadelphia, 2015, Elsevier.

Appendix VI

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Diabetes: Hemoglobin A_{1c} Poor Control	Percentage of patients 18-75 years of age with diabetes who had hemoglobin A_{1c} >9.0% during the measurement period
Diabetes: Low-Density Lipoprotein Cholesterol (LDL-C) Control (<100 mg/dl)	Percentage of patients 18-75 years of age with diabetes whose LDL-C was adequately controlled (<100 mg/dl) during the measurement period
Heart Failure (HF): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy for Left Ventricular Systolic Dysfunction (LVSD)	Percentage of patients aged 18 years and older with a diagnosis of HF with a current or prior left ventricular ejection fraction <40% who were prescribed ACE inhibitor or ARB therapy either within a 12-month period when seen in the outpatient setting *or* at each hospital discharge
Coronary Artery Disease (CAD): Antiplatelet Therapy	Percentage of patients aged 18 years and older with a diagnosis of CAD seen within a 12-month period who were prescribed aspirin or clopidogrel
CAD: Beta-Blocker Therapy—Prior Myocardial Infarction (MI) or LVSD (LVEF <40%)	Percentage of patients aged 18 years and older with a diagnosis of CAD seen within a 12-month period who also have prior MI *or* a current or prior LVEF <40% who were prescribed beta-blocker therapy
HF: Beta-Blocker Therapy for LVSD	Percentage of patients aged 18 years and older with a diagnosis of HF with a current or prior left ventricular ejection fraction <40% who were prescribed beta-blocker therapy either within a 12-month period when seen in the outpatient setting *or* at each hospital discharge
Antidepressant Medication Management	Percentage of patients 18 years of age and older who were found to have major depression and treated with antidepressant medication, and who remained on antidepressant medication treatment. Two rates are reported: 1. Percentage of patients who remained on an antidepressant medication for at least 84 days (12 weeks) 2. Percentage of patients who remained on an antidepressant medication for at least 180 days (6 months)
Primary Open-Angle Glaucoma (POAG): Optic Nerve Evaluation	Percentage of patients aged 18 years and older with a diagnosis of POAG who have an optic nerve head evaluation during one or more office visits within 12 months
Age-Related Macular Degeneration (AMD): Dilated Macular Examination	Percentage of patients aged 50 years and older with a diagnosis of AMD who had a dilated macular examination performed that included documentation of the presence or absence of macular thickening or hemorrhage *and* the level of macular degeneration severity during one or more office visits within 12 months
Diabetic Retinopathy: Documentation of Presence or Absence of Macular Edema and Level of Severity of Retinopathy	Percentage of patients aged 18 years and older with a diagnosis of diabetic retinopathy who had a dilated macular or fundus examination performed that included documentation of the level of severity of retinopathy and the presence or absence of macular edema during one or more office visits within 12 months
Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care	Percentage of patients aged 18 years and older with a diagnosis of diabetic retinopathy who had a dilated macular or fundus examination performed with documented communication to the physician who manages the ongoing care of the patient with diabetes mellitus regarding the findings of the macular or fundus examination at least once within 12 months
Perioperative Care: Selection of Prophylactic Antibiotic—First- or Second-Generation Cephalosporin	Percentage of surgical patients aged 18 years and older undergoing procedures with the indications for a first- *or* second-generation cephalosporin prophylactic antibiotic, who had an order for a first- *or* second-generation cephalosporin for antimicrobial prophylaxis

Continued on following page

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Perioperative Care: Discontinuation of Prophylactic Parenteral Antibiotics (Noncardiac Procedures)	Percentage of noncardiac surgical patients aged 18 years and older undergoing procedures with the indications for prophylactic parenteral antibiotics *and* who received a prophylactic parenteral antibiotic, who have an order for discontinuation of prophylactic parenteral antibiotics within 24 hours of surgical end time
Perioperative Care: Venous Thromboembolism (VTE) Prophylaxis (When Indicated in *All* Patients)	Percentage of surgical patients aged 18 years and older undergoing procedures for which VTE prophylaxis is indicated in all patients, who had an order for low-molecular-weight heparin, low-dose unfractionated heparin, adjusted-dose warfarin, fondaparinux, or mechanical prophylaxis to be given within 24 hours before incision time or within 24 hours after surgery end time
Communication with the Physician or Other Clinician Managing Ongoing Care Postfracture for Men and Women Aged 50 Years and Older	Percentage of patients aged 50 years and older treated for a fracture with documentation of communication, between the physician treating the fracture and the physician or other clinician managing the patient's ongoing care, that a fracture occurred and that the patient was or should be considered for osteoporosis treatment or testing. This measure is reported by the physician who treats the fracture and who therefore is held accountable for the communication.
Stroke and Stroke Rehabilitation: Discharged on Antithrombotic Therapy	Percentage of patients aged 18 years and older with a diagnosis of ischemic stroke or transient ischemic attack (TIA) with documented permanent, persistent, or paroxysmal atrial fibrillation who were prescribed an antithrombotic at discharge
Screening for Osteoporosis for Women Aged 65-85 Years	Percentage of female patients aged 65-85 years who ever had a central dual-energy x-ray absorptiometry to check for osteoporosis
Osteoporosis: Pharmacologic Therapy for Men and Women Aged 50 Years and Older	Percentage of patients aged 50 years and older with a diagnosis of osteoporosis who were prescribed pharmacologic therapy within 12 months
Coronary Artery Bypass Graft (CABG): Use of Internal Mammary Artery (IMA) in Patients with Isolated CABG Surgery	Percentage of patients aged 18 years and older undergoing isolated CABG surgery who received an IMA graft
CABG: Preoperative Beta-Blocker in Patients with Isolated CABG Surgery	Percentage of isolated CABG surgeries for patients aged 18 years and older who received a beta-blocker within 24 hours before surgical incision
Medication Reconciliation Postdischarge	Percentage of discharges from any inpatient facility (e.g., hospital, skilled nursing facility, or rehabilitation facility) for patients 18 years and older seen within 30 days after discharge in the office by the physician, prescribing practitioner, registered nurse, or clinical pharmacist providing ongoing care for whom the discharge medication list was reconciled with the current medication list in the outpatient medical record. This measure is reported as three rates stratified by age group: • Reporting criteria 1: 18-64 years of age • Reporting criteria 2: 65 years and older • Total rate: All patients 18 years of age and older
Care Plan	Percentage of patients aged 65 years and older who have an advance care plan or surrogate decision maker documented in the medical record or documentation in the medical record that an advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan
Urinary Incontinence: Assessment of Presence or Absence of Urinary Incontinence in Women Aged 65 Years and Older	Percentage of female patients aged 65 years and older who were assessed for the presence or absence of urinary incontinence within 12 months
Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older	Percentage of female patients aged 65 years and older with a diagnosis of urinary incontinence with a documented plan of care for urinary incontinence at least once within 12 months
Chronic Obstructive Pulmonary Disease (COPD): Spirometry Evaluation	Percentage of patients aged 18 years and older with a diagnosis of COPD who had spirometry results documented
COPD: Inhaled Bronchodilator Therapy	Percentage of patients aged 18 years and older with a diagnosis of COPD and who have an FEV_1 <60% predicted and have symptoms who were prescribed an inhaled bronchodilator
Asthma: Pharmacologic Therapy for Persistent Asthma—Ambulatory Care Setting	Percentage of patients aged 5 years and older with a diagnosis of persistent asthma who were prescribed long-term control medication
Emergency Medicine: 12-Lead ECG Performed for Nontraumatic Chest Pain	Percentage of patients aged 40 years and older with an emergency department discharge diagnosis of nontraumatic chest pain who had a 12-lead ECG performed
Appropriate Treatment for Children with Upper Respiratory Infection (URI)	Percentage of children 3 months through 18 years of age who were diagnosed with URI and were not dispensed an antibiotic prescription on or 3 days after the episode
Appropriate Testing for Children with Pharyngitis	Percentage of children 3-18 years of age who were diagnosed with pharyngitis, ordered an antibiotic, and received a group A streptococcus (strep) test for the episode
Hematology: Myelodysplastic Syndrome (MDS) and Acute Leukemia—Baseline Cytogenetic Testing Performed on Bone Marrow	Percentage of patients aged 18 years and older with a diagnosis of MDS or an acute leukemia who had baseline cytogenetic testing performed on bone marrow

Measure Title	Measure Description
Hematology: MDS—Documentation of Iron Stores in Patients Receiving Erythropoietin Therapy	Percentage of patients aged 18 years and older with a diagnosis of MDS who are receiving erythropoietin therapy with documentation of iron stores within 60 days before initiating erythropoietin therapy
Hematology: Multiple Myeloma: Treatment with Bisphosphonates	Percentage of patients aged 18 years and older with a diagnosis of multiple myeloma, not in remission, who were prescribed or received intravenous bisphosphonate therapy within the 12-month reporting period
Hematology: Chronic Lymphocytic Leukemia (CLL): Baseline Flow Cytometry	Percentage of patients aged 18 years and older seen within a 12-month reporting period with a diagnosis of CLL made at any time during or before the reporting period who had baseline flow cytometry studies performed and documented in the chart
Breast Cancer: Hormonal Therapy for Stage IC-IIIC Estrogen Receptor/Progesterone Receptor (ER/PR) Positive Breast Cancer	Percentage of female patients aged 18 years and older with stage IC through IIIC ER- or PR-positive breast cancer who were prescribed tamoxifen or aromatase inhibitor during the 12-month reporting period
Colon Cancer: Chemotherapy for American Joint Committee on Cancer (AJCC) Stage III Colon Cancer Patients	Percentage of patients aged 18-80 years with AJCC stage III colon cancer who are referred for adjuvant chemotherapy, are prescribed adjuvant chemotherapy, or have previously received adjuvant chemotherapy within the 12-month reporting period
Prevention of Central Venous Catheter (CVC)–Related Bloodstream Infections	Percentage of patients, regardless of age, who undergo CVC insertion for whom CVC was inserted with all elements of maximal sterile barrier technique, hand hygiene, skin preparation, and, if ultrasound is used, sterile ultrasound techniques followed
Hepatitis C: RNA Testing Before Initiating Treatment	Percentage of patients aged 18 years and older with a diagnosis of chronic hepatitis C who started antiviral treatment within the 12-month reporting period for whom quantitative HCV RNA testing was performed within 12 months before initiation of antiviral treatment
Hepatitis C: Hepatitis C Virus (HCV) Genotype Testing Before Treatment	Percentage of patients aged 18 years and older with a diagnosis of chronic hepatitis C who started antiviral treatment within the 12-month reporting period for whom HCV genotype testing was performed within 12 months before initiation of antiviral treatment
Hepatitis C: HCV RNA Testing Between 4 and 12 Weeks After Initiation of Treatment	Percentage of patients aged 18 years and older with a diagnosis of chronic hepatitis C who are receiving antiviral treatment for whom quantitative HCV RNA testing was performed between 4 and 12 weeks after the initiation of antiviral treatment
Acute Otitis Externa (AOE): Topical Therapy	Percentage of patients aged 2 years and older with a diagnosis of AOE who were prescribed topical preparations
AOE: Systemic Antimicrobial Therapy—Avoidance of Inappropriate Use	Percentage of patients aged 2 years and older with a diagnosis of AOE who were not prescribed systemic antimicrobial therapy
Breast Cancer Resection Pathology Reporting: pT Category and pN Category with Histologic Grade	Percentage of breast cancer resection pathology reports that include the pT category, the pN category, and the histologic grade
Colorectal Cancer Resection Pathology Reporting: pT Category and pN Category with Histologic Grade	Percentage of colon and rectum cancer resection pathology reports that include the pT category, the pN category, and the histologic grade
Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low-Risk Prostate Cancer Patients	Percentage of patients, regardless of age, with a diagnosis of prostate cancer at low risk of recurrence receiving interstitial prostate brachytherapy, *or* external beam radiotherapy to the prostate, *or* radical prostatectomy, *or* cryotherapy who did not have a bone scan performed at any time since diagnosis of prostate cancer
Prostate Cancer: Adjuvant Hormonal Therapy for High-Risk or Very-High-Risk Prostate Cancer	Percentage of patients, regardless of age, with a diagnosis of prostate cancer at high or very high risk of recurrence receiving external beam radiotherapy to the prostate who were prescribed adjuvant hormonal therapy (GnRH agonist or antagonist)
Adult Major Depressive Disorder (MDD): Suicide Risk Assessment	Percentage of patients aged 18 years and older with a diagnosis of MDD with a suicide risk assessment completed during the visit in which a new diagnosis or recurrent episode was identified
Rheumatoid Arthritis (RA): Disease Modifying Anti-Rheumatic Drug (DMARD) Therapy	Percentage of patients aged 18 years and older who were diagnosed with RA and were prescribed, dispensed, or administered at least one ambulatory prescription for a DMARD
Osteoarthritis (OA): Function and Pain Assessment	Percentage of patient visits for patients aged 21 years and older with a diagnosis of OA with assessment for function and pain
Preventive Care and Screening: Influenza Immunization	Percentage of patients aged 6 months and older seen for a visit between October 1 and March 31 who received an influenza immunization *or* who reported previous receipt of an influenza immunization
Pneumonia Vaccination Status for Older Adults	Percentage of patients 65 years of age and older who have ever received a pneumococcal vaccine
Breast Cancer Screening	Percentage of women 50 through 74 years of age who had a mammogram to screen for breast cancer within 27 months
Colorectal Cancer Screening	Percentage of patients 50-75 years of age who had appropriate screening for colorectal cancer

Continued on following page

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Antibiotic Treatment for Adults with Acute Bronchitis: Avoidance of Inappropriate Use	Percentage of adults 18-64 years of age with a diagnosis of acute bronchitis who were not prescribed or dispensed an antibiotic prescription on or 3 days after the episode
Diabetes: Eye Examination	Percentage of patients 18-75 years of age with diabetes who had a retinal or dilated eye examination by an eye care professional during the measurement period or a negative retinal or dilated eye examination (no evidence of retinopathy) in the 12 months before the measurement period
CAD: ACE Inhibitor or ARB Therapy—Diabetes or LVSD (LVEF <40%)	Percentage of patients aged 18 years and older with a diagnosis of CAD seen within a 12-month period who also have diabetes *or* a current or prior LVEF <40% who were prescribed ACE inhibitor or ARB therapy
Diabetes: Medical Attention for Nephropathy	Percentage of patients 18-75 years of age with diabetes who had a nephropathy screening test or evidence of nephropathy during the measurement period
Adult Kidney Disease: Laboratory Testing (Lipid Profile)	Percentage of patients aged 18 years and older with a diagnosis of chronic kidney disease (CKD) (stage 3, 4, or 5, not receiving renal replacement therapy [RRT]) who had a fasting lipid profile performed at least once within a 12-month period
Adult Kidney Disease: BP Management	Percentage of patient visits for those patients aged 18 years and older with a diagnosis of CKD (stage 3, 4, or 5, not receiving RRT) with a BP <140/90 mm Hg *or* ≥140/90 mm Hg with a documented plan of care
Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy—Neurological Evaluation	Percentage of patients aged 18 years and older with a diagnosis of diabetes mellitus who had a neurological examination of their lower extremities within 12 months
Diabetes Mellitus: Diabetic Foot and Ankle Care, Ulcer Prevention—Evaluation of Footwear	Percentage of patients aged 18 years and older with a diagnosis of diabetes mellitus who were evaluated for proper footwear and sizing
Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan	Percentage of patients aged 18 years and older with a BMI documented during the current encounter or during the previous 6 months *and* with a BMI outside of normal parameters, a follow-up plan is documented during the encounter or during the previous 6 months of the current encounter Normal parameters: Age 65 years and older and BMI ≥23 and <30 kg/m^2; age 18-64 years and BMI ≥18.5 and <25 kg/m^2
Documentation of Current Medications in the Medical Record	Percentage of visits for patients aged 18 years and older for which the eligible professional attests to documenting a list of current medications using all immediate resources available on the date of the encounter. This list must include *all* known prescriptions, over-the-counters, herbals, and vitamin/mineral/dietary (nutritional) supplements *and* must contain the medications' name, dosage, frequency, and route of administration.
Pain Assessment and Follow-Up	Percentage of visits for patients aged 18 years and older with documentation of a pain assessment using a standardized tool(s) on each visit *and* documentation of a follow-up plan when pain is present
Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan	Percentage of patients aged 12 years and older screened for clinical depression on the date of the encounter using an age-appropriate standardized depression screening tool, *and* if positive, a follow-up plan is documented on the date of the positive screen
Melanoma: Continuity of Care—Recall System	Percentage of patients, regardless of age, with a current diagnosis of melanoma or a history of melanoma whose information was entered, at least once within a 12-month period, into a recall system that includes: • A target date for the next complete physical skin examination, *and* • A process to follow up with patients who either did not make an appointment within the specified time frame or who missed a scheduled appointment
Melanoma: Coordination of Care	Percentage of patient visits, regardless of age, with a new occurrence of melanoma who have a treatment plan documented in the chart that was communicated to the physician(s) providing continuing care within 1 month of diagnosis
AMD: Counseling on Antioxidant Supplement	Percentage of patients aged 50 years and older with a diagnosis of AMD or their caregiver(s) who were counseled within 12 months on the benefits and/or risks of the Age-Related Eye Disease Study formulation for preventing progression of AMD
POAG: Reduction of Intraocular Pressure (IOP) by 15% *or* Documentation of a Plan of Care	Percentage of patients aged 18 years and older with a diagnosis of POAG whose glaucoma treatment has not failed (the most recent IOP was reduced by at least 15% from the preintervention level) *or* if the most recent IOP was not reduced by at least 15% from the preintervention level, a plan of care was documented within 12 months
Oncology: Medical and Radiation—Pain Intensity Quantified	Percentage of patient visits, regardless of patient age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy in which pain intensity is quantified
Oncology: Medical and Radiation—Plan of Care for Pain	Percentage of visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain with a documented plan of care to address pain

Measure Title	Measure Description
Radiology: Exposure Time Reported for Procedures Using Fluoroscopy	Final reports for procedures using fluoroscopy that document radiation exposure indices, or exposure time and number of fluorographic images (if radiation exposure indices are not available)
Radiology: Inappropriate Use of "Probably Benign" Assessment Category in Mammography Screening	Percentage of final reports for screening mammograms that are classified as "probably benign"
Nuclear Medicine: Correlation with Existing Imaging Studies for All Patients Undergoing Bone Scintigraphy	Percentage of final reports for all patients, regardless of age, undergoing bone scintigraphy that include physician documentation of correlation with existing relevant imaging studies (e.g., x-ray, MRI, CT, etc.) that were performed
Falls: Risk Assessment	Percentage of patients aged 65 years and older with a history of falls who had a risk assessment for falls completed within 12 months
Falls: Plan of Care	Percentage of patients aged 65 years and older with a history of falls who had a plan of care for falls documented within 12 months
Oncology: Radiation Dose Limits to Normal Tissues	Percentage of patients, regardless of age, with a diagnosis of breast, rectal, pancreatic, or lung cancer receiving 3D conformal radiation therapy who had documentation in medical record that radiation dose limits to normal tissues were established before the initiation of a course of 3D conformal radiation for a minimum of two tissues
HIV/AIDS: *Pneumocystis jiroveci* Pneumonia (PCP) Prophylaxis	Percentage of patients aged 6 weeks and older with a diagnosis of HIV/AIDS who were prescribed PCP prophylaxis
Diabetes: Foot Examination	Percentage of patients aged 18-75 years with diabetes who had a foot examination during the measurement period
Coronary Artery Bypass Graft (CABG): Prolonged Intubation	Percentage of patients aged 18 years and older undergoing isolated CABG surgery who require postoperative intubation >24 hours
CABG: Deep Sternal Wound Infection Rate	Percentage of patients aged 18 years and older undergoing isolated CABG surgery who, within 30 days postoperatively, develop deep sternal wound infection involving muscle, bone, and/or mediastinum requiring operative intervention
CABG: Stroke	Percentage of patients aged 18 years and older undergoing isolated CABG surgery who have a postoperative stroke (i.e., any confirmed neurological deficit of abrupt onset caused by a disturbance in blood supply to the brain) that did not resolve within 24 hours
CABG: Postoperative Renal Failure	Percentage of patients aged 18 years and older undergoing isolated CABG surgery (without preexisting renal failure) who develop postoperative renal failure or require dialysis
CABG: Surgical Re-Exploration	Percentage of patients aged 18 years and older undergoing isolated CABG surgery who require a return to the operating room during the current hospitalization for mediastinal bleeding with or without tamponade, graft occlusion, valve dysfunction, or other cardiac reason
RA: Tuberculosis (TB) Screening	Percentage of patients aged 18 years and older with a diagnosis of RA who have documentation of a TB screening performed and results interpreted within 6 months before receiving a first course of therapy using a biologic DMARD
RA: Periodic Assessment of Disease Activity	Percentage of patients aged 18 years and older with a diagnosis of RA who have an assessment and classification of disease activity within 12 months
RA: Functional Status Assessment	Percentage of patients aged 18 years and older with a diagnosis of RA for whom a functional status assessment was performed at least once within 12 months
RA: Assessment and Classification of Disease Prognosis	Percentage of patients aged 18 years and older with a diagnosis of RA who have an assessment and classification of disease prognosis at least once within 12 months
RA: Glucocorticoid Management	Percentage of patients aged 18 years and older with a diagnosis of RA who have been assessed for glucocorticoid use and, for those on prolonged doses of prednisone ≥10 mg daily (or equivalent) with improvement or no change in disease activity, documentation of glucocorticoid management plan within 12 months
Elder Maltreatment Screen and Follow-Up Plan	Percentage of patients aged 65 years and older with a documented elder maltreatment screen using an Elder Maltreatment Screening Tool on the date of encounter *and* a documented follow-up plan on the date of the positive screen
Functional Outcome Assessment	Percentage of visits for patients aged 18 years and older with documentation of a current functional outcome assessment using a standardized functional outcome assessment tool on the date of encounter *and* documentation of a care plan based on identified functional outcome deficiencies on the date of the identified deficiencies
Hepatitis C: Hepatitis A Vaccination	Percentage of patients aged 18 years and older with a diagnosis of chronic hepatitis C who have received at least one injection of hepatitis A vaccine, or who have documented immunity to hepatitis A
Colonoscopy Interval for Patients with a History of Adenomatous Polyps—Avoidance of Inappropriate Use	Percentage of patients aged 18 years and older receiving a surveillance colonoscopy, with a history of a prior adenomatous polyp(s) in previous colonoscopy findings, who had an interval of 3 or more years since their last colonoscopy

Continued on following page

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Stroke and Stroke Rehabilitation: Thrombolytic Therapy	Percentage of patients aged 18 years and older with a diagnosis of acute ischemic stroke who arrive at the hospital within 2 hours of time last known well and for whom IV tPA was initiated within 3 hours of time last known well
Cataracts: 20/40 or Better Visual Acuity Within 90 Days After Cataract Surgery	Percentage of patients aged 18 years and older with a diagnosis of uncomplicated cataract who had cataract surgery and no significant ocular conditions affecting the visual outcome of surgery and had best-corrected visual acuity of 20/40 or better (distance or near) achieved within 90 days after the cataract surgery
Cataracts: Complications Within 30 Days After Cataract Surgery Requiring Additional Surgical Procedures	Percentage of patients aged 18 years and older with a diagnosis of uncomplicated cataract who had cataract surgery and had any of a specified list of surgical procedures in the 30 days after cataract surgery that would indicate the occurrence of any of the following major complications: retained nuclear fragments, endophthalmitis, dislocated or wrong power intraocular lens, retinal detachment, or wound dehiscence
Radiology: Stenosis Measurement in Carotid Imaging Reports	Percentage of final reports for carotid imaging studies (neck MRA, neck CTA, neck duplex ultrasonography, carotid angiogram) performed that include direct or indirect reference to measurements of distal internal carotid diameter as the denominator for stenosis measurement
Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antithrombotic	Percentage of patients 18 years of age and older who were discharged alive for acute myocardial infarction, coronary artery bypass graft, or percutaneous coronary interventions in the 12 months before the measurement period, or who had an active diagnosis of IVD during the measurement period and who had documentation of use of aspirin or another antithrombotic during the measurement period
HIV/AIDS: Sexually Transmitted Disease Screening for Chlamydia, Gonorrhea, and Syphilis	Percentage of patients aged 13 years and older with a diagnosis of HIV/AIDS for whom chlamydia, gonorrhea, and syphilis screenings were performed at least once since the diagnosis of HIV infection
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Knee Impairments	Percentage of patients aged 18 years or older who receive treatment for a functional deficit secondary to a diagnosis that affects the knee in which the change in their risk-adjusted functional status is measured
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Hip Impairments	Percentage of patients aged 18 or older who receive treatment for a functional deficit secondary to a diagnosis that affects the hip in which the change in their risk-adjusted functional status is measured
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Lower Leg, Foot, or Ankle Impairments	Percentage of patients aged 18 years or older who receive treatment for a functional deficit secondary to a diagnosis that affects the lower leg, foot, or ankle in which the change in their risk-adjusted functional status is measured
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Lumbar Spine Impairments	Percentage of patients aged 18 years or older who receive treatment for a functional deficit secondary to a diagnosis that affects the lumbar spine in which the change in their risk-adjusted functional status is measured
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Shoulder Impairments	Percentage of patients aged 18 years or older who receive treatment for a functional deficit secondary to a diagnosis that affects the shoulder in which the change in their risk-adjusted functional status is measured
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Elbow, Wrist, or Hand Impairments	Percentage of patients aged 18 years or older who receive treatment for a functional deficit secondary to a diagnosis that affects the elbow, wrist, or hand in which the change in their risk-adjusted functional status is measured
Functional Deficit: Change in Risk-Adjusted Functional Status for Patients with Neck, Cranium, Mandible, Thoracic Spine, Ribs, or Other General Orthopedic Impairments	Percentage of patients aged 18 years or older who receive treatment for a functional deficit secondary to a diagnosis that affects the neck, cranium, mandible, thoracic spine, ribs, or other general orthopedic impairment in which the change in their risk-adjusted functional status is measured
Melanoma: Overutilization of Imaging Studies in Melanoma	Percentage of patients, regardless of age, with a current diagnosis of stage 0–IIC melanoma or a history of melanoma of any stage, without signs or symptoms suggesting systemic spread, seen for an office visit during the 1-year measurement period, for whom no diagnostic imaging studies were ordered
Radiology: Reminder System for Screening Mammograms	Percentage of patients undergoing a screening mammogram whose information is entered into a reminder system with a target due date for the next mammogram
Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention	Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months *and* who received cessation counseling intervention if identified as a tobacco user
Controlling High BP	Percentage of patients 18-85 years of age who had a diagnosis of hypertension and whose BP was adequately controlled (<140/90 mm Hg) during the measurement period
Use of High-Risk Medications in the Elderly	Percentage of patients 66 years of age and older who were ordered high-risk medications. Two rates are reported: 1. Percentage of patients who were ordered at least one high-risk medication 2. Percentage of patients who were ordered at least two different high-risk medications

Measure Title	Measure Description
Weight Assessment and Counseling for Nutrition and Physical Activity for Children and Adolescents	Percentage of patients 3-17 years of age who had an outpatient visit with a primary care physician or obstetrician/gynecologist and who had evidence of the following during the measurement period. Three rates are reported: 1. Percentage of patients with height, weight, and body mass index percentile documentation 2. Percentage of patients with counseling for nutrition 3. Percentage of patients with counseling for physical activity
Childhood Immunization Status	Percentage of children 2 years of age who had four diphtheria, tetanus, and acellular pertussis; three polio; one measles, mumps, and rubella; three H influenza type B; three hepatitis B; one chickenpox; four pneumococcal conjugate; one hepatitis A; two or three rotavirus; and two influenza vaccines by their second birthday
IVD: Complete Lipid Profile and LDL-C Control (<100 mg/dl)	Percentage of patients 18 years of age and older who were discharged alive for acute MI, CABG, or percutaneous coronary interventions (PCI) in the 12 months before the measurement period, or who had an active diagnosis of IVD during the measurement period, and who had each of the following during the measurement period: a complete lipid profile and LDL-C was adequately controlled (<100 mg/dl)
CAD: Symptom Management	Percentage of patients aged 18 years and older with a diagnosis of CAD seen within a 12-month period with results of an evaluation of level of activity and an assessment of whether anginal symptoms are present or absent with appropriate management of anginal symptoms within a 12-month period
Cardiac Rehabilitation Patient Referral from an Outpatient Setting	Percentage of patients evaluated in an outpatient setting who within the previous 12 months have experienced an acute MI, CABG surgery, a PCI, cardiac valve surgery, or cardiac transplantation, or who have chronic stable angina and have not already participated in an early outpatient cardiac rehabilitation/secondary prevention (CR) program for the qualifying event/diagnosis who were referred to a CR program
Barrett Esophagus	Percentage of esophageal biopsy reports that document the presence of Barrett mucosa that also include a statement about dysplasia
Radical Prostatectomy Pathology Reporting	Percentage of radical prostatectomy pathology reports that include the pT category, the pN category, the Gleason score, and a statement about margin status
Quantitative Immunohistochemical (IHC) Evaluation of Human Epidermal Growth Factor Receptor 2 Testing (HER2) for Breast Cancer Patients	This is a measure based on whether quantitative evaluation of HER2 testing by IHC uses the system recommended in the current ASCO/CAP Guidelines for HER2 testing in breast cancer
Ultrasound Determination of Pregnancy Location for Pregnant Patients with Abdominal Pain	Percentage of pregnant female patients aged 14-50 years who present to the emergency department with a chief complaint of abdominal pain or vaginal bleeding who receive a transabdominal or transvaginal ultrasonography to determine pregnancy location
Rh Immunoglobulin (Rhogam) for Rh-Negative Pregnant Women at Risk of Fetal Blood Exposure	Percentage of Rh-negative pregnant women aged 14-50 years at risk of fetal blood exposure who receive Rhogam in the emergency department
Statin Therapy at Discharge After Lower Extremity Bypass (LEB)	Percentage of patients aged 18 years and older undergoing infrainguinal lower extremity bypass who are prescribed a statin medication at discharge
Rate of Open Repair of Small or Moderate Nonruptured Abdominal Aortic Aneurysms (AAA) Without Major Complications (Discharged to Home by Postoperative Day 7)	Percent age of patients undergoing open repair of small or moderate-sized nonruptured AAA who do not experience a major complication (discharge to home no later than postoperative day 7)
Rate of Endovascular Aneurysm Repair (EVAR) of Small or Moderate Nonruptured AAA Without Major Complications (Discharged to Home by Postoperative Day 2)	Percent of patients undergoing endovascular repair of small or moderate nonruptured AAA who do not experience a major complication (discharged to home no later than postoperative day 2)
Rate of Carotid Endarterectomy (CEA) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Postoperative Day 2)	Percentage of asymptomatic patients undergoing CEA who are discharged to home no later than postoperative day 2
Referral for Otologic Evaluation for Patients with Acute or Chronic Dizziness	Percentageage of patients aged birth and older referred to a physician (preferably a physician specially trained in disorders of the ear) for an otologic evaluation subsequent to an audiologic evaluation after presenting with acute or chronic dizziness
Image Confirmation of Successful Excision of Image-Localized Breast Lesion	Image confirmation of lesion(s) targeted for image-guided excisional biopsy or image-guided partial mastectomy in patients with nonpalpable, image-detected breast lesion(s). Lesions may include microcalcifications, mammographic or sonographic mass or architectural distortion, focal suspicious abnormalities on MRI or other breast imaging amenable to localization such as positron emission tomography mammography, or a biopsy marker demarcating site of confirmed pathology as established by previous core biopsy.
Preoperative Diagnosis of Breast Cancer	Percentage of patients undergoing breast cancer operations who obtained the diagnosis of breast cancer preoperatively by a minimally invasive biopsy method
Sentinel Lymph Node Biopsy for Invasive Breast Cancer	Percentage of clinically node-negative (clinical stage T1N0M0 or T2N0M0) breast cancer patients who undergo a sentinel lymph node procedure

Continued on following page

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Biopsy Follow-Up	Percentage of new patients whose biopsy results have been reviewed and communicated to the primary care/referring physician and patient by the performing physician
Epilepsy: Counseling for Women of Childbearing Potential with Epilepsy	All female patients of childbearing potential (12-44 years old) found to have epilepsy who were counseled or referred for counseling for how epilepsy and its treatment may affect contraception *or* pregnancy at least once a year
Inflammatory Bowel Disease (IBD): Preventive Care: Corticosteroid Sparing Therapy	Percentage of patients aged 18 years and older with a diagnosis of inflammatory bowel disease who have been managed by corticosteroids ≥10 mg/day of prednisone equivalents for 60 or greater consecutive days or a single prescription equating to 600 mg prednisone or greater for all fills that have been prescribed corticosteroid-sparing therapy within the last 12 months
IBD: Preventive Care: Corticosteroid-Related Iatrogenic Injury—Bone Loss Assessment	Percentage of patients aged 18 years and older with an inflammatory bowel disease encounter who were prescribed prednisone equivalents ≥10 mg/day for 60 or greater consecutive days or a single prescription equating to 600 mg prednisone or greater for all fills and were documented for risk of bone loss once during the reporting year or the previous calendar year
IBD: Testing for Latent TB Before Initiating Anti-TNF (Tumor Necrosis Factor) Therapy	Percentage of patients aged 18 years and older with a diagnosis of IBD) for whom a TB screening was performed and results interpreted within 6 months before receiving a first course of anti-TNF therapy
IBD: Assessment of Hepatitis B Virus (HBV) Status Before Initiating Anti-TNF Therapy	Percentage of patients aged 18 years and older with a diagnosis of IBD who had HBV status assessed and results interpreted within 1 year before receiving a first course of anti-TNF therapy
Sleep Apnea: Assessment of Sleep Symptoms	Percentage of visits for patients aged 18 years and older with a diagnosis of obstructive sleep apnea that includes documentation of an assessment of sleep symptoms, including presence or absence of snoring and daytime sleepiness
Sleep Apnea: Severity Assessment at Initial Diagnosis	Percentage of patients aged 18 years and older with a diagnosis of obstructive sleep apnea who had an apnea hypopnea index or a respiratory disturbance index measured at the time of initial diagnosis
Sleep Apnea: Positive Airway Pressure Therapy Prescribed	Percentage of patients aged 18 years and older with a diagnosis of moderate or severe obstructive sleep apnea who were prescribed positive airway pressure therapy
Sleep Apnea: Assessment of Adherence to Positive Airway Pressure Therapy	Percentage of visits for patients aged 18 years and older with a diagnosis of obstructive sleep apnea who were prescribed positive airway pressure therapy who had documentation that adherence to positive airway pressure therapy was objectively measured
Dementia: Staging of Dementia	Percentage of patients, regardless of age, with a diagnosis of dementia whose severity of dementia was classified as mild, moderate, or severe at least once within a 12-month period
Dementia: Cognitive Assessment	Percentage of patients, regardless of age, with a diagnosis of dementia for whom an assessment of cognition is performed and the results reviewed at least once within a 12-month period
Dementia: Functional Status Assessment	Percentage of patients, regardless of age, with a diagnosis of dementia for whom an assessment of functional status is performed and the results reviewed at least once within a 12-month period
Dementia: Neuropsychiatric Symptom Assessment	Percentage of patients, regardless of age, with a diagnosis of dementia and for whom an assessment of neuropsychiatric symptoms is performed and results reviewed at least once in a 12-month period
Dementia: Management of Neuropsychiatric Symptoms	Percentage of patients, regardless of age, with a diagnosis of dementia who have one or more neuropsychiatric symptoms who received or were recommended to receive an intervention for neuropsychiatric symptoms within a 12-month period
Dementia: Counseling Regarding Safety Concerns	Percentage of patients, regardless of age, with a diagnosis of dementia or their caregiver(s) who were counseled or referred for counseling regarding safety concerns within a 12-month period
Dementia: Counseling Regarding Risks of Driving	Percentage of patients, regardless of age, with a diagnosis of dementia or their caregiver(s) who were counseled regarding the risks of driving and the alternatives to driving at least once within a 12-month period
Dementia: Caregiver Education and Support	Percentage of patients, regardless of age, with a diagnosis of dementia whose caregiver(s) were provided with education on dementia disease management and health behavior changes *and* referred to additional sources for support within a 12-month period
Parkinson Disease: Annual Parkinson Disease Diagnosis Review	All patients with a diagnosis of Parkinson disease who had an annual assessment, including a review of current medications (e.g., medications that can produce Parkinson-like signs or symptoms) and a review for the presence of atypical features (e.g., falls at presentation and early in the disease course, poor response to levodopa, symmetry at onset, rapid progression [to Hoehn and Yahr stage 3 in 3 years], and lack of tremor or dysautonomia) at least annually

Measure Title	Measure Description
Parkinson Disease: Psychiatric Disorders or Disturbances Assessment	All patients with a diagnosis of Parkinson disease who were assessed for psychiatric disorders or disturbances (e.g., psychosis, depression, anxiety disorder, apathy, or impulse control disorder) at least annually
Parkinson Disease: Cognitive Impairment or Dysfunction Assessment	All patients with a diagnosis of Parkinson disease who were assessed for cognitive impairment or dysfunction at least annually
Parkinson Disease: Querying About Sleep Disturbances	All patients with a diagnosis of Parkinson disease (or caregivers, as appropriate) who were queried about sleep disturbances at least annually
Parkinson Disease: Rehabilitative Therapy Options	All patients with a diagnosis of Parkinson disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (e.g., physical, occupational, or speech therapy) discussed at least annually
Parkinson Disease: Parkinson Disease Medical and Surgical Treatment Options Reviewed	All patients with a diagnosis of Parkinson disease (or caregiver(s), as appropriate) who had the Parkinson disease treatment options (e.g., nonpharmacological treatment, pharmacological treatment, or surgical treatment) reviewed at least once annually
Cataracts: Improvement in Patient's Visual Function Within 90 Days After Cataract Surgery	Percentage of patients aged 18 years and older in sample who had cataract surgery and had improvement in visual function achieved within 90 days after the cataract surgery, based on completing a preoperative and postoperative visual function survey
Cataracts: Patient Satisfaction Within 90 Days After Cataract Surgery	Percentage of patients aged 18 years and older in sample who had cataract surgery and were satisfied with their care within 90 days after the cataract surgery, based on completion of the Consumer Assessment of Healthcare Providers and Systems Surgical Care Survey
Initiation and Engagement of Alcohol and Other Drug Dependence (AOD) Treatment	Percentage of patients 13 years of age and older with a new episode of AOD dependence who received the following. Two rates are reported: 1. Percentage of patients who initiated treatment within 14 days of the diagnosis 2. Percentage of patients who initiated treatment and who had two or more additional services with an AOD diagnosis within 30 days of the initiation visit
Cervical Cancer Screening	Percentage of women 21-64 years of age who received one or more Pap tests to screen for cervical cancer
Chlamydia Screening for Women	Percentage of women 16-24 years of age who were identified as sexually active and who had at least one test for chlamydia during the measurement period
Use of Appropriate Medications for Asthma	Percentage of patients 5-64 years of age who were identified as having persistent asthma and were appropriately prescribed medication during the measurement period
Use of Imaging Studies for Low Back Pain	Percentage of patients 18-50 years of age with a diagnosis of low back pain who did not have an imaging study (plain X-ray, MRI, CT scan) within 28 days of the diagnosis
Preventive Care and Screening: Cholesterol—Fasting LDL-C Test Performed *and* Risk-Stratified Fasting LDL-C	Percentage of patients aged 20-79 years whose risk factors* have been assessed and a fasting LDL-C test has been performed *and* percentage of patients aged 20-79 years who had a fasting LDL-C test performed and whose risk-stratified fasting LDL-C is at or below the recommended LDL-C goal. *There are three criteria for this measure based on the patient's risk category: 1. Highest level of risk: CHD or CHD risk equivalent *or* 10-year Framingham risk >20% 2. Moderate level of risk: multiple (2+) risk factors *or* 10-year Framingham risk 10%-20% 3. Lowest level of risk: 0 or 1 risk factor *or* 10-year Framingham risk <10%
Preventive Care and Screening: Screening for High BP and Follow-Up Documented	Percentage of patients aged 18 years and older seen during the reporting period who were screened for high BP *and* a recommended follow-up plan is documented based on the current BP reading as indicated
Falls: Screening for Fall Risk	Percentage of patients 65 years of age and older who were screened for future fall risk at least once during the measurement period
Appropriate Follow-Up Interval for Normal Colonoscopy in Average-Risk Patients	Percentage of patients aged 50 to 75 years receiving a screening colonoscopy without biopsy or polypectomy who had a recommended follow-up interval of at least 10 years for repeat colonoscopy documented in their colonoscopy report
Consumer Assessment of Healthcare Providers and Systems for PQRS Clinician/Group Survey	• Getting timely care, appointments, and information • How well providers communicate • Patient's rating of provider • Access to specialists • Health promotion & education • Shared decision making • Health status/functional status • Courteous and helpful office staff • Care coordination • Communication between visits • Helping your patient to take medication as directed • Stewardship of patient resources

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Preoperative Evaluation in Low-Risk Surgery Patients	Percentage of stress single-photon emission computed tomography (SPECT) myocardial perfusion imaging, stress ECHO, cardiac CTA, or cardiac magnetic resonance performed in low-risk surgery patients 18 years or older for preoperative evaluation during the 12-month reporting period
Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Routine Testing After PCI	Percentage of all stress SPECT myocardial perfusion imaging, stress ECHO, cardiac CTA, and cardiovascular magnetic resonance performed in patients aged 18 years and older routinely after PCI, with reference to timing of test after PCI and symptom status
Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Testing in Asymptomatic, Low-Risk Patients	Percentage of all stress SPECT myocardial perfusion imaging, stress ECHO, cardiac CTA, and cardiovascular magnetic resonance performed in asymptomatic, low-CHD-risk patients 18 years and older for initial detection and risk assessment
Adult MDD: Coordination of Care of Patients with Specific Comorbid Conditions	Percentage of medical records of patients aged 18 years and older with a diagnosis of MDD and a specific diagnosed comorbid condition (diabetes, CAD, ischemic stroke, intracranial hemorrhage, CKD [stages 4 or 5], end-stage renal disease [ESRD], or CHF) being treated by another clinician with communication to the clinician treating the comorbid condition
Atrial Fibrillation (AF) and Atrial Flutter: Chronic Anticoagulation Therapy	Percentage of patients aged 18 years and older with a diagnosis of nonvalvular AF or atrial flutter whose assessment of the specified thromboembolic risk factors indicate one or more high-risk factors or more than one moderate-risk factor, as determined by CHADS2 risk stratification, who are prescribed warfarin *or* another oral anticoagulant drug that is FDA-approved for the prevention of thromboembolism
Pediatric Kidney Disease: Adequacy of Volume Management	Percentage of calendar months within a 12-month period during which patients aged 17 years and younger with a diagnosis of ESRD undergoing maintenance hemodialysis in an outpatient dialysis facility have an assessment of the adequacy of volume management from a nephrologist
Pediatric Kidney Disease: ESRD Patients Receiving Dialysis: Hemoglobin Level <10 g/dl	Percentage of calendar months within a 12-month period during which patients aged 17 years and younger with a diagnosis of ESRD receiving hemodialysis or peritoneal dialysis have a hemoglobin level <10 g/dl
Adult Kidney Disease: Catheter Use at Initiation of Hemodialysis	Percentage of patients aged 18 years and older with a diagnosis of ESRD who initiate maintenance hemodialysis during the measurement period, whose mode of vascular access is a catheter at the time maintenance hemodialysis is initiated
Adult Kidney Disease: Catheter Use for Greater Than or Equal to 90 Days	Percentage of patients aged 18 years and older with a diagnosis of ESRD receiving maintenance hemodialysis for ≥90 days whose mode of vascular access is a catheter
Adult Sinusitis: Antibiotic Prescribed for Acute Sinusitis (Overuse)	Percentage of patients aged 18 years and older with a diagnosis of acute sinusitis who were prescribed an antibiotic within 10 days after onset of symptoms
Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin with or without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use)	Percentage of patients aged 18 years and older with a diagnosis of acute bacterial sinusitis who were prescribed amoxicillin, with or without clavulanate, as a first-line antibiotic at the time of diagnosis
Adult Sinusitis: CT for Acute Sinusitis (Overuse)	Percentage of patients aged 18 years and older with a diagnosis of acute sinusitis who had a CT scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis
Adult Sinusitis: More Than One CT Scan Within 90 Days for Chronic Sinusitis (Overuse)	Percentage of patients aged 18 years and older with a diagnosis of chronic sinusitis who had more than one CT scan of the paranasal sinuses ordered or received within 90 days after the date of diagnosis
Maternity Care: Elective Delivery or Early Induction Without Medical Indication at ≥37 and <39 Weeks	Percentage of patients, regardless of age, who gave birth during a 12-month period who delivered a live singleton at ≥37 and <39 weeks of gestation completed who had elective deliveries or early inductions without medical indication
Maternity Care: Postpartum Follow-Up and Care Coordination	Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care within 8 weeks of giving birth who received a breast feeding evaluation and education, postpartum depression screening, postpartum glucose screening for gestational diabetes patients, and family and contraceptive planning
TB Prevention for Psoriasis, Psoriatic Arthritis, and RA Patients on a Biological Immune Response Modifier	Percentage of patients whose providers are ensuring active TB prevention either through yearly negative standard TB screening tests or are reviewing the patient's history to determine if they have had appropriate management for a recent or prior positive test
HIV Viral Load Suppression	Percentage of patients, regardless of age, with a diagnosis of HIV with a HIV viral load <200 copies/ml at last HIV viral load test during the measurement year
Prescription of HIV Antiretroviral Therapy	Percentage of patients, regardless of age, with a diagnosis of HIV prescribed antiretroviral therapy for the treatment of HIV infection during the measurement year
HIV Medical Visit Frequency	Percentage of patients, regardless of age, with a diagnosis of HIV who had at least one medical visit in each 6-month period of the 24-month measurement period, with a minimum of 60 days between medical visits

Measure Title	Measure Description
Pain Brought Under Control Within 48 Hours	Patients aged 18 years and older who report being uncomfortable because of pain at the initial assessment (after admission to palliative care services) who report pain was brought to a comfortable level within 48 hours
Screening Colonoscopy Adenoma Detection Rate Measure	Percentage of patients aged 50 years or older with at least one conventional adenoma or colorectal cancer detected during screening colonoscopy
Rate of Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Postoperative Day 2)	Percentage of asymptomatic patients undergoing CAS who are discharged to home no later than postoperative day 2
Rate of Postoperative Stroke or Death in Asymptomatic Patients Undergoing CAS	Percentage of asymptomatic patients undergoing CAS who experience stroke or death after surgery while in the hospital
Rate of Postoperative Stroke or Death in Asymptomatic Patients Undergoing Carotid Endarterectomy (CEA)	Percentage of asymptomatic patients undergoing CEA who experience stroke or death after surgery while in the hospital
Rate of EVAR of Small or Moderate Nonruptured AAA Who Die While in Hospital	Percentage of patients undergoing endovascular repair of small or moderate AAA who die while in the hospital
HRS-3: Implantable Cardioverter-Defibrillator (ICD) Complications Rate	Patientsage with physician-specific risk-standardized rates of procedural complications after the first-time implantation of an ICD
Total Knee Replacement: Shared Decision Making: Trial of Conservative (Nonsurgical) Therapy	Percentage of patients regardless of age or gender undergoing a total knee replacement with documented shared decision making with discussion of conservative (nonsurgical) therapy (e.g., clavulanate anti-inflammatory drugs [NSAIDs], analgesics, weight loss, exercise, injections) before the procedure
Total Knee Replacement: Venous Thromboembolic and Cardiovascular Risk Evaluation	Percentage of patients regardless of age or gender undergoing a total knee replacement who are evaluated for the presence or absence of venous thromboembolic and cardiovascular risk factors within 30 days before the procedure (e.g., history of DVT, pulmonary embolism, MI, arrhythmia, and stroke)
Total Knee Replacement: Preoperative Antibiotic Infusion with Proximal Tourniquet	Percentage of patients regardless of age or gender undergoing a total knee replacement who had the prophylactic antibiotic completely infused before the inflation of the proximal tourniquet
Total Knee Replacement: Identification of Implanted Prosthesis in Operative Report	Percentage of patients regardless of age or gender undergoing a total knee replacement whose operative report identifies the prosthetic implant specifications, including the prosthetic implant manufacturer, the brand name of the prosthetic implant, and the size of each prosthetic implant
Anastomotic Leak Intervention	Percentage of patients aged 18 years and older who required an anastomotic leak intervention after gastric bypass or colectomy surgery
Unplanned Reoperation Within the 30-Day Postoperative Period	Percentage of patients aged 18 years and older who had any unplanned reoperation within the 30-day postoperative period
Unplanned Hospital Readmission Within 30 Days of Principal Procedure	Percentage of patients aged 18 years and older who had an unplanned hospital readmission within 30 days of principal procedure
Surgical Site Infection (SSI)	Percentage of patients aged 18 years and older who had an SSI
Patient-Centered Surgical Risk Assessment and Communication	Percentage of patients who underwent a nonemergency surgery who had their personalized risks of postoperative complications assessed by their surgical team before surgery using a clinical-data-based, patient-specific risk calculator and who received personal discussion of those risks with the surgeon
Optimizing Patient Exposure to Ionizing Radiation: Utilization of a Standardized Nomenclature for CT Imaging Description	Percentage of CT imaging reports for all patients, regardless of age, with the imaging study named according to a standardized nomenclature and the standardized nomenclature is used in institution's computer systems
Optimizing Patient Exposure to Ionizing Radiation: Count of Potential High-Dose Radiation Imaging Studies: CT and Cardiac Nuclear Medicine Studies	Percentage of CT and cardiac nuclear medicine (myocardial perfusion studies) imaging reports for all patients, regardless of age, that document a count of known previous CT (any type of CT) and cardiac nuclear medicine (myocardial perfusion) studies that the patient has received in the 12-month period before the current study
Optimizing Patient Exposure to Ionizing Radiation: Reporting to a Radiation Dose Index Registry	Percentage of total CT studies performed for all patients, regardless of age, that are reported to a radiation dose index registry *and* that include at a minimum selected data elements
Optimizing Patient Exposure to Ionizing Radiation: CT Images Available for Patient Follow-Up and Comparison Purposes	Percentage of final reports for CT studies performed for all patients, regardless of age, which document that Digital Imaging and Communications in Medicine (DICOM) format image data are available to nonaffiliated external health care facilities or entities on a secure, media-free, reciprocally searchable basis with patient authorization for at least a 12-month period after the study
Optimizing Patient Exposure to Ionizing Radiation: Search for Prior CT Studies Through a Secure, Authorized, Media-Free, Shared Archive	Percentage of final reports of CT studies performed for all patients, regardless of age, which document that a search for DICOM format images was conducted for prior patient CT imaging studies completed at nonaffiliated external health care facilities or entities within the past 12 months and are available through a secure, authorized, media-free, shared archive before an imaging study being performed
Optimizing Patient Exposure to Ionizing Radiation: Appropriateness: Follow-Up CT Imaging for Incidentally Detected Pulmonary Nodules According to Recommended Guidelines	Percentage of final reports for CT imaging studies of the thorax for patients aged 18 years and older with documented follow-up recommendations for incidentally detected pulmonary nodules (e.g., follow-up CT imaging studies needed or that no follow-up is needed) based at a minimum on nodule size *and* patient risk factors

Continued on following page

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Hemoglobin A_{1c} Test for Pediatric Patients	Percentage of patients 5-17 years of age with diabetes with a HbA_{1c} test during the measurement period
Attention-Deficit/Hyperactivity Disorder (ADHD): Follow-Up Care for Children Prescribed ADHD Medication	Percentage of children 6-12 years of age and newly dispensed a medication for ADHD who had appropriate follow-up care. Two rates are reported: 1. Percentage of children who had one follow-up visit with a practitioner with prescribing authority during the 30-day initiation phase 2. Percentage of children who remained on ADHD medication for at least 210 days and who, in addition to the visit in the initiation phase, had at least two additional follow-up visits with a practitioner within 270 days (9 months) after the initiation phase ended
Bipolar Disorder and Major Depression: Appraisal for Alcohol or Chemical Substance Use	Percentage of patients with depression or bipolar disorder with evidence of an initial assessment that includes an appraisal for alcohol or chemical substance use
HIV/AIDS: Medical Visit	Percentage of patients, regardless of age, with a diagnosis of HIV/AIDS with at least two medical visits during the measurement year with a minimum of 90 days between each visit
Pregnant Women Who Had HBsAg Testing	This measure identifies pregnant women who had a HBsAg (hepatitis B) test during their pregnancy
Depression Remission at 12 Months	Adult patients aged 18 years and older with major depression or dysthymia and an initial Patient Health Questionnaire (PHQ-9) score >9 who demonstrate remission at 12 months defined as PHQ-9 score <5. This measure applies to both patients with newly diagnosed and existing depression whose current PHQ-9 score indicates a need for treatment.
Depression Utilization of the PHQ-9 Tool	Adult patients aged 18 years and older with the diagnosis of major depression or dysthymia who have a PHQ-9 tool administered at least once during a 4-month period in which there was a qualifying visit
Maternal Depression Screening	Percentage of children who turned 6 months of age during the measurement year who had a face-to-face visit between the clinician and the child during child's first 6 months and who had a maternal depression screening for the mother at least once between 0 and 6 months of life
Hypertension: Improvement in BP	Percentage of patients aged 18-85 years of age with a diagnosis of hypertension whose BP improved during the measurement period
Closing the Referral Loop: Receipt of Specialist Report	Percentage of patients with referrals, regardless of age, for which the referring provider receives a report from the provider to whom the patient was referred
Functional Status Assessment for Knee Replacement	Percentage of patients aged 18 years and older with primary total knee arthroplasty who completed baseline and follow-up (patient-reported) functional status assessments
Functional Status Assessment for Hip Replacement	Percentage of patients aged 18 years and older with primary total hip arthroplasty who completed baseline and follow-up (patient-reported) functional status assessments
Functional Status Assessment for Complex Chronic Conditions	Percentage of patients aged 65 years and older with HF who completed initial and follow-up patient-reported functional status assessments
Children Who Have Dental Decay or Cavities	Percentage of children, aged 0-20 years, who have had tooth decay or cavities during the measurement period
Primary Caries Prevention Intervention as Offered by Primary Care Providers, Including Dentists	Percentage of children, aged 0-20 years, who received a fluoride varnish application during the measurement period
Adverse Drug Event Prevention and Monitoring: Warfarin Time in Therapeutic Range	Average percentage of time in which patients aged 18 years and older with atrial fibrillation who are on chronic warfarin therapy have international normalized ratio test results within the therapeutic range (i.e., TTR) during the measurement period
HIV/AIDS: RNA Control for Patients with HIV	Percentage of patients aged 13 years and older with a diagnosis of HIV/AIDS, with at least two visits during the measurement year, with at least 90 days between each visit, whose most recent HIV RNA level is <200 copies/ml
Child and Adolescent MDD: Suicide Risk Assessment	Percentage of patient visits for those patients aged 6-17 years with a diagnosis of MDD with an assessment for suicide risk
Adherence to Antipsychotic Medications for Individuals with Schizophrenia	Percentage of individuals at least 18 years of age as of the beginning of the measurement period with schizophrenia or schizoaffective disorder who had at least two prescriptions filled for any antipsychotic medication and who had a PDC of at least 0.8 for antipsychotic medications during the measurement period (12 consecutive months)
Adult Primary Rhegmatogenous Retinal Detachment Surgery: No Return to the Operating Room Within 90 Days of Surgery	Patients aged 18 years and older who had surgery for primary rhegmatogenous retinal detachment who did not require a return to the operating room within 90 days of surgery
Adult Primary Rhegmatogenous Retinal Detachment Surgery: Visual Acuity Improvement Within 90 Days of Surgery	Patients aged 18 years and older who had surgery for primary rhegmatogenous retinal detachment and achieved an improvement in their visual acuity, from their preoperative level, within 90 days of surgery in the operative eye
Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences	Percentage of patients found to have ALS who were offered assistance in planning for end-of-life issues (e.g., advance directives, invasive ventilation, hospice) at least once annually

Measure Title	Measure Description
Annual HCV Screening for Patients Who Are Active Injection Drug Users	Percentage of patients regardless of age who are active injection drug users who received screening for HCV infection within the 12-month reporting period
Cataract Surgery with Intraoperative Complications (Unplanned Rupture of Posterior Capsule Requiring Unplanned Vitrectomy)	Percentage of patients aged 18 years and older who had cataract surgery performed and had an unplanned rupture of the posterior capsule requiring vitrectomy
Cataract Surgery: Difference Between Planned and Final Refraction	Percentage of patients aged 18 years and older who had cataract surgery performed and who achieved a final refraction within ±1.0 diopters of their planned (target) refraction
Hepatitis C: Discussion and Shared Decision Making Surrounding Treatment Options	Percentage of patients aged 18 years and older with a diagnosis of hepatitis C with whom a physician or other qualified health care professional reviewed the range of treatment options appropriate to their genotype and demonstrated a shared decision-making approach with the patient. To meet the measure, there must be documentation in the patient record of a discussion between the physician or other qualified health care professional and the patient that includes all of the following: treatment choices appropriate to genotype, risks and benefits, evidence of effectiveness, and patient preferences toward treatment
Follow-Up After Hospitalization for Mental Illness	Percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness diagnoses and who had an outpatient visit, an intensive outpatient encounter, or partial hospitalization with a mental health practitioner. Two rates are reported: 1. Percentage of discharges for which the patient received follow-up within 30 days of discharge 2. Percentage of discharges for which the patient received follow-up within 7 days of discharge
HRS-12: Cardiac Tamponade and/or Pericardiocentesis After Atrial Fibrillation Ablation	Rate of cardiac tamponade and/or pericardiocentesis after atrial fibrillation ablation This measure is reported as four rates stratified by age and gender: • Reporting age criteria 1: Females <65 years of age • Reporting age criteria 2: Males <65 years of age • Reporting age criteria 3: Females 65 years of age and older • Reporting age criteria 4: Males 65 years of age and older
HRS-9: Infection Within 180 Days of Cardiac Implantable Electronic Device (CIED) Implantation, Replacement, or Revision	Infection rate after CIED device implantation, replacement, or revision
Immunizations for Adolescents	Percentage of adolescents 13 years of age who had the recommended immunizations by their 13th birthday
Lung Cancer Reporting (Biopsy/Cytology Specimens)	Pathology reports based on biopsy and/or cytology specimens with a diagnosis of primary non–small-cell lung cancer classified into specific histologic type or classified as non–small-cell lung cancer not otherwise specified with an explanation included in the pathology report
Lung Cancer Reporting (Resection Specimens)	Pathology reports based on resection specimens with a diagnosis of primary lung carcinoma that include the pT category, pN category, and, for non–small cell lung cancer, histologic type
Melanoma Reporting	Pathology reports for primary malignant cutaneous melanoma that include the pT category and a statement on thickness and ulceration and for pT1, mitotic rate
Optimal Asthma Control	Patients aged 5-50 years (pediatrics aged 5-17 years) whose asthma is well controlled as demonstrated by one of three age-appropriate patient-reported outcome tools
Postprocedural Optimal Medical Therapy Composite (Percutaneous Coronary Intervention [PCI])	Percentage of patients aged 18 years and older for whom PCI is performed who are prescribed optimal medical therapy at discharge
One-Time Screening for HCV for Patients at Risk	Percentage of patients aged 18 years and older with one or more of the following: a history of injection drug use, receipt of a blood transfusion before 1992, receiving maintenance hemodialysis, *or* birthdate in the years 1945-1965 who received a one-time screening for HCV infection
Hepatitis C: Screening for Hepatocellular Carcinoma (HCC) in Patients with Cirrhosis	Percentage of patients aged 18 years and older with a diagnosis of chronic hepatitis C cirrhosis who underwent imaging with either ultrasonography, contrast-enhanced CT, or MRI for HCC at least once within the 12-month reporting period
Tobacco Use and Help with Quitting Among Adolescents	Percentage of adolescents 12 to 20 years of age with a primary care visit during the measurement year for whom tobacco use status was documented and received help with quitting if identified as a tobacco user
Adult Kidney Disease: Referral to Hospice	Percentage of patients aged 18 years and older with a diagnosis of ESRD who withdraw from hemodialysis peritoneal dialysis who are referred to hospice care
Anesthesiology Smoking Abstinence	Percentage of current smokers who abstain from cigarettes before anesthesia on the day of elective surgery or procedure

Continued on following page

Physician Quality Reporting System (PQRS) Measures

Measure Title	Measure Description
Appropriate Follow-Up Imaging for Incidental Abdominal Lesions	Percentage of final reports for abdominal imaging studies for asymptomatic patients aged 18 years and older with one or more of the following noted incidentally with follow-up imaging recommended: • Liver lesion ≤0.5 cm • Cystic kidney lesion <1.0 cm • Adrenal lesion ≤1.0 cm
Appropriate Follow-Up Imaging for Incidental Thyroid Nodules in Patients	Percentage of final reports for CT or MRI studies of the chest or neck or ultrasonography of the neck for patients aged 18 years and older with no known thyroid disease with a thyroid nodule <1.0 cm noted incidentally with follow-up imaging recommended
Appropriate Treatment of Methicillin-Sensitive *Staphylococcus aureus* (MSSA) Bacteremia	Percentage of patients with sepsis due to MSSA bacteremia who received beta-lactam antibiotic (e.g., nafcillin, oxacillin, or cefazolin) as definitive therapy
Opioid Therapy Follow-Up Evaluation	All patients aged 18 years and older prescribed opiates for longer than 6 weeks' duration who had a follow-up evaluation conducted at least every 3 months during opioid therapy documented in the medical record
Clinical Outcome Postendovascular Stroke Treatment	Percentage of patients with an mRs score of 0 to 2 at 90 days after endovascular stroke intervention
Psoriasis: Clinical Response to Oral Systemic or Biologic Medications	Percentage of psoriasis patients receiving oral systemic or biologic therapy who meet minimal physician- or patient-reported disease activity levels. It is implied that establishment and maintenance of an established minimum level of disease control as measured by physician- and/or patient-reported outcomes will increase patient satisfaction with and adherence to treatment.
Depression Remission at 6 Months	Adult patients aged 18 years and older with major depression or dysthymia and an initial PHQ-9 score >9 who demonstrate remission at 6 months defined as a PHQ-9 score <5. This measure applies to both patients with newly diagnosed and existing depression whose current PHQ-9 score indicates a need for treatment.
Documentation of Signed Opioid Treatment Agreement	All patients aged 18 years and older prescribed opiates for longer than 6 weeks' duration who signed an opioid treatment agreement at least once during opioid therapy documented in the medical record
Door to Puncture Time for Endovascular Stroke Treatment	Percentage of patients undergoing endovascular stroke treatment who have a door to puncture time of <2 hours
Evaluation or Interview for Risk of Opioid Misuse	All patients aged 18 years and older prescribed opiates for longer than 6 weeks' duration evaluated for risk of opioid misuse using a brief validated instrument (e.g., Opioid Risk Tool, SOAAP-R) or patient interview documented at least once during opioid therapy in the medical record
Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 18 Years and Older	Percentage of emergency department visits for patients aged 18 years and older who presented within 24 hours of a minor blunt head trauma with a Glasgow Coma Scale (GCS) score of 15 and who had a head CT for trauma ordered by an emergency care provider who have an indication for a head CT
Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 2 through 17 Years	Percentage of emergency department visits for patients aged 2-17 years who presented within 24 hours of a minor blunt head trauma with a GCS score of 15 and who had a head CT for trauma ordered by an emergency care provider who are classified as low risk according to the Pediatric Emergency Care Applied Research Network prediction rules for traumatic brain injury
Rate of Open Repair of Ascending AAA Where Patients Are Discharged Alive	Percentage of patients undergoing open repair of AAA who are discharged alive
Osteoporosis Management in Women Who Had a Fracture	Percentage of women aged 50-85 years who suffered a fracture and who either had a bone mineral density test or received a prescription for a drug to treat osteoporosis
Overuse of Neuroimaging for Patients with Primary Headache and a Normal Neurological Examination	Percentage of patients with a diagnosis of primary headache disorder for whom advanced brain imaging was not ordered
Varicose Vein Treatment with Saphenous Ablation: Outcome Survey	Percentage of patients treated for varicose veins (CEAP C2-S) who are treated with saphenous ablation (with or without adjunctive tributary treatment) that report an improvement on a disease-specific patient reported outcome survey instrument after treatment
Appropriate Assessment of Retrievable Inferior Vena Cava (IVC) Filters for Removal	Percentage of patients in whom a retrievable IVC filter is placed who, within 3 months postplacement, have a documented assessment for the appropriateness of continued filtration, device removal, or the inability to contact the patient with at least two attempts
Performing Cystoscopy at the Time of Hysterectomy for Pelvic Organ Prolapse to Detect Lower Urinary Tract Injury	Percentage of patients who undergo cystoscopy to evaluate for lower urinary tract injury at the time of hysterectomy for pelvic organ prolapse
Perioperative Antiplatelet Therapy for Patients Undergoing Carotid Endarterectomy	Percentage of patients undergoing carotid endarterectomy who are taking an antiplatelet agent (aspirin or clopidogrel or equivalent such as aggrenox/tiglacor, etc.) within 48 hours before surgery and are prescribed this medication at hospital discharge after surgery
Perioperative Temperature Management	Percentage of patients, regardless of age, who undergo surgical or therapeutic procedures under general or neuraxial anesthesia of 60 minutes' duration or longer for whom at least one body temperature ≥35.5° C (or 95.9° F) was recorded within the 30 minutes immediately before or the 15 minutes immediately after anesthesia end time

Measure Title	Measure Description
Photodocumentation of Cecal Intubation	The rate of screening and surveillance colonoscopies for which photodocumentation of landmarks of cecal intubation is performed to establish a complete examination
Postanesthetic Transfer of Care Measure: Procedure Room to a Postanesthesia Care Unit (PACU):	Percentage of patients, regardless of age, who are under the care of an anesthesia practitioner and are admitted to a PACU in which a postanesthetic formal transfer of care protocol or checklist that includes the key transfer of care elements is used
Postanesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU)	Percentage of patients, regardless of age, who undergo a procedure under anesthesia and are admitted to an ICU directly from the anesthetizing location, who have a documented use of a checklist or protocol for the transfer of care from the responsible anesthesia practitioner to the responsible ICU team or team member
Pelvic Organ Prolapse: Preoperative Assessment of Occult Stress Urinary Incontinence	Percentage of patients undergoing appropriate preoperative evaluation for the indication of stress urinary incontinence per ACOG/AUGS/AUA guidelines
Pelvic Organ Prolapse: Preoperative Screening for Uterine Malignancy	Percentage of patients who are screened for uterine malignancy before surgery for pelvic organ prolapse
Prevention of Postoperative Nausea and Vomiting (PONV)—Combination Therapy	Percentage of patients, aged 18 years and older, who undergo a procedure under an inhalational general anesthetic, *and* who have three or more risk factors for PONV, who receive combination therapy consisting of at least two prophylactic pharmacologic antiemetic agents of different classes preoperatively or intraoperatively
Preventive Care and Screening: Unhealthy Alcohol Use: Screening and Brief Counseling	Percentage of patients aged 18 years and older who were screened at least once within the last 24 months for unhealthy alcohol use using a systematic screening method *and* who received brief counseling if identified as an unhealthy alcohol user
Proportion of Patients Sustaining a Bladder Injury at the Time of Any Pelvic Organ Prolapse Repair	Percentage of patients undergoing any surgery to repair pelvic organ prolapse who sustains an injury to the bladder recognized either during or within 1 month after surgery
Proportion of Patients Sustaining a Major Viscus Injury at the Time of Any Pelvic Organ Prolapse Repair	Percentage of patients undergoing surgical repair of pelvic organ prolapse that is complicated by perforation of a major viscus at the time of index surgery that is recognized intraoperative or within 1 month after surgery
Proportion of Patients Sustaining a Ureter Injury at the Time of Any Pelvic Organ Prolapse Repair	Percentage of patients undergoing a pelvic organ prolapse repair who sustain an injury to the ureter recognized either during or within 1 month after surgery
Quality of Life Assessment for Patients with Primary Headache Disorders	Percentage of patients with a diagnosis of primary headache disorder whose health-related quality of life (HRQoL) was assessed with a tool(s)* during at least two visits during the 12-month measurement period *and* whose HRQoL score stayed the same or improved
Radiation Consideration for Adult CT: Utilization of Dose-Lowering Techniques	Percentage of final reports for patients aged 18 years and older undergoing CT with documentation that one or more of the following dose reduction techniques were used: • Automated exposure control • Adjustment of the mA and/or kV according to patient size • Use of iterative reconstruction technique
Rate of Surgical Conversion from Lower Extremity Endovascular Revascularization Procedure	Inpatients assigned to endovascular treatment for obstructive arterial disease, percentage of patients who undergo unplanned major amputation or surgical bypass within 48 hours of the index procedure
Statin Therapy for the Prevention and Treatment of Cardiovascular Disease	Percentage of the following patients—all considered at high risk of cardiovascular events—who were prescribed or were on statin therapy during the measurement period: • Adults aged ≥21 years who were previously found to have or currently have an active diagnosis of clinical atherosclerotic cardiovascular disease; *or* • Adults aged ≥21 years with a fasting or direct LDL-C level ≥190 mg/dl; *or* • Adults aged 40-75 years with a diagnosis of diabetes with a fasting or direct LDL-C level of 70-189 mg/dl
Age-Appropriate Screening Colonoscopy	Percentage of patients >85 years of age who received a screening colonoscopy from January 1 to December 31

AIDS, Acquired immunodeficiency syndrome; *CTA,* computed tomography angiography; *CT,* computed tomography; *ECG,* electrocardiogram; *GnRH,* gonadotropin-releasing hormone; *HIV,* human immunodeficiency virus; *MRA,* magnetic resonance angiography; *MRI,* magnetic resonance imaging; *pT,* primary tumor; *pN,* regional lymph nodes; *RNA,* ribonucleic acid; *tPA,* tissue plasminogen activator.

Appendix VIII

Palliative Care

According to the American Academy of Hospice and Palliative Medicine (AAHPM), palliative care involves "the **relieving of symptoms** of a disease or disorder while aiming to maintain the highest possible **quality of life** for patients" and their families. This entails making every day the best day possible in the setting of serious illness, often requiring **goals of care** discussions with patients and their family members. Palliative care is appropriate at any age and at any stage of serious illness, *not* only at the end of life, and can be employed at the same time as treatments and life-prolonging therapies, such as chemotherapy, radiation therapy, or hemodialysis. The World Health Organization (WHO) adds that a palliative care approach:

- Affirms life and regards dying as a normal process
- Intends neither to hasten nor to postpone death
- Integrates psychological and spiritual aspects of patient care
- Offers a **support system** to help patients live as actively as possible until death
- Offers a support system to help the family cope during the patient's illness and after the patient's death

A palliative care team may involve chaplains, doctors, nurse practitioners, nurses, pharmacists, physician assistants, and social workers. Keys to a successful family meeting for cancer patients are summarized in Box 1.

PRIMARY PALLIATIVE CARE

According to Quill and Abernethy (2013), all medical providers, including primary care and specialists, should possess core symptom management and **communication skills** for providing primary palliative care, not necessarily requiring a palliative care specialist. These areas of proficiency should include:

- Basic discussions about patient goals, quality of life, advance care planning, and prognosis
- Recognizing the importance of social, cultural, and spiritual aspects of patient care
- Basic symptom management of pain, nausea, dyspnea, and fatigue
- Basic management of depression and anxiety

The rationale for obtaining and employing these skills is to embrace the excellent opportunity for early palliative care discussions by providers that already have a working relationship and knowledge of their patients. Key points in addressing the needs of the family are summarized in Box 2. Palliative care should be considered for any patient living with a progressive, chronic medical condition, including cancer, heart or lung disease, dementia, renal or liver failure, or stroke with significant functional impairment. Personal and external influences concerning preferred place of care are illustrated in Fig. 1. Kelley and Morrison (2015) point out that over 80% of advanced cancer patients experience pain and over 90% of advanced

BOX 1 Keys to a Successful Family Meeting

One of an oncology clinician's most difficult tasks is to conduct a successful family meeting when the burden of disease-directed therapies exceeds the benefits. Although chemotherapy or radiation might no longer offer benefit, it is never true that "there is nothing more we can do for you." The following steps increase the chance that the meeting will enhance communication among clinicians, patients, and family members; relieve concerns of abandonment; enhance trust; and provide a conversational template for the tough times to come.

1. **Schedule a Premeeting (Actual or Virtual) and Consider the Following Questions:**
   - A. Who needs to be there (which family members and which members of the clinical team)?
   - B. What is the realistic prognosis or functional goal for the patient?
   - C. Who will run the meeting? How can others help (e.g., the palliative care clinicians or the social worker)?
   - D. Who will stay with the patient and family to debrief?
2. **During the Meeting:**
   - A. Everyone must be seated.
   - B. Introduce everyone present.
   - C. ASK–tell–ask:
     - i. How do you think you (or "the patient") is/are doing?
     - ii. What changes have you seen in the last (days, weeks, months)?
     - iii. What are you hoping for? And what else?
     - iv. What are you most concerned about? What are your worst fears?
     - v. How can we help?
   - D. Ask–TELL–ask:
     - i. Answer their questions.
     - ii. Provide key medical information but AVOID giving medical details that obscure the big picture.
       - Example: The (disease) is clearly progressing despite our best efforts. In my best judgment, s/he has only (days, weeks, months) of good time left. S/He may well live longer, but this is the time when s/he will have the most energy, think the most clearly, and be most him/herself.
     - iii. STOP TALKING.
       - Counting silently to 20 helps.
     - iv. Respond to their grief.
   - E. Ask–tell–ASK:
     - i. What do you still want to accomplish during your life?
     - ii. What might be left undone if you were to die today?
     - iii. What legacy do you want to leave to your family?
     - iv. What do you want your children and grandchildren to remember about you?
     - v. How can we help NOW?
3. **After the Meeting:**
   - A. Review with your team how everyone is doing.
   - B. Make a plan for who will follow up next with the family.
   - C. Success is measured by how much they trust you and how little they feel abandoned. Feeling bad is normal and expected, both on your part and theirs; it does not mean that you were not successful.

From Niederhuber JE: *Abeloff's clinical oncology,* ed 6, Philadelphia, 2020, Elsevier.

BOX 2 Addressing the Needs of the Family

During the last weeks to months of the patient's life, office visits become impractical. Regular contact by telephone, supplemented, when possible, by one or more home visits, retains the connection that patients and families need with their primary treatment team. Clinicians also can promote continuity and minimize feelings of abandonment by collaborating with the home care or hospice nurses and, as requested, with the social workers who are part of the home care team. Praising the family caregivers for the work they are doing, helping them to anticipate upcoming problems and make contingency plans, and checking in with them at regular intervals promote timely identification and, when possible, resolution of new problems.

Many family members and medical staff, as well as trainees, have never seen anyone die an expected death outside an intensive care unit. A clinician who is familiar with the dying process can be a crucial source of information and comfort. For inpatients, the clinician works with the nursing team caring for the patient and serves as an attentive observer, striving to provide maximum comfort. Because clinical status and comfort level can change rapidly and frequently even in seemingly stable patients at the end of life, it can be helpful to make two or more visits a day to patients to monitor their comfort through reports from nursing and family, to answer questions, and to educate professional and family caregivers as to what they should expect in the last days.

Patients who were formerly alert and communicative usually become less so. They are apparently still comforted by the touch and voices of those they love and might even emerge from what seemed to be an unconscious state to greet a welcome newcomer. I tell families that to me, it is as though the patient lives in a house with many rooms, a mansion. As they come closer to dying, the patient moves farther and farther back in the house, and it is more and more effort for them to greet callers at the front of the house. But the callers are still welcome, as are their voices and conversation. I ask families to let patients know they have arrived and then to add that patients should not feel obliged to speak to them. Patients can also be asked to provide a hand squeeze or other sign of recognition. With close family, I discuss the "Five Things" (see the section of the chapter titled "Social Causes") and suggest that they find the time to share with the patient any of those sentiments they believe would be appropriate.

I reassure families that we know that dying patients are rarely hungry or thirsty and that moistening the mouth is all that is needed. If necessary, I review the burdens of hydration (see the section titled "Xerostomia"). I also explain about Cheyne-Stokes breathing and that it does not indicate that the patient is gasping for breath. I also ask them to feel free to let us know if the patient seems uncomfortable or develops noisy breathing because we want to address any source of discomfort as rapidly as possible. I offer the services of chaplaincy, and I am alert to whether a social worker would be helpful, if chaplains and social workers are not already involved. Many family members do not know that this kind of help is available to them in the hospital.

If the family has not done so already, I urge them to choose a funeral home and make all the necessary arrangements before the patient has actually died, to free themselves of that task when the death occurs. Families often ask how they will know that the patient is dying. I ask them to look for a marked decrease in urine output (in a Foley bag or diapers), cooling of the arms and legs, and new pallor or mottling of the skin. Some patients experience fecal incontinence as they die, so if hospice is not involved and the patient is at home, I alert the family to this possibility.

Supporting the Ward Personnel and the House Staff

To decrease potential feelings of guilt and anxiety, I review with all team members the history of the illness, the limits of the treatments that remain, the burdens of those treatments, and, when appropriate, the limits the patient has placed on further supportive measures. I also remind them that despite our best efforts, patients still die, and it is no one's fault. I also suggest things they can do that will enhance the patient's last days and that will further the healing process of the survivors.

During the hospitalizations that lead to death and after the death itself, I try to dispel any misconceptions they have about their "fault" for the death and to praise the work they did to make the dying person as comfortable as possible. This kind of support goes a long way toward enabling young physicians and ward staff to recover from the pain they experience when a patient dies and to allow themselves to feel a sense of satisfaction for a job well done.

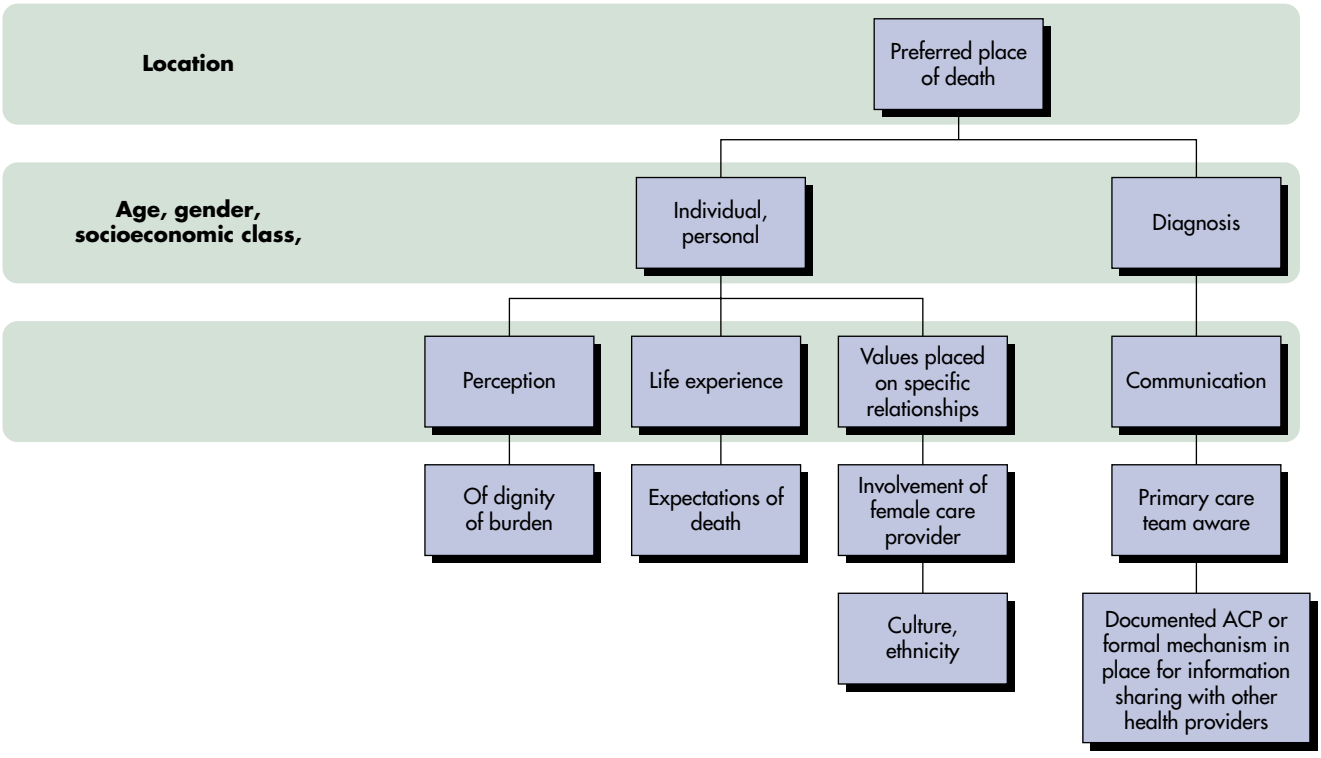

FIG. 1 Personal and external influences concerning preferred place of care. *ACP,* Advance care planning. (From Fillit HM: *Brocklehurst's textbook of geriatric medicine and gerontology,* ed 8, Philadelphia, 2017, Elsevier.)

heart failure patients experience dyspnea, so early identification and proficiency in symptom management are imperative.

SPECIALTY PALLIATIVE CARE

Involvement of a palliative care specialist with additional training or expertise may be required in more complex situations involving complicated family dynamics; ethical issues, including but not limited to medical futility, voluntary stopping of eating and drinking (VSED), and palliative sedation; uncontrolled existential distress; and refractory symptom management. Fig. 2 illustrates an algorithm for treatment of agitation in the last days of life. Palliative care specialists also work in specialty clinics alongside a patient's oncologist, cardiologist, or pulmonologist. Many of these specialists have completed fellowship training and are recognized with board certification by the American Board of Medical Specialties (ABMS).

INITIATING PRIMARY PALLIATIVE CARE

There's no perfect time to start thinking about palliative care for a patient, but if the "surprise question" of "would you be **surprised** if your patient died in the next 12 months?" answer is "no," then now may be a good time. Other situations suggesting appropriateness for a palliative care discussion may be:

- New serious diagnoses (e.g., cancer, COPD, heart failure, advanced dementia)
- Irreversible decline of a known illness
- Drastic changes in symptoms
- Changes in functional status (e.g., immobility, activities of daily living, weight loss)
- Treatment or cure failure
- Change in setting (e.g., home → hospital → home or nursing facility)

Palliative care often begins with **goals of care** discussions with the patient, family, or friends. The patient should be **asked permission** to initiate these discussions and allowed the opportunity to have his or her support system present. Ideally, the patient's **durable power of attorney for health care** (also known as a health care proxy or health care surrogate) is present for these discussions to be best informed what the patient's instructions would be if the patient were unable to verbalize with the health care providers.

GOALS OF CARE/DELIVERING SERIOUS NEWS

Good communication is one of the foundations of a palliative care approach. Practicing these skills is the only way to improve and become comfortable delivering serious news and having proficient goals of care and family meetings. There are several approaches and variations of formats for these discussions throughout the literature.

1. Ask permission to have a serious news discussion.
   a. "How do you feel about discussing your health issues at this time?"
   b. "What are you hoping to talk about today?"
   c. "What other family or friends would like here during these discussions?"
2. Get the patient's story.
   a. "What do you know about your health situation?"
   b. "Tell me more about…"
   c. "How is your illness affecting your life?"
   d. "Where do you get your strength or support?"

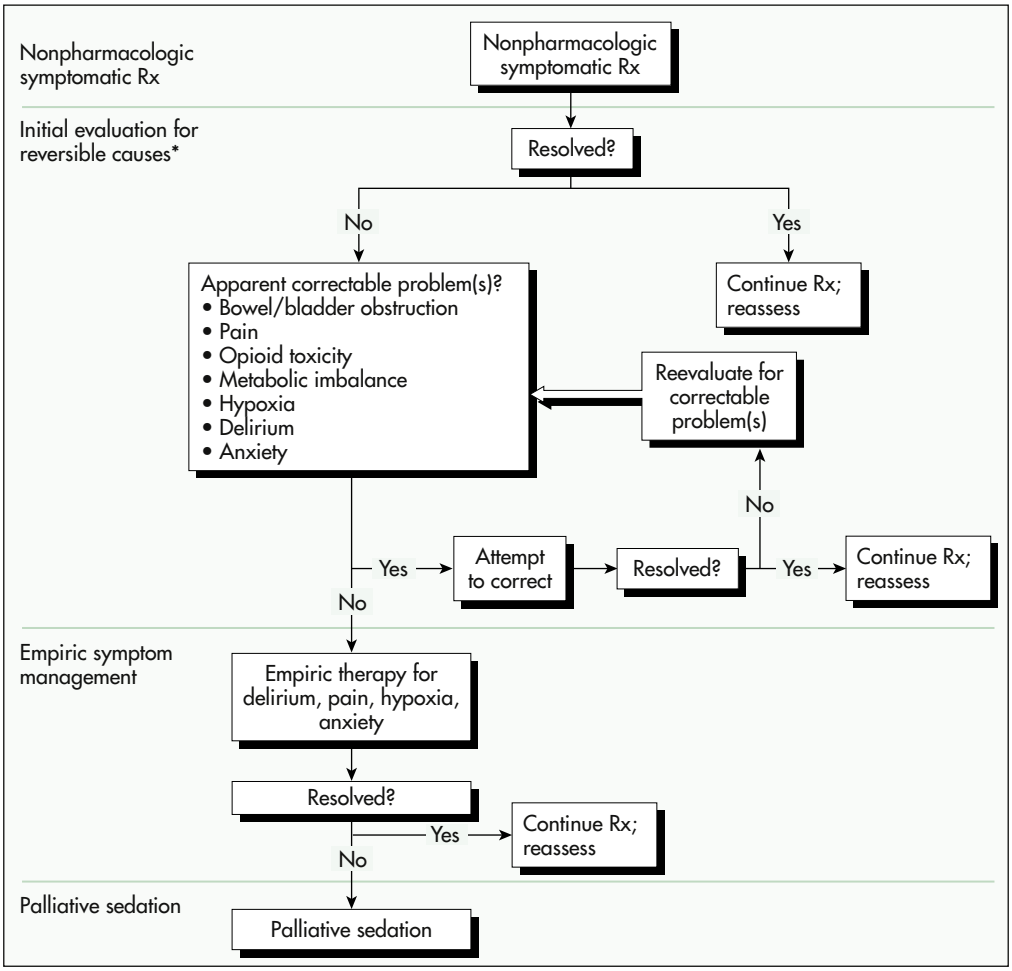

FIG. 2 Algorithm for treatment of agitation in the last days of life. *Guided by patient/family wishes and burden versus benefit. *Rx,* Prescription. (From Niederhuber JE: *Abeloff's clinical oncology,* ed 6, Philadelphia, 2020, Elsevier.)

- . Give the medical story after receiving permission to fill in any medical information gaps.
  1. Give a forewarning to prepare the patient for serious news, such as: "I wish we had better news but we're worried…"
  2. Practice silence, silence, and more silence. Let the patient break the silence.
  3. "Is this information surprising for you to hear?"
  4. "Knowing this information, what's most important to you going forward?"
  5. "What path going forward makes the most sense for you?"
  6. Offer a **best case/worst case scenario.**
  7. Acknowledge and validate emotions by patient and family: "I cannot imagine how difficult this must be for you."
- . Ask permission to make a recommendation based on patient's priorities and goals.
  1. "Based on what you've told me is important to you, I recommend…"
  2. Consider a time trial for an intervention (e.g., dialysis, feeding tube), if necessary.
  3. Promise continued support to patient and family.

General communication pearls:

- Ask open-ended questions as often as possible.
- Use the teach back method as you go—"In your own words, what did you take away from our discussion?"
- The patient and family should spend more time talking than the provider.
- Question, reflect, and summarize back in the patient's own words.
- Obtaining substituted judgment from a health care proxy—"Given her current medical condition, what would be most important to your loved one?"

PROGNOSTICATION

Prognostication is not an exact science but can be very useful to the patient's medical decision-making process. Life expectancy can be estimated using known disease trajectories and recent changes in a patient's functional capacity, including ambulation, cognition, weight, and verbalization abilities. If these changes have taken place over weeks, and the underlying cause of the decline is not reversed, the patient likely has "in the weeks range" to live. It is not recommended that a specific number of weeks be included in the prognosis. The "surprise question" mentioned above has been shown to provide useful information to providers when attempting prognostication.

ADVANCE CARE PLANNING

Advance care planning is a process and discussion regarding a patient's wishes about what is wanted and not wanted in regard to health care under certain circumstances. The goal is to maintain patient autonomy while defining a patient's personal definition of an acceptable quality of life. Advance care planning includes:

- Code status discussion.
- Advance directives (e.g., Five Wishes) completion—legal document that tells an individual's doctor and family members what kind of care the individual would like to have if he or she becomes unable to make medical decisions.
  1. Includes living will and durable power of attorney for health care/health care proxy.
  2. No lawyer is required.
- Medical Orders for Life-Sustaining Treatment (MOLST) form completion—a physician order for end-of-life treatments for seriously ill patients that should be placed in the chart and be very visible to EMTs/paramedics who enter a patient's home.

BASIC PAIN MANAGEMENT

Primary care providers may choose to treat patients with pain associated with their serious or terminal illness, such as cancer syndromes. Chronic pain management is covered elsewhere in this text but here are a few "pearls":

- Evaluate pain in all patients using a 0 to 10 scoring scale.
- Assess the patient's goal for an acceptable pain level.
- "Total pain," caused by a combination of physical, emotional, spiritual, and psychological pain, is usually refractory to escalating opioid doses.
- When pain is chronic and opioids are required, long-acting preparations should be used after a total required daily dose is determined.
- PRN doses of short-acting opioids should be 10% to 15% of the total daily dose.
- When rotating opioids, calculate a 24-hour requirement to "oral morphine equivalents" (OMEs) and then use a standard conversion table (see the Chronic Pain Management chapter in this text).
- When rotating opioids, consider reducing the equianalgesic dose by 25% to 50% to account for "incomplete cross-tolerance."
- Patient-controlled analgesia (PCA) has minimal risk for overdose or respiratory depression because the patient will fall asleep before he or she can administer a toxic dose.

When considering buprenorphine, ketamine, or methadone for pain, patients would likely benefit from referral to a pain management or palliative care specialist.

PSYCHOSOCIAL AND SPIRITUAL CARE

Palliative care includes attentive psychosocial and spiritual care. Primary providers should be proficient in assessing and treating anxiety and depression for seriously ill patients. Patients often ask, "Why is this happening to me?" When asked "Where do you find your strength during difficult times?" patients may answer "God" or "My faith." It is important to explore patients' spiritual needs to assist finding meaning in their illness, which may improve coping skills. Chaplains are excellent resources to assist with patient reconciliation issues with self, others, and God.

HOSPICE TRANSITION

At some point, most palliative care patients continue to decline clinically and functionally and may benefit from hospice care. Hospice is a specific type of palliative care for seriously ill patients with likely life expectancy of less than 6 months if the disease process runs its natural course and is deemed irreversible and incurable. Common misconceptions about hospice are summarized in Box 3. Hospice care can be provided at a hospice facility, hospital, or nursing home, or in the patient's home. Medicare-mandated hospice services are summarized in Box 4.

BOX 3 Common Misconceptions about Hospice

Patients enrolling in hospice must choose not to be resuscitated. Patients do not have to relinquish resuscitation to enroll in hospice. After they and their families fully understand the implications of the resuscitation, most patients elect not to be resuscitated.

Patients enrolled in hospice lose their primary physicians. The referring attending physician continues to direct and approve all the patient's care.

Hospice patients cannot be hospitalized and remain enrolled in hospice. Any hospice patient can be admitted to an acute, inpatient level of care to control a distressing symptom. Hospices can admit patients to contract beds in acute care hospitals or to their own inpatient facilities.

Hospice patients cannot participate in research projects while enrolled in hospice. Hospice patients have the right to participate in research studies. Hospice ethics and research committees usually evaluate the burden versus the benefit of the research for the patient, family, and hospice staff.

Hospice nursing personnel do not provide sophisticated care. Hospice personnel provide expert palliative care that requires astute assessment and expert intervention tailored to the patient and family goals.

Patients can "use up" their hospice eligibility, so it is important not to enroll them too soon. Patients are initially certified for 3 months of service, after which their physician and the hospice medical director are asked to recertify them indefinitely, at 2-month intervals. Patients who choose to revoke the hospice benefit to seek life-prolonging therapies may choose to reenroll if their goals change.

Patients must have a live-in caregiver to enroll in hospice. With appropriate safeguards (e.g., "lock boxes" to provide access in emergencies and daily phone contact), hospice care can be safely provided to patients who live alone.

From Niederhuber JE: *Abeloff's clinical oncology,* ed 6, Philadelphia, 2020, Elsevier.

BOX 4 Medicare-Mandated Hospice Services

Practitioners Available

Medical director, nurses, social workers, home health aides, chaplains, volunteers, administrative personnel, medical consultations, occupational therapy, physical therapy, speech therapy, bereavement counseling

Palliative Treatment of Terminal Illness

Prescription medications
Durable medical equipment and supplies
Oxygen
Radiation and chemotherapy
Laboratory and diagnostic procedures

Other Benefits

Transportation when medically necessary for changes in level of care
When needed, continuous care at home or in a skilled nursing facility or inpatient setting
Respite care (care in a nursing facility that provides a "respite" for the caregivers)

Data from Medicare Hospice Regulations: 42 Codes of Federal Regulations, Part 418, 1993. From Niederhuber JE: *Abeloff's clinical oncology,* ed 6, Philadelphia, 2020, Elsevier.

ALG Appendix IX

Preoperative Evaluation

BASIC INFORMATION

DEFINITION

Preoperative evaluation is the clinical risk evaluation for patients undergoing surgery. It is an overall assessment of the patient's health and surgery's risk. The goal of the assessment is not to "clear" the patient for the surgery, because there is always some level of risk, but to provide accurate preoperative risk stratification and implement possible risk reduction strategies. Preoperative evaluation should also include functional assessment and determining social support. It also provides an opportunity for discussion and helps to alleviate the patient's anxiety before surgery.

SYNONYMS

Preoperative evaluation and risk reduction
Risk reduction in patients undergoing invasive procedures
Preoperative clearance

ICD-10CM CODES

Z01.810 Encounter for preprocedural cardiovascular examination
Z01.811 Encounter for preprocedural respiratory examination
Z01.812 Encounter for preprocedural laboratory examination
Z01.818 Encounter for other preprocedural examination

EPIDEMIOLOGY & DEMOGRAPHICS

The number of outpatient surgical procedures performed in the U.S. has been gradually increasing over the years.

Some studies have shown the benefits of preoperative testing whereas others have shown no added benefit. Lack of added benefit has been particularly true for otherwise healthy individuals: The prevalence of significant unrecognized disease and the predictive value of tests are both low for this population, leading to an excess of false-positive tests.

Certain risk factors do exist that may be helpful: The nature and extent of surgery appear to play a role, as do increasing age, exercise capacity, and certain medications. Additionally, patients with certain preexisting conditions such as diabetes may benefit from adjustments to their insulin preoperatively, for instance. The primary care physician may be best suited to adjust medications. Table 1 describes stratification of risk of common noncardiac surgical procedures.

Preoperative evaluation offers an excellent opportunity to reach out to patients about other preventive, screening, and routine health care issues as well. The primary care physician is uniquely poised to provide an accurate assessment and risk stratification of patients and to develop care plans for follow-up. This information can then be used to help surgeons counsel patients and guide patients' decision making.

PEAK INCIDENCE: When there are adverse consequences from surgery, cardiovascular complications account for the majority of morbidity and mortality in patients. Perioperative myocardial infarctions (PMIs) are one of the most important predictors of short- and long-term morbidity and mortality associated with surgery. The highest incidence of PMI is in the first 3 to 5 days after surgery.

PHYSICAL FINDINGS & CLINICAL PRESENTATION

The history, physical, and other studies need to assess the risks for myocardial infarction, arrhythmias, heart failure, endocarditis, stroke, venous thrombosis and pulmonary embolism, prolonged mechanical ventilation and respiratory failure, hemorrhage, diabetic acidosis, renal or hepatic failure, and infection.

DX DIAGNOSIS

WORKUP (FIG. 1)

HISTORY: A thorough medical history is the most valuable tool. Assess the urgency of the surgical procedure. A conversation with the surgical team is helpful for urgent and emergent procedures.

Some standard screening questionnaires have been adapted to help identify patients who would benefit from formal preoperative evaluation.

- Age is important to consider because age is often associated with an increasing number of comorbidities, which are in turn associated with an increase in perioperative risk.
- All patients should be asked about their exercise capacity before surgery. One way to assess functional capacity is in metabolic equivalents (METs) (Table 2). Studies have shown that those who have a low exercise capacity have twice as much risk for postoperative complications compared to those who have high exercise capacity.
- Evaluate for evidence of active cardiac conditions: unstable angina, recent MI (<30 days), significant arrhythmia, decompensated CHF, and severe valvular disease. Table 3 describes active cardiac conditions for

TABLE 1 Cardiac Risk* Stratification for Noncardiac Surgical Procedures

Risk Stratification	Examples of Procedures
High (reported cardiac risk often >5%)	Aortic and other major vascular surgery Peripheral vascular surgery
Intermediate (reported cardiac risk generally 1%-5%)	Intraperitoneal and intrathoracic surgery Carotid endarterectomy Head and neck surgery Orthopedic surgery Prostate surgery
Low† (reported cardiac risk generally <1%)	Endoscopic procedures Superficial procedure Cataract surgery Breast surgery Ambulatory surgery

*Combined incidence of cardiac death and nonfatal myocardial infarction.
†These procedures do not generally require further preoperative cardiac testing.
From Fleisher LA et al: 2009 ACCF/AHA focused update on perioperative beta blockade incorporated into the ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery: a report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines, *J Am Coll Cardiol* 54(22):e13, 2009. In Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.

(From Fleisher LA et al: 2014 ACC/AHA guideline on perioperative cardiovascular evaluation and management of patients undergoing noncardiac surgery: a report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines, *J Am Coll Cardiol* 64:e77-137, 2014. In Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.)

TABLE 2 Functional Capacity (Metabolic Equivalents [METs])

<4 METs	4-10 METs	>10 METs
Daily living activities	Heavy housework	Strenuous exercise
Walking (2 mph)	Walking up a hill	Skiing
Walk 1-2 blocks	Walking (4 mph)	Tennis (single)
	Cycling	
	Golf	
	Tennis (double)	

(1 MET: Energy expenditure of 70-kg man sitting quietly)

Adapted from Fleisher LA et al: ACC/AHA 2007 Guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery, *Circulation* 116:e418-e500, 2007.

TABLE 3 Active Cardiac Conditions for Which Patients Should Undergo Evaluation and Treatment before Noncardiac Surgery (Class I; Level of Evidence: B)

Condition	Examples
Unstable coronary syndromes	Unstable or severe angina* (CCS class III or IV)† Recent myocardial infarction (MI)‡
Decompensated HF (NYHA functional class IV; worsening or new-onset HF)	
Significant arrhythmias	High-grade atrioventricular block Mobitz II atrioventricular block Third-degree atrioventricular heart block Symptomatic ventricular arrhythmias Supraventricular arrhythmias (including atrial fibrillation) with an uncontrolled ventricular rate (heart rate >100 beats/min at rest) Symptomatic bradycardia Newly recognized ventricular tachycardia
Severe valvular disease	Severe aortic stenosis (mean pressure gradient >40 mm Hg, aortic valve area <1.0 cm^2, or symptomatic) Symptomatic mitral stenosis (progressive dyspnea on exertion, exertional presyncope, or HF)

*According to Campeau L et al: Atherosclerosis and late closure of aortocoronary saphenous vein grafts: sequential angiographic studies at 2 weeks, 1 year, 5 to 7 years, and 10 to 12 years after surgery, *Circulation* 68(Suppl II):1, 1983.

†May include "stable" angina in patients who are unusually sedentary.

‡The American College of Cardiology National Database Library defines "recent" MI as more than 7 days but 1 mo or less (within 30 days), although the 2014 guidelines suggest 60 days.

CCS, Canadian Cardiovascular Society; *HF,* heart failure; *NYHA,* New York Heart Association.

From Fleisher LA et al: 2009 ACCF/AHA focused update on perioperative beta blockade incorporated into the ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery: a report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines, *J Am Coll Cardiol* 54(22):e13, 2009. In Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.

which patients should undergo evaluation and treatment before noncardiac surgery. Fig. 2 illustrates a treatment algorithm for patients with coronary stents undergoing noncardiac surgery.

- Other medical conditions and risk factors:
  1. Stable CAD, compensated CHF, HTN
  2. Chronic lung diseases
  3. Obstructive sleep apnea (preoperative screening [STOP-Bang, Berlin scores] in all patients)
  4. Other medical comorbidities: CVA, diabetes mellitus (DM), CKD, liver diseases
  5. Personal or family history of anesthetic complications
  6. Personal or family history of hypercoagulable states or bleeding disorders
  7. Medications such as anticoagulants, antiplatelets, NSAIDs, and oral hypoglycemic agents
  8. Smoking
  9. Alcohol
  10. Obesity
  11. Pregnancy
- Consider further testing based on above risk factors. The decision to order preoperative tests should be guided by the patient's clinical history, comorbidities, and physical examination findings.

The American College of Cardiology and American Heart Associated (ACC/AHA) 2014 guidelines[1] classify the urgency of surgery in four categories:

- Emergency (necessary within 6 hours)
- Urgent (necessary within 6 to 24 hours)
- Time-sensitive (can delay 1 to 6 wk)
- Elective (can delay up to 1 yr)

Surgical risk based on surgical and patient characteristics is either low (<1% risk of major adverse cardiac events) or high (≥1% risk of major adverse cardiac events). The intermediate risk category has been eliminated. Examples of high-risk procedures include vascular surgery, orthopedic surgery, intraperitoneal and intrathoracic surgery, head and neck surgery, and prostate surgery. Ambulatory surgery, endoscopic procedures, and cataract surgery are considered low risk. The Revised Cardiac Risk Index (RCRI) is based on the following 6 factors, each worth a point: high-risk surgery, ischemic heart disease, heart failure, stroke or TIA, diabetes requiring insulin, and renal insufficiency (serum creatinine >2.0 mg/dl). A patient with an RCRI score 0 to 1 is considered to be at low risk; a value of 2 or above is high risk.

PHYSICAL EXAMINATION

- Vital signs: Blood pressure, heart rate and rhythm, rate and ease of respirations, and temperature.
- Cardiovascular examination: Auscultate heart to check for heart murmurs, pathologic heart sounds, and ventricular systolic or diastolic dysfunction.
- Respiratory examination: Auscultate lungs for crackles, wheezes, decreased breath sounds.
- Vascular examination: Examine for carotid, abdominal, and femoral bruits.
- Integumentary examination: Check for evidence of venous stasis in lower extremities, petechiae, and unusual bruises.
- Mental status: Conduct a mini-mental status examination.

LABORATORY TESTS & IMAGING STUDIES

- Determine the patient's age, height, weight.
- Routine laboratory studies are not necessary unless there is a specific medical indication. Testing need not be repeated if results are recently available, unless there has been a change in clinical status.
  1. Low-risk procedures do not require routine basic metabolic panel, blood glucose, liver function, hemostasis evaluation, or urine analysis.
  2. For intermediate- and high-risk procedures as well as in the setting of diabetes, cardiac, or renal disease, obtain a complete blood count (CBC).
  3. A CBC is recommended for all patients older than age 65 undergoing major surgery as well as anyone undergoing a surgery with expected large amounts of blood loss.
  4. Fasting glucose is recommended for all patients age >45 yr. Coagulation studies are only needed for patients with personal or family history of bleeding or thrombophilia and for those taking anticoagulants.
  5. Urine hCG is recommended for all women of childbearing age.
- Electrocardiogram: Routine ECG is not recommended. ACC/AHA guidelines recommend resting 12-lead ECG for patients with:

[1] Fleisher LA et al: 2014 ACC/AHA guideline on perioperative cardiovascular evaluation and management of patients undergoing noncardiac surgery: a report of the American College of Cardiology/American Heart Association Task Force on practice guidelines, *J Am Coll Cardiol* 64:e77-e137, 2014.

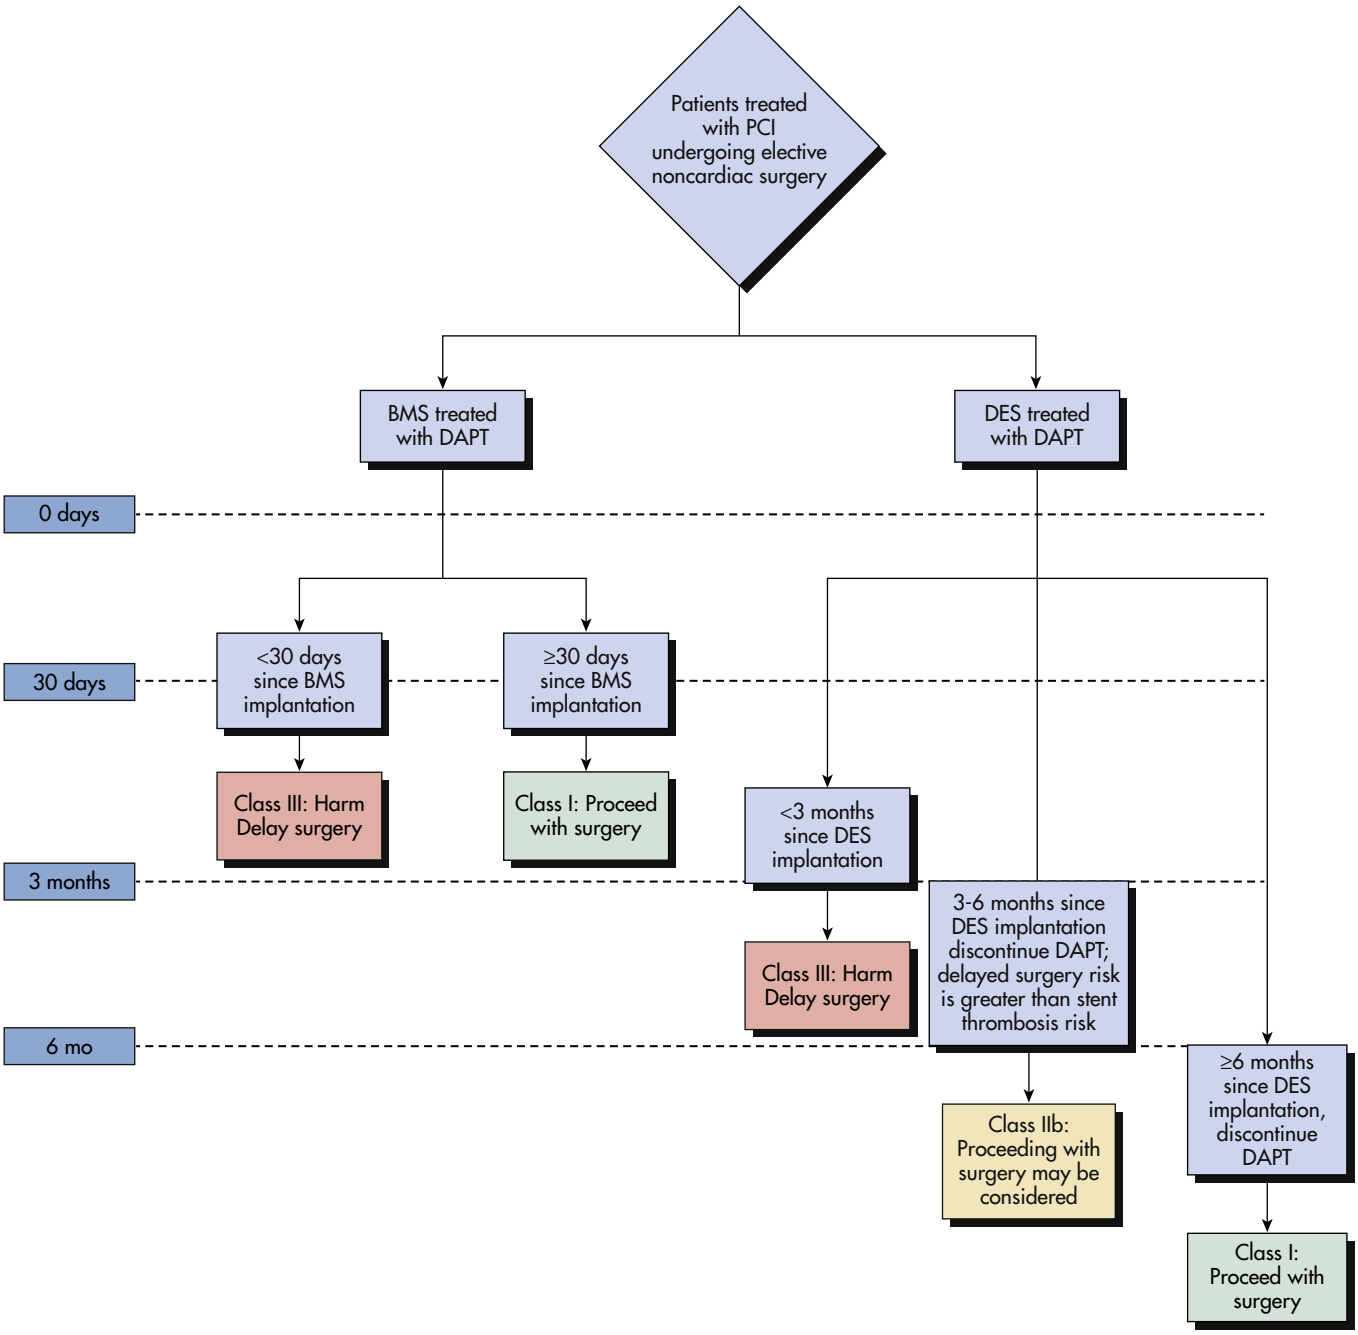

FIG. 2 Treatment algorithm for patients with coronary stents undergoing noncardiac surgery. *BMS,* Bare metal stent; *DAPT,* dual-antiplatelet therapy; *DES,* drug-eluting stent; *PCI,* percutaneous coronary intervention. (From Levine GN et al: 2016 ACC/AHA guideline focused update on duration of dual antiplatelet therapy in patients with coronary artery disease: a report of the American College of Cardiology/American Heart Association Task Force on Clinical Practice Guidelines, *J Am Coll Cardiol* 68:1082-115, 2016. In Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.)

1. At least one clinical risk factor for those who are undergoing vascular surgery (class I, level of evidence [LOE] B)
2. Known cardiovascular disease, peripheral arterial disease, and cerebrovascular disease for patients scheduled for intermediate-risk surgery (class I, LOE C)
3. No clinical risk factors for patients scheduled to undergo vascular surgery (class IIa, LOE B)
4. At least one clinical risk factor for patients who are undergoing intermediate-risk surgery (class IIb LOE B)

- Echocardiography: Indicated only if new signs and symptoms of CHF or new cardiac murmurs on physical examination.
- Exercise or pharmacologic stress testing: Only indicated for evaluation of potentially high-risk patients: For patients scheduled to undergo vascular surgery with 3 or more clinical risk factors and poor functional capacity (<4 METs) if it will change management (class IIa). Chest x-ray: Routine CXR is not recommended. It is indicated for patients >50 yr of age undergoing high-risk procedures (American College of Physicians [ACP] recommendations) and patients with new respiratory symptoms, suspected congestive heart failure, or valvular heart disease.
- Pulmonary function tests: It is only recommended for patients undergoing lung resection surgery but can be considered in:
  1. Patients with COPD or asthma, only if clinical evaluation cannot determine if they are at their best baseline.
  2. Patients with dyspnea or exercise intolerance that remains unexplained after clinical evaluation.
- Arterial blood gas: Should be obtained only when clinically significant (to determine if lung disease is compensated).

Rx TREATMENT

- Beta-blockers: While routine administration of perioperative beta-blockers was advocated for many years, conflicting evidence currently exists regarding their efficacy. Table 4 summarizes recommendations for perioperative therapy with beta-blockers.
- Statins: Decrease cardiovascular events in patients undergoing vascular surgery (*N Engl J Med,* 2009).
- Aspirin: Continuation of aspirin should be considered in patients who were previously taking aspirin (class IIa, LOE B). For surgeries where increased bleeding could result in significant morbidity (e.g., neurosurgery) or when the risk of stopping aspirin is minimal, aspirin should be stopped 7 days or more before surgery. Aspirin can be restarted on the first postoperative day as long as adequate hemostasis has been achieved.
- Adenosine diphosphate (ADP) antagonists (ticlopidine, clopidogrel, prasugrel): In patients with recently placed stents, elective surgical procedures should be delayed (minimum 3 wk for bare metal stents [BMSs] and 3 mo for drug-eluting stents [DESs]) while the patient is undergoing dual antiplatelet therapy. For procedures that must be performed, continuation of aspirin therapy is recommended. A short-term discontinuation of anti-ADP therapy while aspirin is continued may be relatively safe.
- Anticoagulation therapy: Patients taking warfarin who have a high risk of thromboembolism should be bridged with low-molecular-weight heparin (LMWH) (with the last dose 24 hr before surgery) or unfractionated heparin (UFH) (with drip stopped 4 hr before surgery). Resumption of bridging therapy within 24 hr is safe for minor procedures but is associated with unacceptably high bleeding rates in patients undergoing major surgery. Therefore it is recommended to wait 48 to 72 hr postoperatively to resume bridging therapy in patients who had major surgery. Another alternative regimen is to resume warfarin 12 to 24 hr postoperatively without any bridging therapy. Bridging anticoagulation is not indicated in atrial fibrillation patients when direct oral anticoagulants (e.g., edoxaban, apixaban, rivaroxaban, dabigatran) are interrupted for procedures. Table 5 summarizes perioperative management strategies for patients on chronic oral anticoagulant therapy.
- NSAIDs: NSAID therapy is almost never necessary, and it should be stopped before surgery (5 to 10 days prior).

TABLE 4 Recommendations for Perioperative Therapy with Beta-Blockers

Class I

- Continue beta-blockers in patients who are receiving beta-blockers chronically.

Class IIa

- Guide management of beta-blockers after surgery by clinical circumstances.

Class IIb

- In patients with intermediate- or high-risk preoperative tests, it may be reasonable to begin beta-blockers.
- In patients with ≥3 Revised Cardiac Risk Index (RCRI) factors, it may be reasonable to begin beta-blockers before surgery.
- Initiating beta-blockers in the perioperative setting as an approach to reduce perioperative risk is of uncertain benefit in those with a long-term indication but no other RCRI risk factors.*
- It may be reasonable to begin perioperative beta-blockers long enough in advance to assess safety and tolerability, preferably >1 day before surgery.

Class III

- Beta-blocker therapy should not be started on the day of surgery.

*Clinical risk factors include a history of ischemic heart disease, history of compensated or previous heart failure, history of cerebrovascular disease, diabetes mellitus, and renal insufficiency (defined in the RCRI as a preoperative serum creatinine level of 2 mg/dl).

From Fleisher LA et al: 2014 ACC/AHA guideline on perioperative cardiovascular evaluation and management of patients undergoing noncardiac surgery: a report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines, *J Am Coll Cardiol* 64:e77-137, 2014. In Zipes DP: *Braunwald's heart disease, a textbook of cardiovascular medicine,* ed 11, Philadelphia, 2019, Elsevier.

- Pacemakers and defibrillators: Consultation with an electrophysiologist is recommended. Pacemaker should be reprogrammed to an asynchronous mode (VOO, DOO), and defibrillation function must be set off to avoid unintentional discharge during surgery (electrocauterization).
- Smoking: Smoking cessation is recommended at least 8 wk before surgery.
- Chronic obstructive pulmonary disease (COPD): COPD therapy should be optimized. Steroids and maximal bronchodilator therapy are reasonable for patients who are not at their best baseline.
- Hypertension: SBP <180 mm Hg and DBP <110 mm Hg are generally considered acceptable. In case of elective surgery, though, it is better to postpone it to allow for better BP control.
- Diabetes mellitus (DM):
  1. Type I DM: Scheduled basal insulin should be given the night before surgery or the morning of surgery. Continuous insulin infusion with glucose infusions might be necessary during prolonged procedures.
  2. In type II DM with oral therapy: Short-acting sulfonylureas and other oral agents should be held the same day. Metformin and long-acting sulfonylureas should be held 1 day prior, and metformin should be kept on hold for 48 hr postoperatively. Short-acting insulin sliding scale should be used for blood glucose control meanwhile.
  3. In insulin-dependent type II DM: 50% to 100% of the basal insulin should be given depending on whether the patient will be able to eat postoperatively. During major procedures, patients may need an insulin drip and D5% infusion.

  Currently, a blood glucose level <180 mg/dl postoperatively is considered appropriate. Aggressive blood glucose control (81 to 108 mg/dl vs. <180 mg/dl) showed a slight increase in risks in both surgical and medical critical care patients.
- Liver disease: Nonoperative alternative should be strongly recommended in patients with advanced cirrhosis. If surgery is deemed necessary, optimize preoperative status: correct coagulopathy, thrombocytopenia, volume status, electrolytes, ascites, and encephalopathy.
- End-stage renal disease: Achieve euvolemia and correct electrolytes. Patients receiving hemodialysis should undergo dialysis the day before surgery. In patients with a prior history of uremic bleeding, desmopressin administration should be considered.
- Corticosteroid management and adrenal insufficiency: In patients taking exogenous steroids, continuation of the same steroid regimen is reasonable. In those with chronic adrenal insufficiency, steroid supple-

TABLE 5 Perioperative Management Strategies for Patients on Chronic Oral Anticoagulant Therapy

Clinical Situation	Suggested Anticoagulation Management
Low bleeding-risk surgery (dental, cataract, skin)	• Consider reducing dose of warfarin to achieve INR ≤2.0 • Consider holding dose of DOAC until after the procedure
Low thrombotic risk Aortic valve prosthesis without other thrombotic risk factors[a] *Or* AF with low stroke risk *Or* VTE >3 mo previously	• Stop warfarin 4-5 days before surgery, safe to operate when INR ≤1.5 • Hold DOACs for 5 half-lives—dabigatran for 3-4 days, rivaroxaban, apixaban, edoxaban for 2-3 days • Restart warfarin in evening of the day of surgery after hemostasis secured; restart DOACs on postoperative day 3 or 4 • Start prophylactic LMWH on the morning of the day after surgery and continue until INR >1.8 or full dose of DOACs resumed
Moderate thrombotic risk Mitral or multiple valve prostheses *Or* Aortic prosthesis with risk factors for thrombosis *Or* AF at high stroke risk *Or* VTE within past 3 mo	• Stop VKA 5 days before surgery • Begin twice-daily LMWH in therapeutic doses starting 3 days before surgery with last dose at least 12 hr before surgery • Hold DOACs for 5 half-lives—dabigatran for 3-4 days, rivaroxaban, apixaban, edoxaban for 2-3 days; no bridging • Restart warfarin in evening of the day of surgery after hemostasis secured; restart DOACs on postoperative day 3 or 4 • Start prophylactic LMWH on the morning of the day after surgery and continue until INR >1.8 or full dose of DOACs resumed

AF, Atrial fibrillation; *DOAC,* direct oral anticoagulant; *INR,* international normalized ratio; *LMWH,* low-molecular-weight heparin; *VKA,* vitamin K antagonist (i.e., warfarin); *VTE,* venous thromboembolism.
[a]Risk factors include caged-ball or single tilting-disk valve, AF, history of stroke/transient ischemic attack/other embolic event, left ventricular failure, and underlying hypercoagulable state, including cancer.
From Hoffman R et al: *Hematology, basic principles and practice,* ed 7, Philadelphia, 2018, Elsevier.

mentation is generally recommended with the dose titrated to the level of stress of the surgical procedure.

PEARLS & CONSIDERATIONS

COMMENTS

Although most individuals will not require any significant preoperative testing, certain conditions will require further workup.

- Ischemic heart disease:
  1. If patient has angina, determine frequency, precipitating factors, and response to rest and nitroglycerin.
  2. If patient has had prior cardiac catheterizations or coronary revascularizations, obtain previous records.
- Dysrhythmias and pacemakers:
  1. Examine current and prior ECGs for high-grade atrioventricular block, symptomatic ventricular arrhythmias, and supraventricular tachycardias at uncontrolled rates.
  2. If patient has a pacemaker, establish the type and mode, date of implantation, and when it was last interrogated.
- Valvular and congenital heart disease:
  1. Look for signs of severe valvular heart disease on last echocardiographic evaluations.
- Cerebrovascular disease:
  1. Inquire about prior carotid artery ultrasounds.
- Venous thromboembolism:
  1. Determine results of studies for thrombophilia (factor V Leiden mutation, lupus anticoagulant, antithrombin III, protein C or S).

PATIENT & FAMILY EDUCATION

Advise patients that their preoperative evaluation visit with their PCP is another opportunity for them to bring up concerns or get questions answered about their upcoming procedure.

Erectile dysfunction	I
Fatigue, algorithm	III
Factitious disorder (including Munchausen syndrome)	I
Hypoactive sexual desire disorder	I
Insomnia	I
Memory loss symptoms, elderly patients	II
Narcissistic personality disorder	I
Neurocognitive disorders	I
Neuroleptic malignant syndrome	I
Obsessive-compulsive disorder (OCD)	I
Opioid dependence	I
Panic disorder, with or without agoraphobia	I
Patient with ill-defined physical complaints, algorithm	III
Phobias	I
Postpartum depression	I
Posttraumatic stress disorder	I
Premenstrual syndrome	I
Schizophrenia	I
Serotonin syndrome	I
Sexual assault	I
Sexual dysfunction	III
Sexual dysfunction, female	II
Shift work disorder	I
Sleep disorders	III
Somatic cough syndrome and tic cough	I
Somatic symptom disorder	I
Tardive dyskinesia	I
Tourette syndrome	I
Transient global amnesia	I

PULMONARY DISEASE

Acid-base homeostasis	III
Acidosis, respiratory, acute	III
Acidosis, respiratory, chronic	III
Acute respiratory failure (ARF)	I
Acute bronchitis	I
Acute respiratory distress syndrome	I
Air-space opacification on x-ray	II
Alkalosis, respiratory, treatment	III
Alpha-1-antitrypsin deficiency	I
Asbestosis	I
Aspergillosis	I
Aspiration, gastric contents	III
Aspiration, oral contents	III
Aspiration pneumonia	I
Asthma	I
Asthma-COPD overlap syndrome	I
Atelectasis	I
Bronchial obstruction	II
Bronchiectasis	I
Bronchopleural fistula	II
Chronic obstructive pulmonary disease	I
Churg-Strauss syndrome	I
Chylothorax	II
Cor pulmonale	I
Cough, chronic, algorithm	III
Cryptogenic organizing pneumonia	I
Cyanosis	I, II, III
Cystic fibrosis	I
Deep vein thrombosis	I
Diaphragm elevation, bilateral, symmetrical	II
Diaphragm elevation, unilateral	II
Drug-induced parenchymal lung disease	I
Dyspnea, diagnosis	III
Empyema	I
Eosinophilic lung disease	II
Goodpasture syndrome	I
Hemoptysis	I
Hemoptysis, algorithm	III
Hepatopulmonary syndrome	I
High-altitude sickness	I
Hypersensitivity pneumonitis	I
Idiopathic pulmonary fibrosis	I
Interstitial lung disease	I
Legionnaires' disease	I
Lung abscess	I
Lung cancer, occupational causes	II
Lung neoplasms, primary	I
Mesothelioma, malignant	I
Middle East respiratory syndrome	I
Necrotizing pneumonias	II
Neurofibromatosis	I
Obesity-hypoventilation syndrome	I
Opacification of hemidiaphragm on x-ray	II
Pertussis	I
Pleural effusion	I
Pleural effusion, malignant	III
Pleural effusions, malignancy-associated	II
Pleural space fluid	III
Pleurisy	I
Pneumonia, bacterial	I
Pneumonia, *mycoplasma*	I
Pneumonia, *pneumocystis jiroveci*	I
Pneumonia, viral	I
Primary chest wall tumors	I
Pulmonary cysts on x-ray	II
Pulmonary edema, non-cardiogenic	II
Pulmonary embolism	I
Pulmonary hemorrhagic syndromes, diffuse	II
Pulmonary hypertension	I
Pulmonary mass, solitary, causes	II
Pulmonary mass, solitary, mimics	II
Pulmonary nodule, algorithm	III
Pulmonary nodule, solitary, differential diagnosis	II
Sarcoidosis	I
Silicosis	I
Sleep apnea	I
Tracheobronchial narrowing on x-ray	II
Tuberculosis, pulmonary	I
Tuberculosis, miliary	I
Upper extremity deep vein thrombosis	I
Ventilation-perfusion mismatch on lung scan	II
Viral bronchiolitis	I

RHEUMATOLOGY

Adult onset Still disease	I
Ankylosing spondylitis	I
Antinuclear antibody (ANA)	IV
Antiphospholipid antibody syndrome	I
Arthralgia limited to one or few joints	III
Arthritis and abdominal pain	II
Arthritis and diarrhea	II
Aseptic necrosis	I
Back pain, algorithm	III
Back pain, low, acute	II
Basic calcium phosphate (BCP) deposition	I
Calcium pyrophosphate deposition disease (pseudogout)	I
Carpal tunnel syndrome	I
Cerebral vasculitis	I
Charcot joint	I
Compartment syndrome	I
Complex regional pain syndrome	I
Costochondritis	I
Cryoglobulinemia	I
De Quervain's tenosynovitis	I
Discoid lupus	I
Elbow pain	II
Enteropathic arthritis	I
Erythema elevatum diutinum	I
Erythema nodosum	I
Fibromyalgia	I
Finger lesions, inflammatory	II
Foot and ankle pain, in different age groups	II
Giant cell arteritis	I
Gout	I
Graft-versus-host disease (GVHD)	I
Hip pain, in different age groups	II
Hip pain without obvious fracture	II
Hypertrophic osteoarthropathy	I
Hyperuricemia	I
Hypocomplementemic urticarial vasculitis	I
IgG4-related disease	I
Inclusion body myositis	I
Inflammatory arthritis	III
Joint pain, polyarticular	II
Juvenile idiopathic arthritis	I
Knee pain, anterior, algorithm	III
Knee pain, in different age groups	II
Lyme disease	I
Microscopic polyangiitis	I
Monoarthritis, acute	II
Muscle cramps and aches	III
Myofacial pain syndrome	I
Necrotizing autoimmune myositis	I
Myositis	III
Nodules, painful	II
Osgood-Schlatter disease	I
Osteoarthritis	I
Osteoarthritis dissecans	I
Osteoporosis	I
Osteoporosis, secondary causes	II
Paget disease of the bone	I
Panniculitis	I
Plantar fasciitis	I
Polyarteritis nodosa	I
Polymyalgia rheumatica	I
Psoriatic arthritis	I
Raynaud phenomenon	I
Red hot joint	II
Reiter syndrome (reactive arthritis)	I
Scleroderma (systemic sclerosis)	I
Scleroderma-like symptoms	II
Scoliosis	I
Septic arthritis	I
Shin splints, algorithm	III
Shoulder pain	III
Shoulder pain, in different age groups	II
Sjögren syndrome	I
Spinal cord compression	I
Spinal stenosis, lumbar	I
Spondyloarthropathies	I
Spondyloarthropathy, diagnosis, algorithm	III
Spondyloarthropathy, treatment, algorithm	III
Spondylosis, cervical	III
Synovial fluid analysis	IV
Systemic lupus erythematosus	I
Takayasu arteritis	I
Temporomandibular joint syndrome	I
Trochanteric bursitis	I
Vasculitis, systemic	I
Whiplash	I
Wrist and hand pain, in different age groups	II

SURGERY, GENERAL

Acute pancreatitis	I
Adrenal incidentaloma	III
Adrenal mass, algorithm	III
Anorectal fistula	I
Appendicitis, acute	I
AV malformations, cerebral	I
Bicuspid aortic valve	I
Bite wounds	I
Bleeding, gastrointestinal, algorithm	III
Bleeding, variceal, algorithm	III
Brain neoplasm, glioblastoma	I
Breast abscess	I
Breast cancer	I
Breast, nipple discharge evaluation	III
Breast, radiologic evaluation	III
Breast, routine screen or palpable mass evaluation	III
Burns	I
Cancer of unknown primary site	I
Cholecystitis	I
Cholelithiasis	I
Chronic pancreatitis	I
Colorectal cancer	I
Compartment syndrome	I
Constipation, algorithm	III
Diabetic foot	I
Diverticular disease (diverticulosis, diverticulitis)	I
Electrical injury	I
Esophageal tumors	I
Esophageal varices	I
Fallopian tube cancer	I
Fibrocystic breast disease	I
Frostbite	I
Gallbladder carcinoma	I
Gastric cancer	I
Gastric dilatation	II
Gastric emptying, delayed	II
Goiter evaluation and management	III
Hepatocellular carcinoma	I
Hepatomegaly, algorithm	III
Hepatomegaly, differential diagnosis	II
Intra-abdominal mass lesion, neonatal	II
Large bowel stricture	II
Leg ulcer, algorithm	III
Liver abscess	I
Lung abscess	I
Mesenteric adenitis	I
Mesenteric arterial embolism, associated factors	II
Mesenteric venous thrombosis	I
Nasal and paranasal sinus tumors	II
Nasal masses, congenital	II
Neck mass, algorithm	III
Oral cancer	I
Paget disease of the breast	I
Pancreatic cancer, exocrine	I
Pancreatic islet cell tumors	III
Paronychia	I
Parotid swelling	II
Pelvic abscess	I
Pelvic mass, algorithm	III
Pelvic pain, causes in women	II
Pelvic pain, reproductive-age woman	III
Peripheral arterial disease	I
Perirectal abscess	I
Peritonitis	I
Pilonidal disease	I
Pituitary region tumors	II
Pneumatosis intestinalis in neonate and older child	II
Pneumoperitoneum, neonatal	II
Pneumothorax, spontaneous	I
Portal vein thrombosis	I
Primary chest wall tumors	I
Scrotal mass, algorithm	III
Short bowel syndrome	I
Splenomegaly, algorithm	III
Subphrenic abscess	I
Testicular cancer	I
Testicular torsion	I
Thyroid carcinoma	I
Thyroid nodule	I
Ureteric obstruction, congenital	II
Urethral obstruction, children	II
Urolithiasis	I
Varicose veins	I
Ventricular septal defect	I

UROLOGY

Acute urinary retention (AUR)	I
Autosomal dominant polycystic kidney disease	I
Benign prostatic hyperplasia	I
Bladder cancer	I
Bladder pain syndrome	I

Calcifications, genital tract, female on x-ray II
Cystitis, acute III
Ejaculation disorders I
Epididymitis I
Erectile dysfunction I
Erosions, genitalia II
Groin masses II
Hematuria, differential diagnosis II
Hematuria, pediatric patient II, III
Hydrocele I
Incontinence (urinary) I
Infertility I
Kidney enlargement, unilateral II
Neuropathic bladder II
Oliguria III
Orchitis I
Pelvic mass, algorithm III
Pelvic pain, reproductive-age woman III
Penile rash II
Peyronie's disease I
Pigmenturia II
Prostate cancer I
Prostatitis I
Renal mass, algorithm III
Scrotal mass, algorithm III
Sexual dysfunction III
Sexual dysfunction in women I, II
Testicular cancer I
Testicular torsion I
Ureteral colic II
Ureteric obstruction, congenital II
Urethral obstruction, children II
Urinary retention II
Urinary tract infection I
Urine color abnormalities II
Urolithiasis I

INTERDISCIPLINARY MEDICINE
Acetaminophen poisoning I
Acid-base homeostasis III
Acidosis, metabolic, algorithm III
Acidosis, metabolic, differential diagnosis II
Acute respiratory distress syndrome I
Alkalosis, metabolic, algorithm III
Alkalosis, metabolic, differential diagnosis II
Aneurysm, abdominal aorta I
Angioedema I
Aortic dissection I
Aseptic necrosis I
Calcium-alkali syndrome I
Carbon monoxide poisoning I
Cardiorenal syndrome I
Chronic fatigue syndrome I
Chronic pain management I
Churg-Strauss syndrome I
Claudication I
Cocaine overdose I
Constipation, algorithm III
Creatine kinase (CK, CPK) IV
Cyanosis, algorithm III
Deep vein thrombosis I
Diarrhea, acute III
Diarrhea, chronic III
Dilated pupil III
Dyspepsia III
Dyspnea, evaluation, algorithm III
Dyspnea, differential diagnosis II
Edema, generalized III
Edema, regional, algorithm III
Electrical injury I
Failure to thrive I
Falls in the elderly I
Familial Mediterranean fever I
Fatigue, algorithm III
Fever of undetermined origin I
Graft-versus-host disease (GVHD) I
Hemolytic-uremic syndrome I
Hepatomegaly III
High-altitude sickness I
Hot flashes I
Hypotension III
Insomnia I
Lymphadenopathy, generalized, algorithm III
Lymphedema I
Malabsorption III
Mallory-Weiss tear I
Mediastinitis I
Mediastinitis, acute II
Medical marijuana I
Mesenteric venous thrombosis I
Muscle cramps and aches III
Muscle weakness, algorithm III
Neck pain III
Neurofibromatosis I
Neuroleptic malignant syndrome I
Obesity I
Obesity-hypoventilation syndrome I
Oliguria III
Patient with ill-defined physical complaints III
Peripheral arterial disease I
Portal vein thrombosis I
Postural hypotension, nonneurologic causes II
Pressure ulcers I
Pruritus, generalized III
Psychosis II
Rh incompatibility I
Rhabdomyolysis I
Sexual dysfunction III
Shock, clinical algorithm III
Subclavian steal syndrome I
Superior vena cava syndrome I
Thoracic outlet syndrome I
Thrombophlebitis, superficial I
Tumor lysis syndrome I
Unconscious patient III
Unruptured intracranial aneurysms (UIAs) I
Upper extremity deep vein thrombosis I
Weakness, nonneuromuscular causes II
Weight gain, algorithm III
Weight loss, unintentional, algorithm III
